SINGBHUM, that part of it called the Kolehan is the country proper of the Ho, and is for about 60 miles and from 35 to 60 in breadth a series of fair and fertile plains studded with hills. In Singbhum, occasionally, in the markets, a young man will pounce on a girl and carry her off by force, his friends covering the retreat. Singbhum was never Mahratta, and in 1857 its chief, the rajah of Poorahat, joined in the rebellion, many of the Lurka-Kol following him. A christian mission went to Chota Nagpore, in 1845, and has made much progress amongst the Dhangar race.—*Dalton, pp.* 163, 181.

SING-BRANG-KUN. Lepch, Gordonia wallichii, a timber of the Himalaya, universally adopted for ploughshares and other purposes requiring a hard wood. It ascends 4,000 feet on the mountains. In very dry soils it is replaced by "sal" Vateria robusta, and more rare the Pinus longifolia.

SINGESHWAR, an ancient buddhist temple in the Chayagang Duar, a southern division of Kamroop. It has been appropriated by the hindoos.

SING-GE-CHU. The Garo river is the Sing-ge-chu or Indus, also called there Gar-jung-chu, and there is no great eastern branch as some suppose. At Garo, according to Moorcroft, it is a very insignificant stream.—*Capt. Gerard's Account of Koonawar, pp.* 3 *to* 144. See Indus.

SINGH, Hind, from the Sanscrit Sinh or Sinha a lion, is a suffix to the names of the military castes of Rajputs, also of Sikhs, when fighting men. When a Manjhee Singh dies, leaving no male offspring, his brothers, or his nephews, of the full blood, assume the right of succession, to which the widows become competitors. According to the Shasters (if they may be considered applicable to public property and chiefships,) the prior title of the widows is held; but the Sikhs, with a view to avoid an open and direct violation of a known law, have a custom termed kurawa, or chadur-dalna, which obtains in every family, with the exception of those of the Bhaee, the eldest surviving brother of the deceased places a white robe over, and the neeth, or ring, in the nose of the widow, which ceremony constitutes her his wife.—*Steinbach's Punjab, pp.* 79-80; *Wilson.*

SINGHA RAJA, a ruler of Kandy in Ceylon, a history of whose cruelties is given by Knox, who escaped in 1679.—*Knox's Relation.*

SINGHALESE, natives of Ceylon. The population in 1844 was estimated at 1,442,062, and in 1857 it amounted to 1,697,975 besides about 30,000 soldiers and foreigners. Since then an estimate has been made, which shows a population close on three millions. There are various statements as to the races occupying Ceylon. The European population is small, under 4,000, consisting chiefly of British emigrants employed in the civil and military service or on the plantations. Descendants of Europeans, or Ceylonese, are about 15,000 or 20,000.

Burgher is a term properly applicable only to white persons of pure Dutch descent, of whom there are now but very few in Ceylon; but the name has, by courtesy, been given to all those who in India are styled Indo-Britons, Eurasians, Anglo-Indians, East-Indians or half-castes, namely, the descendants of Europeans by native women, therefore a race of mixed European and native origin.

The coast people of Ceylon are of a Tamulian or Dravidian stock. Those of Kandy, with their habits of polyandry, would seem to be more allied to the people of Coorg, but the coast tribes are of the same race as the Tamular of the peninsula. The Singhalese themselves, however, do anything but favour this idea. They regard the Tamuls with dislike, as foreigners who warred on them and conquered the northern part of the island. Intermarriages are exceedingly rare, and the Singhalese of any position who formed such a union would be considered socially degraded. There are a few wild out-caste races, the Gahaleya, Rhodiah and Veddah in the forests and unfrequented parts. The Singhalese range themselves under the heads of Kandians, low-country Singhalese, Rhodiah and Veddah. The Tamul people of Ceylon belong to the same race as the Tamular of Southern India, and consist either of those who have been on the island for centuries or who are recent emigrants. They are chiefly to be found in the north-east portion of the island, and the two towns to which they chiefly resort are Jaffna and Trincomallee. Batticaloa is the centre of the dense Tamul population. Their main occupation is agricultural. The labourers of the island are styled coolee also a Tamul word. They come over in large numbers from the continent during the coffee season.

Lord Valentia who travelled in Ceylon,

in the beginning of the century, says the races are the Rajah Wansaya, the king's caste.

Brahmana Wansaya, the caste of brahmins skilled in science. This race belong to the Tamul family, following the hindoo religion. The highest of the Singhalese races is the Velala or Goya.

Wanija Warsaya, the merchant caste.

Gowi wansaya, the caste of Gowi, who cultivate the ground, known in Ceylon by the name of Vellala, which however is not a Singhalese word. These Gowi or Vellala are of the highest caste of Singhalese on the island.

Chandalayo, inhabitants of the woods, who strip the skins of animals to make leather thongs.

Veddo, a people who live wild in the woods, and kill wild beasts.

Duravo caste, commonly called Chando, which is not a Singhalese word. The name Duravo is compounded of two words, which signify come from afar.

Karawo. There are nine sub-divisions of this race, which is commonly called the fisherman's caste; it derives its name from a compound word which signifies "evil-doers," because the occupation of the caste is the destroying of animals, which by the religion of Buddha is forbidden.

Sirr in his Ceylon says, the principal castes are four, viz:

The Surya Vause or royal race; this has two divisions, viz:

Goe Wanse, a division of the Surya or royal race, cultivators, the most numerous in the island, and to it belong the nobles, chiefs, priests, and nearly all the government servants.

Nille Makareya, or shepherds, is the second division of the Surya.

Brahmina Wanse, descendants of brahmins.

Wiepa Wanse, is divided into two classes, cultivators and shepherds.

Kshoodra Wanse, which has sixty subdivisions. The Singhalese are a small race, and by no means good-looking. Their complexion is the same as that of the hindoos; but their features are of the European type, and their skin is far fairer than that of the Tamul race in Ceylon.

The costume of the men is a long petticoat, fastened round the waist and reaching to the heels. Tortoise-shell combs are worn by men as well as women. In the numerous excesses into which European costume has been carried, the size of the back comb worn by ladies has never attained that of the Singhalese men, who also wear a narrow long bent comb across the forepart of the head—the lighter coloured shell is most esteemed by them. Five pounds is a moderate price for a tortoise-shell back comb, which increases in value according to the size and quality of the shell: hair pins of tortoise-shell are worn by the women: gold and silver being substituted for full dress; these hair pins are among the articles purchased by passengers in the steam-boats. The rich and well-watered delta between Colombo and Galle is an overgrown waste. The Singhalese, whose property it is, have covered it with cocoanut, bread-fruit and jack-fruit trees, and on these they are content to live, or rather exist, passing the great part of their time in sleep, while the women of their household work.

Kandians are the inhabitants of the hill-country, and are a hardy robust race, never till recently intermingling with their low country-brethren. Their language is made up of three component parts, Elu (or Singhalese pure) the Pali, and the Sanscrit. They possess an extensive literature, and their religion is buddhism. The low country Singalese are either Buddhists, Roman Catholics, or Protestants. The influence of Roman Catholicism is very great, and the people are divided into classes according to their occupations. Among the Kandyans, polyandry was prevalent till declared illegal in 1856, and the wife had the possession of all the brothers. The children call the eldest brother, father. A man can bring in another not a relation, to have joint marital rights with himself; indeed the first husband, can so introduce, as many as the wife will consent to receive as husbands. According to Polybius, polyandry was practised in ancient Greece, and in Book vii, we read that it was an old and habitual practice in Sparta. In Kandy, in the Beena marriage, the husband went to reside in the wife's house, and the woman shared the family inheritance with her brothers. The husband, in this marriage, can be dismissed summarily, by the family of the wife. In the Deega, a more respectable marriage, the wife leaves her own house for that of the husband—forfeits all claim on the property of her parents but acquiring some claim on that of her husband, and the wife cannot obtain divorce, unless with the full consent of the husband. Divorces are constantly sought for by women, on trivial pretences. A child born within nine months of the divorce, must be maintained by the husband. The Kandyans are a larger race of men than the Singhalese of the coast provinces. They have a saucy, independent mien, but are exceedingly indolent and thriftless.

Gahalaya, are an outcaste predatory race, near Matelle in Ceylon who acted as executioners in the times of the Kandyan kings.

Gattaroo, an outcaste race in Ceylon.

Veddah, are hunters, and are supposed to be amongst the first occupants of the island. They are a wild semi-savage race residing in the interior. The forest Veddah dwell in hollow trees or caves, subsist on game which they kill with rudely formed bows and arrows, wandering from jungle to jungle, as the game becomes scarce. They will not hold the slightest intercourse with any natives but those of their own tribe, and their language is said to be unintelligible to all others. The village Veddah dwell in certain districts, hold but slight intercourse with the other inhabitants of the island, will not intermarry nor mix with them. They can make themselves understood to the Singhalese. Their sole clothing is a strip of cloth which hangs down in front, and is fastened by a coir cord, which passes round their loins. Their hair, beards and whiskers are never shorn or cleansed, but hang down in matted masses. Tennent describes the Veddah as miserable objects, active but timid, athletic though deformed, with large heads and misshapen limbs. Their long black hair and beards fall down to the middle in uncombed lumps, they stood before him with their faces bent towards the ground, and their restless eyes twinkled upwards with an expression of uneasiness and apprehension. The children were unsightly objects, entirely naked, with misshapen joints, huge heads and protuberant stomachs ; the women, who were reluctant to appear, were the most repulsive specimens of humanity he had ever seen in any country.

The forest Veddah are dexterous hunters, and especially skilful in snaring the wild elephant. The two sections of the tribe do not intermarry, as they mutually distrust each other. The Veddah generally deposit their dead in the jungle to be devoured by wild animals. They are said to worship the planets, ? evil spirits and the spirits of deceased ancestors. They have their own headsmen whom they elect and obey. They use bows and arrows and clubs of iron wood. They occupy a district about 90 miles long and 45 broad in the south-eastern side of Ceylon, lying between the sea and the base of the Badullah and Oovah hills. According to Mr. Sirr they are a remnant of the Yakko, the original inhabitants of Ceylon, who, 2,000 years ago, after the conquest of the island by Wajayo and his followers, retired into the wilds as the Kuli in Guzerat, the Bhil in Malwa, the Putwa in Cuttack, the Kond in Gondwana, and the Beda in Mysore retired before conquerors. The Bisadæ, or Besadæ, which in mediæval Greek is called Vesadæ, are alluded to in the tract of Palladius de Moribus Brachmanorum, written about A. D. 400, and the same name is applied by Ptolemy to a similar race inhabiting northern India. A tribe in Mysore, known by the name of Beder or Beda, is said to have formed part of the army of TipuSahib ; the Beder of Mysore and up to the Kistnah river are an active agricultural people though predatory and from them the term Pindara came to be used. The Veddah of Ceylon live by hunting and use the bow, in drawing which they employ their hands and their feet. They are omniverous and eat carrion and vermin, roots, grain, fruit, birds, bats, crows, owls, and kites, but refuse the bear, elephant and buffalo. Their language is a dialect of Singhalese, free from Sanscrit or Pali, but the vocabulary is very limited and they have recourse to gestures and signs. They have no knowledge of God, nor of a future state, and have no temples, idols, altars, prayers, or charms, but have a devil-worship. They do not bury, but cover their dead with leaves in the jungle. They are regarded by the Singhalese as of high descent.

Rhodia, a little numerous outcaste, scarcely civilized, race, in Ceylon, forbidden to approach a temple, or any of the higher castes. According to one tradition, they were hunters who, on the eve of a solemn occasion, failing to obtain game, &c., murdered a child and sent its dismembered body for the king ; but another tradition is to the effect that this caste persisted in eating beef after its use as food had been prohibited. The native laws forbade a Rhodia to approach a temple of buddha or the gods ; to build houses or to live in any abode enclosed within walls, nor even to cultivate the soil or possess land ; and, even to this day, their dwellings are mere sheds. They were forbidden to approach much less to touch or breathe upon a caste man, and all things they touch are deemed unclean. The men wander about in parties or tribes seeking their precarious subsistence. Their women perform feats of legerdemain, and tell fortunes, their want of chastity is proverbial. Their numbers do not exceed a thousand, and they are principally in the Kandyan province, at Saffragam, Dombera, Wallepane, &c. Nominally buddhists they are also devil-worshippers. Rodeya or Rodda, in Singhalese, literally means filth. In their social degradation, they resemble the Cagot and Caqueax, who from time immemorial have been held in abhorrence in the valleys of the Pyrenees and the plains of Bretagne, Poitou and Guienne.

Chalia, the cinnamon-peelers of Ceylon, claim to be superior to the Velalar race. The Chalia were the founders of the Amerapura sect of buddhists in opposition to the sectarian tyranny of the orthodox buddhists.

Amongst the Singhalese buddhists, the term buddha is understood to mean, beings who appear in the world at intervals, and are able to teach men the way to attain nirwana, and they recognize Anomadassa as a Buddha prior to Gautama. Their literature is in Pali, and the Dipavansa contains a history of buddhism in that island which breaks off with the death of Mahasena A. D. 302. The Mahawansa was compiled by Mahawana who lived about A. D. 500, was brought down by successive writers to the eighteenth century and was translated by the Hon'ble G. Turnour of the Ceylon Civil Service. The Singhalese language according to Rask belongs to the Turanian family of speech, but in Ceylon, where the Arian and Dravidian element is intermixed, a remnant of buddhists is still to be found who use the Pali scriptures. In the whole line of coast in the extreme south-east, south and south-west of the peninsula of India, a large part of the population of Ceylon is of foreign blood.

Singhalese seems to bear towards Sanscrit and Pali a relation similar to that which the English of the present day bears to the combination of Latin, Anglo-Saxon and Norman-French, who form the bases of the language. In Singhalese, words connected with rural life and used to denote the ordinary wants of mankind before society had attained organisation, are pure Singhalese. Terms applicable to science and art are from Sanscrit, and those of the national religion are taken from the Pali.

The names of their week days are :—

Sunday.....Irida, from Iru, the Sun.
Monday.....Sanduda, from Chanduya, the Moon.
Tuesday....Angaharuwada, from Angaharawa, Mars.
Wednesday.Badada, from Buda, Mercury.
Thursday...Brahaspatinda, from Brahaspati, Jupiter.
Friday.......Sikurada, from Sikura, Venus.
Saturday....Senusarada, from Senasura, Saturn.

The men as well as the women, have long petticoats, with their hair fastened with a tortoiseshell or silver comb, in a coil at the back of the head. There is very little difference in the dress of the men and the women, the men all wear long hair, which is black, fine and straight. While bathing the men let their hair down, but at other times it is drawn tightly off the face, and rolled in a knob at the back.—*Hardy, pp.* 4, 5, 83, 84, 286, 290, 291, 303, 433 ; *Frere's Antipodes, p.* 146 ; *Tennent's Ceylon* ; *Sirr's Ceylon, Vol.* ii, *p.* 216 ; *Yule Cathay, Vol.* ii, *p.* 371. See Ceylon, India, Rhodia, Spinifex squarrosus, Wijao.

SINGHARA, HIND. This is the spinous fruit of Trapa bispinosa, &c. The plant furnishing this important article of food appears to have been extirpated from the tanks of Southern India, but it has been preserved in the Mahratta country and the Dekhan. There are more than one species which produce the Singhara or Water nuts. The large seeds of Trapa bicornis, a native of China, and of T. bispinosa and T. natans, species indigenous to India, are sweet and eatable, and the aquatic plants which furnish them are hence an extensive article of cultivation. In Cashmere and other parts of the east they are common food, and known under the name of Singhara nuts. In Cashmere the government obtains from these nuts £12,000 of annual revenue. Mr. Moorcroft mentions that Runjeet Singh derived nearly the same sum. From 96,000 to 128,000 loads of this nut are yielded annually by the lake of Ooller alone. The nut abounds in fecula. In China the kernel is used as an article of food, being roasted or boiled like the potato. The Singhara grown in the pools near the Jullundhur cantonment is considered very superior. Dr. Royle writes: that a species of Singhara forms a considerable portion of the food of the inhabitants of Cashmere, and we learn from Mr. Forster, that it yielded the government £12,000 a year of revenue; and Mr. Moorcroft mentions nearly the same sum as Runjeet Singh's share, from 96,000 to 128,000 ass-loads of this nut being yielded by the lake of Oller. The long stalks of the plants reach up to the surface of the water, upon which their green leaves float, and their pure white flowers expand beautifully among them in the latter part of the afternoon. The nut grows under water after the flowers decay ; it is of a triangular shape, and covered with a tough brown integument adhering strongly to the kernel, which is white and esculent, and of a fine cartilaginous texture. They ripen in the latter end of the rainy season and are eatable till November. In the Panjab, the variety called Singhara purbiya, the eastern or down country water caltrops, is deemed of superior quality.—*Sleeman's Rambles of an Indian Official* ; *M. E. J. R.* ; *Simmonds* ; *Powell's Hand-book, Econ. Prod., Panjab, p.* 262 ; *Valentia's Voyage and Travels, Vol.* i, *p.* 492 ; *Rhode's MSS.* ; *Sirr, Vol.* ii, *p.* 316.

SINGHU, SANS. A lion, from singa, to injure.

SINGHU-VAHINEE, SANS., from singhu, and vuh, a vehicle.

SINGHBUM is situated in the Singhbum district, and the inhabitants pay a nominal obedience to the maharajah of that province, but the greater proportion of this population is more under the influence of the rajah of Mokurburj than of any of the other powerful chiefs in that part of the country. But even his orders are obeyed only where they are supposed to tend to the advantage of the Kol themselves. Upon the whole it may be said of this singular people that, living in a primeval and patriarchal manner under their Moondas and Mankies, they have managed to preserve a sort of savage independence, making themselves dreaded and feared by their more powerful and civilized neighbours. The Kolehan with its wilds and jungles is divided into different peer, as they are termed, or pergunnahs. These peer are, generally speaking, not of any great extent, two or three moderate marches carry you through each of them. There can be little doubt, and such is the tradition among the people themselves, that the Lurka Kol came originally from Chota-Nagpore, and are descendants of the old Moonda or Moondaree of that district. They emigrated finding the romantic hills and valleys of Chota-Nagpore too confined for their increasing numbers. The same cast of countenance prevails in the two races, though, perhaps, tinged with a wilder and more fierce expression in the Lurka Kol. The Uraon, who inhabit great part of Chota-Nagpore, regard these Kol as a tribe inferior to themselves, and do not intermarry with them. The villages in the Kolehan are ruled by Moondas and Mankies, as in Chota-Nagpore. The former, the Moonda, is the proprietor of one village; while the latter holds six, eight, or twelve. These village potentates used frequently to wage fierce war with one another, and bitter and long existing feuds have often prevailed amongst them. There is this peculiarity in the Kol character, however, that serious and bloody as may be the domestic quarrels, no sooner are they threatened with hostlilities from without, than all their animosities are laid aside and forgotten for a time. The villages are generally built on some elevated spot surrounded by trees, and, at some little distance from the principal entrance to the villages, the Kol standard or ensign, a pair of buffalo horns, is suspended in a conspicuous situation. The dress of both sexes, is alike, a strip of cloth brought round the loins and passed between the thighs forming their only covering: the women wear a profusion of coloured beads suspended from their necks, and have their ears pierced with a number of small brass rings. Their diet is of a very promiscuous nature; everything almost that can be considered eatable being relished by them, and much of what we consider carrion is eagerly sought for and devoured. In this respect they do not differ from the Kol of Chota-Nagpore. They are greatly addicted to drunkenness; the religion of the Lurka Kol is nothing but a superstition of the grossest kind. Their great divinity is the sun (suruj), next to the sun ranks the moon (chandoo), and then the stars, which they believe to be the children of the latter. They uniformly, upon solemn and great occasions, invoke the sun, and by him many of these lawless men have, at times, sworn allegiance to the East India Company. Another form of oath used by them is that of swearing upon a small quantity of rice, a tiger's skin and claws, and the earth of the white ants nests; besides the sun and moon, other inferior divinities are supposed to exist, to whom the Kol offer up sacrifices of various kinds. These spirits are supposed to inhabit the trees and topes in and around the village. It has not been distinctly ascertained what degree of power is attributed to these penates, as we may call them; but the belief the Kol entertain of the power and influence of the Bhongas must be considerable, as they will on no account allow those trees to be denuded of their branches, and still less cut down. It is the universal custom in the various Kol villages, that when a woman is seized with the pains of labour, she is immediately removed to a lonely hut, the door is shut upon her, offerings of various kinds are suspended near it to propitiate the Bhongas and no one ventures near till all is over. The female sex, it may be observed, is not kept secluded and shut up. Not amongst the least singular of the customs of the Kol is that connected with their marriage. When a youth has fixed his affection on a lass, generally the inhabitant of some neighbouring village, she is waylaid and carried off to his house by himself and his friends. So soon as information of this reaches the parents of the girl, they proceed to the village of the ravisher, not however, in general, with any hostile purpose. Interviews take place between the friends on either side, and at length matters are brought to a final settlement; the new husband paying to the father of his spouse a certain number of cows, goats, or buffaloes, according to his means, or the beauty and comeliness of his bride. After this a scene of feasting and intoxication generally follows, in which women and children as well as men participate. The Kol burn their dead, carefully collecting the bones and ashes and burying them with offerings of rice in or near their villages, placing perpendicular or horizontal slabs of stone over each particular grave. Those grave-stones form a remarkable object, and strike the eye of every stranger on approaching a Kol village. The only weapons used by the Kol, whether in war or hunting are the bow and arrow, and the tulwa or axe.—*Journal of the R. A. S., Vol.* xviii *of* 1861, *pp.* 370-375. See India, Kol.

SINGHIA, Hind. Aconitum kakkra

singi, Hind. Pistacia integerrima.

SINGHPO or Sintipho, a people inhabiting the eastern districts of Assam to the head of the Brahmaputra. According to their own traditions they descended from heaven ; but it is known that about four or five centuries ago they migrated from a mountainous region on the borders of China, gradually advanced to the mountains skirting Assam, and towards the close of the 8th century established themselves on the low lands which they at present occupy. The peoples called Muttuk, Singhpo proper, and Jili, form three divisions of the Singhpo group. The country of the Muttuk lies at a short distance from where the Brahmaputra river enters the Assam valley, dwelling close to the banks and principally on the southern side. The people are called Muttuk, Moran, and Moamerria or Mowameria, and are subjects of the Bursenapati, a vassal of the raja of Asam ; they are vaishnava hindoos. They are in tribes, as the Khaphok, Khanung, Khalang, and Nognum, and their language is said to contain seven dialects, so different as to render them almost unintelligible to one another. The Singhpo proper are a powerful intrusive population residing partly in Assam and Manipur, and partly in the unexplored east. They are of a mixed Buddhist and Pagan creed, and live in separate villages under chiefs called Gam. There are four tribes known—the Thengai, Mayang, Lubrang and Mirip (Miri Mru, &c.) They have a domestic slavery, such bondsmen being called Gum-lao. They practise polygamy. Property is divided between the eldest and youngest brother, the intermediate remaining with these two as clansmen. The Jili are conterminous with the Singhpo proper. Their language being ⅔ Singhpo and ⅓ Garo. The Kaku religion is more or less buddhist, and the chief object of their worship is Gautama. But they likewise worship the elements and their gods, amongst whom are Megh Duta and Ning Shi, to the latter of whom they dedicate skulls of buffaloes and the skulls of their enemies whom they kill in battle. Dr. Latham considers the words Kaku, Kuki, Kakui and Kakhyen to be identical.

But the word Singhpo is said to be merely a word for man in the languages of the tribes to whom it is applied. The great nursery of these tribes is along the Sgin-maee-kha, or great eastern branch of the Irawadi. The wilder tribes are Khakhyen or Kakoo, and these sweep the Shan villages on which they exercise the greatest cruelties. The Muttuk is a branch of the Singhpo group, and the people are called Muttuk Moamerria or Mowameria. Their country is a short distance from where the Brahmaputra river enters the Asam valley, and they dwell close to the banks, and principally on the southern side. The principal tribes on the frontier of Upper Assam are the Muttuk, the Khamtee, and the Singhpo. The Bur Senaputtee or chief of the Muttuk branch of the Singhpo entered into an engagement in May 1826, whereby he acknowledged the supremacy of the British, and bound himself to supply 300 soldiers in time of war. The management of the country was left in his own hands, except as regards capital offences. In January 1835 the obligation to supply troops was commuted to a money payment of rupees 1,800 a year. In 1826, similar agreements were made with the Khamtee chief of Suddeya, but in 1839 they attacked the town of Suddeya, and many persons, as also Colonel White, the Political Agent, were slain. Agreements were also made in May 1836 with the Singpho. These tribes were implicated in the Khamtee rising in 1839, but they were allowed to surrender under conditions. Many of the Singpho clans have become extinct, and the main body have left Assam for Hookong, in Upper Burmah. The Singpho and Muttuk, on the north are bounded by the Brahmaputra or Lohit ; on the west by the Naga tribes ; and on the south by the Patkoi range, on the southern side of which are other Singpho in Burmese territory. The Singpho march on the N. W., with the Mish-mi who occupy the eastern mountainous extremity of the basin of the Brahmaputra, and on the W. and S. W. with the Naga and Munnipuri tribes. In the interior of Arrakan and between it and the Kynduayn river, several tribes are scattered over the highlands to the south of the Kuki, Naga and Manipuri tribes. The Singpho, from their great extension over the upper basin of the Irawadi and their comparative barbarity, it may be inferred, are in fact descended from the stock from which the Burmans were immediately derived. It is probable that the Burman tribes spread into Arrakan and were modified by the influence of the gangetic race, before they re-entered the lower basin of the Irawadi and successfully contested its dominion with the Mon.—*Dr. Latham's Descriptive Ethnology*; *Cole. Myth. Hind.*, *p.* 326 ; *Aitcheson's Engagements, Treaties and Sunnuds.* See Ka-khyen or Kakoo.

SINGIA MOORA, see Haldia moora.

SINGIN JANASCHA, HIND. Syn. of Corchorus olitorius, *Linn.*

SINGKEA MOON. A fishing town in Chusan, at the S. E. extreme of the island, close to the water's edge.

SINGO, HIND. One of the Umbelliferæ.

SINGOOR, a river near Cawnpur and near Moonjh in Etawah.

SINGOOR NADDI, a stream near Cawnpur.

SINGRAM, see Kattyawar.

SINGREE, a river of Rewah near Mungawa, on the right bank of the Nerbudda in Gurrawarra, near Nursingpoor cantonment.

SINGROWLA, NEP. Cassia lignea.

SING SALOH, see Kelat.

SINGYA JAR, or Singya-khar HIND. Aconitum ferox, &c.

SIN'H, see Mewar, Mahratta governments in India, Sevaji.

SIN'H, Si or sih is the usual abbreviated form of Sin'h.

SINHA, see Buddha, Burabur caves.

SINHALA, a buddhist king of whose coronation a representation occurs in the caves of Adjunta.

SINHALA-DEVA, see Ceylon.

SINHASANA, HIND. A throne; in hindoo temples, the sinhasun or throne, is very handsome; the usual supporters, are the Sinha or lions rampant, trampling on elephants couchant, and ridden by amazons armed with shields and swords. See Burabur Caves.

SINHA VARMA, see Inscriptions.

SINHGARH, 18° 21′ 9″; 73° 44′ 4″, in the Dekhan, a large fort, 15 miles S. W. of Poona.

SINHGI, TAM. Myrobalan.

SINH-KA-BAB, a name of the Indus.

SIN-HOA. The country named Aurea chersonesus, by the great Geographer Ptolemy, has been shown by D'Anville to be the Malay peninsula, and his Sin Hoa, the western part of Cochin China.—*Ind. in the 15th Cent.*

SINJET, also Sinjilla PERS., PUSHT. A species of Elæagnus, in Kabul.

SINJAD, HIND, see Sanjad.

SINJAL, or bal Sinjal, HIND. Rhamnus purpureus.

SINJAR, see Mesopotamia.

SINJI, HIND. Melilotus leucantha. A trefoil grown specially by Europeans to feed horses.

SINJLI, HIND., of Kaghan, Zizyphus flexuosa. Sur sinjli, is Cratægus oxyacantha.

SINK, HIND. Anatherum muricatum.

SINKEL, a river on the west coast of Sumatra, in lat. 2° 13′ N.

SINNAKES, see Greeks of Asia.

SINNU, HIND. Fraxinus floribunda.

SINS, HIND. The five great sins in the hindoo code are, stealing gold, drinking spirituous liquors, murder of a brahmin, adultery with the wife of a spiritual teacher, and association with a person guilty of any of these crimes.—*Hindoo Theatre, p.* 30.

SINSAR CHUND, a rajah famed in hindoo story who is supposed to be identical with Sandracottus.

SINSRING, Pupaia javanica.

SINSYN, see Kami-no-mi-tsi.

SINTIPHO, see Singhpo.

SINTOH, a gigantic creeping plant which grows spontaneously, extensively used both by natives and Europeans in making a lye or wash for the hair, which it is said to clean and strengthen in a remarkable degree.

SIN-TU. This religion is prevalent in Japan, but its followers are less numerous than the buddhists; the term is derived from sin the gods, and tu faith. A prominent feature amongst the Japanese is the variety of religious beliefs. One of which is that of Buddha, but the Sin-tu prevails to as great an extent. The priests of the buddhist religion use the Chinese language in their worship except in their poetry which is in the Japanese tongue. There is, at present, no religious persecution, and members of the same family are often of different persuasions. The spiritual emperor is the high-priest of the ancient Japanese religion. The Sin-tu is an ancient religion of Japan, and, like the old pagan religion of Europe, consists of an apotheosis of all great heroes or saints amongst whom the Japanese include Buddha, which explains the great consideration shown by the various sects there. See Japan, Kami-no-mi-tsi.

SIONAK, HIND. Bignonia indica.

SIOOUTEE, BENG. White rose, Rosa nepalensis.

SIPAH, an Affghan tribe.

SIPAHI, HIND., PERS., TURK. A sepoy, or foot soldier, from Persian, Sipah, an army, and hence the words Sipah-salar, commander-in-chief, Sipah-dar, &c.

SI-PAIT, MALAY. Meaning the 'bitter wood,' is the root of a tree of Sarawak. In substance, appearance and lightness, it precisely resembles the Plye; but, while Plye is tasteless, Si-pait is very bitter to the taste. (Pait, in Malay, means bitter).—*Low's Sarawak.*

SIPHA, see Hindu or Hindoo.

SIPHAL, BENG., HIND. Ægle marmelos.

SIPHAR, PERS. A shield.

SIPHOCAMPYLOS, one of the Lobeliaceæ, small pretty shrubs, growing well in a light sandy soil, and propagated by seed and cuttings.—*Riddell.*

SIPHONANTHUS FRAGRANS.

Hatti-kana, Duk. ?

Double variety. A native of China, *Riddell.*

SIPHONANTHUS INDICA, *Linn.*

Clerodendron siphonanthus, *R. Br.*

Burungee, Duk. ?

A tall, erect-growing, suffruticose plant, with linear leaves; flowers white or cream coloured, with long tubes.—*Riddell.*

SIPHONARIA, a genus of Molluscs.

SIPHONIA ELASTICA.

Hevea guianensis.

A tree 50 to 60 feet in height, common in the forests of Guiana and Brazil, and which has been introduced into the West Indies. Condamine frequently mentions it in his voyage down the Amazon. Caoutchouc is the milky juice of the plant, which exudes on incisions being made and solidifies on exposure to the air.—*Eng. Cyc.*

SIPHONIDA, a section of the Conchifera, order of Molluscs. See Molluscs.

SIPI, Duk. A shell, a mollusc, Cardium edule, oyster.

SIPIL, Hind. Bupleurum marginatum.

SI-PI-TO-FA-LA-SEE, Chinese,

SIPPAI MUTHU, Tam. Pearl.

SIPPERAH, the Sifferah of the Arabs. See Babel, Oojein.

SIPRA, a river near Sonwah in the Indore rajah's territory near Kaluhera in Malwa, in Sindhiah's territory, and near Oojein; also a river at Mahidpoor.

SIPRAKA, see Andhra.

SIPU, see Hindu.

SIR,— ? Hedychium spicatum.

SIR, Pers. Allium sativum, *Linn.*, Garlic.

SIR, Hind. Imperata kœnigii.

SIR, Hind. The head, Sir booland, exalted, high, arrogant, hence Sardar, a chief. Sir-pesh, a forehead jewel. Sir-kar, a government, a superintendent. Sar-posh, a cover. Sar-band, or head-binder, becomes with the Turk's turban.

SIR KOTAHA, Hind. Level land, seer cultivation, on the plains, means the land that a man retains for his own individual cultivation.

SIRA, Tel. Ink.

SIRA, Guz. Rhubarb.

SIRA, Hind. Chionanthus, *sp.*

SIRAGADAM, Tel. Ehretia lævis, *Roxb.*

SIRAGAM, Tam. Cumin seed.

SIRAH, Guz., Hind. Rhubarb.

SIRAH, Guz. Hebradendron gambogioides, *Graham.*

SIRAF, Arab., Hind., Pers., a banker, a money dealer, a cashier; it is from the Arabic sarf, expenditure.

SIRANAGAPU, Tam. Cassia buds.

SIRA-PAPU, Tel. Chirongia sapida. *Sirapappu nune*, Tel. Chirongi oil.

SIRA-SHENGALNIR, Tam. Vernonia cinerea, *Less.*

SIRASWATI AKU, Tel. Clerodendron viscosum.

SIRDAR, Pers. A chief; in India, an officer, a European, a title of the rulers of Candahar. See Affghans, Kandahar, Pindara.

SIRDEHI. A small tribe residing at Sirdeh, S. E. of Ghizni.—*Dr. Latham, p.* 197.

SIRDHANA, 29° 8′ 8″; 77° 36′ 1″, in Hindostan, 12 miles N. W. of Mirath; locality undefined 882 feet above the sea.

SIREE, a river of Subathoo.

SIREKU, Maleal. Andropogon schænanthus, also A. citratum, *Linn.*

SIREN.

Zeiren, Greek.

SIRENIA, Herbivorus cetacea, a sub-order of the cetaceæ, as under;

Order.—Cetaceæ, Whale tribe.

2 Fam.; 8 Gen.; 21 Sp. viz.;

Fam.—Delphinidæ, 5 gen.; 14 sp.; Porpoises; Delphinus, 8 sp.; Steno, 2 sp.; Neomeris, 1 sp.; Platanista, 2 sp.; Globiocephalus, 1 sp.

Fam.—Balænidæ, Whales, 4 gen.; 7 sp. Balænoptera, 1 sp.; Balæna, 4 sp.; Physeter, 1 sp.; Phocæna, 1 sp.

Sub-Order.—Sirenia herbivorous cetacea.

gen. Halicore, 3 sp.

SIRGOOJAH, a mountainous tract rising 600 to 700 feet above the level of Chota-Nagpore. Chota-Nagpore, properly ChuttiaNagpore, is the country on the eastern part of the extensive plateau of Central India, on which the Koel, the Subunreka, the Damudah and other rivers have their sources. It extends into Sirgoojah and forms what is called the "Uparghat" or highland of Juspur, and it is connected by a continuous chain of hills with the Vindhyan and Kymor ranges from which flow affluents of the Ganges, and with the highlands of Amerkuntuk on which are the sources of the Nerbudda. The plateau averages 2,000 to 3,000 feet above the level of the sea with an area of about 7,000 square miles. It is on all sides difficult of access. It is a well-wooded, undulating country, diversified by ranges of hills, and has a genial climate. The population, in 1866, was estimated at about a million, and is formed of a number of non-Arian tribes who had fallen back to that refuge from the plains, more than half of them being the race known to Europeans as Kol. On the south-west frontier of Bengal, besides Chota-Nagpore, are Sirgoojah, Palamow, Ramgurh, Hazareebagh, Mynpat and Amerkuntuk. The elevation of Chota-Nagpore, is 2,000 to 3,000 feet with hills running E. and W., but of little height; Sirgoojah is mountainous, rising 600 to 700 feet above the level of Chota-Nagpore. Mynpat is a table-land, about 30 miles S. E., from Sirgoojah town and about 3,000 or 3,500 feet high. Palamow district is very mountainous. Hazareebagh town, 24°, 85° 54′, 1,750 feet. Slope of the country is S. towards Sumbulpore. N. and E. parts of the district, very mountainous, but level and even depressed towards the Mahanuddy. Sumbulpore town, only 400 feet. Orissa table-land then rises on the southern side of Mahanuddy, in some places to 1,700 feet backed by the chain of E. Ghauts, Amerkuntuk, jungle table-land, 22° 40′, 81° 5′, 3,500 feet. The soil in the plains is generally fertile, producing abundant crops of wheat, barley, rice, pulse, excellent vegetables, cotton and sugar-cane. The cultivated parts are overrun with a coarse grass. There are 21 mehals which form the S. W. frontier, and which may be classified in four groups, the Sumbulpore, Patna and Sirgoojah groups, and Singbhoom.

The Sumbulpore Group.

Sumbulpore proper.
Burgurgh.
Raigurh.
Suktee.
Gangpoore.
Sarunghur.
Bunnie.
Bamra.
Rehra Cole.
Sonepore.

The Patna Group.

Patna proper.
Phooljhur.
Bora Samur.
Khuriar.
Bindra Nowagurh.

The Sirgoojah Group.

Sirgoojah proper
Jushpore.
Oodeypoore.
Korea
Chang Bukar.

The Singbhum group.

The territories comprised in the Sumbulpore and Patna groups were ceded to the British Indian government by the treaty of 1830, with Ragoji Bhonsla, were all, except Raigarh, restored in 1806, and finally reverted to the British in 1826. The Sumbulpore and Patna groups are in the circle of the Cuttack tributary Mahals. Singbhoom was never Mahratta, and 1857 its chief, the raja of Poorahat, joined in the rebellion, many of the Lurka Kol, following him. The territories forming the Sirgoojah group were ceded in 1817, and in 1818 the British government sent a Superintendent to Sirgoojah to restore order in the country, which had become distracted by domestic feuds. In 1820 and 1825, engagements were made with the chief of Sirgoojah. In 1819 engagements were also taken from the chiefs of Jushpore and Korea, of which latter state Chang Bukar was then a feudal dependency; but, in 1848, separate settlements were made with Korea and Chang Bukar. The Sirgoojah mountains, are in length 90 miles; breadth 85 miles, and lie between 22° 34,′ 24° 54′, and 82° 40,′ 84° 6.′ Sirgoojah is rugged and mountainous, from 500 to 600 feet above the adjoining table-land of Chota-Nagpore. Drained by the rivers Kunher and Rhern, with its feeder.—*Major Dalton's Annals of Indian Administration; Aitcheson's Treaties, &c.* See Kol, Singhbum.

SIRGUNDA PALA, Tel. Hemidesmus indicus, *R. Brown.*

SIRHIND, the capital of the province of that name, is now a town in the state of Patiala. Its gardens are described by Abul Fazul as laid out by Hafiz Rahmat, a grandee of Humayun's court. Thanesar in Sirhind, on the route from Kurnal to Loodiana, is celebrated as the object of one Mahmud of Ghazni's iconoclastic expeditions. It is still surrounded by a ruined wall evidently once of considerable height connected with which is a dilapidated fort with numerous towers.—*Cal. Rev., Jan.* 1871. See Kattyawar, Kuru-Khet.

SIRI, Sri or Siris, was one of the principal deities of Arabian and Ethiopian theologies. Deodorus says the Greeks prefixed an O, and made it Osiris.

SIRI, The ancient name of the ancient city of Delhi; prior to its capture in A. H. 587, A. D. 1191.—*Prin. Ind. Ant.*, 326.

SIRI, Jav. Lemon grass.

SIRI, Malay. Betel-leaf.

SIRI, or Siris, Hind. Acacia speciosa.

SIRIAN, see Rangoon.

SIRIANNEM, Tel. Briedelia scandens, *Willd.*

SIRIARI, Beng., Hind. Tiaridium indicum.

SIRIBOO PEPPER, Eng. Chavica seriboo, *Miq.*

SIR-I-BUL, see Kashmir.

SIRI LAKSHMIVARMA, see Inscriptions.

SIRI MANU, Tel. Conocarpus latifolia, *Roxb.*

SIRIUS, see Bachus osiris.

SIRIN, or sires Hind. Pji. Acacia sirissa also Acacia speciosa, also Acacia stipulata. Chiti sirin, is Cedrela toona. Kali sirin, is Acacia speciosa. Sirin or sares the Acacia speciosa attains full size in 50 years; grows to a great height, length of trunk to first branch 12 feet and girth 6 feet. Sap-wood white, and heart-wood of old trees of a dark colour, heavy and strong; used as building timber, and by zemindars for mills and boats. It is considered unlucky to employ this wood in house-building.—*Mr. Barnes' Kangra Settlement Report, para.* 152; *Lt.-Colonel Lake, quoting Balfour's Timber Trees, p.* 26; *Roorkee Proceeding papers on Gwalior Timber, p.* 27; *Powell's Hand-book, Vol.* i, *p.* 542.

SIRINGRI, Hind. Plectranthus rugosus.

SIRINJI, Tel. Grislea tomentosa, *Roxb.*

SIRI-MINIAK, an oil of Sumatra, prepared from the lemon-grass.

SIRIPOOL, see Andkho.

SIRIS, Hind. Acacia speciosa. Safed siris, is Acacia elata. The "siris" Acacia serissa, yields a coarse gum used by calico printers.

SIRSA TREE, Eng. Acacia speciosa *Willd., W. & A.*

SIRISHA, Beng. Acacia speciosa.

SIRISHT, Guz., Hind. Glue: size.

SIR-I-SHUR, see Takht-i-Soliman.

SIRITETH—? Gingelly seed.

SIRI ULAVA, Tel. Rhynchosia rufescens, *D C.*

SIRIUS, see Iswara.

SIRKA, also Khall, Hind. Acetic acid, vinegar.

SIRKAR, a government, a head of a department: In Calcutta, a supplier.

SIRKI and Kanna, stems of Saccharum munja and of Saccharum sara, also thatch made of the tapering top of the flower stalk of munj grass.

SIR-KAP, part of Taxila. Hatial is a strong fortified position on the west end of a spur of the Margala range, and immediately to the north-east of the Bir mound, from which it is separated by the Tabra Nala. The fortified city of Sir-kap is situated on a large level mound immediately at the north foot of Hatial, of which it really forms a part, as its walls are joined to those of the Kot or citadel.—*Cunningham's Ancient Geog. of India, p.* 115.

SIRKUNDA — ? Saccharum procerum.

SIRMOOR, or Nahun. In recognition of the services rendered by rajah Shumsher Purgass during the mutiny, he received a khillat of rupees 5,000, and a salute of seven guns. The family is Rajput. The revenue of Sirmoor may be estimated at a lakh of rupees a year. The rajah maintains a small force of drilled sepoys, numbering 250 men. The population, according to the latest census, amounted to 75,595. The rajah pays no tribute, but is bound to render feudal service. In Sirmoor some women are to be seen delicate in form and feature, but to the northward, the female countenance is generally good humoured, but the form coarse and highly vulgar.—*Fraser's Himalayan Mountains, p.* 205.

SIRNA, Hind. When Moses, after the Exodus, made a division of the lands of Canaan amongst the Israelites, and appointed six cities to be the refuge of him who had slain unwittingly, from the avenger of blood, the intention was not to afford facilities for eluding justice, but to check the hasty impulse of revenge; for the slayer was only to be protected until he stood before the congregation for judgment, or until the death of the high-priest, which event appears to have been considered as the termination of revenge. In India the infraction of political sanctuary (sirna torna) often gave rise to the most inveterate feuds; and its abuse by the priests is highly prejudicial to society. Moses limited priestly interference, by appointing but six cities of refuge to the whole Levite tribe. The privileges of sirna, or 'sanctuary,' when claimed by the unfortunate or criminal, is sacred in the eye of the Rajput. Kal-Yamun, was the foe of Krishna, ere his apotheosis, from whom he fled to Dwarica and thence acquired the name of Rinchor. Within the sacred bounds of Mount Aboo is the sanctuary (sirna) of Kaniya, where the criminal is free from pursuit; nor dare the rod of justice appear on the mount, or the foot of the pursuer pass the stream; neither within it can blood be spilt, for the pastoral Kaniya delights not in offerings of this kind. The territory contains within its precincts abundant space for the town, the temple, and the establishments of the priests, as well as for the numerous resident worshippers, and the constant influx of votaries from the most distant regions.—*Tod's Rajasthan, Vol.* i, *pp.* 523, 526; *Vol.* ii, *p.* 378.

SIRNAGA-PU, Tam. Cassia buds.

SIRNATH GHOSI, see Inscriptions.

SIROCCO, the sirocco wind in the Mediterranean, on the healthy has little effect, but the weak and diseased are materially injured by its depressing influence. The term has an Arabic origin from Sharq, the east wind.

SIROES, see Sassanian kings.

SIROHI. The Deora of Sirohi is a branch of the Chohan tribe, one of the four Agnicula, a race sprung from fire.—*Tod's Rajasthan, Vol.* ii, *p.* 115. See vol. i.

SIRONCHA, the head-quarters station of the Upper Godavari district, pleasantly situated on the left bank of the Pranhita, two miles above its confluence with the Godavari, and 120 miles south-south-east of Chanda, the nearest station of the Central Provinces. It is 520 feet above the sea-level according to the topographical survey maps, but only 360 according to the levels of the Public Works Department: forty miles above Sironcha occurs what is known as the third barrier, which is a far more formidable obstruction to navigation than either of the other Godavari barriers. The river has a broad, sandy bed, which in the rainy seasons is full from bank to bank with a rushing flood, but in the dry weather consists for the greater part of broad reaches of sand, with small and shallow streams flowing through them.

SIROPA, the Rajpoot term for a khillat or robe of honour, properly Sir-a-pa (from 'head,' sir, to 'foot' pa,) and means a complete dress; in short, cap-a-pied.—*Tod's Rajasthan, Vol.* i, *p.* 265.

SIRPHERRA, a tribe, who reside in summer in Gurghina, and winter in Kach Gandava.

SIRA, see Kelat.

SIRR, salt lakes, throughout the whole of the Indian desert, are termed sirr, though none are of the same consequence as those of Marwar. The largest is at the town of Sirr, so named after the lake, which is about six miles in circumference. There is another at Chaupur about two miles in length, and although each of them frequently contains a depth of four feet of water, this entirely evaporates in the hot winds, leaving a thick sheet of saline incrustation. The salt of both is deemed of inferior quality to that of the more southerly lakes.—*Tod.*

SIRRAS, Mahr. Acacia odoratissima, Acacia sirissa, and Acacia speciosa.

SIRRI, of Amboyna, Andropogon schœnanthus, *Linn.*

SIRRISHT, Guz. Glue.

SIRRI-TEKKU, Singh. Gunta baringa?

SIRROO-KALUNG, Tam. Plectranthus rugosus.

SIRRU CALAKA PALLAM, Tam. Carissa spinarum, *Linn., Don.*

SIRRUGHU, also Sirrughu kuttale, Tam. Aloe litoralis, *Kœnig.*

SIRRU KANCHURI, Tam. Tragia cannabina, *Linn.*, Guz. Size.

SIRRU KANGORI VER, Tam. Root of Tragia cannabina.

SIRRU KATTALAY, Tam. Aloe litoralis, *Kœnig.*

SIRRU KIRE, Tam. Amarantus campestris, *Willd.*

SIRRU KALAKA PALLAM, Tam. Carissa spinarum.

SIRRU KORRUTTI VER, Tam. Root of trichosanthes incisa.

SIRRU KURA, Tel. Amarantus campestris, *Willde.*

SIRRU KURUNGA VER, Tam. Root of Periploca sylvestris.

SIRRU NAGA, Tam. Eugenia jambolana, *Lam., Roxb.*

SIRRU-PULE, Tam. Ærua lanata, Illecebrum lanatum.

SIRRU SANUL VEREI, Tam. Linseed.

SIRRU VALLI KALANG, Tam. Dioscorea aculeata.

SIRSA, Hind. Acacia odoratissima, *Roxb.*

SIRSA. The principal products of the Sirsa district are grains of all kinds ghee, wool, sujji, moonj, red pepper, bullocks and camels. They are transported mostly to Marwar on camels, to meet the demand for food occasioned in that part of the country, by an apparently chronic state of famine existing there.—*Ann. Ind. Adm., Vol.* xii, *pp.* 104-5.

SIRSEE. Maharajah Dowlut Rao Sindia in 1820 granted three-fourths of the revenue of the talooka of Sirsee to Bharut Sah on condition that he would pay the remaining one-fourth and honestly discharge the duties entrusted to him by reducing the Grassias, &c., to obedience.

SIRSHUF, Pers. Mustard seed.

SIRSOOTI. There are 24 dams on this river, between T'hanesur and Sagara, where it joins the Caggar river, the dry river bed under Sirsa.

SIRSUN, also Rajika, Sans. Mustard seed.

SIR-SUK-ka-KOT, part of Taxila.

SIRU KIRE, or Sirru kire, Tam. Amarantus campestris, *Linn.*

SIRU PADI, Tam. Coldenia procumbens, *Linn., Roxb.*

SIRUTALI, Tam. Ipomœa gemella, *Roth.*

SIS, Hind. Crotalaria burhia.

SISA, or Sheesha, Guz., Hind. Lead.

SISAGI, Hind. A tree of Chota-Nagpore, with hard, white timber.—*Cal. Cat. Ex.* 1862.

SISAKA, Sans. Lead.

SISALIUS, Hind. Leucas cephalotes.

SISAMU, Tel. Lead.

SISAN, Sind. Crocodile.

SISANBAR, Arab. Thymus chamædrys.

SISHA, also Shish. Hind. Lead.

SISHAM, or Sisu, Hind. Dalbergia sissoo.

SISI, Hind. Glass.

SISIK KURAKURA, also Sisik panu, Malay. Tortoise shell.

SISKE, Hind. Sambucus ebulus.

SISKIN. The Himalayan Siskin Carduelis spinoides is common in the forest, and generally seen in flocks.

SISPARA, a ghaut on the Malabar side of India, 6,742 feet above the level of the sea.

SISSA, Can. Dalbergia acuminata, *Ains.*

SISSAI, Hind. Crotalaria burhia.

SIS, also Sissai, Meini, Pola, Trans-Indus. Crotalaria burhia, *Ham., Buch.*

SISSOO, Hind. Dalbergia acuminata, *Ains.*, also Dalbergia sissoo, *Roxb.*, is one of the most valuable of the timber-trees of India, and with the Saul, is more extensively employed than any other in north-west India. The ship-builders in Bengal select it for their crooked timbers and knees; it is remarkably strong, its colour is a light greyish-brown, with darker coloured veins. In structure it somewhat resembles the finer species of teak, but it is tougher and more elastic. There are two kinds used respectively in Bengal and Bombay, the latter is much darker in colour. The Indian black rose-wood (Dalbergia latifolia,) is a superior species of sissoo, from the Malabar coast. Cuttack forests are composed of teak, sal, sissoo, ebony, Pentaptera buchanania, and other trees of a dry soil, and that require a dry season alternating with a wet one. These are unknown in the Chittagong forests, which have Jarool, Lagerstrœmia, Mesua, Dipterocarpi, nutmegs, oaks of several kinds, and many other trees not known in the Cuttack forests, and all typical of a perennially humid atmosphere.—*Holt* ; *Hooker's Him. Jour., Vol.* ii, *p.* 340 ; *Edye.*

SISSOO-WOOD OIL, see Oil, Wood-oil from Chittagong.

SISSOWA, URYA. Dalbergia sissoo, *Roxb.*

SISSU, TEL. Dalbergia sissu. *Roxb.*

SISUM, GUZ., HIND., MAHR. Dalbergia latifolia. Blackwood.

SISUNAGA, a Maghadha dynasty in India, that succeeded the parricide Battya B. C. 446, by the murder by Sisunaga of the last Bhatty.

Sisunaga reigned	18	years	B. C.	446.
Kalasoka ,,	28	,,	,,	428.
Bhadyasena and 9 brothers } ,,	22	,,	,,	379.

The last brother Pingamakha, was dethroned by Nanda.—*Vol.* iii, *p.* 541. See Bhattya.

SISWA SAH, see Inscriptions, Junagurh.

SISYMBRIUM ATROVIRENO.

Ting-lih, CHIN.

A plant of several parts of China given in dropsy, fevers, amenorrhœa.

SISYMBRIUM IRIS,

Khub, Kalan, Khakshi.

Small oval bright yellow seeds. Used for coughs, but seldom. Formerly used as a pot-herb in England.—*Powell's Hand-book, Vol.* i, *p.* 327.

SISYMBRIUM NASTURTIUM, *Linn.* Garden cresses.

SISYPHUS BOWRINGII, two of the Coleoptera of Hong-kong are S. Senegalensis, the largest known species of Sisyphus on record and the S. bowringii *White*, remarkable for the extraordinary spinal projections from its coxæ. Similar spines occur in S. senegalensis.

SIT, BURM. Acacia elata ; Acacia serissa.

SITA, SANS. Anona squamosa, *Linn.*

SITA, Spouse of Rama : in Hindoo mythology an incarnation of Lakshmi, to accompany Vishnu incarnate as Rama. Rama Chandra had been brought up in the paths of religion and virtue, and had been taught that one of the first duties of a prince was to subjugate his own passions to their control. When, therefore, Ravana became an apostate from his duty to the gods, Rama Chandra was appointed the instrument of his destruction. The Grecians had their Homer to render imperishable the fame acquired by their glorious combats in the Trojan war ; the Latins had Virgil, to sing the prowess of Eneas ; and the hindoos have had their Valmiki, to immortalize the martial deeds of Rama, and his army of monkeys, in subduing the giant Ravana and his hosts of many-headed monsters. The Ramayana, one of the finest epic poems (in spite of its many extravagances) extant, beautifully describes the incidents of Rama's life, and the exploits of the contending foes. The deity whose fame is thus celebrated, is, in the pictorial representations of him, usually described as a green man, seated beneath an umbrella, the emblem of sovereignty, on a throne : a quiver of arrows hangs at his back ; in one hand he holds his destructive bow, and in the other a flower of the sacred lotus. By his side is placed Sita, who is depicted as a goddess of transcendant beauty, of a deep-yellow complexion. The incarnate deity, Rama, whose exploits are recorded by the poet Valmiki, is considered by Sir William Jones to be the same as the Dionysos or Bacchus of the Greeks. This Dionysos, or Bacchus, whom he imagined to be Rama, the son of Cush, is said to have invaded India and other countries with an army of satyrs, commanded by the sylvan deity Pan, and Sir William Jones concludes that this army, or probably part of it which he thinks may have been composed of hardy mountaineers, gave rise to the poetical tale of the feats of Rama, aided by the heroic Hanuman and his host of monkeys. We shall, however, obtain a more consistent, as well as a better understood comprehension of Rama, in considering him to have been the son of Desaratha, of the solar race, king of Ayodhya, now termed Oud'h, a potent sovereign of Hindustan, who having been banished by his father in consequence of the machinations of his queens, retired to the banks of the Godavery, accompanied by his brother Lakshmana, and his wife Sita and lived in the neighbouring forests the austere and secluded life of an ascetic, but Sita having been forcibly taken from him by Ravana, the king of Lanka (Ceylon), Rama, with the aid of Sugriva, the sovereign of Karnata, invaded the kingdom of Ravana, and having conquered him, placed his brother on the throne of Lanka in his stead. The Godavery is a sacred stream, and its banks appear to be classic. After the recovery of Sita, Rama subjected her to the fiery ordeal, to discover whether

her virtue had suffered while thus forcibly separated.

The hindoo gods are supposed to be exempt from the momentary elevation and depression of the upper eye-lid, to which mortals are subject, and to look with a firm unintermitted gaze. Hence a deity is termed Animisha and Animesha, one whose eyes do not twinkle. Various allusions to this attribute occur in poetry. When Indra visits Sita to encourage her, he assumes at her request the marks of divinity—he treads the air, and suspends the motion of the eye-lids. when Agni, Varuna, and Indra, all assume the form of Nala at the marriage of Damayanti, she distinguishes her mortal lover by the twinkling of his eyes, whilst the gods are stabdha lochana, fixed-eyed. And when the Aswini Kumara practice the same trick upon the bride of Chyavana, she recognises her husband by this amongst other indications. The notion is the more deserving of attention, as it is one of those coincidences with classical mythology which can scarcely be accidental. Heliodorus says : " The gods may be known by the eyes looking with a fixed regard, and never closing the eye-lids ;" and he cites Hômer in proof of it. An instance from the Iliad which he has not noticed, may be cited perhaps as an additional confirmation, and the marble eyes of Venus, by which Helen knew the goddess, and which the commentators and translators seem to be much perplexed with, are probably the stabdha lochana, the fixed eyes, of the hindoos, full, unveiled even for an instant, like the eyes of a marble statue.—*Hindoo Theatre, Vol.* i, *p.* 137. See Asoka, India, Inscriptions, Mahabharata, Padma Purana, Rama, Ramanandi or Ramawat, Ramayana, Sacti, Sects, Vishnu.

SITABBOGAM, see Oryza sativa.

SITABALDI, 21° 10′ ; 79° 6′, in Berar, a large station adjoining. Nagpur. Mean height of the plain, 1,169 feet. The hill of Sitabaldi, standing close over the Residency, consists of two eminences joined by a narrow neck of ground, about 300 yards in length, of considerably lesser elevation than either of the two hills. The whole surface is rock, —*Schl., Ad.* See Statistics of battles.

SITA-KI-PUNJERI, Duk. Lavandula vera.

SITAL, Hind. Nyctanthes arbor-tristis.

SITAL PATI, Beng. Maranta dichotoma, *Wall.* Grows in Bengal abundantly, makes a fine reed mat.

SITAL SINH, munshi to the raja of Benares, author of a history of the various hindoo sects.

SIT-AMANAKU YENNAY, Tam. Ricinus communis.

SITA MANOHARAM, Tel. Pergularia odoratissima, *Linn.*

SITA MERDU, Maleal. Cocculus cordifolius. *D C.*

SITA MULI, Hind. Syn of Pavonia zeylanica.

SITAMMA POGU NULU, Tel. Cuscuta reflexa, *L* ; *R., Vol.* i, *p.* 446 ; *Cor.* 104.

SITAMMA VARI SAVARAM, or Lanja savaram, Tel., Ipomœa filicaulis, *Bl.*

SITA MULI, Hind. ?

SITANA. Below Derbund, lies the district of Sitana, about 15 miles north of Torbaila, near the base of Muhabun, and on the bank of the Indus. The Syuds of this place are the remnant of the followers of Syed Ahmed, who, gathering the handful of " Gazee," (warlike devotees), from various parts of India, raised a formidable rebellion in Peshawur. After winning and losing Peshawur and Eusufzye, the Syud was eventually slain at the mouth of the Kaghan glen by Sheer Sing, the son of maharajah Runjeet Sing. Most of his adherents, chiefly foreigners to the Punjab, dispersed, and the remainder settled at Sitana. These Sitana people are evil-intentioned and ill-conditioned. They endeavour to rouse the bigotry of the surrounding mahomedan tribes, and especially of the Swatee. They endeavour to intrigue with Wahabees and such like fanatic religionists among the mahomedan population in various parts of India.—*Papers, East India, Cabul and Affghanistan,* 1859, *p.* 20.

SITANG, a river of Burmah, rises in lat. 21° 40′, long. 96° 50′ S., runs into the Gulf of Martaban, length 420 miles ; Yennan, 115 ; Saar, 120 miles. It is a navigable river for about 190 miles, forms the boundary between the Tenasserim provinces and Pegu. Its valley is the valley of Pegu. The whole extent of the valley is about 350 miles, of which one-half lies within the British provinces of Pegu and Martaban. Its mouth is about fifteen leagues eastward from Rangoon bar, and is the easternmost and principal branch of the Pegu or Sirian river.

SITANIKA, Tel. Epicarpus spinosa, *R. W.*

SITANTA, see Meru.

SITANUK, one valve of a muscle shell, with the dried fish attached. The punsaris of Ajmir call it " the small head of a sea animal :" used in Ajmir as an aphrodisiac, and also said to cure the cynanche of children : comes from Bombay viâ Pali : one seer costs two rupees. —*Genl. Med. Top., p.* 132.

SITAPA CHETTU, Tel. Smilax ovalifolia.

SITA-PHAL, Duk. Syn. fruit of Anona squamosa, named after Sita—wife of Rama. It is smooth and soft outside, and in shape not very conical. It is fancied to resemble the mamma of the human female; and legends are popularly related of the origin and application of these appellations, but it is not always that the popular legends of hindoo fabulists will bear expounding to a European reader.—*Moor*. See Bhilva, Sita.

SITAPA CHETTU, or Konda tamara Tel. Smilax ovalifolia, *R*.

SITAPHALAM, Tel. Anonia squamosa, *L*., *R*., ii, 657, 21; *Rheede*, iii, 29.

SITAR, or Sitara, a musical instrument similar to the Cithera, supposed to have obtained its name from the Sih-tara, the three-stringed, and believed to be the source of the word guitar. See Kemanchi.

SITASAVARAM, also Sitamma vari savaram, Tel. Ipomœa filicaulis, *Bl*.

SITASIVA, also Seleya, Maleal., Sans. Dill seed, Anethum sowa, *Roxb*.

SITAVANAKU, Maleal. Ricinus communis, *Linn*.

SITA-VER, Hind. Asparagus adscendens.

SITAWAR, Hind. Asparagus filicinus and A. racemosus.

SIT GURJUN, Beng. Dipterocarpus turbinatus.

SITHAI-NAR, the Umbrella tree, Screw Pine or Vacoa, Pandanus odoratissimus.

SITHA SARMI, see Inscriptions.

SI-THO-TOO NAN-TOO CHYKIA, see Chinese.

SITI, Beng. The noble Magnolia, Magnolia insignis.

SITKOKF ISLAND, according to a Japanese geographer, cited by Kampfer, contains many mountainous and barren districts, and is, on the whole, less fertile than the other large islands.

SITODIUM CAULIFLORUM, *Gært*. Syn. of Artocarpus integrifolius.

SITPHAN, also Setphan, Burm. A tree of Moulmein. Its wood is used in common purposes of building.—*Cal. Cat. Ex*. 1862.

SITRA MUTI, Tam. Pavonia zeylanica, *Cor*.

SITS, Dut. Chintz.

SIT-SAL, Beng. Dalbergia latifolia, *Roxb*.

SITTA, Hind. A kind of sweetmeat.

SITTA CINNAMOVENTRIS, S. europæa and S. cœsia, &c., birds of India. Sitta Syriaca, or 'Rock Nuthatch' of S. E. Europe, and Asia Minor, or a species of similar habits (most probably the same), inhabits Affghanistan.

SITTAMUTTI, Tam.

Pavonia zeylanica,	Cavan.	Mutti-ver,	Tam.
Bulla,	Sans.	Tsinna mootapolaghun vayroo,	Tel.

This root, as it appears in the bazars, has little sensible taste or smell. An infusion of it is ordered as a drink in fevers.—*Ains. Mat. Med*., *p*. 115.

SITTAVINDI, Tel. Ricinus communis, *Linn*.

SITTRA-PALADI, Tam. Euphorbia thymifolia, *Linn*.

SITTU, also Situn, Hind. Boucerosia edulis of Edgeworth. A curious plant in the Multan division, eaten as a vegetable.

SITUS-HOOKA, Rus. Hordeum hexastichon, *Linn*., *Roxb*.

SIVA, one of the hindoo deities and the object of worship of the saiva sect of hindoos, the most numerous of all the hindoo religionists. Nearly all the Rajput races, most of the hindoos in the valley of the Ganges, and three-fourths of all the hindoos of the south of India worship the god Siva, in some of his emblematic forms, the most received of which is that of the lingam. Magnificent temples have been erected to him, all over British India, to each of which from thousands, to hundreds of thousands of pilgrims annually resort. Those in the Madras presidency are grand. Siva and his worship are confined to British India. The name is variously pronounced and written Siva, Shiva, Sivin, Seo, Sheo, Shev, Seb, S'hiu, Shivu and Chivin, and the earliest mention of this god is in the Book of Amos, (Ch. v, 25, 26.) "Have ye offered unto me sacrifices and offerings in the wilderness, forty years, O house of Israel? But ye have borne the tabernacle of your Moloch, and Chiun, your images, the star of your god, which ye made yourselves; therefore will I cause you to go into captivity before Damascus." And it is evident from this that even then, B. C., 955, the emblem under which Siva is still worshipped and the marks, which his followers put on their foreheads were both well-known. His attributes are many. Siva, as the destroyer, is named Isa or Iswara; Rudra; Hara; Sambhu; Mahadeva or Mahesha. Siva is time, the Sun; he is Fire, the destroyer, the generator. His consort, Parvati, is the symbol of created nature, and in that character named Prakriti. As the deity presiding over generation his type is the linga, the origin doubtless of the phallic emblem of Egypt and Greece and Rome. As the god of justice, which character he shares with Yama and other deities, he rides a bull, the symbol of divine justice. He holds, as his commonest attribute, a trident, called Trisula. in this and in some other points resembling Neptune. His colour, as well as that of the bull, is white, and his hair of a reddish colour. He is sometimes represented as with two, four, eight, or ten hands, and with five faces. He has a third eye on his forehead pointing up and down, a distinction peculiar to him and his avatars. As Mahadeva, he is abundantly decked with serpents, emblems of immortality, and common ornaments to many deities. He is often represented with his trisula or trident, in one hand ; as also the pasha, string or rope, also often depicted in the hands of his consort Kali, for binding and strangling incorrigible offenders. Serpents, emblems of eternity, form his ear-rings, called Nag-nundala : his pendent collar of human heads, his Mund-Mala, marks his character of destruction or Time ; and his frontal crescent points at its most obvious measurement, by the phases of the moon. Occasionally, in his hands, is represented the warlike mace, (Gadha or Parasha), and Mrigu or Sasin, a name for the antelope, given also as an attribute of the god Chandra the Moon. Frequently Siva's loins are seen wrapped in a tiger's skin, and the river goddess Ganga smiles serenely from his Mugut, or headpiece. Another author writes, " To Siva is given three eyes, probably to denote his view of three divisions of Time, the past, the present, and the future. A crescent on his forehead pourtrays the measure of time by the phases of the moon ; a serpent forms a necklace, to denote the measure of time by years : a second necklace formed of human skulls marks the lapse and revolution of ages, and the extinction and succession of the generations of mankind. He holds a trident, to show that the three great attributes are in him assembled and united : in another hand is a rattle, called a damaru, shaped like an hour-glass. Siva is also called Sri Virupacsha or the three-eyed god. This name of Sri Virupacsha is, however, differently translated by different Sanscrit scholars. The earliest renders it as above : another, " with a disgreeable countenance :" a third, " the auspicious deity with uneven eyes :" and as the title is also given to an inferior deity, who is not fabled to have three eyes (Nirut), perhaps the latter interpretations are to be preferred. Professor Muller in his ' Results of Turanian Researches,' interprets Siva's triumph over Tripura, and the Garudas devouring the Kiratas, as traditions of the conquest of the Nishada races by the Aryans. Siva is principally worshipped under the form of the linga. Some of these emblems, usually of basalt or dark coloured green stone, are of an enormous size ; and they are also made, morning and evening, of the clay of the Ganges, which, after worship, are thrown into the river. The linga is never carried in procession. The temples dedicated to it are square gothic buildings, the roofs of which are round, and tapering to a point. In many parts of Hindustan they are more numerous than those dedicated to the worship of any other of the hindoo idols ; as are the numbers of the worshippers of this symbol, beyond comparison, more extensive than the worshippers of the other deities or their emblems. The Binlang stone is also sacred to Siva. Besides the daily worship of the linga in the temples, there are several other periods in which images of Siva are worshipped under different forms ; and these are to be seen in numbers, conveyed through the streets of Calcutta, after the festivals in honour of Siva, to be cast into the river. In the month Phulgunu he is worshipped for one day as a mendicant. On the following day the images of him, with a bloated countenance, matted locks, and inflamed eyes, are carried in procession, attended by a large concourse of people, dancing, singing, and playing on various instruments, and thrown into the river. In the month of Mughut, there is another festival in honour of him, called Hari Gauri, in which he is represented riding on a bull, with Parvati on his knee. But the most celebrated occasion of his worship is in the month Choitru, at the time that the ceremony of the churka, or swinging by hooks fastened in the flesh of the back, is performed. This festival derives its name (churakh or chakra, a wheel or discus,) from the circle performed in the swinging part of it, that terminates the ceremonies, which should properly last a lunar month ; but the term is now much shortened, and the observances of it are limited to the followers of Siva. The higher classes do not engage in it, although they contribute towards the expense of, and countenance it. The initiatory ceremonies of purification, abstinence and exercises of devotion, take place several days before the commencement of the rites, during which time the sanyasis, or worshippers, form themselves into parties, and wander about the streets with horns, drums, &c., making a most intolerable and horrid din. The first exhibition is that of suspension, which is performed by two posts being erected, on the top of which is placed a strong bar, from which the sanyasi, or worshipper, is suspended by his feet over a fire, kindled beneath him, into which rosin is occasionally cast. His head is then completely enveloped in the smoke, though sufficiently high to be beyond the reach of the flame. On the following day the sanyasis dance and roll themselves upon the beds formed of various descriptions of prickly plants. Their next ceremony is called the Jamp Sanya, or jumping on a couch of pointed steel, which has been thus described. A bamboo scaffolding, of three or four stages is erected, on which the saynasis stand, tier above tier, the principal and most expert occupying the upper row, which is sometimes between twenty and thirty feet high. A kind of bedding, supported by ropes, is stretched beneath the scaffolding by a number of men. Upon the mattrass are attached several bars of wood, to which are fixed very loosely, and in a position sloping forward, semi-circular knives, upon which the sanyasis throw themselves in succession. In general, the effect of the fall is to turn the knives flat upon the bedding, in which case they do no harm; but occasionally severe wounds, and even death are the consequences of this rite. Before they take their leap, the performers cast fruits, such as cocoanuts, betel, plantains, &c., among the crowd, on which there is a great scramble for them, as they are supposed to possess much virtue. Women desirous of progeny are very anxious to get these donations, and those of the first families send persons to obtain and bring them for their private eating. The ensuing day is spent in revelling and dancing among burning ashes, and afterwards casting them at each other. On the following day they again infest the streets, attended by music of such an abominable description, that the old British instruments of hymeneal serenade would be almost celestial harmony to it. In the immediate neighbourhood of Calcutta, at Kalighat, stands the celebrate temple of Kali, the energy of Siva in his destructive character of Kal, or Time, on whose altars myriads are annually sacrificed. To this temple the collected crowds, from miles round the Indian metropolis, pour, like a living stream of frantic bacchanals, and till recently exhibiting in their progress sights of which the imagination of those who have not witnessed them could scarcely form a conception. On this occasion they practised the most painful self-inflicted tortures, piercing their tongues and sides, and sticking in the holes heavy pieces of iron, arrows, canes, living snakes, &c., &c., with which they dance with indecent gestures, to the obscene songs of the surrounding multitude. Mr. Ward says that in one year, a man thrust his finger through the tongue of another, and they thus proceeded dancing with much indecency together through the streets; and that another had his breast, arms and other parts stuck entirely full of pins, as thick as nails or packing-needles. In Madras, in 1849, a little boy was led through the crowd with a wooden skewer transfixing both cheeks. These acts are devotional, and are considered proofs of holiness and merit. The tortures, however, thus inflicted are temporary: but some of these religious mendicants impose upon themselves others which are of a more durable description; such as carrying the arm erect over the head till it become so fixed that the miserable devotee is unable to bend it: sitting in the same manner with both the arms or legs similarly placed, clinching the hand, and allowing the nails to grow through it to a considerable length from the back, sliding backwards and forwards on their bellies, from which position they will not stir, preserving a sitting posture, from which they never move; dwelling surrounded by fires, and beneath a scorching sun in the summer, and exposed to the rigours of the seasons in the winter. These and many other self-inflicted tortures, might formerly be daily witnessed in the streets of the Indian cities and their neighbourhoods. The wretched fanatics were covered with filth and ashes, and, even until the close of the 19th century, go entirely naked, except a small piece of cloth between the thighs, fixed round the waist with a cord. Many of them are robust, powerful, sleek-skinned men in no way indicative of ascetic lives. On the day of the charakh, or swinging ceremony, posts about thirty-feet in height are erected in the suburbs of a town, across the upper part of which are loosely suspended long bamboos, so as to enable them to traverse freely. To one end of the bamboo two hooks are fixed by ropes, which are run through the fleshy parts or the back, near the shoulders. A rope is also fastened to the other end of the bamboo, which, as soon as the party who is to swing is secured to the hooks, is pulled by several men, who thus raise the other end somewhat higher than the post. They then go round with it, with considerable velocity, by which means the man at the other end describes a circle of about thirty feet in diameter. Sometimes a cloth is tied round the body and secured to the hooks, to prevent, if the flesh should be torn away, the man from being dashed to pieces, but such is frequently not the case, and the party falling is often killed upon the spot. Some of these men, while swinging, often amuse themselves in smoking and throwing fruit and flowers (which they take up on purpose) among the spectators. Mr. Ward relates a story of a man who had a monkey's collar run through his hinder parts, in which state the man and monkey whirled round together, and on another occasion, of a man who took a large log of wood in his mouth, and swang for a considerable time, without having any cloth round him to preserve him from falling. He also states, that in the year 1800, five women swung with hooks through their backs and thighs in the neighbourhood of Calcutta. The parties sometimes swing for a considerable time, and make very light of the business. A gentleman, in Calcutta, missed, on one of these festivals, one of his bearers or palanquin carriers, and, as he was going out, left home without him. On his return he found him carrying his palanquin, and when he arrived at his home, questioned him where he had been? The man coolly answered, "he had only been performing charakh," that is, had been swinging, and, on his master inspecting his back, the spots, pierced by the hooks, were conspicuous enough. The wounds are very simply treated. The parts are first well-pressed with the flat palm of the hand, or trodden on with the sole of the foot, to cause their re-union. Clarified butter is then spread over on a leaf, and the place is bandaged, this dressing is renewed two or three times. In 1849, in Madras, on the second day after the swinging, a lascar of the Medical Store Depôt who had swung, was seen contentedly at work, in the Depôt. To judge by the number of shrines dedicated to the only form under which Siva is worshipped, that of the Linga, his worship appears to be the most prevalent and popular of all the modes of adoration. Yet these temples are little resorted to by votaries, they are regarded with comparatively little veneration by the hindoos, and flowers and fruit are thrown with little solemnity before the image. The only exception to this is the temple of Visweswara at Benares, which is thronged with a never-ceasing crowd of admirers. Along the banks of the Ganges the worship of Siva is not the prevailing nor the popular condition of the hindoo faith, and it is only in the south of India that the people possess popular legends regarding him. His worship in northern India, is confined to the brahmans, and those who practise the rites of the Vedas, or who profess the study of the Sastras, who receive Siva as their tutelar deity, wear his insignia, and worship the Linga, either in temples or in houses, or on the side of a sacred stream, providing in the latter case, extempore emblems kneaded out of the mud or clay of the river-bed. And this example of the brahmans, and the practice of ages, maintain the veneration usually offered to the type of Siva.

Siva, from his destruction of the three cities of a demon, is thence named Tripura or Tripurasura, the supposed origin of the modern Tippera. Siva is represented with three eyes; hence is title of Trinitira and Tri-lochun, and in this form he is the Tri-opthalmic Jupiter of the Greeks. From the fire of the central eye of Siva is to proceed Pralaya, or the final destruction of the universe: this eye placed vertically, resembling the flame of a taper, is a distinguishing mark on the foreheads of his votaries. The eye in the forehead is one peculiar characteristic of Siva and of his consort when armed with his terrors. The second of Vishnu's ten grand avatars, or incarnations, was in the form of a tortoise, and hence called the Kurma avatara, the principal incident in which was churning the ocean with the mountain Mandara, the huge serpent Sesha serving as a rope to whirl the mountain round withal, and Vishnu, in the shape of a tortoise, sustained the vast load. The result was fourteen precious articles, called gems, or chaoda ratni, (more classically Chatur desa ratna), and one of the fourteen was poison; but,

> "To soften human ills dread Siva drank
> The poisonous flood that stain'd his azure neck."

It might perhaps have been more in character, if the preserving power had averted from mankind the calamities incident to the production of this "poisonous flood," but the legend, which is very popular, gives the action to Mahadeva, whence the epithet Nilakantha, or blue throated, is a name of Siva. With the saiva sect it is now not an uncommon name, usually pronounced, as is that of the deity, Nilkant. The opposing worshippers of Vishnu and Siva, long desolated India with wars and persecutions. Siva is gratified by severities. He gave Arjuna a weapon, Krishna appears to have been opposed both to the Siva and Indra sects. If any credit could be given to the hindoo legends, Ravan, who reigned over Ceylon and the southern part of the peninsula at the time of Rama's invasion, was the head of a civilised and powerful state; but, by the same accounts, he was a hindoo and a follower of Siva. The hindoos who worship both Siva and Vishnu are of the sect of Bhagwat Sampradai or devotees of a two-fold deity, these being ordinarily the lingam and yoni as emblems of Siva and his sakti (devi) and of Krishna, of the Yadu form, with Lakshmi. Vaishnava brahmins will never worship Siva nor any emblem of that deity, nor even enter his temple, nor fast on the days of Siva's fast days. Saiva people generally worship all deities; they are in truth, polytheists, but Vira-Saiva Lingaets and Smarta brahmins and those who recognise the Rig Veda do not worship at the vaishnava temples. The period of sectarian intolerance is now past; and as far as observation goes, the ministers of Vishnu, Siva, and Budha, view each other without malignity; which feeling never appears to have influenced the laity of either sect, who are indiscriminately respectful to the ministers of other religions, whatever be their tenets. It is sufficient that their office is one of sanctity, and that they are ministers of the Divinity, who, they say, excludes the homage of none, in whatever tongue, or whatever manner he is sought; and with this spirit of entire toleration prevailing, the devout missionary of the christians or moolla of the mahomedans would in no country meet more security or hospitable courtesy than among the hindoo races. They must, however, adopt the toleration they would find practised towards themselves, and not exclude, as some of them do, the races of Surya and Chandra from divine mercy, who, with less arrogance, and more reliance on the compassionate nature of the Creator, say, he has established a variety of paths by which the good may attain beatitude.

Every hindoo has a sect mark on his forehead, of white earth, red ochre or sandal wood. The worshippers of Vishnu place the mark perpendicularly, and two perpendicular lines and a dot between denotes a worshipper of Vishnu as Rama or Krishna. The worshippers of Siva mark horizontally. Any conical or triangular mark is a symbol of the linga. About 500 years B.C. the pantheism of the Vedas became transformed into the idolatry of symbolical embodiments of Siva or Vishnu. In the sixth century B.C., there sprung up a school of religious philosophy called the philosophy of the Vedanta or Mimansa, the search after Wisdom, (the end of the Vedas —the aim of learning.) It was in direct opposition to the Sankhya philosophy (deliberation—contemplation—knowledge derived from pure reason.) The vedanta or mimansa philosophy is treated as a scholastic philosophy which basing itself on the sacred books and the popular religion seeks for unity of thought only as a means of introducing order amid the divine personages and legends, and has sought to give a spiritual import, a sort of new birth, to the gods of brahmanism. In the Vedanta philosophy, Brahma is placed in the foreground as the soul of the universe. The Primal Being which alone has true Existence. To this school not matter only, was a semblance,—even the soul was a transient phenomenon. The Sankhya philosophy is contrasted with it, as an atheistic or purely pantheistic system. In this view this philosophy has broken completely with the popular creed, and with the doctrines of the Vedas and the Brahmans. The Sankhya philosophy occupies itself more with life in manifestation, therefore especially with the life of the individual spirit connected by its body to the outward world. Both of these leave the Vedas unassailed, nay, the whole brahmanic religion in so far as it concerns rites and customs. The Sankhya philosophy is no more atheistic, than the system which culminates in Brahma, as the Primal Being. Both are alike pantheistic with a sense of a universal presence of god in all things which produces a mental intoxication gradually destructive of all healthy religious perception. The priesthood did not declare war on the Sankhya philosophy.

One distinguishing mark of the faith of Siva is a crescent on the forehead: with his ascetic devotees the hair is braided and forms a tiara round the head, and with its folds a chaplet of the lotus-seed is often entwined. They smear the body with ashes, and use garments dyed of an orange hue. They bury their dead in a sitting posture; and erect tumuli over them, which are generally conical in form. At a cemetery of these, each of very small dimensions, which may be described as so many concentric rings of earth, diminishing to the apex, crowned with a cylindrical stone pillar, as Colonel Tod looked on, one of the disciples of Siva was performing rites to the manes, strewing leaves of an ever-green and sprinkling water over the graves. Col. Tod says it is not uncommon for priestesses to officiate at the shrines of Siva. Siva is represented with his person powdered with the greyish white ashes of burnt cow-dung, termed nibhuti, which is consequently used in a similar way by all the saiva and by many of the vaishnava ascetics. The season of autumn, or that following the rains, is said to be invested with a similar whiteness, from the kasa grass, or Saccharum spontaneum, with which the country along the Ganges, and the banks of rivers in general, are overspread at this period. This grass grows from ten to fifteen feet high, and the base of the flowers is surrounded with an immense quantity of bright silver-coloured wool, which whitens all the fields. Part of Siva's scanty raiment is the skin of an elephant, or more properly of an Asura or Titan killed by him under that form, and thence named Gajasura.

Inferior enjoyment in heaven is not an object of desire to the more enthusiastic of the hindoos, as it is but finite, and after its cessation the individual is born again in the world, and exposed to the calamities of a frail existence. The great aim of devotion is union with the supreme and universal spirit, in which case the soul no more assumes a perishable shape. The character of the benediction to this effect in the drama of the Hero and the Nymph corresponds with that of Sakuntala and the Malavikagnimitra, and indicate the author's belonging to that modification of the hindoo faith in which the abstract deism of the

Vedanta is qualified by identifying the supreme, invisible, and inappreciable spirit with a delusive form, which was the person of Rudra or Siva. It is of a more practical character, therefore, than pure Vedantism, and it is equally different from both the metaphysical and theistical Sankhya. It is, in fact, the doctrine of the Saiva Puranas (*As. Res., Vol.* xvii). The brahmans of the south and west are mostly of this sect; and whatever Sankara Swami may have taught, it is that of his descendants the Das-nami Gosains. The sect is probably the oldest of all now existing in India. To Siva, are dedicated the Jonesia asoca, Cæsalpinia pulcherrima, *Sw.* : Jasminum undulatum : Guettardia speciosa, Calophyllum inophyllum : Origanum marjorana ; Ixora van Ihuca ; Artemissia austriac, Nerium odorum : and Chrysanthemum indicum. The last eight are also dedicated to Vishnu. The sects of the hindoos merge into each other ; for, in consequence of the interposition of Vishnu to appease a physiological difference between Mahadeva and Parvati, or the worshippers of the Linga and Yoni, his (Vishnu's) navel, says Major Moor, came to be considered as the same with the Yoni, confounding the yonija with the vaishnava. The saiva sect are all worshippers of Siva and Bhavani conjointly ; and they adore the linga, or compound type of this god and goddess, as the vaishnava do the image of Lakshmi-Narayana. There are no exclusive worshippers of Siva besides the sect of naked gymnosophists, called Lingi ; and the exclusive adorers of the goddess are the Sacta sect. The saiva and sacta delineate on their foreheads three horizontal lines with ashes obtained, if possible, from the hearth on which a consecrated fire has been maintained ; they add a red circlet which the Saiva make of red sanders, and which the sacta, when they avow themselves, mark either with saffron, or with turmeric and borax. The left-handed path, or indecent mode of worship of the several sects, especially that of the sacta, is founded on the Tantra, which are, for this reason, held in disesteem. The worshippers of Vishnu, Siva and the Sakti, are not to be confounded with the orthodox adorers of those divinities ; few brahmans of learning, if they have any religion at all, will acknowledge themselves to belong to any of the popular divisions of the hindoo faith, although, as a matter of simple preference, they more especially worship some individual deity as their chosen or Ishta Devata. They refer also to the Veda, the books of law, the Purana, and Tantra, as the only ritual which they recognise, and regard all practices not derived from those sources as irregular and profane. Vishnu and all other of the h deities have their different avatars or in tions, in all of which, except that sacti themselves, they have their sa energies of their attributes. These hav ramified into numerous names and The great point of difference amon sectaries is as to the claims of respective deities to be regarded as the First Cause. Some assert that as Vishnu (the preserving spirit of God) was sleeping on the serpent Ananta, or eternity, on the face of the waters, after the annihilation of a former world, a lotus sprung from trisula, the trident of Siva. It is considered to be in continual motion over the face of the universe to guard and preserve its creatures. To oppose its course would be to incur immediate death. Its motion would appear to be regular, but varying according to the days in the week. Thus it is imagined that it is unlucky to proceed towards the westward on Sundays and Fridays, to the northward on Tuesdays and Wednesdays, to the eastward on Saturdays and Mondays, and to the southward on Thursdays. The trisula or trident symbol of Siva was once used on a copper paisa weighing 98¼ grains for circulation in the province of Benares only. Siva, as Mahadeo is often represented sitting on a tiger's-skin, with a Nag-snake around his head. In the different terrific forms of Siva and Durga, a necklace of skulls, forms, an invariable decoration, as does the crescent or half-moon on the forehead ; and the moon is considered to be the peculiar reservoir of Amrita or the beverage of immortality. Aghoraghanta, invoking Chamunda, says of Durga, a sacti of Siva,

> The elephant hide that robes thee, to thy steps
> Swings to and fro ; the whirling talons rend
> The crescent on thy brow ; from the torn orb
> The trickling nectar falls, and every skull
> That gems thy necklace laughs with horrid life.

Siva is said to have five faces, his designation Trimurti is said to relate to his three eyes.—*Cole., Myth., Hind., pp.* 66 *to* 70 ; *Tod's Rajasthan, Vol.* i, *p.* 517 ; *Hind. Theat., Hero and the Nymph, Vol.* ii, *pp.* 59, 195-196 ; ***Prinsep's Indian Antiquities; Major Moor's Oriental Fragments*** ; ***Major Moor's Hindoo Pantheon.*** See Hindoo.

SIVA-BAKHT, see Hindoo.

SIVA-CHIPAGA-WANLOO of Bellary, are worshippers of Siva. The Siva-chipegereo or Nagaleka-balji wanloo, worship Siva in the form of a snake.

SIVA-DUTA, messengers of Siva.

SIVAGNABODHA, a small celebrated saiva work.

SIVAJI a celebrated chieftain of the Mahrattas, and founder of the mahratta empire, which lasted until the year 1817. The attas remained almost wholly unnotic- Indian History until the reign of gzeb; probably prior to the time of , the mahratta country, like other the Dekkan, was divided into little lities and chiefships, many of which dependant on the neighbouring mahomedan princes, but never completely brought under subjection. Sivajee, the first Mahratta commander who combined the efforts of these discordant chiefs and tribes, was born in A.D. 1626, and died in 1680. His genealogy being obscure, his adherents were at liberty to invent the most illustrious, and accordingly traced his origin from the ranas of Odeypoor, (the purest of the Khetri caste), who claim a descent, from Nowshirwan the just, but towards the close of the 18th century, they suddenly started on a career of conquest during which they obtained the control over a great portion of British India, and established governments of shorter or longer duration at Poonah, Sattarah, Gwalior, Nagpore, Indore, Gujerat and Travancore.—*Moor*, *p.* 241; *Cole.*, *Myth.*, *Hind*, *p.* 285. See Mahratta government, Sevajee.

SIVALAYA, a temple of Siva, from Siva, and alaya, an abode. The Sivalaya in old Burdwan consists of 108 temples in two large amphitheatrical circles, one within the other.—*Tr. of Hind.*, *Vol.* i, *p.* 157.

SIVA LINGA, see Inscriptions, Kala, Priyanath.

SIVA NARAYANA, a unitarian sect of the people of India who do not worship or regard any object of hindoo or mahomedan veneration. They admit alike hindoos, mahomedans and christians, as proselytes. Their cardinal virtues are truth, temperance and mercy. Polygamy is prohibited; the founder was Siva Narayana, a Rajput, who flourished about A. D. 1735, in the reign of Mahomed Shah. See Hindoo.

SIVA-RATRI, or Maha Shiva-ratri, the great night of Siva, the festival of the nights of Siva, is held about the 11th March by saivites in honour of Siva, during which they worship the lingam, the priapus of the Romans and phallus of the Greeks. The 14th of the dark half of Magha is so held. On the 29th of each month the lingam is worshipped by all saivites, but in the worship on the Maha Shiva-ratri, the thousand different names of Siva are repeated over the lingam and a leaf of the Ægle marmelos dropped on it at each name. Siva seems to have been a warrior who came to India towards Guzerat bringing with him the physiological worship of the phallic emblem, with the Tak or snake spreading its hood over the lingam, or he may have been a Scythic warrior who added the snake to the lingam. Vishnu and his nine avatars are deified warriors, with distinct heroic acts, generally exercised to destroy oppressors and root out oppression.

SIVA'S SACTI, see Linga.

SIVA SITA, see Inscriptions.

SIVATHERIUM, a gigantic fossil, four-horned, ruminant like animal, discovered by Dr. Falconer in the Sewalik hills, which he considered had been furnished with a trunk like the Tapir. He also discovered fossil apes. The term Sivatherium is from Siva, an Indian deity. It is a genus of extinct animals belonging to the family Elephantidæ. The remains of species of this remarkable genus were found by Dr. Falconer and Colonel Cautley in the valley of Mackanda, in the Sewalik hills of the Himalaya. Two species of this genus, S. giganteum and S. perimense, have been described. A cranium, lower jaw and teeth, and bones of the extremities of S. giganteum are now in the British Museum. The skull of this animal is nearly as long as that of the elephant, the neck was shorter and stronger than in the Giraffe. The posterior portion of the skull is greatly developed, and formed of cellular cavities, as in the elephant. The face is short, and the nasal bones are remarkable for the manner in which they are prolonged into a pointed arch above the external nostrils, indicating a trunk, or proboscis. The very inclined direction of the front of the face in relation to the triturating surface of the teeth imparts a physiognomy altogether peculiar. Two horns arise from the brow between the orbits, and diverge from each other, and it is probable that the posterior protuberances of the forehead also supported a pair of short massive horns. When living, the Sivatherium must have resembled an immense Gnu, or antelope, with a short thick head surmounted with two pairs of horns. The front pair of these horns were small, whilst those behind were probably palmated. The eyes were small, and it had a nasal proboscis, an organ unknown amongst the Ruminantia.—*Mantell, Petrefactions and their Teachings; Journal of the Asiatic Society; Eng. Cyc.*; *Falconer's Palæzoic remains.*

SIVA-VAKYA, the name of a well-known work treating of Siva as the supreme being.

SIVION, or Sivum, or Sivun, HIND., MAHR. Gmelina arborea.

SIVIRA, or Seoree, a race in Ghazepur, Gorukpur, Behar, Benares and Mirzapur, whom Buchanan thinks identical with the Kol and the Cheru.—*Elliot.*

SIVITE, or Saiva, a follower of the hindoo god Siva.

SIV-PURANA, see Surya.

SIWAL, also Kali siwal, Lal siwal, and Siwalara, HIND. Amarantus anardana.

SIWALIK HILLS. Low down, on the southern slopes of the Himalaya mountains, at an elevation of from 8,000 to 1,500 feet, there are found uplifted stratified rocks, consisting of hornblende rock and slate, limestone, sandstone, great beds of quartz, clay, mica, chlorite, and talc slates, resting on the gnesis and granite ; and lower still at altitudes of 3,000 to 2,500 feet above the level of the sea, gravel, boulders, marl with coal, recent clays and sandstone form the Siwalik, or sub-Himalayan mountains. It is in these hills that extensive fossil remains were discovered, and the low alluvial tract known as the Terai, is the valley formed by the junction of the Siwalik with the Himalayan inclined rocks. The term Siwalik is restricted by A. Cunningham to the lowermost range of the Himalaya, composed of sandstone. Siwalik hills were shown by Messrs. Cautley and Falconer, to form the tertiary strata, of which the Subathu beds constitute the base. The Siwalik tract, includes the range so called by Europeans, lying under and external to the Himalaya at from 1,000 to 2,500 and occasionally rising to 3,000 feet. Many of the trees, shrubs, &c., which grow in that tract extend to some distance within the Himalaya in the valley's of the great rivers to a similar height, and where a similar climate prevails to that of the Siwalik.

SIWARJI, See Cairn, Hindu, Kelat.

SIWIN, HIND. Vermicelli.

SIYAH, HIND. Black, hence

Siyah bhor, HIND., the colour of the black humble bee, " bhor."

Siyah chob, HIND. Fraxinus, *sp.*

Siyadanah, PERS. Nigella indica.

Siyah Musli, HIND. Anilema tuberosa.

Zira siyah, Carum carui.

Siyahi, HIND. Ink, lamp black.

Siyahi, HIND. Smut of Triticum æstivum.

SIYAKA, see Inscriptions.

SIYUL, HIND. Sil, a slate, a slab.

SIZE.

Sirus,	GUZ.	Sirisht,	HIND.

A gelatinous substance, obtained from parchment, shavings, fish skin, and several animal membranes. It is less adhesive than glue, and is used by book-binders, paper-hangers and painters.—*Waterston, Faulkner.*

SIZGAI, HIND. Brassica griffithii.

SJARANK, EGYPT. Ganjah.

SJERIA SAMSTRAVADI, MALEAL. Barringtonia acutangula.

SJO-COMPASS, SP. Compass.

SJOVANNA AMELPODI — ? Ophioxylon serpentinum.

SJOVANNA-POLA-TALI — ? Crinum latifolium.

SKAMMONIEN, GER. Scammony.

SKAṆDA, a name of Subhramanya. See Saraswati.

SKANDA GUPTA, see Buddha, Inscriptions.

SKANDA PURANA, a holy book of the hindoos : it is read through once a year in the temples of Siva. See Purana.

SKANDA SHASTHI, a fast and festival observed in honor of Skanda.

SKANDA SIVA, see Linga.

SKANNA BHATTA, see Inscriptions.

SKAR, HIND., PUSHTU. Crude soda, transmutation of Khar.

SKARDO, 35° 20′ 2″ ; 75° 44′ 0″, in Balti, the capital of the province, on the left bank of the Indus. Level of the Indus at the rock 'Mendok Kar' 7,255 feet. It is also written Iscardo. Skar-ma-m-do, means the starry place, one of its name is Balolo. Little Tibet, is called Skardo by the people, as also Iskardo. It was conquered in 1840, for the rajah Gholab Singh, by his general Zorawar Singh, with his Dogra troops. The people grow corn, irrigating the land, and using manure and are fond of out-of-door or manly games. Skardo, or Iskardo, or Little Tibet, is a Bhot tract, but the people are mahomedans. Skardo is also designated Bulti, Bultiyul, Balor, Palolo, and Nang Koa. The people are strong and hardy, they grow corn and cut watercourses like the people of Rongdo. Skardo is called by the Lamas of Ladak, Skar-ma-m-do, meaning the enclosed place or the starry place. Iskardo, is the Arab-mahomedan pronunciation, who fail in all attempts to pronounce the double consonant beginning with S, requiring to prefix an I. The double consonants in S and V form a shibboleth for the mahomedans.—*Latham's Descriptive Ethnology ; Adolphe Schlagentweit.* See Balti, Gylpo, India, Iskardo, Maryul or Lowland.

SKECHO, HIND. Iris, *sp.*

SKEEN, HIND. Male of Capra ibex Himalayana, *Blyth.* See Skeen, Skyin.

SKENJEHIL, PERS. A beverage, in use with the native hakims, a syrup of vinegar, diluted with water.

SKIMMI, JAP. Illicium anisatum ; Star anise.

SKIMMIA LAUREOLA.

Limonia, *Wall.*

Ner	of Jhelum.	Shalangli	of Ravi.
Burroo	of Ravi.		

A common small plant of the Himalaya. It has been introduced into English gardens, from the north-west Himalaya, and is greatly admired for its aromatic, evergreen foliage, and clusters of scarlet berries. It is a curious fact, that this plant never bears scarlet berries in Sikkim, apparently owing to the want of sun ; the fruit ripens, but is of a greenish-red or purplish colour.—*Hooker's Him. Jour.*, *Vol.* i, *p.* 187 ; *Dr. J. L. Stewart.*

SKIMMIA REEVESIANA, *Fortune.*

Skimmia japonica, *Lindley.*

On the same stage, with an Azalea Fortune says, he observed a fine new shrub, which he mistook for a holly. It turned out to be a species of Skimmia, and Dr. Lindley described it as Skimmia japonica. It is, however, quite a different plant from that known by the name in the gardens of England, and he proposed to call it Skimmia reevesiana.—*Fortune's Districts, p.* 329.

SKIMMIA JAPONICA, *Thbg.* A tree of Japan.

SKINNERIA CŒSPITOSA, *Choisy.* One of the convolvulaceæ, a plant of Bengal, Assam and Penang.

SKIN, also Skeen, Skyin, Sakin, Iskin, TIB. Capra sibirica, *Meyer*, Ibex ; *Blyth.*

SKINANG, HIND. Equisetum debile.

SKINS.

Peaux,	FR.	Charm,	PERS.

Chamro,	GUZ.	Charma,	SANS.
Chamra,	HIND.	Pieles,	SP.
Pelli,	IT.	Tol,	TAM.
Kulit-balulang,	MALAY.	Tolu,	TEL.

This term is applied in commercial language to the skins of calves, deer, goats, lambs, &c., which, when prepared, are used in the lighter works of book-binding, the manufacture of gloves, parchment, &c.; while the term hides, is applied to the skins of the ox, horse, &c., which, when tanned, are used in the manufacture of shoes, harness, &c. Salted and tanned hides, and also sheep and goat skins, are exported from Bombay to London and Liverpool, and after the middle of the 19th century, the trade from Calcutta, Madras and Bombay more than doubled. The greatest portion was from Calcutta, after which comes Bombay. The following were the values from all India :-

1851-52...	£ 303,089	1856-57 ...	£ 572,530
1852-53...	„ 337,849	1857-58...	„ 639,702
1853-54 ..	„ 402,365	1858-59...	„ 544,680
1854-55...	„ 402,386	1859-60...	„ 444,537
1855-56...	„ 431,729	1860-61...	„ 656,629

In India, the hides of the bison, sambre, bullock, horse, cow, sheep, goat, kid, dog and iguana are all tanned. Iguana skins are tanned and dyed black, or are left of their natural colour. They are thin, even, soft, tough and granular, green-like in external appearance. From the absence of gloss, the appearance of this leather is not much in its favour, but it bids fair to be a durable article for light slippers, and a good covering for the commoner kinds of instrument boxes, such as are still done over with shagreen. In the manufactures of Madras, tanned and coloured skins for book-binding purposes and boot-linings, are even, soft and pliant. Some of the coloured leathers are very brilliant. Sheep and kid skins are tanned white, for the better kinds of gloves, and for the purpose of the apothecary. Parchment skins take ink very well.

Wash leather skins are prepared with oil, in imitation of chamois or wash leather, excellent, so far as thickness,' softness, pliancy and colour are concerned, they bear comparison with the European article, and suitable for cleaning brass and harness. As potass, soda, and dry pure deodorizing air are abundant in British India, a very little additional care would ensure the production of a perfectly inodorous chamois leather. Buff leather for accoutrements, are good in quality very economical leathers for manufacturing purposes. The best tanned leather from buffalo, bullock and cow-hides at the Madras Exhibition of 1855, were contributed from the Horse Artillery tannery at Bangalore, along with specimens of leather prepared from the hog, calf, goat and sheep skins, of unexceptionable quality. Python skin, when tanned, makes excellent boots, much prized in England for their strength, pliability, and great beauty, as they are handsomely marked. Boots made from snake's skin are pliable and easy to fit ; perhaps owing to the accommodating nature of the snake's skin when in a live state. Boots of Norwegian manufacture, are made from the skin of a salmon. In certain of the southern States of America the skins of young alligators are tanned, converted into leather, and the leather manufactured into boots. Skins were exhibited at the Lahore Exhibition from the hills around Kangra and Simla ; a few of them had been imported, such as the sable from Russia, and the Karakuli lambskins of Bokhara. Karakuli are so called from Karakul, a province 20 cos south of Bokhara ; as much as 10 lacs worth of these lambskins with the hair on, are exported to Persia, Tartary, Kabul and India ; other districts of Bokhara produce them, but all are called Karakuli. The religious hindoo student sits on the skin of an antelope or tiger, and in the south of India the same is used for weddings. The soft black lambskins of Karakul are immensely prized for making postins and for coats ; they are prepared by taking the skins of the young lambs immediately on their being born : this of course is an expensive method, and the skins are proportionately high-priced.—*Cat. of M. E.* ;

Cat. London Exhib. of 1862; *McCulloch's Commercial Dictionary, p.* 651; *Davies' Report, Appendix* xxii; *Powell's Hand-book of Econ. Prod., Punjab, p.* 155; *Faulkner*; *Madras Exhibition, Juries' Reports.*

SKIOCH, Hind. Euonymus fimbriata.

SKIPIDAR, Rus. Turpentine.

SKIPPETARIAN, the old Eperotic and Illyrian. The language is still well-known. It is the Skippetarian or Albanian or Arnaut. It is a distinct Indo-European idiom, and is one of the great Asiatic-European stock of languages.

SKIRRET, Eng. Sium sisarum, *Wight.* One of the umbelliferæ, the sisaron and the elaphoboskon of Dioscorides, the siser of Pliny.

SKODZE, Hind. Allium, *sp.*

SKORODON, Gr. Garlic.

SKREI TORSK, Dan. Cod.

SKRIPIZII, Rus. Fiddle.

SKUANDI, Singh. Amethyst.

SKURU, Tib. A praying cylinder of wood, four or five inches long, revolving on an iron spindle, on which are wound written prayers and interjections. The lower end of the spindle forms the handle by which the cylinder is twirled. It is of the same character as the praying drums of China.—*Cunningham.*

SKY-BLUE IPOMÆA, Ipomæa cærulea.

SKY-CLAD JAINS. The Jains are at present divided into the Digambara or sky-clad, *i. e.*, naked, and Swetambara, *i. e.*, the white-robed, the former of which is the widest diffused, and seems to have the greatest claim to antiquity. All the Jains in the Dekkan and in western India appear to be Digambara Jains. Indeed the term Jain seems a later appellation, for in the early philosophical writings of the hindoos, they are styled Digambara or Nagna, but in the present day, the Digambara do not go naked except at meal time, but wear coloured garments. The Digambara assert that the women do never attain Nirvan, but the Swetambara admit the fair sex to final annihilation. There are clerical as well as lay Jains, or Yati or Jati and Sravaka, the former of whom lead a religious life and subsist on the alms which the latter supply. The Yati are sometimes collected in maths, called by them Pasala, and even when abroad in the world, they acknowledge a sort of obedience to the head of the Pasala, of which they were once members. The Yati never officiate as priests in the temples, the ceremonies being conducted by a member of the orthodox priesthood, a brahman duly trained for the purpose. They carry a brush to sweep the ground before they tread upon it, never eat nor drink in the dark, lest they should inadvertently swallow an insect, and sometimes wear a thin cloth over their mouths lest their breath should demolish some of the atomic ephemera, that frolic in the sun-beams. They wear their hair cut short or plucked out from the roots. They profess continence and poverty, and pretend to observe frequent fasts and exercise profound abstraction. Some of them are engaged in traffic, and others are proprietors of maths and temples, and derive a comfortable support from the offerings presented by the secular votaries of Jina.

SKYIN, Tib. Wild goat or ibex, Cabra-ibex, of Ladak, with horns 4 feet, 3 inches in length. It frequents the most inaccessible rocks, but about one and two hundred are killed in Balti every winter, when they are forced to descend into the valleys. In Ladak they are snared at night and shot in the grey dawn of the morning when they venture to the streams to drink. Their hair is black, long, coarse and useless, but the soft under-fleece, called Tus, or in Kashmir Asl-Tus, is an exceedingly fine soft wool of a light brown colour, used in Kashmir as a lining for shawls, woollen stockings and gloves. It is also woven into a very fine cloth, called Tusi, of a soft and delicate texture, much prized for its warmth. The term ibex is given in India to several animals of the genus Capra or goats, but, Capra-ibex Himalayana, *Blyth*, is the Himalayan-ibex, the Skeen, Skyn, Sakeen or Sikeen of the Himalaya, the Kyl of Kashmir. These are the names of the male, that of the female, in Tibet, is L'damuo. It inhabits Ladakh and Kashmir. A wild species of ibex, called 'Paseng' by the Persians, occurs in Middle and North Asia, but it belongs to the genus Ægagrus. See Capreæ, Skeen, Skin.

SLAMBOOGHA-POO, or Shamboogha-poo, Tam. Michelia champaca, *Linn.* Its flower.

SLATE.

Ardoise,	Fr.	Pizarra,	P.
Schiefer,	Ger.	Kalpalagi,	Tam.
Sil,	Hind.	Rati palaka,	Tel.
Lavangna, Lastra,	It.		

A laminated rock, of which there are many kinds; though the only one of commercial importance is clay slates employed for roofing, and as writing slates. The principal slate quarries in Britain, are in Wales, Cumberland, Southampton. True slate is capable of almost infinite division, thin plates or slabs splitting with tolerably even surfaces of considerable size, the Kurnool slabs and the same material found in other parts of India, are incapable of this infinite division, &c. The Kurnool slabs are unfitted for sloping roofs; they cannot be procured in slabs dividing naturally of such size and thickness as would adapt them for roofs; sawing them would, even if practicible, be too expensive; the slabs thus procured would be either too thin to give the requisite strength, or if of sufficient strength, would be too heavy and thick for economical or effective use. But for flat roofs and floors, they may be used with advantage. Mr. Oldham adds, stone slab floors, where the proper material can be procured with a moderate amount of carriage, and at a fairly reasonable rate, will prove much more durable, economical, and more cleanly in every respect. Slates are occasionally brought down from the Himalayas and will be so more frequently as the roads are improved and the quarries worked more cheaply; they are of excellent quality. Slates from the Dalhousie quarries are deemed medicine by natives, and called Sang-i-Musa, "Moses' stone." These slates are the products of the hilly tracts of the Sonah, Pali and Firozpur pergunnahs of the Gurgaon district.—*Powell's Hand-book, Econ. Prod., Punjab, p.* 38; *McCulloch's Com. Dict., p.* 1042; *Dr. Oldham's Report on Kurnool Slates.*

SLATE-PENCIL, writing-slates, and the slate-pencil for writing on them are imported into the East Indies from Europe. The materials used in the Indies in lieu of writing-slates are slabs of wood, and thick slabs of paper, for which pencils of soapstone are used. In Cuttack, "kharee" is used for the manufacture of pencils and balls, for writing on the ground or floor, in all rural schools, and by native accountants.—*Cat. Ex.* 1863.

SLAVE.

Das; Dasa,	HIND.	Pullukai,	TAM
Ghulam,	HIND., PERS.		

Slavery, in one form or other exists throughout the East Indies; Okkalu Jamadalu. In Coorg is a predial slave attached to the revenue-lands. They are the personal property of the proprietors and may be sold or mortgaged at pleasure. The Bhumi Jamadalu slaves are attached to the land and transferable with it.

The Badava-hrita, is a man who becomes a slave that he may marry a female slave in the family. By the custom of the mahomedan countries, a servant marrying a slave becomes also a slave. Slave-dealing, from immemorial times has been practised in the northern provinces of Persia. Among all nations, slavery with its accompanying horrors, was the lot of a weaker neighbour; but even in the case of an enemy conquered in battle, it was by the Egyptians sometimes allowed to stand in place of the more triumphant cruelty of slaughter. The Israelites had learned the evils of slavery, from having groaned under it themselves; and they forbad it in every possible case. Exodus, xxi, 16: 'He that stealeth a man,' says the Law, 'or selleth a man, or hath one found on his hands, shall be put to death.' Nevertheless, slavery was a recognizant condition amongst the Hebrew races, as may be observed from reading Matthew xviii, 25, where the Lord Jesus illustrated his sermon by the remark that as he had not to pay, his lord commanded him to be sold, and his wife and children, and all that he had, and payment to be made. The hindoo law recognises 15 kinds of slaves:—1. Grihajata, the child of a female slave; 2. Krita or purchased; 3. Labdha or gifted; 4. Dayadupagata or inherited; 5. Anakalabhrita, taken in time of famine; 6. Ahita, ledged; 7. Rinadasa, voluntarily a slave payment of a debt; 3. Yuddprapta, taken ... a war; 9. Panejita, won in a wager; 10. Tavavaham, voluntarily; 11. Pravarajyavasita, an apostate; 12. Krito, voluntarily for a time; 13. Bhakta-dasa, a slave for his food; 14. Varavahrita, one who by marrying a female slave, becomes a slave; 15. Atmani krayi, one who sells himself as a slave.

In Malabar the Kanakan or Kanaka charma are predial slaves, supposed to be a sub-division of the Palayar.

Charumar are predial slaves whose name Wilson derives from 'Chera" Malyalam, the soil. They follow 'the rule of Maruma-katayam. They are very diminutive with a very black complexion and not unfrequently woolly hair.

The Mukkavan is a fisherman caste of Malabar, also called Makwa and their women Makoti.

The Toddy-drawer of Malabar is called Katti Karan.

The Ashary, in Malabar, is the carpenter caste. In common with the brass-founder, gold and iron-smiths, they there continue the practice of polyandry, but in civil inheritance follow from father to son, and not the old Italian practice of maternal descent, descensus ab utero. The elder brother marries and the wife is common to all the brothers. If a junior wish to marry he must live apart and set up business apart, but if any of his younger brothers reside with him, his wife is common to them.

The Panni Malayan are a servile caste of Malabar.

The Adiyan of Malabar is a slave, serf or vassal who lives under the protection of a rajah or religious establishment.

The Mulayan of Malabar, seem to be the same as the Palayan.

The Nair are the ruling race of Malabar, they profess to be sudras. They were formerly accustomed to duelling. The practice was called Ankam, and hired champions were often substituted ; they have many slaves.

The Pulichi is a forest tribe in Malabar, who are deemed so unclean that they are not allowed to approach other castes.

The Uradi or Urali of Malabar are a servile race.

The Tiyar race in Malabar are toddy-drawers and agriculturists.

The Pulayan or Pulian of Malabar is a servile caste, often slaves, and is doubtless identical with the Pullar.

A writer of the 17th century when noticing the races of Cochin says, the slave castes, the members of which belong to individual masters, are :—

The Cannekaa, who gather the cocoanuts ;

The Bettoa, who make saltpans and collect the salt : these two are the most honourable of the slave castes ;

The Pulleah who are again sub-divided into several classes : the Collamary or smiths ; the Weltoe Caren, the Beltoe Pulleah, and the Canna Pulleah, whose occupation is agriculture, sowing, planting and cutting the Nely, for which they receive both from their proprietors and from strangers one sheaf out of every ten they cut. There was then a dispute between the Cannekaa and the Pulleah as to which is the higher caste ; the first maintaining that their caste ranks first, whilst the Pulleah aver that they enjoy more privileges, as for instance that they may employ barbers, and may wear a fillet on their heads and a long garment reaching to the knees, which the Cannekaa may not do.

Alandadey, TAM. A class of slaves in the Tamil country.

Anakala bhrita, SANS. One of the fifteen kinds of slaves allowed by Hindoo Law : a man who has become a slave voluntarily, for the sake of sustenance at a season of famine.

Balute, in the Mahratta countries means the village officers, several of whom are predial slaves, as the Mahr Holeyar or Dher. The Chakili, or Chamar ; the Talari ; the Mang.

Badava hrita, is a female slave, also a man who becomes a slave that he may marry a female slave in the family.

Bandah, a mahomedan slave : Bandi, a slave girl.

Barda or *Burdu*, HIND., PERS. A slave.

Ana-kala-bhrita, is a person who has voluntarily become so, at a season of famine. In the Tamil countries about Chingleput the Alandadey are a class of slaves. The slaves of the Brahui are of two classes, negroes brought from Muskat, and the descendants of captives made in war, with the people of the western provinces of the country, as Kej, Turbat, &c. ; some have, at various times, been brought from Cashmir and the eastern provinces of Persia. These, in colour and features, in no respect vary from their masters, and some of the females are remarkably handsome. They are better treated than their negro associates in bondage, and less onerous duties are assigned to them. Few of the negroes, and those only who are really useful, are even decently clad, and it is common for them so to multiply, that their masters, from inability to clothe and feed them, dismiss them to provide for themselves in other lands. Until the early part of the 19th century, Great Britain permitted her colonies to retain slaves, but from the efforts of Wilberforce, Clarkson and others, Britain then abolished slavery in her colonies as had already been done in the British Islands. Until after the middle of the 19th century, the United States of America held in slavery about five millions of the African races and their descendants of mixed blood, but the slave law was then changed after a civil war in which a multitude of men were slain. During the 19th century Britain made vast and costly efforts to suppress the slave trade from the West Coast of Africa, but till the year 1873 it continued in great force on the east side of Africa, principally carried on through Arabs and hindoo natives of India. Mathoordas Khetsee, a hindoo merchant of Zanzibar, who visited Europe and resided at Zanzibar and other slave-trafficking districts of Africa for a period of seven years for the purposes of trade, at the close of the year 1872, gave the following account in the 'Rast Goftar' of his experience of the slave-trade. "Kilva and the surrounding districts are the principal seats of the slave-trade. In Zanzibar and the neighbouring places the trade has been monopolized by Arabs, as British subjects are restrained there. Mozambique, Veeboo, and the Gooja territories being under the Portuguese rule, the trade flourishes in them. On the north, the trade is still moderately carried on between Burawa and Central Madagascar and down to Soffala. British influence has succeeded in making this trade a matter of risk. The traders proceed with strict secrecy into the interior of Africa to catch slaves. Ivory being a commodity commonly received on the coast and on the islands from the interior, these traders carry on the slave-trade under cover of the ivory trade. The inhabitants of India mostly Bhattia, Bunnia, Khoja, and Borah, had the greatest share in the slave-trade. Although Borah merchants are not known to be slave-traders, a large number of them reside at the principal towns. Vessels from Bombay proceed by the coast near Burawa as far as Soffala. The native merchants go to Samoo, Mombasa, Zanzibar, Kilva, Queelowa, Mozambique, Madagascar, Soffala and Kurmani. In 1872 there were only from five to ten Khoja, about seventy-five Bhattia and a very large number of Damaun and Div Bunnia in Mozambique. Madagascar, called Bookin by the natives, contains about a thousand Borah and Koja. Up to 1872, they had their families with them. In Zanzibar and such other ports the number of the Bhattia, Bunnia, and Khoja, are nearly equal. There were about five Parsees in Zanzibar, about the same number in Mozambique, two or three in Veeboo, and one or two others here and there. They are all inhabitants of Damaun and Div. They put on Parsee dress, and although they appear not to have anything to do with slave-trade, they are strongly suspected of having some participation in it. The Cutchee Bunnia generally reside in Mombasa and Lamoo, while the Damaun, and Div Bunnia live in Mozambique and the southern territories. The vessels from Damaun and Div proceed direct to the African Coast with these merchants. These latter go there from their infancy and spend their lives in Africa. They live for about thirty to thirty-five years, collect money and return to their native country to get married. The Cutchee Bunnia and Bhattia also go to Africa without their wives or families, but they keep African mistresses with them in their houses. These women generally come from Bookin and other central towns of Africa, where they are to be had for a hundred or a hundred and fifty dollars. They have white skins and handsome complexions. At Zanzibar and other well-known places the merchants keep their mistresses concealed in their houses, but in smaller towns they take them out for a walk. In Mozambique, Veeboo, and other Portuguese towns, Portuguese women, and sometimes even European women, live with these hindoo merchants. The western coast of India has a close mercantile connexion with these places. Grey goods, sugar, ghee, wheat, spices, false pearls, utensils, and iron are the principal commodities imported into the coast towns of Africa by large native firms there. These firms correspond with hindoo and Khoja firms in Bombay. Parents send their children in their minority to Zanzibar to get an insight into the intricacies of trade. A poor person at first obtains a living of say 40 dlrs. a year as cook or menial in some firm. After some years he trades on his own account. An intelligent man who can read and write is more appreciated and gets better pay. Indian merchants have pushed in so far that not a single town is without at least one of them. From ten to twenty thousand slaves [illegible] said to pass yearly through Kilwa on their way to the various parts of the Sowahili and to Arabia. The hindoo races have been settled as traders on the east coast of Africa from the most ancient known times. When the Portuguese first doubled the Cape, they found Banya traders established at every great port, and it was from them that Vasco de Gama and his successors learned the secret of the easy approach to India, by the aid of the monsoons. They have held in their hands the trade of the east coast of Africa, and are still to be found as far south as Delagoa Bay. All the trade between that coast and Europe, America, or Asia, passes through the hands of some branch of the Banya community, purchasing goods wholesale from the European or American importer and selling them in retail for the interior. For many years, Dr. David Livingstone, a native of Scotland, devoted himself to travelling in the interior of eastern Africa, for geographical discoveries and to suppress the slave trade, and actuated with the same noble motives, Sir Samuel Baker moved southwards along the banks of the Nile river. Lord Brougham's Bill 5, George IV, c. 113, had made it felony for any subject of Great Britain to engage openly or secretly in the slave trade, and at the close of the year 1872, a party under the leadership of Sir Bartle Frere went to the east coast of Africa to put it down. The Zanzibar dominions there extend for 350 miles from the equator to ten degrees south latitude and include the islands of Momfia, Pemba and Zanzibar. The last is the seat of government, and is separated from the mainland by a channel about twenty-five miles wide. There is an internal traffic along the coast line from Zanzibar, but by far the greater portion of the traffic is with the coast of Arabia, a certain amount with Persia, and to a smaller extent with Madagascar. Nearly all the slave caravans come from the interior to the port of Kilwa, on the southern border of the Zanzibar dominions, where the slaves are embarked in dhows for the market in Zanzibar. These dhows are from 30 to 120 tons and carry from 100 to 250 slaves packed so extremely close, that many die in the voyage. In the year 1870, about 20,000 slaves were annually re-exported from Zanzibar. The watch of British cruisers, though unable to prevent, has made the trade hazardous and the slaves have been carried more secretly, with a corresponding increase of mortality, a whole shipload have died of small-pox, and as the dhows when chased are run ashore, many slaves are drowned. In April 1855 a treaty was entered into with the

Somali. The 4th Article, April 1855, runs thus:—"The traffic in slaves throughout the Habr Owel territories, including the port of Berbera, shall cease for ever; and any slave or slaves who, contrary to this engagement, shall be introduced into the said territories, shall be delivered up to the British, and the commander of any vessel of Her Majesty's or of the Honorable East India Company's Navy shall have the power of demanding the surrender of such slave or slaves, and of supporting the demand by force of arms, if necessary." The treaty itself was obtained from them under pressure of a blockade instituted in consequence of an outrage on Captain Burton's party, and the murder of Lieutenant Stroyan, and, when compared with similar agreements, made with other native tribes, it will be seen that powers equal to those exacted in this instance were never before demanded, or if demanded never conceded. Moreover, any person well-acquainted with the constitution of the Somali tribes knows full well that the ten elders who signed this treaty no more represented the aggregate of the people than any ten old men in Bombay, respected merely for their age and wisdom, could be justly regarded as a national representation of that island presidency. The 'Lady Canning' returned from Berbera on the 18th April 1869, bringing eighty liberated slaves from that place; mostly young boys of the Galla and other inland tribes. In all, upwards of 135 boys and girls were rescued in two trips of the 'Lady Canning,' and if the traffic is thus largely carried on only 120 miles from Aden, there can be no doubt that it flourishes with impunity along the more eastern and southern parts of the same coast. In the first instance, which occurred chiefly at Bunder Siyara, a number of slaves were known to be secreted on shore, and the elders refusing to surrender them, a shot from the steamer was fired wide of the fort, which soon led to their being brought and delivered up to Captain Playfair, the Assistant Political Resident, who directed the expedition. In the last instance a party of armed seamen from the 'Lady Canning' landed at the same place, and seized a herd of sheep and camels, which were detained as "hostages" (so they were described), until the slaves collected in the locality were given up to the commander of the steamer. One seizure made consisted mainly of marriageable Somali girls. Another seizure was of boys, and these were sent to Bombay. It got abroad among the natives of Aden that they are to be brought up as christians, make them Abyssinians, said a respectable mussulman, but they are Gallas, and the Gallas are not christians. Neither are they mahomedans." Two small screw steamers to watch the whole line of the opposite coast during the trading season, with power to search every native craft which left it, and each carrying a person competent to decide whether any of the individuals on board were bonâ fide slaves for a season or two might not prevent the transport of slaves from the interior to the coast; but there would be no buyers, and the market would soon cease to be supplied.

Through the depopulation of the line of the coast the slave trade has extended further and further inland till in 1870, slaves were being brought from the west of Lake Nyasa, on which the Arabs had dhows to carry their captives across traversing a distance of 500 miles, a three months' journey, during which the sick are left behind to die, and any hesitation is met with instant death. The Manyema, a cannibal nation, are constantly attacked by the Arab slave-traders. The Manyema are honest, industrious cultivators. Their women do not partake of the cannibal feasts, many of them, far down Lualba are very pretty, bathe three or four times a day and are expert divers for oysters. The men are fine tall fellows, not like negroes, they use long spears and are only conquered by the Arab fire-arms.

A firman issued in 1854 by the emperor of Turkey recognized "man as the most noble of all the creatures God has formed; in making him free, selling people is contrary to the will of the Sovereign Creator." The pasha of Egypt described slavery as "a horrible institution inconsistent with civilization and humanity, and therefore, it must be abolished." Six of the chief moollah of Persia delivered to the king their decision that "selling male and female slaves is an abomination; according to the most noble faith, the worst of men is the seller of men: God it is who knows," and the shah of Persia then issued a firman to the governor of Fars, and another to the governor of Ispahan and Persian Arabia, reciting, at the request of Great Britain, that "with a view to preserve the existing friendship between the two exalted States, a decree should be issued from the source of magnificence, the shah, that hereafter the importation of the negro tribes by sea, should be forbidden, and this traffic forbidden; pledging that no negro slave shall be imported in the vessels of the Persian government. Treaties to the same effect were concluded between the British government and the Arab chiefs, and with the imam of Muscat and the sultan of Zanzibar. The sultan of Muscat engaged to prohibit under the severest penalties, the export of slaves from his African dominions and their importation into his dominions from any part of Africa and to use his influence with all the chiefs of Arabia, the Red Sea and the Persian Gulf, in like manner, to prevent the introduction of slaves from Africa into their respective territories: and he permits the seizure and confiscation by British cruisers of all vessels carrying slaves, except between the allowed limits of the internal trade in the port of Lamoo to the north of Keeluhu or Kilwa to the south." Lamoo has long been a centre of the African slave-trade, and, the former importers of slaves into British India were called the 'Lamau.'

The East African slave-trade by the year 1872, had depopulated much of the sea coast line. To the south of Pangani is the territory of the heathen Wasegua tribe and the great centre of the traffic. The Arabs of Zanzibar come here, and for muskets, powder and shot, purchase the slaves from the Wasegu chiefs. In the Netherland possessions in India, slavery was abolished about the middle of the 19th century. Slavery still exists in China, and in all the countries surrounding British India. In British India slavery is illegal, but there are many slaves in the feudatory States, and the non-hindoo races in many of the villages of British India, the pariah and tanner races are predial slaves. The Abid, is a slave, of which the mahomedan law recognizes only two kinds, viz., infidels made captive in war and their descendants: in practice, however, a title to slaves may be acquired by purchase, donation or inheritance. The Adavi slave of Canara is a serf, an unpaid labourer. The Tamil and Malealam Adima or Udima, means any slave; a predial slave attached hereditarily to the land and only transferrable with it. In Malabar, amongst the Nair, it means a feudal dependency.

The Malealam Adiyan, pl. Adiyar, is a slave, serf or vassal in Malabar, a low-caste man under the protection of a rajah or a religious establishment.—*Wilson's Glossary*; *Masson's Narrative, p.* 50; *Times of India*; *Dr. Livingstone, Mr. H. A. Fraser, Dr. Kraff, Col. Rigby, Mr. Allington, Rev. Horace Waller, Hon. C. Vivian, in the House of Commons Report,* 1872; *Sharpe's History of Egypt, Vol.* i, *p.* 84; *Vigne's a personal Narrative, p.* 145.

SLAVONIAN and Slavonic are terms applied to races and their languages now found in the east of Europe and all Turkestan eastwards to the China Sea. The Slavonian and Sarmatian dialects comprehend the languages of eastern Europe, Russian, Polish, Bohemian, and the dialects in the greater part of Europe subject to the Turkish empire. Of the Slavonic languages, properly, so called, the eastern branch comprehends the Russian with various local dialects; the Bulgarian and the Illyrian. It is one of the Aryan tongues.—*Muller's Lectures, pp.* 187-8. See India, Sanscrit.

SLEEMAN, Colonel, of the Bengal Service, was long Resident at Lucknow, having previously been Political Agent at Gwalior. He wrote Rambles and Recollections of an Indian Official, Lond., 1843, 2 Vols. 8vo. See Cal. Rev. of 1845, No. v.—*Dr. Buist.*

SLEEPERS for railways in India, are now of iron; wooden-sleepers utterly failed, their production bared the country, and their purchase impoverished the Companies. Iron-sleepers are a great success. Every wooden-sleeper on an Indian railway cost from three to four rupees, and required to be renewed every six years, and cost twelve and a half lakhs of rupees annually on the East India line alone. The difficulty of finding wood, at once cheap, durable and in sufficient quantity, led to experiments with iron sleepers, the rails being laid above iron supports like inverted saucers. The earliest railways in England were laid down on stone blocks by the Stephensons, but wood was soon found to be so much more elastic, that stone was not persevered with. Mr. Lackland, a civil engineer, took out a patent for certain improvements to the ordinary railway chair and to the rail joint, whereby that rail is held firmly in its position without the use of wooden keys.—*Friend of India, Oct.* 2.

SLEEPING HOUSES for the unmarried young men and girls, the lads apart and the lasses apart, are in use amongst the Bor and Bor Abor and others of the races in Assam, Sirgoojah and in the Eastern Archipelago. In Fiji there are two kinds; those in which the men sleep (Bure ni sa), and those dedicated to the gods (Bure kalow.) The sleeping bure may aptly be compared to the European clubs. In buildings or bure like these, all the male population, married, sleeps. The boys, until they have come of age, erect a bure of their own, often built on raised stages over the water, and approachable only by a long narrow trunk of a tree. The women and girls sleep at home, and it is quite against Fijian etiquette for a husband to take his night's repose anywhere except at one of the public bure of his town or village, though he will go to his family soon after dawn.—*Galton's Vacation Tourists, pp.* 253-4.

SLEINANACHD, Gaelic. The mahomedans in India often cast lots, and in Sind is a practice similar to that of the mountaineers of Scotland, called Sleinanachd, or, "reading the speal-bone," or the blade-bone of a shoulder of mutton. The poet Drayton alludes to the practice of this "divination strange" amongst the "Dutch-made English," settled about Pembrokeshire, in his Polyalbion, Song 5. Camden notices the same superstition in Ireland.—*Richard F. Burtons' Sind, p.* 404; *Tod'. Rajasthan, Vol.* i, *p.* 71.

SLIPPERS.

Juti; Jora,	HIND.	Papoos,	TAM.
Pai-posh,	PERS.	Sapata,	TAM.

In Turkey, Egypt, amongst the Persians, and throughout British India, slippers are removed as a mark of respect just as the hat is in Europe. To enter a room with slippers on, would be like wearing one's hat in a London saloon. The Persians and all mahomedans and all hindoos always take off their boots or slippers when they enter into a mosque or temple, or visit the shrine of their holy men, the mahomedans giving as a reason, that Moses was commanded by God to leave his slippers on approaching the burning bush, because he was treading on holy ground: In Persia, a native never enters a room in boots or slippers; and when a foreigner attempts any transgression of this usage, it is looked upon as the height of ill-breeding, if not quite a premeditated insult. In some cases, where it has been intimated, reasons of policy have compelled an apparent toleration of the objection, by providing the expedient of receiving such visitors in the open air, but the necessity is always remembered with repugnance to the exactors. The custom of leaving the outward covering of the feet at the door, is of very ancient practice all over the east, and especially so, when the place to be trod on, is connected with any religious ideas. We find it recorded, so far back as in the book of Exodus, (iii, 5,) at the account of Moses turning aside to observe the burning bush where it is written: "The Lord called to him, and said, Put off thy shoes from off thy feet, for the place whereon thou standest is holy ground." And again, we read in the book of Joshua, that when that great captain of Israel was encamped in the plain of Gilgal, the same Divine Being appeared to him, and said to him also, "Loose thy shoe from off thy foot; for the place whereon thou standest is holy. And Joshua did so." These two notices of the custom, are selected on account of their antiquity, from many others which it is needless to add. In British India about A. D. 1850, the richer hindoos and mahomedans who visited amongst Europeans, began to wear patent leather shoes or boots to obviate the necessity of taking off their slippers, but at native Courts, and at their places of worship, the visitor enters either on his bare feet or on his stockings. It is a part of the customs of eastern races, from which they never deviate, amongst themselves. Similarly, no person changes his position without first shaking his raiment, and no man can quit the ground from which he has risen until he has, in the words of Nehemiah, "shook his lap," and thrown out the impurities he could not but have collected from his manner of sitting down. As the slippers are always left at the outer door, it is very common to strike them two or three times on the pavement before putting in the feet, and thus shake off the dust.

In the Zend Avesta itself there is nowhere any particular statement made regarding the propriety or impropriety of taking off the shoes, when entering a room. The word for 'shoe' is in Zend 'aothra,' and of comparatively rare occurrence in the sacred texts. In a vocabulary to the Zend texts, he found the words in the following passages only. In the Vendidad, fasgard 13, verse 39, the dog is said to have been created by Ahuramazda as "ga aothra, *i. e.*, having his own (natural) shoes on.

In the Aban Yasht, which is devoted to the praise of Anahit, the celestial water, this angel is said (in verses 64-78) to appear before her worshipper in the shape of a beautiful girl "aothropaitis mukhta," *i. e.*, having tied up her shoes. Paitis mukhta really means "tied up," and not "loosened," taken off, as some scholars perhaps might be inclined to explain, starting from the original meaning of the root "much" to shake off, to liberate, (whence comes the celebrated Sanscrit word "mukti," final liberation from re-birth, the everlasting bliss of the hindoos) is shown by the Vedic sister language (being nothing but another dialect of the Zend language). In the White Yajurveda (6, 8), we find in a formula recited up to this day by one of the sacrificial priests previously to carrying the sacrificial goat to the slaughter tva pacena pratimunchami, *i. e.*, I bind thee with a cord. The commentator to this passage informs us, that the root "much" "to loosen," if the preposition prati, (which is identical with paiti, paitis in Zend) is joined to it, means "to tie." In the Ram Yasht we find (verse 57) the angel Mino Ram invoked as Zaranyoaothrem, *i. e.*, having on golden shoes.

In the Aban Nyayish (the prayer, which the Parsees generally repeat at evening time when standing before the water) the dative plural (in the sense of an instrumental) aothrabyo "with shoes" occurs; but is very difficult to decide from the context which appears to be disturbed, as to whom this expression *refers, whether to the worshipper, or to the angel invoked. According to the present* **state** *of the text it is more advisable to refer it to the worshipper. The meaning then is, "I will worship Anahit with the shoes on."*

From all these passages no other fact is to be established but the existence of the custom to wear shoes in ancient times, and to tie them with a cord or thread. Although we nowhere find direct precepts given as to the necessity to have always the shoes on, it is decidedly against the spirit of the Zoroastrian religion to walk barefooted, or even to appear, without having one's shoes on, before anybody. The reason is, that everything coming from the human body, like such as the breath, sweat, &c., is regarded as unclean, and polluting the pure elements. The priest, when standing before the sacred fire, must even cover his mouth with a cloth in order to prevent the pure element from becoming polluted by the breath. The earth is sacred, and regarded as an archangel who would be defiled by being touched with the naked foot.—*Burton's Scinde, Vol.* ii, *p.* 16; *Barron C. A. D.,pp.* 170, 194.

SLIPPER PLANT, Euphorbia thymaloides.

SLOKA, a Sanscrit word, a couplet from a Shastra. A stanza or verse; the Malays probably derived the term for their poetry styled "Shair" from the Arabs, and that of "Sloka" from the hindoos. The origin of the Malay word Pantun is not so easily decided from its name, one word used is Bar-beit which is from the Arabic bait, a couplet, but perhaps pantun itself is a Malayan word.—*Jour. SMALL-POX.

Mata; Sitla, HIND. | Amoor, TAM., TEL.

Small-pox is regarded by the hindoos as a manifestation of the hindoo goddess called Devi, Mata and Sitla, who is supposed by them to be a form of Kali, the wife of Siva. In India as in Europe, the mortality from small-pox is great. By way of impressing the ravages of small-pox in the pre-Jennerian period on people's minds in a manner more picturesque than that of ordinary statistics, Dr. John Gairdner mentions the history of a few Royal Houses. Thus, of the 42 lineal descendants of Charles I of Great Britain, up to the date 1712, five were killed outright by small-pox—viz., his son Henry, Duke of Gloucester, and his daughter Mary, wife of the Prince of Orange and mother of William III; and three of the children of James II—viz., Charles, Duke of Cambridge, in 1677; Mary, Queen of England, and wife of William III, in 1694; and the Princess Maria Louisa, in April 1712. This does not include, of course, severe attacks not fatal, such as those from which both Queen Anne and William III suffered. Of the immediate descendants of his contemporary, Louis XIV of France (who himself survived a severe attack of small-pox), five also died of it in the interval between 1711 and 1774—viz., his son Louis, the Dauphin of France, in April of 1711; Louis, Duke of Burgundy, son of the preceding, and also Dauphin, and the Dauphiness, his wife, in 1712; their son, the Duc de Bretagne, and Louis XV, the great-grandson of Louis XIV. Among other Royal deaths from small-pox in the same period were those of Joseph I, Emperor of Germany, in 1711; Peter II, Emperor of Russia, in 1730; Henry, Prince of Prussia, 1767; Maximilian Joseph, Elector of Bavaria, December 30, 1777.—*British Med. Journal.*

SMALTE.

Smalt,	FR.	Lasor,	RUS.
Schmalz,	GER.	Esmalte, Azul-azur,	SP.
Smalto azzurro, Smaltino,	IT.		

An oxide of cobalt, melted with siliceous earth and potash. It is a sort of glass, of a beautiful deep blue colour; and being ground very fine, is known by the name of azure or blue powder. It is in great demand for the painting of earthenware, in the colouring of paper, and for other purposes in the arts.

Smalt is principally manufactured in Germany and Norway. The Chinese use it for painting on porcelain and glazed copper vessels ; the consumption, which was never very great, has fallen off, and the price declined the last few years.—*Morrison* ; *McCulloch's Com. Dict.*, *p.* 1051.

SMALTO, It. Enamel.

SMALTO AZZURRO, also Smaltino, It. Smalte.

SMARA, see Krishna.

SMARAGD, Ger. Smaragdus, Lat. Emerald.

SMARTA, a sect of the brahman race of India, followers of Sancara Achari. They are generally called saivites, but are in fact free-thinkers, equally willing to adore Siva and Vishnu. Their creed may be found in the Mahabharata, the Bhagavat and the Ramayana, all of which are entirely rejected by the disciples of Basava. There are indeed, some few Siva brahmins who officiate as priests in the saiva temples, the Smartas refuse to receive the holy water and rice (tirtha prasad) from their hands. The Smarta sect regard Brahma and Vishnu, as manifestations of Siva, and Siva or Para-brahma, the supreme, or rather the universal, spirit, and they mark their forehead with three (sometimes only one) horizontal lines of pulverized sandalwood with a reddish or blackish round spot in the centre. Smarta brahmins never perform Chakrankitum or burning on the two arms.

SMART-WOOD, Liu Chin., is the Polygonum amphibium, an acrid plant, with seeds acrid, emetic and stimulant : the seeds are applied to scald head and to wounds.

SMASAN, Sans.

Shudu-ka-du, ,	Tam.
Smashanam,	Sans., Tam., Tel.
Smasbanam, rudra bhumi,	Sans., Tel.

The place of incremation of the hindoo dead, the place where bodies are burnt ; temples of Durga in some of her terrific forms are usually erected in or near it, and monuments of stone or brick are not unfrequently reared where the funeral pile has stood.—*Hind. Theat.*, *Vol.* ii, *p.* 55.

SMELLING SALTS, Eng. Carbonate of Ammonia.

SMERALDO, It. Emerald.

SMERGLIO, also Smeregio, It. Emery.

SMILACEÆ, *R. Br.* The Smilax tribe of plants comprise 11 gen., 61 sp., viz., 1 Trillium ; 1 Paris ; 1 Stretopus ; 1 Smilacina ; 9 Polygonatum ; 27 Smilax ; 4 Tupistra ; 2 Stemona ; 4 Teta ; 10 Liriope ; 1 Bulbospermum. They are found in all parts of the world, and species of Smilax are useful as medicinal plants.

SMILACINA, is a pot-herb growing in Tibet, north of Kinchinjunga. This beautiful plant grows from two to five feet high, and has plaited leaves and crowded panicles of white bell-shaped flowers, like those of its ally the lily of the valley, which it also resembles in its mucilaginous properties. It is called 'Choklibi,' and its young flower-heads sheathed in tender green leaves, form an excellent vegetable.—*Hooker's Him. Jour.*, *Vol.* ii, *p.* 47.

SMILAX, a genus of plants which gives its name to the natural order Smilaceæ. The name occurs in the Greek authors, Theophrastus and Dioscorides, but was applied to several different kinds of plants, as the yew-tree, a species of Phaseolus or Convolvulus Σμίλαξ τραχεῖα is Smilax aspera, which belongs to the present genus. The species form evergreen climbing shrubs, of which a few, as S. aspera, are found in temperate, but the majority in warm and tropical regions of both hemispheres, and extend south to Australia, and north to Japan, North America, and the south of Europe, those celebrated for yielding the different kinds of Sarza or Sarsaparilla are natives of South America. But S. aspera still continues to be employed for medicinal purposes in the south of Europe, where it is called Sarsaparilla italica. Smilax china, has a tuberous root abounding in fecula, and therefore probably useful as a demulcent, though the Chinese esteem it invigorating, and ascribe to it other virtues. It is remarkable that two Indian species, which, like the Chinese species, have tuberous roots, should be called in Sylhet Hurina-Shook-China and Gootea-Shook-China. These are Smilax glabra and S. lanceæfolia, and their roots cannot be distinguished from the China-root, or Chobchinee, as it is called in India. A similar species is common in the southern parts of North America, and has been called Smilax pseudo-China, though there is reason to believe that more than one species may be confounded under this name. S. glycyphylla is an Australian species, which has received its specific name from the sweetish taste of its leaves, and has been called Sweet Tea from its employment in the form of infusion, and is probably alterative and diaphoretic, as well as slightly tonic. It is probable that some of the species found in the Old World will be discovered to be possessed of virtues equal to the American species.

S. anceps, *Willde*, Mauritius.
S. bona-nox, *Linn.*, Carolina.
S. elegans, Dehra Dhoon.
S. glabra, *Roxb.*, Garrow Hills, Sylhet.
S. randifolia, *Linn.*, Concans, Dekhan, Bengal.
S. grandis, *Wall.*—?
S. herbacea, *Linn.*, North America.
S. lanceæfolia, *Roxb.*, Sylhet.

S. maculata, *Roxb.*, Nepal, Kumaon, Missuri.
S. ovalifolia, *Roxb.*, Concans, Bengal.
S. prolifera, „ Rajmahal, Bengal.
S. pseudo—China, *Linn.*, Virginia, Jamaica, Garrow Hills.
S. retusa, *Roxb.*, Bengal.
S. roxburghiana, *Wall.*, Garrow Mts., Khassya Mts.
S. sarsaparilla, *Linn.*, Virginia, introduced in India.
S. stipulacea, *Bojer*, Mauritius.
S. villandia, Morung Hills.
S. zeylanica, *Wight*, Ceylon.

Together with these may be noticed, S. Roxburghiana, or " Koomare shook China," and S. oxyphylla, or " Chotee or small koomaree ;" S. rigida and ferox, are Nepaulese species. S. elegans, extends to the Dehra Doon, and S. maculata is found in Nepaul, Kumaon, and Missourie. S. prolifera occurs very generally, and S. Villandia on the Morung hills. Dr. Royle also mentions a root sold in the bazaars under the name of Ashoba mugrabee. This is translated sarsaparilla in dictionaries, and the root much resembles that drug. Its origin is unknown. The natives of India use the roots of the S. glabra in venereal and leprous ulcers, and they also employ the S. lanceæfolia very extensively for the same purpose, and in the treatment of rheumatism. Both these species deserve attentive examination. It seems, however, that the Ununtamol (Hemidesmus indicus) is likely to supersede all the varieties of sarsaparilla not only in Indian but in European practice. There are two or more species of smilax in Tenasserim jungles, one of which is used by the natives as medicine, to supply the place of a species of sarsaparilla, whose dried roots are sold in the bazaars. —*O'Shaughnessy, pp.* 645-46 ; *Eng. Cyc., Dr. Mason.*

SMILAX ASPERA, syn. of Hemidesmus indicus, *Rheede, R. Brown, W. Ic. contr.*

SMILAX CHINESIS, *Linn., Ains.*

Smilax china, *Linn.*

Shook-china,	BENG.	Rasna,Sugandamula,	SANS.
Tseiu-apho-ta-roup,	BURM.	China-alla,	SINGH.
Tu-fu-ling,	CHIN.	Poringay,	TAM.
China root,	ENG.	Gali chakka,	TEL.
Chinese smilax,	„	Pirangi chakka,	„
Chob chini,	HIND.		

Dr. Smith, in his Chinese Materia Medica, applies the above Burmese and Chinese names to the tuberous root of Pachyma cocos.

The Roots.

Shook-china,	BENG.	Chob-chinee,	HIND.

Grows wild in China, from which it is exported to Burmah and to India ; the rhizome is hard, large, woody, knotty, brown or blackish externally, white in substance. The root is one of the China roots of the bazaars, it is much, and it is believed advantageously, employed as a substitute for sarsaparilla. It is largely imported into Calcutta from the eastward, and much employed by native practitioners. The China root which comes to Ajmere viâ Bombay : is a largish, insipid, whitish root, in slices : is taken as restorative and aphrodisiac in milk, one tola is a dose : used also in mesalihs : one seer costs two rupees. Natives suppose that this is the root of the " hazari," marygold Tagetes erecta, after being in the ground three years.—*O'Shaughnessy, p.* 645 ; *Gen. Med. Top., p.* 131 ; *Smith, p.* 198. See Sarsaparilla.

SMILAX GLABRA, *Roxb.*

Gooteea shook China, BENG.

A climber with a large tuberous rhizome, a native of Sylhet, the Garrow Hills and the adjacent country. The stem and branches are thornless, leaves lanceolate, pointed, pale green beneath. Flowers umbellate, axillary, sessile and solitary. The root is identical in appearance with the China root of commerce. The natives use the large tuberous fresh root in decoction for the cure of sores and syphilitic eruptions.—*O'Shaughnessy, p.* 645.

SMILAX LANCEÆFOLIA, *Roxb.*, not S. lanceolata, *Wall and Loureir.*

Hurria shook China, BENG.

Much resembles the former, the leaves are lance-shaped and three-nerved, umbels stalked. Its large tuberous roots are much used by the natives of India, in medicine.—*O'Shaughnessy.*

SMILAX OVALIFOLIA. *Roxb., W. Ic.*

SMITH, Colonel W. Baird, an officer first of the Madras, and subsequently of the Bengal Engineers. He established a Museum of Economic Geology for N. W. Provinces, of which see Bl. As. Trans., 1841, Vol. x, p. 779.—Was author of Memoir on Indian Earthquakes, Ibid, 1841 and 43 ; and Edin. New. Phil. Jl., 1842, Vol. xxxiv, p. 107.—Wrote an account of the delta of the Ganges, Cal. Jl. Nat. Hist., Vol. iii.—And on the Irrigation of the N.W. Provinces, Pamphlet, 8vo., 1849.

SMITH, Lieut.-General Sir Harry George Wakelyn Smith, Bart., G.C.B., died 1860, at the age of seventy-two. He was born in 1788 at Whittlesea, in the Isle of Ely where his father was a surgeon, he entered the army in 1805 as second-lieutenant in the Rifle Brigade, and took part in the siege, storming, and capture of Montevideo under General Sir Samuel Auchmuty, and in the attack on Buenos Ayres under Brigadier-General Crawfurd. He was also present at the capture of Copenhagen, under the Earl Cathcart, and afterwards employed in Spain under Sir John Moore, he took an active part in the leading engagements of the peninsular war, from the battle of Vimiera down to the embarkation of the troops at Corunna. Returning to the peninsula again in 1809, he took an active part in the action on the bridge of Coa, near Almeida, where he was severely wounded, and commanded a company in pursuit of Massena, from the lines of Lisbon, and in one or two subsequent engagements of lesser importance. Having been appointed brigade major to the 2nd light brigade in the Light Division, he was present at the battle of Fuentes d'Onor, and at the sieges and storming of Ciudad Rodrigo and Badajoz, the battles of Salamanca, Vittoria, Orthes, and Toulouse, and in several lesser engagements, indeed, in every important battle throughout the war, with the exception of Talavera. He was present at the capture of Washington under General Ross, where he was assistant adjutant-general. His next battlefield was New Orleans, whither he proceeded as military secretary under Sir Edward Pakenham, who fell in his arms mortally wounded. He was soon afterwards appointed military secretary to Sir John Lambert, under whom he took part in the siege and capture of Fort Bowyer. He acted as assistant quarter-master general to the sixth division of the army at Waterloo, next serving as Deputy Adjutant General successively at Halifax, Nova Scotia, and in the West Indies, whence he was transferred in 1827 to the Cape of Good Hope, and commanded a division under the late Sir B. D'Urban, throughout the operations against the Caffre tribes in 1834 and the following year. In 1839-40 he was appointed adjutant-general to the forces in India, and was present in that capacity at the battles of Gwalior and Maharajpore, for his gallantry in which action he was nominated a K.C.B. Subsequently he took a leading part in the Punjab campaign of 1845-6; he was in command of a division at Moodkee, and of the reserve at the battle of Ferozepore, where he nobly supported the late Sir John Littler in his charge upon the guns of the enemy. A few days later the Sikh forces, crossed the river Sutlej, near Loodianah, and took up their position at Aliwal. Lord Gough immediately despatched Sir Harry Smith, with 7,000 men and twenty-four guns to relieve Loodianah, and this object he succeeded in effecting. On the 28th of January 1846, Sir Harry Smith led the main charge in the battle of Aliwal, carrying that village at the point of the bayonet, and capturing all the enemy's guns, to the number of sixty-seven—a success which enabled him to come to the assistance of the Commander-in-chief, and to join in the final and crowning victory of Sobraon (February 10), which crushed the last hopes of the Sikh leaders and their troops, and secured the possession of the Punjab to the British forces. For his conduct on these occasions, Sir Harry Smith was highly commended in the despatches of Lord Gough, who attributed the victory of Aliwal mainly to his valour and judgment. The Earl of Ripon in the House of Lords, proposed the formal thanks of that House to Sir Harry Smith for his distinguished services in India, and it was supported by the testimony of the Duke of Wellington. At the same time Sir Harry was presented with the freedom of the city of London and the thanks of the Hon'ble East India Company, and not long afterwards was created baronet, and further rewarded by being advanced to the dignity of a G.C.B. He had not long returned to England when he was appointed to the colonelcy of the Rifle Brigade, and in September 1847, he was nominated to the Governorship of the Cape of Good Hope, together with the command of the forces in that colony. There he conducted with great ability all the operations of the Caffre war of 1851-2, until succeeded by Sir George Cathcart. In 1854 Sir Harry Smith was promoted to the rank of Lieut.-General, and in the same year was appointed to the military command of the northern and midland districts, which he held for the full term. He married in 1814, a Spanish lady, the Donna Juana Maria de los Dolores de Leon, by whom he had no issue; and the baronetcy became extinct by his death.

SMITH, Sir James Edward, author of Notes on Indian Plants in Rees' Cyclopædia.

Snakes or Serpents are alluded to in the most ancient of the writings and traditions of the world. They are very numerous in many parts in the south of Asia, admired but dreaded by many, but protected and worshipped by other, of the races. The colours of the backs of such as creep on the ground are generally of a brownish hue, much resembling the soil on which they move. The colours of the dendrophidæ or tree snakes are of various shades of green: so that, aided by their quiet gliding motion, snakes though numerous unless looked for are seldom seen by any person. But a search in the least promising places, will always produce to the naturalist some specimens. The backs of the water-snakes, the Hydridæ are also usually of a brownish colour, from which in the green sea-water or in that of quiet lakes or tanks they are detected as readily as the tree and land snakes escape observance. It has long been known that though the non-scientific world regard all snakes as poisonous and though many deaths do occur from snake bite, the numbers of poisonous snakes are not great. Of 43 species examined by Dr. Russell, only 7 were found with poison fangs, Dr. Davy in Ceylon, found 4 poisonous out of 20 species, and the fatal accidents which follow from bites are the results of the deadly character of the poison with which the poisonous kinds are provided. The difficulty of detecting and avoiding them is known to all. Amos, v. 19, says a man may flee from a lion and be met by a bear, but leaned his hand on the wall, and a serpent bit him. Snakes are very frequently found in old unplastered walls, built of bricks, and fatal accidents are not uncommon in such houses, as well as in those built only with mud. In the district of North Canara, in the Taluk of Cumpta, is a place called Naga Tirtha. There is a small well-built tank around which are small artificial caves containing thousands of serpent images. Throughout all the south of India south of the Vindhya mountains, the cobra snake is everywhere worshipped, both alive and as stone images and many stories are told by the people relating to their beliefs. Two guests, says an author, came once on a time to the house of a Shrawuk Waneeo. The master of the house was at the market, and his wife, after she had made her friends sit down, was obliged to go away to the well for water. While the guests sat waiting for the master of the house a large snake made its appearance. One of them jumped up and pinned it to the ground with a stick, while the other set to work to find a split bamboo, which people keep ready in their houses for securing snakes. Meanwhile the woman came back with the water, and seeing the snake pinned to the ground, cried out, 'let him go; let him go; he is our Poorwuj Dev; he used to get into my mother-in-law's head, and set her a-trembling, and then he would mention the name of my father-in-law, who died sometime ago, and say that it was he. He said also that his soul had been wrapped up in his property, on which account he had become a snake and was going to live in the house. One day he bit a neighbour of ours, and the Jutee came to cure the man. Poorwuj Dev then set the neighbour a-trembling, and said he had bitten him because he fought with his son, and that he would quit him when he got security that there should be no more quarrelling. In this way he quitted him. From that day forth if the snake go to our neighbours houses no one molests him. If at any time we were to set him down at a place twenty miles off he would come back to this very spot. He has often touched my foot, but he never bit me; and if I happen to be gone to draw water, and the child cries at home, he will rock him in his cradle. This I've seen him do many a time.' In this way she prevented their interfering with the snake, and, releasing him, paid him obeisance. The guest, too, who had seized him, took off his turban, and said, 'O! father snake, forgive my having pinned you to the earth. I am your child!' after a short time, a cat having killed the snake, the people of the house took the pieces of it and burned them on a pyre, offering, in fire-sacrifice, a cocoa-nut and sandal-wood, with clarified butter.' This was to perform the snakes funeral rites and it was customary till the end of the 19th century. A brahmin, having purchased premises in the ancient town of Dholka, set to work to make excavations for a new building, and, in so doing, came upon a subterranean chamber, which contained a great deal of property. There was, however, a large snake stationed there to protect the treasure, which snake appeared to the brahmin by night in a dream, and said to him, 'this property is mine, and I live here for its protection; therefore you must not injure the chamber nor covet the treasure which it contains. If you do so, I will cut off all your posterity. In the morning, the brahmin poured a vessel of hot oil into the chamber, so that the snake died. He then destroyed the chamber, having first removed the treasure, and burned the body of the snake in due form in the yard of his house. With the treasure he had thus obtained he erected splendid buildings, but he never had a son, and his daughter remained childless, and whoever received any part of the property, or became his servant, or acted as his agent or as his family priest, was childless too. These things happened, it is said, about forty years ago. Similar stories are very common in Guzerat, and it is the general belief in India, that serpents are always to be found wherever a hoard is buried.

In Ceylon, the rat snake's domestication is encouraged by servants, in consideration of its services in destroying vermin. One day says Sir J. E. Tennent had an opportunity of surprising a snake that had just seized on a rat of this description, and of covering it suddenly with a glass shade, before it had time to swallow its prey. The serpent appeared stunned by its own capture, and allowed the rat to escape from its jaws, which cowered at one side of the glass in the most pitiable state of trembling terror. The two were left alone for some moments, and on his return to them the snake was as before in the same attitude of sullen stupor. On setting them at liberty, the rat bounded towards the nearest fence; but quick as lightning it was followed by its pursuer, which seized it before it could gain the hedge, through which he saw the snake glide with its victim in its jaws. In parts of the Central Province, of Ceylon, at Oovah and Bintenne, the house-rat is eaten as a common article of food. The Singhalese believe it and the mouse to be liable to hydrophobia.

The land snakes often enter the water of lakes and tanks and quest round their borders for frogs and other prey. The true sea snakes are seen around the coasts within soundings, a water snake (Hypotrophis jukesii), mentioned by Macgillivray as four feet two inches long, was caught several miles off the land at Keppell's island. Snakes breed in captivity. A Russell's Viper (Daboia elegans) which Dr. Shortt had kept for some seven weeks, measuring three and a half feet in length, on the 30th July 1872, produced thirty-nine young. Each little one measured eight and a half inches in length, and one out of these when about six hours old, in an experiment, killed in ten seconds a young partridge weighing nine and a half tolahs or 1710 grains. This proves how prolific these deadly snakes are. Snakes lay from 11 to 15 eggs, and, as a rule, all these perfect, but allowing for destruction by man and animals, nearly half the brood attain maturity. The Tangli snake of Assam causes much anxiety from its fierceness, a pair of them in possession of a bamboo clump in the rear of a house, kept the whole family in a state of great alarm for days. Unable to move about their house, but with the greatest precaution, they applied for relief, which was afforded by shooting the pair. The Tangli is quite as active in the water as on dry land. Whilst pursuing in a canoe over inundated ground, a large deer happened to pass, one of these snakes when first noticed, must have been at least thirty yards off, but raising his head, he made for the canoe with such velocity that though it was paddled by four strong men, it overtook the canoe and would inevitably have been aboard, if it had not been prevented by a shot. The Hydridæ or sea snakes are venomous. They appear to live on sea-weed. They lay their eggs on the shore and coil themselves up on the sand. They are found at sea all along the coast, within soundings, and their appearance always marks the approach to land. They are often thrown ashore by the surf and they are occasionally carried up rivers by the tide, but they cannot live in fresh-water. Fishermen greatly dread these snakes. The following genera and species occur in the south and east of Asia;

Pelamis bicolor, Pacific Ocean.
,, ornata, Borneo.
Lapemis curtus, Madras.
,, hardwickii, Borneo.
Aturia belcheri, N. Guinea.
,, ornata, Indian Seas.
Microcephalophis gracilis, kadel-nagam of Madras.
Enhydrina bengalensis, Madras.
,, valakadyen, Madras.
Hydrophis obscura, the sun shooter, Madras.
,, lindsayii, China.
,, fasciata, Indian Ocean.
,, nigrocincta, the kerril, Bengal.
,, doliata, the black-headed kerril, Austr.
,, subcincta, Shaw's chittul, Ind. Ocean.
,, sublævis, the chittul, China & Ind. Ocean.
,, mentalis, the pale chittul, Indian Ocean.
,, ocellata, the eyed chittul, Australian Seas.
,, spiralis, the shiddil, Indian Ocean.
,, subannulata, the ringed sea snake, India.
,, aspera, the rough sea snake, Singapore.
,, cærulescens, the bluish sea snake, Bengal
Chitulia inornata, Indian Ocean.
,, fasciata, Indian Ocean.
Kerilia jerdonii, the kerilia, Madras.
Hydrus major, the sea snake, India & Australia.
,, annulatus, the ringed sea snake, Singapore.
Tomogaster eydouxii, Indian Ocean.
Stephanohydra fusca, Juke's hypotrophis, Darnley.
Chersydrus annulatus, Madras.
,, granulata, the Madras chersydrus.

Acrochordus javanicus, Java.
Erpetonina erpeton,
„ tentaculus, the erpeton.
Cerberus cinereus, the karoo bokadam, India.
„ acutus, Borneo.
„ unicolor, Philippines.
„ australis, Australia.
Homalopsis buccata, Java.
„ hardwickii, India.
Phytolapsis punctata, India.
Tropidophis schistosus, the chittee, Ceylon.
Myron richardsonii, Australia.
„ trivittatus, India.
Hypsirhina plumbea, Borneo.
„ hardwickii, Penang.
„ Aer, the Ular Aer, Borneo.
„ bilineata, China.
„ chinensis, China.
„ benettii, China.
Fordonia leucobalia, Timor.
„ unicolor, Borneo.
Raclitia indica, India.
Miralia alternans, Java.
Xenodermus javanicus, the Gonionote, Java.

But, fortunately for the fishermen, who sometimes find them unexpectedly among the contents of their nets, sea snakes are unable, like other venomous serpents, to open the jaws widely, and in reality they rarely inflict a wound. Dr. Cantor believes, that they are blinded by the light when removed from their own element; and he adds that they become sluggish and speedily die. Those found near the coasts of Ceylon are generally small, from one to three feet in length, and apparently immature, and it is certain that the largest specimens taken in the Pacific do not attain to greater length than eight feet. In colour they are generally of a greenish-brown, in parts inclining to yellow, with occasionally cross bands of black. How numerous the reptiles of India are is well illustrated by a writer of "*Trifles from Ceylon,*" *in All the Year Round.* The centipedes, scorpions, a stranger in Ceylon soon learns to take it for granted that they may be found wherever there is shelter for them. Although, however, there are reptiles in almost every house, accidents are comparatively rare. I have been a good many years in Ceylon, and yet I have only once been bitten by a centipede. He fell on me while asleep in a bed without curtains, and nipped me in the arm. The pain was sharp for a time, but subsided before long. Some persons suffer agonies from the bite. A stiffish whip is the best thing to use, as it is pliable, and bends over a snake or other creature, while a stick can only touch them in one part. Every one can speak of some narrow escape. Twice, on nearly the same spot, did I drive over a deadly snake. It was near a coral wall at Point Pedro. One snake was a cobra, the other a tic polonga. My wife one day opened a drawer, and was going to put in her hand, when she saw a venomous snake lying coiled up in a basket. She remained quiet, and I despatched it with a stick. Some years previous, when still unmarried, she and another young lady, climbing about the rocks at Trincomalle, at a pic-nic, found their feet within the coils of a python, which they had inadvertently disturbed in his sleep. The narrowest escape I ever had was at Point Pedro, where I placed my foot on a cobra-de-capella, and actually stood on him for an instant, while I could hear him beating the ground with the rest of his body. After the house had been closed for the night, when I was going to bed, I saw a snake coiled up near a door. I went for a stick and despatched a cobra, between four and a half and five feet long. Evidently it had taken refuge within the house after I had trodden on him, and lay quiet behind the door. He had remained there without moving, while my wife and myself had been drinking some lemonade at a table within a few feet of where he lay. He had remained quiet and unnoticed when the servant shut the door, although he must have been exposed to light. And there he still was when my eye fell on him. The rat-snake, a harmless creature, very like the cobra, but without a hood, is a very active snake, and moves away with great rapidity. A house which we occupied a few months ago was much infested by snakes. Standing on the verandah one afternoon I saw a cobra deliberately move towards the house. Of course I at once put an end to him. Remembering what Sir Emerson Tennent says about snakes of this kind being generally found in couples, I was not surprised by the breathless announcement my little girl made on my return home some days afterwards. There was a fine banyan-tree in front of the house, into which the children used to climb and regale themselves with imaginary breakfasts—sumptuous curries of all kinds, sambals of delicious flavour, and other luxurious dishes, really made of gravel and served up in cocoanut shells. It appeared that as they were regaling themselves on one of these gorgeous repasts, Fanny had spied a cobra: on which they scrambled down the tree and alarmed the household, and the cook valiantly broke a door-bar over the cobra, and then dragged him by the tail out of a hole into which he was creeping; after which he was (I suppose from the natural love cooks have for roasting and boiling) cast into the fire and burnt. His head was, however, raked out of the ashes, in corroboration of their story, and triumphantly shown me. A groom and his wife were sleeping in the stable of a friend of mine, when a cobra bit the woman in the head. Probably the reptile had coiled himself near her for warmth, and the woman had, in her sleep, disturbed him. Immediately the man carried her into his master's house ; but before she had been in the room five minutes, death ensued. I have seen snake-charmers bitten and have seen the snake stone applied, but there was no evidence of a satisfactory nature that the poison of that particular snake had not been extracted. I remember one evening striking with my shoe at a cockroach, and bringing it down within a few inches of a deadly snake which I had not before observed. Two men in the civil service of the island were out shooting together. A herd of deer were seen a short way off, and they commenced stalking them. One of the two, an old sportsman, wished to give his friend the first shot : so he whispered to him to advance first, while he followed a few paces in the rear. The foremost of the two, with eyes intently fixed on the deer, advanced on tiptoe. His friend behind, to his intense horror, saw him put down his foot exactly over one of the most deadly snakes in the island, as it lay across his path. It was too late to warn him ; but providentially, walking as he did on tiptoe, he trod so that the heel did not press on the reptile ; he passed on, and so, unknown to himself, escaped deadly danger. A Singhalese toddy-charmer was once bitten in the finger by a deadly snake ; on which he laid the finger against a tree, raised his sharp bill-hook, and with one blow severed the finger from the hand. Snakes, remarks Viscountess Falkland, are really sensible to the charms of music. Educated snakes, who have been for sometime in the hands of a snake-charmer, are, of course, more susceptible than wild ones, and manifest their pleasure with less reserve, possibly, because they have become used to the musician's appearance, and are less inclined to try to escape, which would probably be the first impulse of the wild one. But all the family have naturally a taste for music, which may be proved by any one who has kept one of the harmless English snakes as a pet. The animal will always pay attention to any rather monotonous tune played on a flute or flageolet. This taste, by the way, is shared by many of the lizard tribe, by some pigeons, and very generally by hedgehogs ; at least, she says, I have known three or four instances of it on the part of a hedgehog, kept in the lower story of a house, as an exterminator of blackbeetles and cockroaches. If after nightfall, when the hedgehog generally awakes and runs about in search of prey, he heard the sound of a violin or piano, he would always endeavour to make his way to the place whence the sound came, and if admitted into the room where the instrument was, he would stand entranced as long as the music continued. I mention this merely as a proof that several of the lower animals are attracted by music. But as regards Indian snakes, I have, she says, seen cases in which I had no room to doubt that the charmer, by his monotonous piping and drumming, did tempt really wild snakes from their hiding places. It is not often, however, that the charmer trusts entirely to his music. I have known them, when sent for to catch a large, and apparently very dangerous cobra, which had a hole in a dry stone wall, inconveniently near a gentleman's house, come provided with a tame cobra, whose fangs had been extracted. The cobra was carried in a bag, very cleverly concealed under the arm of one of the charmers. The musician commenced piping, and all the spectators naturally directed their attention to him. He walked along the wall, and when he got near the supposed hole, piped more vigorously than before, and directed his own eyes and those of the spectators to a particular spot. On a sudden his accomplice gave a loud cry, and on looking at him, he was seen on the ground, grasping the neck of a large cobra, which he appeared to have seized as it was in the act of issuing from a hole in the wall, and whose tail was twisting round the man's arms and body. The other charmers came to his aid, and the snake was at length duly deposited in a basket, and covered with a cloth The imposture was discovered by a gentleman who owned the house insisting on the shooting the snake. The charmers remonstrated, said ' it was their god, had come out in consequence of their invocations, and would, if killed, haunt and ruin them, &c. The gentleman was obstinate, but at last told the charmers he would spare their snake, if they confessed the cheat he suspected. This they did, and showed him the bag in which the reptile had been concealed under the arm of one of their number, and satisfied him that the snake was destitute of fangs, and must therefore have been previously caught, and deprived of his weapons of offence. There is no doubt, she says, that there are particular individuals who are very little obnoxious to snake bites ; just as there are particular people whom bees will never sting. She learned two very decided and well authenticated instances of this. One was a half-witted boy of the wild tribe of Bheels, in Candeish. He was found by his relations playing with wild snakes, and had the power of attracting and taming them. He had numbers of all kinds of snakes in the jungle, near the hut where his parents lived, and these snakes would come to him and allow them to handle them with impunity. After some months he began to be known to the people round about as a prodigy, but as the part of the country where he lived was very remote, it was long before his fame spread to any distance ; and soon after he had been heard of by the government officials, and official enquiry had been made to an extent sufficient to verify the main facts of the story, the poor boy was bitten by one of his favourites and died. The other case occurred in the Sattara territory, about twenty-five years ago (about A.D. 1815.) It was noised abroad that the son of a brahmin, not far from Wace, had the power of attracting the most venomous snakes and handling them with impunity. Numbers visited him, and seeing the story was true, spread his fame, and his relations finding that his reputation was likely to be profitable to them, added all sorts of marvels to the current tales. He was one of the promised avatars of the God Krishna, which are yet to come. He was to restore hindooism in its purity, and re-establish brahminical superiority in the Deccan. Thousands flocked to see him, and pay their respects, and bring oblations ; and so great was the excitement, that the raja of Sattara and the English government officials got alarmed. The poor boy, however, like the Candeish Bheel, was not permanently proof against snake bites, and was bitten and died just when his village had become the point to which every devotee in the Deccan was hastening, and the excitement subsided as quickly as it arose. In the Madras Presidency with about thirty millions of inhabitants, the deaths from snake bite in 1866 were 1,894, and in 1867, 1,810. It may be mentioned that a snake visiting a house is always looked on as a sign of luck ; and when a snake discovers how to get at the eggs and milk in the larder, no native will on any account, kill what he regards as the good genius of the house. The cobra or hooded snake, is often personified in Indian stories. In many parts of western India, after killing a cobra, the non-Aryan races give it all the honours of a cremation, assuring it, with many protestations that they are guiltless of its blood, that they slew it by order of their master, or that they had no other way to prevent its biting the chicken or the chickens. The possession of a poisonous salivary secretion is confined to a few kinds of snakes, and most of these are very rare. Out of the twenty-one families into which Indian snakes are at present divided, there are four families of venomous snakes. These twenty-one families include about 90 genera, of which 20 are venomous, but only 13 of these are land snakes. The species now number about 400, of which about 80 are venomous, but as 43 of these are sea snakes, we may reduce the proportion to 37 venomous land snakes, out of a total of about 360 species ; but by far the greater number of these are either very rare or confined to some particular part of the East Indies. All snakes have a long bifid tongue, which, usually retracted in a sheath below the windpipe, is capable of rapid and vibrating protrusion through a chink in the rostral shield ; it is moved by means of two long elastic bones extending along the greater part of its length in the form of a long V with the tongue rising perpendicularly from the angle of the V, muscles convert these bones into levers which jerk the tongue up and down with great celerity and freedom of play. This tongue is not peculiar to snakes ; the large water lizards (Varanus) for instance have this bifid organ still more developed. Harmless snakes have a row of about six to sixteen teeth in each upper jaw, besides generally two rows of palate teeth. In the venomous kinds the maxillary teeth are generally replaced by a single tubular tooth of variable length, but hardly exceeding a quarter of an inch in an adult cobra, and half an inch in an adult chain-viper (Daboia elegans.) The often mentioned erection of the fang takes place to a very slight extent in the cobra, which is unprovided with any special erective apparatus ; the fang is always recurved backwards at an angle of about forty-five degrees and received into a depression in the lower lip. In some of the vipers there is a special erective muscle, but in every case the uncovering of the fang is a passive act as regards the snake, being effected by the gingival envelope being pushed up mechanically by the object bitten. The fang is at the anterior extremity of the upper jaw-bone while the poison gland is situated on the cheek behind the eye ; the poison on being ejected either by direct muscular action or by a reflex nervous action similar to that excited in the human mouth by the idea of eating lemon, proceeds along a duct which passes below the eye over the jaw-bone and terminates at the bottom of the gingival envelope of the fang, and just in front of the superior orifice of its canal. There is no continuity between the orifice of the poison duct and that of the poison fang. They are merely in opposition, and the poisonous salivary secretion is directed into the fang by the retraction of the gingival envelope round the fang in the act of biting. Every tooth in the snake's mouth, whether simple tooth or poison fang, is enveloped more or less in a gingival envelope which contains at its base the matrix of a series of other teeth; these young teeth are constantly growing, and the eldest of them periodically replaces the fixed tooth and becomes fixed until it is shed in its turn. This shedding is a gradual process compared to the shedding of the epidermis, but the two operations coincide in time and take place about once in two months. The common exceptions are the cobra, and the Bungarus. In India, the usual snake of the latter genus is Bungarus arcuatus, the white-arched bungarus ; it has a white belly from which pairs of white arches cross the black back. In Burmah this is replaced by Bungarus fasciatus, the yellow and black-banded bungarus ; it has alternate complete rings of black and yellow. The Hamadryad, Ophiophagus elaps, a member of the Elapidæ family, is extremely rare ; it resembles a huge cobra. This family is also distinguished from the rest of the shield-headed or harmless colubrine snakes by the absence of the loreal-shield, a small shield usually separating the antocular shield from the posterior nasal, so that there are but two shields instead of three between the eye and the nostril. The sea-snakes which have shielded heads are also an exceptional family, being all or nearly all venomous. They are known from other acquatic snakes by their perpendicularly flattened tail. A scaly head (that is, the crown covered with scales as on the rest of the body) is generally the sign of a poisonous snake. The scaly-headed snakes are usually vipers. The Viperidæ have usually a high flat head, very distinct at the neck and broad behind the jaws. They have long, more or less erectile fangs, with an erect pupil. The only one fatal to human life is the chain-viper, Daboia elegans, known by a triple chain of oval black links and an indistinct yellow on its head. The green tree viper, Trimesurus, is a short stout snake, very different in build from the long slender green tree-snake ; it is venomous in a very slight degree. As exceptions to these general remarks however, the Erycidæ and Acrochordidæ have also scaly heads ; a common sand snake, Eryx johnii, might possibly be mistaken for a viper, but its small head is very different from that of the vipers. It is a popular belief that the male and female cobra are very different in appearance. The origin of this error appears to be as follows : The Ptyas (mucosus or korros), dhaman in Hindustani, sarai or sara pamboo in Tamil, chera pamboo in Malayalum, lem-we in Burmese, is generally supposed by natives of the South of India and of Burmah, to unite with the cobra, producing a very venomous hybrid offspring, of doubtful identity ; hence it is frequently called the male cobra. Pytas, the dhaman, is indifferently known as the whip snake, the rat snake, the rock snake, in Madras ; whilst in Bengal the name rock snake is usually given to the Python. Any snake found near or in the water is usually called a water snake, from ignorance of the fact that nearly all snakes can swim and will readily take to the water if necessary. Indeed a snake which rejoices in the highly terrestrial name of Psammodynastes pulverulentus, the dusty king of the desert, was captured whilst it was swimming across the Rangoon lake. Also, if any word could be more inappropriate and deceptive than another, it is the term 'hood' as applied to the broad expansion produced by the elevation of the cervical ribs of Naga tripudians and Ophiophagus elaps. The native terms used to describe it, putum in Tamil and Malayalum, meaning a cloth, a picture, a map, and phun in Hindustani, both give an idea of breadth and expansion entirely wanting in the terms 'capella' and 'hood' ; So cautiously do serpents make their appearance that the surprise of persons long resident is invariably expressed at the rarity with which they are to be seen. Mr. Bennett, who resided much in the south-east of Ceylon, ascribes the rarity of serpents in the jungle to the abundance of the wild pea-fowl, whose partiality to young snakes renders them the chief destroyers of these reptiles. It is likely, too, that they are killed by the jungle-fowl ; for they are frequently eaten by the common barn-door-fowl in Ceylon. This is rendered the more probable by the fact, that in those districts where the extension of cultivation, and the visits of sportsmen, have reduced the numbers of the jungle-cocks and pea-fowl, snakes have perceptibly increased. The deer also are enemies of the snakes, and the natives who have had opportunities of watching their encounters assert that they have seen deer rush upon a serpent and crush it by leaping on it with all its four feet. As to the venomous powers of snakes, Dr. Davy, whose attention was carefully directed to the poisonous serpents of Ceylon, came to the conclusion that but four, out of twenty species examined by him, were venomous, and that of these only two (the tic-polonga (Daboia elegans, *Daud*) and cobra-de-capello), (Naja tripudians, *Merr.*) were capable of inflicting a wound likely to be fatal to man. The third is the carawala, (Tringonocephalus hypriale, *Merr.*) a brown snake of about two feet in length ; and for the fourth, in like manner, the tic-polonga, particularised by Dr. Davy, is said to be but one out of seven varieties of that formidable reptile. The word 'tic' means literally the 'spotted' polonga, from the superior clearness of the markings on its scales. Another, the nidi, or 'sleeping' polonga, is so called from the fact that a person bitten by it is soon prostrated by a lethargy from which he never awakes. These formidable serpents so infested the official residence of the District Judge of Trincomallee in 1858, as to compel his family to abandon it. In another instance, a friend of Sir J. E. Tennent going hastily to take a supply of wafers from an open tin case which stood in his office, drew back his hand, on finding the box occupied by a tic-polonga coiled within it. During Tennent's residence in Ceylon, he never heard of the death of a European which had been caused by the bite of a snake; and in the returns of coroner's inquests made officially to his department, such accidents to the natives appear chiefly to have happened at night, when the animal, having been surprised or trodden on, inflicted the wound in self-defence. For these reasons the Singhalese, as indeed the natives of all India, when obliged to leave their houses in the dark, carry a stick with a loose ring, the noise of which as they strike it on the ground is sufficient to warn the snakes to leave their path.

There is a belief in Ceylon that the bite of the rat-snake, *Coryphodon blumenbachii*, though harmless to man, is fatal to black cattle. The Singhalese add that it would be equally so to man were the wound to be touched by cowdung. Wolf, in the interesting story of his Life and Adventures in C[illegible] 'mentions that rat-snakes were often [illegible]ticated by the natives as to feed at [illegible]e. He says: "I once saw an ex[illegible] of this in the house of a native. It [illegible]g meal-time, he called his snake, which [illegible]mediately came forth from the roof under which he and I were sitting. He gave it victuals from his own dish, which the snake took of itself from off a fig-leaf that was laid for it, and ate along with its host. When it had eaten its fill, he gave it a kiss, and bade it go to its hole." Major Skinner, writing to Sir J. E. Tennent on 12th December 1858, mentions the still more remarkable cause of the domestication of the cobra-de-capella in Ceylon: "Did you ever hear," he says, "of tame cobras being kept and domesticated about a house, going in and out at pleasure, and in common with the rest of the inmates? In one family, near Negombo, cobras are kept as protectors, in the place of dogs, by a wealthy man who has always large sums of money in his house. But this is not a solitary case of the kind. I heard of it only the other day, but from undoubtedly good authority. The snakes glide about the house, a terror to thieves, but never attempting to harm the inmates. The Egyptian juggler is said to take up in his hands the Naga or small viper, and pressing a finger on the nape of its neck, puts it into a catalepsy, which makes it motionless and stiff like a rod; and when it regains its power of motion, the cheated by-standers fancy that the magician's rod has been changed into a serpent.

Snakes cast their skins periodically, and the Chinese and hindoo physicians use the skins medicinally. Snakes are said to avoid the fennel plant as well as all places where the fennel seed (Nigella sativa) is strewed. —*Macgillivray's Voyage, Vol.* i, *p.* 66; *Madras Mail, August* 2, 1872; *McCulloch's Records, G. I. F. D., pp.* 31-2; *Eng. SNAKE BITE. Dr. Shortt, M.D, a medical officer of the Madras Army recommends Liquor Potassæ internally, for the cure of persons wounded by poisonous snakes and several persons have recovered with whom it was used. Surgeon J. Fayrer of the Bengal Army recommends Liquor Ammoniæ. In the year 1866, so many as 1,894 persons died from snake bite in the Madras Presidency, and in 1867 the deaths were 1,810; all stimulants are useful, spirits and the essential oils of cinnamon, peppermint, &c.

SNAKE EATER, Capra megaceros, *Hutton.*

SNAKE GOURD, Trichosanthes anguina, a curious contorted gourd, peculiar to India, and in very general demand for vegetable curries. The plant is of easy culture on trellises around the doors of the native cabins, and the fruit often grows two feet long, beautifully striped, small, and tapering, so that streaming down from the trellis, they immediately remind one of striped snakes suspended from the foliage of trees.—*Mason.*

SNAKE FRUIT, Eleagnus conferta.

SNAKE RACE. The Snake race, or the Takshac race, was one of the most extensive and earliest of Higher Asia, and celebrated in all its extent, and the Ramayana relates that the sacrificial horse was stolen by "a serpent (Takshac) assuming the form of Ananta." The snake race of India, were the foes of the Pandu. The Mahabharat records constant war from ancient times amongst the children of Surya (the sun), and the Tak or Takshac (serpent) races, and mentions that the horse of the sun, liberated preparatory to sacrifice, by the father of Rama, was seized by the Takshac, literally rendered, the snake. The, successor of Janmejaya carried war into the seats of this Tak or serpent race, and is said to have sacrificed 20,000 of them in revenge; but although it is specifically stated that he subsequently compelled them to sign tributary engagements (penameh), the brahmins have nevertheless distorted a plain historical fact by a literal and puerile interpretation. The Paratacæ (Mountain Tak) of Alexander were doubtless of this race, as was his ally Taxiles, which appellation was titular as he was called Omphis till his father's death. It is even probable that this name is the Greek, in which they recognized the tribe of the Tak or Snake. Taxiles may be compounded of *es*, 'lord or chief,' silla, 'rock or mountain,' and Tak, 'lord of the mountain Tak,' whose capital was in the range west of the Indus. We are indebted to the emperor Baber for the exact position of the capital of this celebrated race, which he passed on his route of conquest. We have, however, an intermediate notice of it between Alexander and Baber, in the early history of the Yadu Bhatti, who came in conflict with the Tak on their expulsion from Zabulist'han and settlement in the Punjab. How soon after the flood, the Surya, or sun-worshippers, entered India proper, must ever remain uncertain. It is certain that they were anterior in date to the Indu races who trace their descent from the moon (Ind); as the migration of the latter from the central lands of Indo-Scythia was antecedent to that of the Agnicula, or fire-worshippers, of the snake race, claiming Takshac as their original progenitor. The Surya, who migrated both to the east and west, as population became redundant in these fertile regions, may be considered the Celtic, as the Indo-Getæ may be accounted the Gothic, races of India. To attempt to discriminate these different races, and mark the shades which once separated them, would be fruitless; but the observer of ancient customs may, with the imperfect guidance of peculiar rites, discover things, and even names, totally incongruous with the brahminical system, and which could never have originated within the Indus or Uttuc, the Rubicon of Gangetic antiquarians, who fear to look beyond that stream for the origin of tribes. The Sauromatia, or Sarmatians of early Europe, as well as the Syrians, were most probably colonies of the same Suryavansi, who simultaneously peopled the shores of the Caspian and Mediterranean, and the banks of the Indus and Ganges. Many of the tribes described by Strabo as dwelling around the Caspian, are enumerated amongst the thirty-six royal races of India. One of these, the Sacaseni, supposed to be the ancestors of the Saxon race, settled themselves on the Araxes in Armenia, adjoining Albania.—*Tod's Rajasthan, Vol.* i, *pp.* 536, 556-58, 580-81.

SNAKE ROOT. Polygala senega.

SNAKE'S HEAD LILY, Amaryllis frittilaria.

SNAKE-STONE.

Pambu kallu, TAM.

Snake stone is a term employed in tropical countries to various absorbent substances applied to snake bites. That in use in Ceylon, is charred bone. The bezoar and magnesian limestones, and chalk are also used. The virtues of these depend on their absorbent qualities, and earth has been recommended. Dr. Davy's belief was that a piece of charred bone is filled with blood perhaps several times, and then carefully charred again. Evidence of this is afforded, as well by the apertures of cells or tubes on its surface as by the fact that it yields and breaks under pressure, and exhibits an organic structure within. Dr. Davy, on the authority of Sir Alexander Johnston, says the manufacture of them is a lucrative trade, carried on by the monks of Manilla, who supply the merchants of India, and his analysis confirms that of Mr. Faraday. Thunberg was shown the snake stone used by the boers at the Cape in 1772, which was imported for them "from the Indies, especially from Malabar," at so high a price that few of the farmers could afford to possess themselves of it; he describes it as convex on one side, black, and so porous that "when thrown into water, it caused bubbles to rise;" and hence, by its absorbent qualities, it served, if speedily applied, to extract the poison from the wound. Mr. Hardy furnished Sir J. E. Tennent with an account of the piedra ponsona, the snake-stone of Mexico:—"Take a piece of hartshorn of any convenient size and shape; cover it well round with grass or hay, enclose both in a thin piece of sheet copper well wrapped round them, and place the parcel in a charcoal fire till the bone is sufficiently charred. When cold, remove the calcined horn from its envelope, when it will be ready for immediate use. In this state it will resemble a solid black fibrous substance, of the same shape and size as before it was subjected to this treatment. The wound being slightly punctured, apply the bone to the opening, to which it will adhere firmly for the space of two minutes; and when it falls, it should be received into a basin of water. It should then be dried in a cloth, and again applied to the wound. But it will not adhere longer than about one minute. In like manner it may be applied a third time; but now it will fall almost immediately, and nothing will cause it to adhere any more.

SNAKE-WORSHIP. In all mythological language the snake is an emblem of immortality ; its endless figure, when its tail is inserted in its mouth, and the annual renewal of its skin and vigour, afford symbols of continued youth and eternity, and its supposed medicinal or life-preserving qualities may also have contributed to the fabled honours of the serpent tribe. In hindoo mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. Ingenious and learned authors attribute this universality of serpent forms to the early and all-pervading prevalence of sin. The allegories of sin and death, and the end of their empire, contain allusions to the christian dispensation in the traditions of the hindoos. Krishna crushing, but not destroying the type of sin, has been largely discussed. Garuda, the vahan of the hindoo god Vishnu, is also the proverbial but not the utter, destroyer, for he spared one, they and their archotype being, in reference to created beings, eternal. His continual and destined state of warfare with the serpent, a shape mostly assumed by the enemies of the virtuous incarnations or deified heroes of the hindoos, has been supposed to be a continued allegory of the conflicts between vice and virtue so infinitely personified. In this view, Garuda, appears the coadjutor of all virtuous sin-subduing efforts, as the vehicle of the chastening and triumphant party, and conveys him on the wings of the winds, to the regions of eternal day. But, the accepted explanation of the traditions of the Garuda and his victories over the snakes, is that Garuda is the type of the religion of Vishnu and the snakes alluded to are the naga, or snake-race who followed the budd'hist faith of Sakya Muni. There is ample reason to believe that at one time the ophite or snake-worship extended all over India ; and everywhere throughout the peninsula and Ceylon snakes are to this day worshipped. In the holy books of the hindoos, the destruction of the entire serpent-race by the rajah Janamejaya, the son of Parichshit, is chronicled as a historical event, but probably it is merely a typical and emblematical shadowing forth of the actual fact, *i. e.*, that the faith of the Vedas was founded on the ruins of the original and local superstition of the Nagas, when Janamejaya subverted the ancient Ophite worship. At all events, there is no doubt whatever that this singular superstition existed originally in Cashmere, as snakes and snake-deities play an important part in the legendary history of the valley. Abul Fazl (alluding to an epoch about 350 or 400 years B.C.) mentions "that there are seven hundred places where carved snakes are worshipped in in the province," and up to the close of the 19th century, in every town in the south of India the cobra snake, both alive and in the form of carved images is worshipped. The hindoo races worship three classes of deities, the gramma devata or village god ; the kula devata or household god, and the ista devata, the personal or patron god. Snake-worship is general throughout peninsular India, both of the sculptured form and of the living creature. The sculpture is invariably of the form of the Nag or Cobra, and almost every hamlet has its serpent deity. Sometimes this is a single snake, the hood of the cobra being spread open. Occasionally, the sculptured figures are nine in number, and this form is called "nao-nag," and is intended to represent a parent snake and eight of its young, but the prevailing form is that of two snakes twining in the manner of the Esculapian rod. Some hindoos who have been educated in the schools established by the British hold that the living snake is not worshipped as a devata, by any hindoo sect, but is reverenced in commemoration of some ancient event. Others however maintain that it is as a devata, the snake is worshipped. But whatever be the origin of the adoration, the living snake is worshipped everywhere throughout Southern India. On these occasions, the worshippers resort to the snake's residence, called in Urdu the samp-ki-hut, which they ornament with streaks of vermillion, and daubs of turmeric and of wheat flour mixed with sugar, and they hang garlands of flowers near, strung on white cotton thread and placed over wooden frames. Also, in the month Sravan, which occurs in the rainy season, the nag-panchami festival occurs, on which hindoos go in search of snakes or have them brought to their houses by the "Sampeli," the snake-charmers, who snare them. The snakes are then worshipped and offerings are made to them of milk, and nearly in every house are figures of snakes drawn on wood or on paper, and these are fixed on the walls and worshipped. Those who visit the snakes' hut, plant sticks around the aperture and wind white cotton thread around and over the sticks. The Mahratta women go a number together to the snakes' "hut," and, joining hands for five times, circle round and round it, singing songs, praying for their desires and then prostrating themselves. Alike in the several Vihara and the Chaitya at Adjunta, are sculptured figures of snakes. The gramma devata of Assaye, where Sir Arthur Wellesley defeated the Mahrattas, is a figure of Hanuman with a lingam, and the Nanda, or Basava, [illegible]he vahan bull of Saiva and the tulsi plant growing near, but on its western wall, a cobra snake is sketched, in white colours, in the wavy form which snakes assume when moving on the ground. The worshippers believe that it is travelling to Lanka (Ceylon), but they smiled on it being remarked to them that it would be a long time on its journey. Figures of the cobra snake are often drawn on paper and in sculpture with the hood spread, like a canopy over the lingam, the emblem of Saiva or Mahadeo; and this deity is often represented sitting on a tiger skin with a cobra snake wound around his head. Vishnu, in his prolonged sleep, while passing from one avatar to another, is shaded by the canopy of a cobra's head. Saiva is fabled to have drank up the poison produced in the churning of the ocean, and, in his agony, to cool himself to have wrapped snakes around his neck.

In Southern India, the deity under whose name the snake is worshipped is Subramani, whose shrine is said to be in the western part of Mysore, and the image there is described as a shapeless lump of earth. The editor has only once seen living snakes in the form of the Esculapian rod. It was at Ahmednuggur, in 1841, in a clear moonlight night. They dropped into the garden, from over the thatched roof of the house, and stood erect on their tails. They were all cobras, and no one could have seen them without at once recognising that they were in congress. Captain Havelock, to whom the editor showed these remarks, mentioned in reply that he once in broad day-light, in the jungles, saw pythons in the attitudes here described, in the singular form of the Esculapian rod, but many natives of India mention having seen this sight and recognise it as the serpent's "Laq." Natives of India believe that it is most fortunate to witness snakes so engaged, and that if they can throw a cloth at the pair to touch them with it, the cloth becomes a representative form of Lakshmi, of the highest virtue, and is taken home to their houses and preserved as such. No hindoo ordinarily will kill a snake but turns aside, on seeing it. Young men who have been educated at English schools, however, have no such great reserve, and a Mahratta brahman so educated, informed the editor that he had killed three of them. Snakes are kept in houses in Ceylon and Guzerat, partly, seemingly, as objects of worship and partly to destroy rats, but no similar practice prevails in the S. E. of the peninsula. In Guzerat no [illegible] kill a snake but it is taken outside [illegible] and released. Esculapius, amongst [illegible]ks and Romans, was the god to whom [illegible]are of medicine and health pertained. Esmun, the snake-god of the Phœnicians, is identified by Bunsen with the Egyptian Hermes, called Tet and Taautes in Phœnician. Esmun Esculapius is strictly a Phœnician god. He was especially worshipped at Berytus. At Carthage, he was called the highest god, together with Astarte and Hercules. At Babylon, Bel corresponded with him. According to Jamblicus and the Hermetic books, the Egyptian name of Esculapius was Kameph. The Aswini-Kumara, the sons of Surya, amongst the hindoos, correspond with the western Greek and Roman Esculapius. The Esculapian Rod has been supposed by some to be the stem of a Bauhinia plant. It is more probably, however, the form that serpents assume when in congress and which is represented in every hindoo serpent shrine. The idea of the medicinal virtues of these snake forms is very old in India : a hindoo attacked by fever or other disease, makes a serpent of brass or clay, and performs certain ceremonies to its honour, in furtherance of his recovery. Such ceremonies are particularly efficacious when the moon is in the nakshatra (mansion, sign, or asterism,) called Sarpa, or the serpent ; called also Ashlesha. The snakes when in congress rise on the tips of their tails and approach each other not twining as represented in the esculapian rod, though, at a little distance, they seem to be twining. Mr. James Fergusson wrote on the 6th March 1868, acknowledging notes on snake-worship, which the Editor sent from Hingolee and Omraoti, which have since been published as appendix D to his work on Tree and Serpent-worship. In his letter he expresses his belief that serpent-worship mixed with buddhism must have prevailed all through the Nizam's country and Berar or rather Nagpore, from at least the 4th to the 10th or 12th centuries, and that there must be temples of the Ophite budd'hism still existing especially about Warangal and its neighbourhood. A great serpent is said to have been worshipped at Sumbulpore on the Mahanuddy ever since the world began. The snake-worship of the Tacshac travelled from Scythia to Cashmere and thence to Hindustan.—*Bunsen's Egypts place in Universal History, Vol.* iv, *pp.*256-7-9 ; *The Editor in Appendix D, of Fergusson's Tree and Serpent Worship* ; *Ras Mala Hindoo Annals, Vol.* ii, *pp.*389-90 ; *Adventures of a lady in Tartary, &c., by Mrs. Hervey, Vol.* iii, *pp.* 156-58 ; *Travels in the Interior of Mexico, published in* 1830, *R. SNAKE-WOOD, Letter or speckled wood, is the wood of Piratouera guianensis of South

America, also of the Strychnos colubrina of the E. Indies. A wood bearing this name is used at Demerara, Surinam, and along the banks of the Orinoko, for the bows of the Indians. The colour of the wood is red hazle, with numerous black spots and marks, which have been tortured into the resemblance of letters, or of the scales of the reptile ; when fine it is very beautiful, but it is scarce in England, and chiefly used for walking sticks, which are expensive ; the pieces that are from 2 to 6 inch diameter, are said to be the produce of large trees, from three to four times those diameters, the remainder being sap. Dr. Bancroft says, "Bourra courra, as it is called by the Indians, by the French Bois du lettre, and by the Dutch Lettre hout, is the heart of a tree growing 30 feet in height with many branches," &c. The *Canjica paise*, No. 64, in Mr. Morney's collection of Brazilian woods, is somewhat like snakewood, but less beautiful ; it is much less red, and the marks are paler and larger. If not an accidental variety, the wood would be worth seeking. The above must not be confounded with the snake-wood of the West Indies and South America, the Cecropia, of which there are three species all furnishing trees of straight and tall growth, and a wood of very light structure, presenting sometimes distinct and hollow cells. The Balsas, or floats, used by the Indians of South America for fishing, &c., are very commonly constructed of this wood.—*Holtzappfel.*

SNIPE. The snipes, so well known to all sportsmen, are birds belonging to the family Scolopacidæ, sub-family Scolopacinæ, viz. :—

Fam. Scolopacidæ, 16 gen., 32 sp.

4 Ibidorhynchus ; 4 Totanus ; 3 Actitis ; 6 Tringa ; 1 Terekia ; 2 Limosa ; 2 Numenius ; 1 Eurinorhynchus, 1 Calidris ; 1 Philomachus ; 1 Strepsilas ; 1 Phalaropus ; 1 Scolopax ; 1 Macrorhamphus ; 6 Gallinago ; 1 Rhynchæa.

The solitary snipe is the Gallinago solitaria. It is found throughout India, northwards to the Himalaya where, in the lonely glen, by the side of the mountain-torrent, where the pine grows tall and dense and the sun's rays seldom penetrate, may be found the great snipe (Gallinago solitaria), from the lower to the upper ranges of the forest region. The painted species, the Rhynchæa bengalensis, belongs to a different genus from the true snipes, far more diverse than the closely akin one of the woodcocks. Sportsmen acknowledge this when they refuse to allow it to count in the game-bag. It is not a migratory bird, and both eggs and young have been obtained in the vicinity of Calcutta. Indeed, Mr. Blyth has taken the egg from the oviduct of a bird brought to the bazaar. Its flight is not in the least like that of a real snipe, and has been aptly compared to that of a huge moth fluttering over the ground. One remarkable peculiarity of the painted snipe consists in the dissimilarity of the sexes, the female being the larger and more finely coloured bird of the two ; while the young in their first plumage resemble the mature male. The same has been observed of the Australian painted snipe (R. australis), which externally differs little from the Indian except in having shorter toes. Nevertheless, the female only of the Australian painted snipe has an extraordinary prolongation of the trachea or windpipe, as described by Gould, which is not the case with that sex of the Indian species. Whether it occurs, also, in that of South Africa (R. capensis) is not known, but so curious a difference of structure existing in two species which externally are so much alike as the painted snipes of India and Australia, is a most remarkable fact.

The Macrorhamphus combines the form and exact bill of the snipes, with the plumage and seasoned changes of colouring of the godwits, knot, &c., becoming rufous in the breeding season. Blyth once obtained this bird in the Calcutta provision bazaar, and the specimen was preserved in the Asiatic Society's museum. A second example was obtained in the Madras presidency ; and it is a bird that should be looked for on the sea coast. 'Shore snipe' should indeed be its popular name. Whether the species be identical with that common in North America, and now and then met with in Europe, is a disputed point ; the late prince of Canino (a high authority) considered them to be the same, but we presume, without having seen an Indian specimen ; nevertheless, being familiar with M. griseus, he could estimate the value of the alleged distinction of the Indian bird, upon which the name M. semipalmatus was founded, and he is probably right therefore in assuming the specifical identity.

Gallinago scolopacinus, (Scolopax gallinago,) the 'common snipe' of Europe, North Africa : is very common in In

Gallinago gallinula, (Scolopax the 'jack snipe' of Europe, Asia, B common in India.

These are migratory, coming over the Himalaya in October, but the Gallinago stenura snipe precedes them, though few sportsmen discriminate it from the common British snipe which makes its appearance somewhat later. G. stenura is nevertheless a different bird, at once distinguished by having a set of curious pin-feathers on each side of its tail, whereas the British snipe, which is equally abundant in India, has a broad fan-shaped tail, as unlike that of the other as can well be. The pin-tailed is the common snipe of the Malay countries; and is unknown in Europe, excepting as an exceedingly rare straggler from its proper habitat, the East. The 'double snipe' is the Gallinago major of Europe, distinct from the two species of large or 'solitary snipes' of the Himalaya, G. solitaria and G. nemoricola. The snipes may be thus shown :—

Fam. Scolopacidæ.
Sub-fam. Scolopacinæ; snipes.
Scolopax rusticola, *Linn.* The woodcock, all India.
S. saturata, *Horsfield*, Java.
S. minor, *Gmelin.*
Gallinago nemoricola, *Hodg.* Wood snipe, all India.
G. solitaria, *Hodg.* Solitary snipe, Himalaya.
G. stenura, *Temm.* Pin-tailed snipe, all India.
G. scolopacinus, *Bonap.* Common snipe, all northern latitudes.
G. gallinula, *Linn.* Jack snipe.
Rhynchæa bengalensis, *Linn.* Painted snipe.

SNOW.

Mo-bwing,	BURM.	Barf,	HIND.

Snow is not known to fall in any part of British India south of the Himalaya. In every part of the Himalaya, and of Western Tibet, wherever the mountains attain a sufficient elevation to be covered with perpetual snow, glaciers are to be found. In the lofty chain of the Cis and Trans-Sutlej Himalaya, and of the Kouen-lun, whose peaks rise to a very great height and collect in winter enormous depths of snow, they are of great length. In the central parts of Tibet which are often lower, and even in their loftiest parts are less snowy than the bounding chains, the glaciers are of inferior dimensions where the snow-bed is at once cut off abruptly in an ice cliff, which can hardly be said to be in motion or rather whose motion must be almost entirely from above downwards. Moraines, which, on the larger glaciers and among mountains of easily decaying rocks, are of astonishing dimensions, form the margins of each glacier, and also occur longitudinally. The annual rising of the rivers Indus and Ganges depend to a great extent on the melting of snows on the mountains. The permanent flooding of the Euphrates is also caused by the melting of the snow in the mountains along the upper part of its course. This takes place about the beginning of March, and it increases gradually up to the time of barley harvest, or about the last days in May, when it is usually of its greatest height. In the report of the Proceedings of the Magnetic Survey it is mentioned that the phenomenon of the illumination of snow-clad mountains after sunset (analogous to the glowing of the Alpine snows) was seen several times in those nights when there was no moon. It was seen particularly well near Chibra, to the north of Karakorum. Judging of it, as seen there, it was thought to be quite independent of a spontaneous development of light from snow, and evidently caused by an illumination of the snow-fields from the west-north-western parts of the sky. This illumination is only visible after a certain time after the sun has set, namely, when the projection of the earth's shade has reached an angular height exceeding that of the mountains, and when the atmospheric light has decreased so much that the atmosphere behind the mountains reflects less light than the snow-clad slopes of the mountains exposed to the west-north-west. The Lachen valley, says Hooker, remains almost level for several miles, the road running along the east bank of the Lachen. Shoots of stones descend from the ravines, all of a white fine-grained granite, stained red with a minute conferva, which has been taken by Himalayan travellers for red snow; a phenomenon Dr. Hooker never saw in Sikkim. Red snow was never found in the Antarctic regions during Sir James Ross's South Polar voyage; nor does Dr. Hooker know any authentic record of its having been seen in the Himalaya.—*Hooker's Him. Jour., Vol.* ii, *p.* 118; *Report on the Proceedings of the Magnetic Survey of India, p.* 8.

SNUFF.

Tabac en poudre,	FR.	Tobacco da naso,	IT.
Schnupftaback.	GER.	Nosowoi tabak,	RUS.
Nas,	HIND.	Tabaco de polvo,	SP.

Snuff is tobacco in a powdered state, and in general use as an errhine. Other articles are sometimes added to vary its pungency, scent, &c. The snuff of Masulipatam used to be found throughout the peninsula of India where many hindoos and mahomedans use it. Snuff is very little used by the inhabitants of the Punjab plains, but the Biluchi and Hill tribes of the Derajat use it more frequently. It is preserved in small egg-shaped boxes, with a little ivory stopper, some of them are very prettily carved out of the fruits of Feronia elephantum.—*Powell's Hand-book*

Vol. i, *p*. 291 ; *McCulloch* ; *Faulkner*. See Tobacco.

SNUHI, see Serpent.

SOA, Hind. Hordeum hexastichum.

SOA, Hind. Morus serrata.

SOA, Jhotak or Shiroka of Ladak.

SOA GANDAL, Hind. Asparagus punjabensis.

SOALUM, Tam. Sorghum vulgare.

SOAM, a river near Billaspoor in the Umballa range.

SOANE, a river near Kuttesur in Patna, the Hyraniabhya of the ancient Magadha and Prachii, and the Erranaboas of Arrian and Pliny. Palibothra was situated as stated by Megasthenes at the junction of the Ganges and Erranaboas.—*Tr. of Hind*, *Vol.* i, *p*. 225.

Sapo,	Lat.	Natsowcaram,	Tam.

The manufacture of soap was known to the Romans, and has long been practised in India, but the identity of its names in different regions shows that its manufacture was learned from one source. Hard or Castile soap is made by beating together olive oil and a solution of caustic soda. Chemists conceive that at the time when soap is formed, the elaine and margarine are, by a re-arrangement of their elements, converted into two acids, called elaic and margaric acids, and that these combine with the soda forming eleates and margarates of soda. But with the formation of the acids, a new substance, glycerine, is also produced, and becomes dissolved in the water which forms one of the constituents of soap. Some oils and animal fats contain stearine, a substance closely allied to margarine: in that case some stearic acid is also formed. All soaps are slightly alkaline, feel soft and slippery, and are detergent. The watery solution is readily decomposed by acids, also by earthy and many metallic salts, hence, when water holds any of them in solution instead of dissolving, the soap becomes decomposed. Such waters are called hard, while those which are comparatively pure are called soft waters. Castile soap is composed of 9· to 10·5 of Soda, 76·5 to 75·2 of Oleic and Margaric acids, and 14·3 to 14·5 of water. Common soap made of tallow and soda, and yellow soap of tallow, resin, and soda, are not so well adapted for medical use. The soaps of Europe, a mixture of an alkali with some oily or fatty substance, are not known to the Chinese who use the native soda (Kan ; Kien): or the pods of the Acacia concinna (Fei-tsau-toh). Soap seems to have been introduced by the mahomedans into India, though the hindoos have long used alkaline leys, obtained from the ashes of plants, for many of the purposes of soap ; and they have a substitute for soap in several berries. Soap is made at Dacca, of fine shell lime, 10 mds. ; saji muttee, impure carbonate of soda, 16 mds. ; common salt, 15 mds. ; sesamum oil, 12 mds. ; goat's suet, 15 seers. It is made of good quality at Saharunpore ; and some marine soap, of excellent quality though in small quantity, was sent to the Exhibition of 1851 from Calicut. The soap made at Dacca, is considered the best in India ; and like the soap of Tranquebar, which is also of an excellent quality, it was formerly an export to Mauritius, Pinang, Sumatra, and the islands of the Indian Archipelago. The manufacture of this article is carried on by the mahomedans, by whom it appears to have been introduced into India. The Arabic word saboon indeed, is the origin of the names given to soap in many countries, as that of sabun in the Crimea, and savum at Genoa. At the Madras Exhibition of 1855, several samples of soap were exhibited. The best appeared to be a cake of castor oil soap, exhibited by Dr. G. W. Flynn, for which the Jury awarded a 2nd Class Medal.

Soft soap, as used in the arts, is made with caustic potash and fish-oil and tallow ; is semi-transparent, of the consistence of honey, brownish coloured, and nauseous, that referred to by the British Colleges is made with potash and olive oil, Dr. Pereira was unable to meet with it and found on inquiry that common soft soap is usually substituted in making Ung. Sulphuris comp.—*Dr. Clarke's Travels in Russia and on the Don* ; *Royle's Arts.*, *&c.*, *of India*, *p*. 484; *Dr. Taylor* ; *M. E. J. R.* ; *Smith's Mat. Med.*

SOAP ACACIA, the Acacia rugata, *Buch*. The dried pods of this plant are sold in the bazaars of all the East Indies, and used as a substitute for soap in cleansing the hair.—*Mason.*

SOAP-BEAN TREE, see Dyes.

SOAP NUT, Emarginated.

Buro ritah,	Beng.	Arishta, Phenila,	Sans.
Soap berry,	Eng.	Puvandie cottay,	Tam.
Emarginated ,,	,,	Manay pungung-kai,	,,

Bindak-i-hindi,	Pers.		

The Sapindus emarginatus *Vahl.*, yields this product. The capsules contain black seeds, which have a singular sweetish bitter taste, and a smell not unlike that of an over-ripe mango. They are used medicinally by native practitioners ; and form, when bruised and agitated in water, a kind of sud[illegible]hat of common soap, which is exte[illegible] by the natives in India for wa[illegible]air of their heads ; and by wa[illegible]r cleaning silks. The pounde[illegible]s are said to be a valuable remedy for epile[illegible]tic paroxysms and other diseases. Soap nuts are procurable [illegible] most bazaars.

The Oil.

[illegible]-ka-tel,	HIND.	Poongum kai yennai.	TAM
[illegible]day kotte-yennai,	TAM.	Kooncoodi nunay,	TEL.

[illegible]mi-solid oil is used medicinally by the [illegible] and is extracted from the kernel of the so[illegible]ut. Its cost prevents its general use.

The Tree.

Pot-stone; Steatite,	ENG.	Bulpam,	TAM., TEL.
Sunkjiri,	GUZ.		

This mineral has a soft and greasy feel ; is of a yellowish white or greenish gray colour : sometimes spotted or veined ; with little lustre or transparency. It is composed of silica, alumina, oxide of iron, and water, in various proportions, according to the variety and the place whence obtained, in many parts of India, and is constantly for sale in the bazaars, being used to write with on black boards, as Europeans use chalk. In Burmah it is abundant.—*M. E. J. R.*

SOAP-WORTS. The Soap tree of China, Sapindus chinensis, is a large tree bearing round berries resembling the fruit of the Melia. The tree is called by the Chinese Wa-hwan-tsze and Fei-chu-tsze. The berries are sometimes used in making rosaries, and when roasted are eaten by the Chinese, notwithstanding their apparent acridity. In the form of tincture of the berries, they were used in skin-diseases. The followers of the Tau faith, employ sticks of this tree to exorcise demons. The soap-wort, soap-fruits and soap-nuts in tropical climates furnish substitutes for soaps, of a more or less useful character, and the dried berries are to be found in almost every bazaar, being used throughout India for washing silk, or hair, or woollens and cloths of various kinds. The soap-berries of the W. Indies and the continent of America are from the Sapindus saponaria, and in Java, Sapindus rarak. In India, several species, as Sapindus laurifolius, Sapindus acuminatus, Sapindus emarginatus, and Sapindus detergens, yield berries, used similarly. The fleshy part of these sapindus berries is viscid, and when dry and rubbed with water, they form a lather like soap, and the bark and roots have similar properties, though it is said that articles washed by the root and bark rapidly corrode. Hindoo physicians deem the endocarp a useful expectorant, and it is said the seeds, pounded with water and a small quantity put into the patient's mouth often put an end to the epileptic paroxysm. The tincture or extract, of the soapy matter of the capsules of S. saponaria has been used in chlorosis. The berries, which are about the size of cherries, inclose black shining nuts which take a fine polish, and were formerly much used in England for making buttons after having been tipped with gold, silver or other metal. They are also made into beads, necklaces, &c. The kernel contains an edible oil, which is sometimes used for burning. In India the nuts of the rheeta, S. emarginatus, are eaten by young people, and in the West Indies, the fruits of S. senegalensis and S. esculentus are deemed as palatable as the hazel nut and almond. S. rubiginosus has a close-grained, hard wood, and forms an excellent timber. Saponaria vaccaria, is well known in India, and is identical in its properties with S. officinalis, a decoction of the root, frothing like a solution of soap. Kritz, kris, or kreess, the root of some parasitical plant, but of unknown origin, is used in Cashmere to wash the shawls, soap being used only for the white shawls. It is used also medicinally, and for dyeing the colour called na-furmanee.—*Smith, p.* 199; *Symonds.* See Sapindaceæ.

SOD, HIND. Anethum sowa.

SODA, DUT. Barilla.

SODA, TEL. Panicum paludosum, ***Roxb.***

SODA, a Rajput race, scattered over the

desert, some are mahomedans. The Sumaicha is a mahomedan proselyte from the Soda. Alore, an ancient city on the Indus was the capital of the Soda dynasty. The Soda tribe is an important branch of the Pramara (Puar) race. The Soda tribes over whom the emigrants of the Ganges obtained the mastery, dwelt from the Jumna to the Indus, and the Garah river to the Aravalli hills. First, on the east, the Cuchwaha, under Milaisi, whose father, Rao Pujoon, was killed in the war of Canouj, Ajmir, Sambhur, and the best lands of the Chohan, fell rapidly to the mahomedans, though the strongholds of the Aravalli yet sheltered some, and Nadole continued for a century more to be governed by a descendant of Beesuldeo. Mansi, rana of the Eendoh tribe, a branch of the Purihar still held Mundore, and the various Bhumia around paid him a feudal subjection as the first chief of the desert. Northward, about Nagore, lived the community of the Mohil (a name now extinct), whose chief place was Aureent, on which depended 1,440 villages. The whole of the tracts now occupied by Bikaner to Bhatnair were partitioned into petty republics of Gete or Jit. Thence to the Garah river, the Johya, Dya, Cathæ, Langaha, and other tribes whose names are now obliterated, partly by the sword, partly by conversion to mahomedanism. The Bhatti had for centuries been established within the bounds they still inhabit, and little expected that this handful of the Rahtor was destined to contract them. The Soda princes adjoined the Bhatti south, and the Jharejah race occupied the valley of the Indus and Cutch. The Solankhi Rajputs intervened between them and the Pramara of Aboo and Chandravati, which completed the chain by junction with Nadole. Various chieftains of the more ancient races, leading a life of fearless independence, acknowledging an occasional submission to their more powerful neighbours, were scattered throughout this space; such as the Dabey of Eedur and Mehwo; the Gohil of Kherdhur; the Deora of Sanchore; the Sonigura of Jhalore; the Mohil of Aureent; the Sankla of Sindli, &c., all of whom have either had their birthrights seized by the Rahtor race, or the few who have survived and yet retain them, are enrolled amongst their allodial vassals. The Soda, who has retained the name of hindoo, has yet so far discarded ancient prejudice, that he will drink from the same vessel and smoke out of the same hooka with a mussulman, laying aside only the tube that touches the mouth. With his poverty, the Soda lost his reputation for courage, retaining only the merit of being a dexterous thief, and joining the hordes of Sehrae and Kossa, who prowled from Daoudpotra to Guzerat. The arms the Soda used chiefly, about A. D. 1820, were the sword and the shield, with a long knife in the girdle, which served either as a stiletto or a carver for his meat: few had matchlocks, but the primitive sling was a general weapon of offence, and they were very expert in its use. Their dr[illegible] partakes of the Bhatti and mahomedan [illegible] tume, but the turban is peculiar to [illegible] selves, and by it a Soda may always [illegible] cognized. The Soda is to be found [illegible] over the desert, but there are offs[illegible] tribe, now more numerous than th[illegible]t stock, of which the Sumaicha is the most conspicuous, whether of those who are still hindoo, or who have become converts to Islam. General Cunningham is of opinion that the Sodræ or Sogdi, or Massanæ, of Alexander's historians, are the same as the Soda Rajput. He says that on leaving the confluence of the Punjab rivers, Alexander sailed down the Indus to the realm of the Sogdi, Σόγδοι, where, according to Arrian, "he built another city." Diodorus describes the same people, but under a different name:—"Continuing his descent of the river, he received the submission of the Sodræ and the Massanæ, nations on opposite banks of the stream, and founded another Alexandria, in which he placed 10,000 inhabitants." From these accounts, General Cunningham considers it evident that the Sogdi of Arrian and the Sodræ of Diodorus are the same people, although the former have been identified with the Soda Rajputs by Tod and M'Murdo, the latter with the servile Sudras by Mr. Vaux. The Soda, who are a branch of the Pramara, now occupy the south-eastern district of Sindh, about Umarkot, but according to M'Murdo, generally a most trustworthy guide, there is good reason to believe that they once held large possessions on the banks of the Indus, to the northward of Alore. In adopting this extension of the territory formerly held by the Soda Rajputs, General Cunningham is partly influenced by the statement of Abul Fazl, that the country from Bhakar to Umarkot was peopled by the Soda and Jhareja in the time of Akbar, and partly by the belief that the Massanæ of Diodorus are the Musarnei of Ptolemy, whose name still exists in the district of Muzarka, to the west of the Indus below Mithankot. He would identify the Sogite or Sodræ with the people of Seorai, which was captured by Husen Shah Arghun on his way from Bhakar to Multan. In his time, A. D. 1525, it is described as "the strongest fort in that country." Now in this very position, that is about 8 miles to the north-east of Sabzalkot, the old maps insert a village named Sirwahi, which may possibly represent the Seorai of Sindhian history. It is 96 miles in a direct line below Uchh, and 85 miles above Alore, or very nearly midway between them. The most frequented ghat for the crossing of the Indus towards the west, viâ the Gandava and Bolan Pass lies between Fazilpur on the left bank, and Kasmir on the right bank.

Sir H. Elliot writes the name Sodha, and says that amongst this tribe, the Wairsi was the chief clan, and a cognate clan was called Waisa. The Sameja tribe is a branch of the Sodha. The Sodha or Soda tribe is an offshoot of the Pramara, and for many centuries has been an occupant of the desert tracts of Western India, into which they have been driven forward from the banks of the Indus by more powerful neighbours. They may, he says, possibly be the Sogdi of Alexander's time, and the Sodræ of Diodorus. The Sodha at one time held possession of Amarkot, from which they were expelled by the Talpur dynasty of Sind. The present representative of the Sodha family still retains the title of rana. He resides at Chor, a few miles N. E. of Amarkot, but shorn of all power and hard-pressed for the means of subsistence. The Sodha Grassia are Rajputs of the Sodha tribe, whose women are famed for their beauty and are much sought for by surrounding mahomedans and Rajputs. They sell their female children to the mahomedans. A Sodha father reckons his wealth by his number of daughters. Sodha Rajputs occupy Parkur, engage in cultivation.—*Tod's Rajasthan, Vol.* ii, *p.* 12; *Cunningham's Ancient Geog. of India, p.* 253-4; *Elliot's History of India, pp.* 531-2.

The substance known in commerce by the name of soda is a carbonate of soda, but mixed with various impurities, according to the source whence it has been obtained; that is, either from the Natron lakes, from the soda soils, from the burning of sea-weeds, or from the decomposition of other salts of soda. Barilla is the ash obtained by burning plants on the shores of the Mediterranean, of the Red Sea, and Indian Ocean. Kelp used to be prepared on the coasts of Scotland and its islands, also on those of Ireland and Wales, and on that of Normandy in France, by burning a great variety of sea-weeds. In its original state, soda is of a grey colour, and fracture vitreous: it is an article of the greatest importance in the soap-glass, and other manufactures. The Arabic name, sagimen, seems to be derived from the hindoo saji-noon, that is, sajji salt, or soda salt. Dr. Taylor gave the following as Asiatic salts of soda:—

Soda, from ashes of species of salsola and salicornia, on the Coromandel coast.
Sujjee or carbonate of soda, in Tirhoot.
Oosur salt, Mirzapore, &c.
Lanee kharee, Sind.
Natron, from Lonar Lake, in lat. 20°, and long. 76° 30′.
Mineral alkali, Bombay.
Salt, common, (chloride of sodium,) Tumlook, Balasore, Tanjore, Bellary.
„ or Samur, Samur or Samur Lake.

Borax is supposed to have been known to the Greeks and Romans, and to have been the chrysocolla of Pliny. The hindoos have long been acquainted with it; it is their sohaga, Sanscrit tincana, and one of the kinds of Booruk of the Arabs. Its nature was first ascertained by Geoffroy in 1732. It is produced by spontaneous evaporation on the shores of some lakes in Tibet, in the same country, with Musk and Rhubarb; is brought across the Himalayan Passes into India, and imported into other countries by the names of Tincal and Crude Borax. It is also obtained by saturating the Boracic Acid of the lagoons of Tuscany with Carbonate of Soda. Crude Borax is in pale greenish pieces, covered with an earthy coating, and feels greasy to the touch. The natives of Tibet are said to cover it with some fatty matter, to prevent its destruction by efflorescence. It is purified by calcining, which destroys the fatty matter, or by washing with an alkaline ley, which converts it into a kind of soap, then dissolving and re-crystallizing. Sp. Gr. 1·35. It is colourless, transparent, somewhat shining. It has an alkaline reaction on turmeric. The crystals efflorescent slightly in the air, are soluble in 12 parts of cold and 2 of boiling water. When heated, they lose water, swell up into a porous substance called Borax usta v. calcinata, and at a red heat run into a transparent glass called Glass of Borax, much used as a flux. Another variety, more useful in the arts, crystallizes in octohedra, which are permanent in the air. Borax increases the solubility of Cream of Tartar, and converts mucilage of Lichen and of Salep into a thick jelly.—*Royle's Materia Medica* ; *Smith's Materia Medica, p.* 41.

This was formerly obtained from kelp or barilla, ashes obtained from burning sea weeds and species of salsola. In Europe it is now almost entirely made from common salt, by its conversion first into a sulphate with sulphuric acid, afterwards resolving the salt into a sulphuret, and then a carbonate by combustion with small coal and chalk. This is one of the kinds of Nitrum of the ancients, and is the neter of the Hebrews. It was known to the early hindoos, and is by them now called Sajji-noon, (*i. e.*, Sajji salt or soda salt) ; it is the Sagimen vitri of Geber. The natron lakes of Egypt were known to the ancients, and it was early employed in glass-making, &c. Carbonate of soda is a very valuable article of commerce being largely used not only in medicine but in arts and manufactures ; but it is made from common salt on a large scale in England, and so cheap that the Indian article, though a natural product, could not compete with it in the market. Plants mostly of the natural family of Chenopodeæ, and chiefly of the genera Salsola, Salicornia, Suæda and Chenopodium, are burned on the shores of the Mediterranean, the Red Sea and the Indian Ocean, to obtain the ash. This is barilla, and contains 25 to 40 per cent. of carbonate of soda. The soda is no doubt derived by the plants from the soil. Sajji is produced in Sirsa and Gugaira, &c., by burning various saline plants of the Salsola tribe, which abound in the 'thals' or deserts during the rainy season ; it is exported principally to the other districts within the province.

Mineral Carbonate of Soda.

Dhoby's earth,	ENG.
Soud,	HIND.
Soudoo,	„
Chouroo munnoo,	TAM.
Ovarmunnoo,	„

The earth so called occurs in many parts of India, in marshy places. It occurs in a whitish soil over granitic rocks or over alluvium. The earth is collected and used by washermen instead of soap for washing cloth. There is from 5 up to 30 per cent. of dry carbonate of soda, obtainable : but in the earth this is mixed with muriate of soda and other salts. It is very abundant in some places. It is a sesquicarbonate and occasionally used in baking.

Pearl ash is obtainable from potashes.

is the ash obtained by burning plants, on the shores of the Mediterranean, of the Red Sea, and Indian Ocean. These plants belong mostly to the natural family of Chenopodeæ, q. v. ; and chiefly to the genera Salsola, Salicornia, Suæda, and Chenopodium. The quantity of carbonate of soda in the ash varies from 25 to 40 per cent. and is produced from the combustion of the oxalate and other salts of the vegetable acids. The soda is no doubt obtained from the soil, for Du Hamel planted soda-plants inland, and they yielded only potash. Infusion of a Salsola in cold water afforded by evaporation, two salts, carbonate of soda and chloride of sodium. A portion of the chloride is no doubt converted into the carbonate during the incineration.—*Murr. Chem., Vol.* ii, *p.* 612.

Kelp used to be prepared on the coasts of Scotland and its islands, also on those of Ireland and Wales, and on that of Normandy in France, by burning a great variety of algæ or sea-weeds. The ashes when cold form kelp, which is in hard cellular masses, of a bluish grey colour, and of a disagreeable alkaline taste, containing from 3 to 8·5 per cent. of carbonate of soda and other salts, as in the case of barilla, but also some potash and iodine. Carbonate of soda is, however, now obtained very cheaply from chloride of sodium or sea-salt. This is first converted into sulphate of soda by the action of sulphuric acid then mixed with pounded small coal and chalk, and heated in a reverberatory furnace and stirred. The carbonaceous matter abstracts oxygen both from the sulphuric acid and from the soda ; Sulphuret of sodium is formed, and decomposed by the lime ; carbonate of soda, insoluble oxi-sulphuret of calcium, caustic soda, and carbonaceous matter being the result. The insoluble parts are separated by lixiviation, and the sulphur subsequently burnt away; during which the soda is completely carbonated. The mass now contains about 50 per cent. of soda. Being lixiviated and evaporated, the carbonate is obtained in large crystals. The carbonate of soda produced as above is pure enough. Ainslie tells us that some of the more enlightened vyteans knew how to prepare carbonate of soda from saline earths which contain it, such as ovar munnoo, and poonheer. The soda prepared from the first, the hakeems of lower Hindustan called "chowr ke matti ka namak," that from the second they call "chowr ke phool ka namak.—*Royle's Materia Medica*; *Smith's Materia Medica*; *Powell's Hand-book*; *Murr. Chem., Vol.* ii, *p.* 612 *in Royle*; *Ainslie's Mat. Med., p.* 43.

SODA, Muriate of

Chlor natrium,	Ger.		
Namak, Nun, Lun,	Hind.		

The common salt is obtained from the mines of the Salt Range, as rock salt from the saline lakes and wells of Asia and from the sea water, by evaporation, and from the saline soils by solution and mineral salt of very fair quality was exhibited from Bangalore, Bellary and Hyderabad, and is known to occur also in the Guntoor and Nellore districts, and to be almost invariably accompanied with gypsum, magnesian limestone, sandstone, sulphur, red and brown Iron ores, and alum slate: Muriate and carbonate of soda is obtained from the Loonar lake in the Hyderabad territories. The following is a condensed epitome of the Report, and of the chemical composition of the Loonar salts:—

Dulla, a carbonate of soda with a faint trace of muriate of soda and about 2 per cent. of impurities.

Nimmuck Dulla, is nearly pure muriate of soda.

Khuppul is carbonate of soda with water and about 2 per cent. of impurities.

Puppree is nearly pure carbonate of soda.

Madkhar is an impure salt containing

Carbonate of soda,	...27	Common salt,	17
Clay and sand,	30	Water about	25

Bhooskee is also a crude impure substance

Containing neutral carb. of soda . .	26	Water . . .	15
Insoluble matter chiefly sand and clay . .	58	Common salt . .	2

Travertin contains

Carb. of lime . . .	78	Choloride of sodium.	3
Carb. of magnesia. .	4	Water	2
Insoluble matter with oxide of iron, &c. .	9		

The natron lake of Loònar occurs in the Circars of Meinker, soubah of Berar about 45 miles N. W. of Hingolie in lat. 20 N.; it is about 510 feet below the level of the surrounding ground in a kind of crater of 5 miles in circumference, the lake being about 3 miles in circumference and surrounded by luxuriant vegetation; springs of clear soft water occur close to the lake, which has evidently been extending its bounds lately, as numerous dead trees are standing within its margin, and a well of sweet water protected by a wall is now completely surrounded by the water of the lake. An intolerable stench of sulphuretted hydrogen is emitted by the lake during the heat of the day and its waters prove destructive to animal and vegetable life, and though flocks of duck and teal dot the surface of its waters, its aspect is dreary. There are two saline springs near the centre of the lake and about half a mile apart. These never become dry. It is supposed that the muriate of soda from this source coming in contact with the carbonate of lime which abounds in the vicinity causes the deposition of the carbonate of soda or natron salt in a greater or less state of purity. The depth of the lake near the salt springs varies from 6 feet during the hot months to 12 or 14 feet during the rains. The salt is raised by divers who bring it up in their hands, it is much prized and finds a ready sale in Berar, Nagpore, Candeish, and Poonah, to which places it is carried in bamboo baskets and retailed by dealers. Up to the year 1855, the lake had not been regularly worked since 1836, in which year 2,136 candies of the different salts were raised, valued at Rs. 60,081. In 1853, Major Johnson raised 35 candies valued at Rs. 1,461-4-0. Common salt is abundantly diffused in nature, and, must have been known from the earliest ages. It exists in large quantities in the solid form as rock-salt, or in solution in saline lakes and springs, and everywhere in sea-water. From these it is obtained by evaporation, when it crystallizes with slight variations of appearance, according to differences in the process. These varieties are known by different names in commerce, as butter, stone, and basket salt, also sea salt, and, in large crystals, as malden, fishery, and bay salt. Most of the kinds of salt contain other salts, as alkaline and earthy sulphates and chlorides, especially of magnesium and of calcium.

In China, salt is obtained by the evaporation of the saline inland waters of wells and of the sea water. The wells of Sech'uen vary from 500 to more than 2,000 feet in depth and are only a few inches in diameter. The brine is brought up by means of a bamboo tube, which is alternately lowered and raised, the contents being retained by a strap at the lower end, until the tube reaches the top, when the strap is removed and the brine discharged into cisterns and then evaporated. In Cheh-kiang, salt water is let in upon pieces of ground from three to five hundred yards square, and evaporated by solar heat, as in British India.—*Royle* ; *Smith* ; *M. E. J. R.*

SODÆ SESQUICARBONAS, *L.*

S. bicarbonas.	
Sodæ Carbonas.	
Bicarbonate of Soda.	
Carb. of Soda of the shops.	
Sesqui-carbonate of Soda,	Eng.
Natron,	Eng., Fr.
Bicarbonate de Soude,	,,
Anderthalb kohlensaures Natron,	Ger.
Zweifach kohlensaures Natron,	Ger.

The Trona found near Tripoli in Africa, the Natron of the country to the west of the delta of the Nile, and that of the Loonar lake described by the late Dr. Malcolmson, are all sesqui-carbonates of soda.

The bicarbonate of soda is the same salt as the sesqui-carbonate of soda. That which is met with in commerce is usually a pure salt, but occasionally mixed with a small portion of the carbonate. It exists in some mineral springs highly acidulated with carbonic acid, as in those of Vichy. As usually sold, it is colourless, in powder, or in minute scale-like crystals, having a saline, slightly alkaline taste and reaction.—*Royle.*

SODA, Nitrate of,

Cubic Nitre,	Eng.
Nitrate de Soude,	Fr.
Wurfelsalpetre,	Ger.

It consists of nitric acid and soda, and is similar in its properties to saltpetre, differing chiefly in being more pungent in taste, more soluble in cold water, more inclined to attract moisture from the atmosphere, and in crystallizing in a rhomboid form. It is highly esteemed as a manure for pastures, and for all other sorts of agricultural produce, except that grown in heavy wet soils. It is also applied to many of the purposes for which saltpetre is used, though being more deliquescent than that salt, it is not adapted for the manufacture of gunpowder. This salt is found in immense quantities in deposits in South America, particularly in the districts of Atacama and Tarapaca in Peru. Indifferent samples of this salt were exhibited at the Madras Exhibition of 1857, from Bellary and Hyderabad, where it seems to form a natural efflorescence. Its chief use is as a substitute for saltpetre for the manufacture of nitric and other acids and chemical substances. It is too deliquescent for making gunpowder, though it answers well for some descriptions of fireworks.—*Waterston in Faulkner* ; *M. E. J. R.*

SODA, Sulphate of,

The Chinese names are :—

Mineral Glauber	*Artificial Glauber.*
P'oh siau,	Hiuen-ming-fen,
Pi-siau.	Peh-lung-fen.

It exists in sea-water, in the ashes of many plants, and is found effloresced on the soil in India. It exists in the water of some lakes and mineral springs, also in Glauberite. It is found in the ashes of many plants, and in some animal secretions. In Bengal, an impure sulphate of soda is extracted from earth in which the salt exists, in the proportion of from ten to fifty per 100. It is prepared in large quantities by simply washing the earth. It is usually sold in crystaline dirty brown masses. These are purified by a simple process. In the Chinese provinces of Cheng-ti-fu, in Se-chuen and Ts'ing-chau-fu in Shantung, this occurs, native, as an efflorescence on the soil, from which it is brushed up dissolved in water and coarsely crystalised. In this form it is a natural salt like the Reh of the Doab of Northern India.—*Smith's Materia Medica of China.*

SODHYA, Sans. called sobhacritu in the Carnatic, wrongly written Sodhyum. A constant number to be subtracted in certain computations, to fit the rule to a particular epoch, being the negative of Cshepa.

SODO, a wood resembling the walnut, scarce.

SO-E, Chin. A garment of leaves, which, as well as hats, is fabricated by the agricultural laborers of Northern China, from the leaves of Chamærops excelsa, a palm indigenous in the Northern and Central parts of that country : but in the Southern districts of China, the So-e, is made from the leaves of the bamboo and of other broad leaved grasses.

SOE-KOMPASS, Dan. Compass.

SOENAIR. Colonel Tod relates that a Rajpoot ruler in the fulness of his pride, had divine honours paid him in the rite Soenair. This distinction, which involves the most august ceremony, and is held as a virtual assumption of universal supremacy, had in all ages been attended with disaster. In the rite of Soenair, every office, down to the scullion of the "Rusorah," or banquet-hall, must be performed by royal personages.—*Tod's Rajasthan, Vol.* ii, *p.* 8.

SOFAIDA, or safeda, Hind. Populus alba, white poplar or abile.

SOFALA, a district on the African coast to which the ships of the Hebrews voyaged. See Somal, Beer-us-somal. Ophir.

SOFFAR, means a worker in copper. The Soffaride dynasty began, according to some, Heg. 259, according to others, 248, and lasted for three generations, till it was replaced by that of the Sapanides, about the end of the same century of the Hegira.—*Ferrier's Journ, p.* 323, *quoting D'Herbelot.*

SOFIAN, a little place, which is within the lines of a dreadful battle fought A.D. 1585, between the Turks and Persians : and which gave a signal overthrow to the former power, by the arms of Hamzeh Mirza, who commanded the Persians. The distance from Sofian to Tabreez is twenty-four miles, over a pretty good road, running south-east.—*Porter's Travels, Vol.* i, *pp.* 219-20.

SOFT GLOBE FLOWER. Sphæranthus mollis.

SOGDIANA. According to Bunsen (iii, 584) the separation of the Arians was prior to their leaving Sogd. The Arian emigration from Sogd to Bactria, after the separation, took place B. C. 5,000, consequently before the time of Menes. The immigration into the Indus country about B. C. 4,000 and Zoroasters reform in Bactria about the time of Menes or half a century later. Sogd is said to be the birth place of Arsaces I of the Arsacidæ. Sogdiana in Samarcand, formed the first settlement of the Arians : Sughda, afterwards spelled Sugdia and commonly Sugdiana, is pre-eminently the country : as being the home of the Fire-worshippers. It is described in the Vendidad, as in the 38th degree of latitude, where Mara Kanda (Samarcand) is situated, a paradisiacal land, fertilized by the river Sogd, so that Sogd and Paradise are used synonymously by the later writers. The Vendidad (ii, verse 5) says it was created as the second best of the regions and countries.—*Bunsen, Vol.* iii, *pp.* 584, 586. See Arians, Hindoos, Kabul, Soda.

SOHAG, HIND., ornaments worn by married women while their husbands are alive.

SOHAGIN, HIND., a married woman.

SOHAGEEA, HIND., a class of fuqeers.

SOHANJANA or Sohunjuna, also Moongay ka-jhar, HIND., DUK., is the Horse radish tree, Moringa pterygosperma. See Moringa root, Moringa, Ben.

SOHAGA, HIND. Borax, biborate of soda, Sodæ biboras, used as a medicine.

SOHAGA, HIND. A flat piece of heavy wood dragged over fields after ploughing and sowing, to smooth down the clods.

SOHAWAL. This state was entered in the sunnud granted to rajah Kishore Sing as a feudatory of Punnah. Separate sunnuds were granted to the chiefs of Kotee and Oocheyra on the British occupation of Bundelcund. The area of Sohawal is about 300 square miles, and the population about 50,000, the revenue is Rs. 30,000.—*Aitchison's Treatises, &c., p.* 247.

SOH-LOH, also Soh-loh-shu, CHIN. The green die of China. See Dyes.

SOHOL, RUS. Sable.

SOHALEEAN, HIND. Thin wheaten cakes.

SOHDI, see Khutri.

SOHOJO MAREE, TEL.? URIA? A tree of Ganjam and Gumsur of extreme height 25 feet, circumference 1½ feet, and height from the ground to the intersection of the first branch, 8 feet. Tolerably common in Bodogoda, where it is burnt for firewood but not in Gumsur. The bark is used medicinally.—*Captain Macdonald.*

SOHRAT, see Kelat.

SOHUNJUNA, or Moongay ke-jhar, DUK. Moringa pterygosperma.

SOHURWURDEE, an order of mahomedan devotees.

SOIE, or Soia, BENG., HIND. Anethum sowa or A. graveolens.

SOIE, FR. Silk.

SOIES, FR. Bristles.

SOI KEERY, TAM. Grows in the southern parts of the Peninsula and is eaten as greens by the poor.—*Ainslie's Mat. Med., p.* 257.

SOIL. In the south of India, throughout the entire of the peninsula there are four markedly distinct kinds of soil in which cultivation is conducted. These maybe briefly named as the red soil over the granitic tracts, the black soil or regur also called cotton soil, over the rocks of volcanic origin, the alluvial soil, and the sandy soils along the coasts, in the valleys and in the beds of rivers. There are patches of black soil in various parts of the Ceded Districts, but it is to be seen over all the great volcanic outburst in the N. W. Dekhan. The red soil tract lies over the granitic regions in the eastern and southern parts of the peninsula. The regur or black soil is naturally very retentive of moisture and very fertile, and all the country where it is found is well under cultivation. The field crops grown are cereals, pulses and cottons. Throughout the central and western parts of peninsular India, the cultivators regard hedges and trees as injurious to crops, which are annually enclosed by the branches of thorny trees, consequently when the crops are off the ground the whole territory has a treeless aspect, and in many places fire-wood bears a very high price. There are great tracts, however, which could be beneficially planted with trees. Near Musery, on the banks of the Cauvery, black soil with its accompanying calcareous strata of marl and tuff, rest in common on granite, indicated by rocks of this nature appearing above its surface; and, on the other hand, a red soil prevails where sienite forms the apparent groundwork. It would seem from this that granite is at the bottom of all, and sienite is only superimposed, for the latter appears only in the elevated or higher parts of the country, and the former in the lowest.

The Himalaya range does not abound in volcanic rocks, like the chains of Central and Southern India; and the soils which are there formed from the detritus, contain, in consequence, less phosphoric acid, and are less adapted to the growth of that numerous class of plants which cannot live without phosphates. The volcanic rocks form a plateau upon the sandstone, of almost all the hills of Central and Southern India; and the soil, which is formed from their detritus, is exceedingly fertile, when well-combined, as it commonly is, with the salts and double salts formed by the union of the organic acids with the inorganic bases of alkalis, earths and oxides, which have become soluble, and been brought to the surface from below by capillary attraction, also the basaltic plateaux upon the sandstone rocks of Central and Southern India are often surmounted with a deposit, more or less deep of laterite, or indurated iron clay, the detritus of which tends to promote fertility in the soil. There never is any other deposit than this iron clay or laterite above the basaltic plateaux. The centre of the great table-land of the Dekhan for about eighty miles around Beder is covered with great hills of laterite which occurs also north of Oomraoti, in Berar, and near Madras, along the Malabar coast, and at Rangoon. Laterite is never found in any part of the Himalayan chain. In Bundelcund and other parts of Central and Southern India, the basaltic plateaux are sometimes found reposing immediately upon beds of granite. The soil called 'doomuteea' in N. India, is of a light-brown colour, soon powders into fine dust, and requires much more outlay in manure and labour than the 'muteear' soil. The 'oosur' soil appears to be formed out of both by a superabundance of one or other of the salts or their bases, which are brought to the surface from the beds below, and not carried off or taken back into these beds. It is known that salts of ammonia are injurious to plants, unless combined with organic acids, supplied to the soil by decayed vegetable or animal matter. This matter is necessary to combine with, and fix, the ammonia in the soil, and give it out to the plants as they require it. It is possible that nitrates may superabound in the soil from the oxydizement of the nitrogen of a superfluity of ammonia. The natives say that all land may become 'oosur' from neglect; and, when oosur, can never be made to bear crops, after it has been left long fallow, till it has been flooded with rain-water for two or three seasons, by means of artificial embankments, and then well-watered, manured and ploughed. When well-tilled in this way, all but the very worst kinds of oosur are said to bear tolerable crops. In the midst of a plain of barren oosur land, which has hardly a tree, shrub or blade of grass, we find small oases, or patches of low-land in which accumulated rain-water lies for several months every year, covered with stout grasses of different kinds, a sure indication of ability to bare good crops, under good tillage. From very bad oosur lands, common salt or saltpetre, or both, are obtained by digging out and washing the earth, and then removing the water by evaporation. The clods in the muteear soil not only retain moisture, and give it out slowly as required by the crops, but they give shelter and coolness to the young and tender shoots of grain and pulse. Trees, shrubs and plants of all kinds, everywhere derive carbonic acid gas and ammonia from the atmosphere and decompose them for their own use, in the same manner.

Doctor O'Shaughnessy states, that the reha earth, from Oude, is identical with the sujji muttee of Bengal, and contains carbonate of soda and sulphate of soda as its essential characteristic ingredients, with silicious clay and oxide of iron. But in Oude, the term "sujji" is given to the carbonate and sulphate of soda which remain after the silex has been removed from the reha. The reha is fused into glass after the carbonic acid and moisture have been expelled by heat, and the sujjee is formed into soap, by the addition of lime, fat and linseed oil, in the following proportions: 6 sujji, 4 lime, 2½ fat, and 1½ ulsee oil. The sujji is formed from the reha by filtration. A tank is formed on a terrace of cement. In a hole at one corner is a small tube. Rows of bricks are put down from one end to the other, with intervals between for the liquor to flow through to the tube. On these rows a layer of stout reeds is first placed, and over them another layer composed of the leaves of these reeds. On this bed the coarse reha earth is placed without being refined by the process described in the text above. Some coarse common salt (kharee nimuck) is mixed up with the reha. The tank is then filled with water, which filters slowly through the earth and passes out through the tube into pans, whence it is taken to another tank upon a wider terrace of cement, where it evaporates and leaves the sujji deposited. The second tank is commonly made close under the first, and the liquor flows into it through the tube, rendering pans unnecessary. It is only in the hot months of March, April, May, and part of June, till the rains begin to fall, that the reha and sujji are formed. During the other nine months, the Loonea caste, who provide them, turn their hands to something else. The reha, deprived of its carbonic acid and mixture by heat, is fused into glass. Deprived of silex by this process of filtration, it is formed into sujji, from which the soap is made. On this process of filtration, Doctor O'Shaughnessy observed :—" that he does not in this process, clearly understand the use of the common salt, used in the extraction of soda. But many of the empirical practices of the natives prove, on investigation to square with the most scientific precepts. For example, their proportions in the manufacture of corrosive sublimate are precisely identical with those which the atomic theory leads the European chemist to follow. Every district where there are low lands, which are inundated either by natural or artificial means, produces some rice ; heavy dakar soil suits it. It is one of those crops that requires raising first in a nursery, after which the seedlings are planted out. In the Punjab, the upper valleys of Kangra are the granaries of rice. Here are combined the abundance of water with high temperature and a peculiar soil, which makes rice so exclusive a product. The British Government having solicited information as to the mode of reclamation of saline land in vogue in the Utah territory, the secretary of the Dario County Branch of the Desert Agricultural and Manufacturing Society, wrote to the President of the Desert Agricultural and Manufacturing Society, from Farmington, Davis County, on the 11th January 1872. He states that the efforts of many farmers who own lands bordering immediately on the shores of the Great Salt Lake have been very successful, in almost every instance, by flooding with fresh water during the spring and winter months, thereby washing the land and leaving a deposit of sand and mud washed down from the land through which the stream passes. Some of the farmers are now cutting from two to three tons of fine hay per acre, and from fifty to seventy-five bushels of small grain are raised per acre on land raised by this treatment. Some farmers have been successful by hauling sand and mixing with the soil. These are the only modes of treatment that have proved successful.

In the Punjab and along the course of the Ganges Canal, a saline substance called reh, effloresces on the soil. It is composed principally of sulphate of soda and chloride of sodium, with, in some places, carbonate of soda. The sulphate and carbonate of soda are very efflorescent salts and melt partly in their water of crystallization at a temperature of about 98° while they are rather sparingly soluble, when the temperature falls below 60°. Hence, during the hot weather, the reh melts and percolates the ground to some considerable depth : but as the weather becomes cooler, crystals form in this soil and form a capillary net-work, up which the solution travels till it arrives at the surface where the salt gives off its water of crystallization, and falls into a dry powder by efflorescence highly injurious to vegetable life. It has been proposed to remedy this condition by adding nitrate of lime, which converts the sulphate and carbonate of soda, into nitrate of soda a deliquescing salt, while the lime is changed either into the insoluble carbonate or sparingly soluble sulphate of lime, neither of which are efflorescent nor in any way injurious to vegetation. The plains of the Punjab are vast expanses of alluvial clay and loam, and the main distinction in the soils is that they are sandy, or as is most frequent, rich loam or clay. Rohi soil, is a stiff loam ; the do-shahi is the dumat of Hindustan and is a good quality of clayey soil, on which when manured, are grown cotton, fine wheat, barley, sorghum, zea mays, melons.

Rohi is the finest natural soil, a stiff loam, which breaks up into large clods.

Doshahi is the 'dumat' of Hindustan ; a clayey soil, generally of good quality, manured by cattle being folded on it ; when manured, it grows cotton, fine wheat, barley, joar, makai, melons, &c.

Mera, a mixture of clay and sand, the 'rusli' of Hindustan, has many varieties ; some very good and equal to the best 'doshahi.'

Tibbah, nearly all sand, the 'bhur' of the provinces, worth very little, and only grows the inferior crops of moth, mash, &c.

High and somewhat sandy tracts in the centres of 'doabs,' and equi-distant from river influence on both sides, are almost universal called 'bar.'

In the Cis-Sutlej States, the main divisions of the soil, to a certain extent corresponding to the netar and utar, are the low lands, being called 'khadar ;' lands which have at one time been the beds of the rivers, or have been flooded ; and 'bangar,' high land, requiring irrigation by wells. These great divisions are sub-divided as 'nyain,' loamy land cultivated with manure and artificial irrigation ; 'rusli,' good loam ; 'dakar,' a low-lying stiff clay, productive of rice and gram; and 'bhur,' an inferior land with a large proportion of sand. Land that is inundated is generally unproductive for want of drainage, is called 'choil.' In some of the sandy districts, the names vary considerably. In the Gugaira district, for instance, where the soil is very bare, there is but little scope for all the varieties of inundated, irrigated and other lands; if land is cultivable at all it is fortunate, and there is but little variety to distinguish. The most generally recognised names of the descriptions of culturable soil are 'gusrah,' 'sikand' and 'retli.' In the Settlement Records, the name 'dakar' which is locally unknown, was introduced by the Hindustani ameens employed on the measurements. The equivalent term is 'gusrah.' 'Retli,' as its name implies, is land with an excess of sand, and 'sikand' is a stiff clay soil, suited for rice; it is called in some parts 'pakki chikni.'

The 'kalr,' is a salt efflorescence, which is observed in many places. Sometimes it extends over large tracts of land, rendering them almost entirely unproductive; they are called 'kalri zamin.'

Some kinds of plants like the kair soil, among these may be mentioned garden stocks and wall flowers, and other brassicaceous plants; and also tobacco is said to thrive.

In the hill districts bordering on the Amballa divisions, and Kotaha in the Amballa district the land is divided into 'kulahu,' land watered by kuls (water-courses supplied from an artificial pond formed by damming up the hill streams,) and 'obar,' which is the same as barani, land dependent on rain for its irrigation.

Obar land is of two kinds, 'todah' and 'khil.' Toda are those little hanging fields like steps rising one above another, and are built up at their lower edge with stones, and which are liable to destruction by being washed down when the rain is violent. If the land is good, it is called 'awal kism' or first class; if stony and bad, 'duyam kism' or second class. 'Khil' land is that which is broken up with the hoe on the steep slopes of the hill; it is too steep to be ploughed. These kinds of soil are observable through many hill districts.

The Kangra valley, locality is singular as to its climate, soil, and means of irrigation.

In the N. W. Provinces, the deterioration of land by reh first attracted serious attention in the villages along the Western Jumna Canal, and its branches, about Delhi, Paniput, Rohtak, and Karnal. In 1857, Mr Sherer, Joint Magistrate of Allygurh, went on deputation to examine the tracts of country deteriorated, and the picture presented by him of the suffering in some of the villages was truly deplorable. Out of 580 canal villages, 59 or nearly 10 per cent. had been injured in degrees ranging from severely to partially, 6 per cent. being severely injured. The maximum appeared to be reached in Paniput where 46 villages, or 19 per cent. were injured out of 242. The salt effloresces in several parts of the Punjab, where there are no canals at all; in these places it appears in land irrigated from wells where the water is very far from the surface. The salt itself consists of sulphate of soda with a variable proportion of chloride of sodium (common salt). In some of the instances given by Dr. O'Shaughnessy, the percentage was high at Jagu, in Paniput it was 20 per cent., and this consisted of abundance of carbonate of soda with sulphate, and chloride of sodium and lime. As far as experience goes, lands near canals, like the old Hosli, in the Lahore district, constructed at but not below the ordinary level of the watershed, are usually found to be free from Reh efflorescence. It is admitted by the advocates of re-alignment, that drainage is to a certain extent a palliative and a cure. Generally speaking, the farmers assert that fully impregnated Reh land is incurable and valueless. In gardens and small plots, it has been found useful to dig out the soil to the depth of 2 feet or so entirely, and put in fresh. Dr. Brown, Chemical Examiner for the Punjab, has demonstrated that nitrate of lime would succeed.

In the Punjab, the classification of land according to means of irrigation is understood everywhere. Even where terms descriptive of soil are employed, any or every class of land may also be described as 'chahi,' if it is watered by wells; 'obi,' if by ponds; or 'chalar' to be described hereafter; 'sailabi,' if by flood and inundation of rivers; 'pani mar,' if damaged by drainage floods; and 'barani,' if dependent on rain. These means themselves indicate the source of the water of irrigation.

The plain districts of the Punjab are subdivisions of Doabs. The names of the Doabs are in all instances (excepting the first or Jalandhar Doab) the result of a rude attempt to join the names of the rivers on each side into one word. Thus passing the Jalandhar Doab, between the Sutlej and the Beas, we come to the Bari Doab, (Beas and Ravi.) Then between the Ravi and Chenab, the Richnah Doab; between the Jhilum and Chenab, is the Jach Doab. The last Doab up to the Indus, takes its name from that river, and it is called Sind Sagar, 'the ocean of the Sind' (Indus river), *i. e.*, tracts of country between two rivers.

Goera or nyain, is a term applied only to lands in the vicinity of wells and villages, which are abundantly irrigated and manured. Actual desert soil is called 'thul.'

In Cis-Sutlej, the two great divisions of land are khadir and bangar. Khadir are low lands that owe their depression to having once been the beds of rivers, or levelled in some way by the influence of river action.

The other term, bangar, includes the higher lands, answering to the generic terms 'des' and 'mahjah'. In this tract the wells require to be sunk deep. The water is met with at from 30 to 60 feet.

These terms are however descriptive rather of tracts of country according to situation, &c., than kinds of soils.

'Nyai,' is rich land near villages.

'Rausli,' is a light loam producing all crops, except rice. It is soft and easily worked, consisting of clay and sand ; it is mostly like though superior to the 'doshahi' in the Punjab series.

'Bhur,' answering to 'maira,' is a light sandy soil, the better kinds of it produce bajra, moth, mash, and jawar. Low lands that receive the drainage of neighbouring uplands, and cannot carry it off so that it lies, are called 'choil.' They are unproductive for want of drainage. High tracts from which the water drains off quickly, are called magra and thalli.

'Matyar' is the equivalent Hindustani term of 'rohi,' misar of 'misi,' and 'domat' of 'doshahi.'

In the hill districts, including both hills and intramontane valleys,

The best land is called 'bari.'

The second quality of land is called 'ekfasli.'

The third quality is distinguished by the name 'shand,' this is allowed to lie fallow for two harvests, and is then cultivated only for the rabi.

The fourth kind is 'math,' it is a good quality of land, and is retentive of moisture, and will, if manured, yield two harvests in the year.

The fifth kind is 'regi,' that is mixed with sand, or adjacent to the bed of a nullah or hill stream, 'shelah,' which has washed down quantities of sand.

The natives give the generic name 'damau-i-koh' or 'kandi,' to the low hills that form the bases of the higher ranges, and in which such hill states as Kotahah, and others are situate.—*Punjab Products, pp.* 138-202 ;*Sleeman, Cat. Ex.* 1862.

SOINGHIKEYA, Sans. The son of Singhika.

SOIVYA, Sans. The disciples of Siva.

SOJA, a genus of plants belonging to the natural order Leguminosæ. Soja hispida (*Mœnch*), S. japonica (*Savi*), the Dolichos soja, (*Linn.*), is a native of Japan and the Moluccas, and abundant in the peninsula of India, though probably introduced there. The seeds resemble those of the haricot, French or kidney bean, and are used by the Chinese to form a favourite dish called 'ten-hu,' or 'tau-hu,' which looks like curd, and which, though insipid in itself, yet with proper seasoning is agreeable and wholesome. The Japanese call the seeds 'miso,' and put them into soup, of which they sometimes partake three times a day. They likewise prepare with them the sauce termed 'sooja,' which has been corrupted into 'soy.' Soy is only sparingly used as a sauce in Great Britain. It has the character of being a useful stomachic, but not more so than any of the other condiments when used with moderation.—*Eng. Cyc.*

SOJA HISPIDA, *Mœnch, W. & A., Grah.*

S. japonica, *Savi.*
Gari kulay, Beng.
Soy-bean, Eng.
Dolichos soja, *L., Roxb.*
Sahuca bean, Eng.
Bhut, Panjab.

This plant grows in the N. W. Himalaya, in Nepal, at Taong Dong, in China, Japan and the Moluccas. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6,000 feet. It is cultivated in many parts in the north of India. This is the well-known Chinese bean, which constitutes such a large article of trade between the northern and southern parts of China. Of all vegetable substances, it is richer in nitrogenous or flesh-forming matter than any yet discovered. The Sahuca bean, is the white Soja hispida. *India Museum.*

SOJNA, or Dawut, Hind. The science of exorcism.

SOKA, Hind. A blight, from want of water, when the sugar-cane dies.

SOKKAR, a river of Nagpoor.

SOKPA, a colony of pure Mongols.

SOL, also Aurum, also Rex Metallorum, Lat. Gold.

SOL, the sun : see Osiris. Saraswati, Sun, Surya.

SOL, Rus. Salt.

SOLA, Beng., Hind.

Æschynomene aspera, *L.*
Æ. lagenaria, *Lour.*
Sola, Hind.
Hedysarum lagenarium, *Roxb.*
Phool sola. Hind.

A plant of Bengal, Coromandel, Sylhet, Assam, Saharunpoor, common in moist places, in the rainy season. The lower part of the stem is rough and scabrous, as well as the legumes. The plants are remarkable for their light and spongy texture, and seem indeed to be composed almost entirely of pith. The thicker stemmed plants are collected in the dry months of April and May, and the light substance applied to making some kinds of toys, the floats of fishermen's nets, and cut into thin slices and pasted together, for making hats, which, being light and having broad brims, are well suited for protecting the head from the influence of the powerful Indian sun, especially if a handkerchief be put loosely into the crown of the hat. This substance has also been employed for lining drawers of natural history, and in its texture very much resembles the substance called rice-paper, which is the pith or stem of a malvaceous plant cut into thin slices. The larger plants are particularly light, white and spongy.—*Roxb.*, *Voigt.*, *M. E. J. R.*

SOLADI-TURTAVA, Ocymum basilicum.

SOLANACEÆ, *Lindl.* The night-shade tribe of plants, comprising 7 gen., 44 sp., viz., 31 Solanum; 4 Physalis; 1 Anisodus; 5 Datura; 1 Hyoscyamus; 1 Atropa; 1 Lycium.

Mandragora officinarum.

Some of this family are deleterious, some have narcotic qualities. The tubercles of such as produce them are amylaceous and nutritive. The leaves are generally narcotic, but lose that quality by boiling. The fruits which are red or yellow are acid and eatable, as the alkakengi, tomato and capsicum: those which are black or purple are deleterious, as the mandrake, belladonna, thorn apple, henbane, cestrum, &c. Atropa belladonna, *L.*, the suchi of the Sutlej, is found wild in Kanawar at 8,500 feet. It is stated to be burned in order to kill fleas.—*Dr. J. L. Stewart, M.D.; Voigt.*

SOLANEE, a river near Landhoura, Kheree and Hurowrah in Saharunpoor.

SOLANDS, see Kyan.

SOLANGKA is the Mongol name of the northern part of the Sungari river, *Klaproth in Yule Cathay, Vol.* ii, *pp.* 267-268.

SOLANKI or Chalook. Though we cannot trace the history of this branch of the four Agnicula Rajputs to such periods of antiquity as the Pramara or Chohan, it is from the deficiency of materials, rather than any want of celebrity, that we are unable to place it, in this respect, on a level with them. The tradition of the bard makes the Solanki important as princes of Sooru on the Ganges, before the Rahtor obtained Canouj. Their capital was to India what Venice was to Europe, the entrepot of the products of both the eastern and western hemispheres. It fully recovered the shock given by Mahmud and the desultory wars of his successors ; and we find Sid Rae Jey Sing, the seventh from the founder, at the head of the richest, if not the most warlike, kingdom of India. The lieutenants of Shahab-u-Din disturbed the close of Komarpal's reign ; and his successor, Ballo Mooldeo, closed this dynasty in S. 1284 (A. D. 1228), when a new dynasty, called the Baghela (descendants of Sid Rae) under Beesildeo, succeeded. Though the stem of the Solanki was thus uprooted, many of its branches (Sachæ), had fixed themselves in other soils. The most conspicuous of these is the Bhagela family, which gave its name to an entire division of Hindustan ; and Bhagelkhund has now been ruled for many centuries by the descendants of Sid Rae. Besides Bandoogurh, there are minor chieftainship still in Guzerat of the Bhagela tribe. Of these, Peetapoor and Theraud are the most conspicuous. One of the chieftains of the second class in Mewar is a Solanki, and traces his line immediately from Sid Rae : this is the chief of Roopnagurh, whose stronghold commands one of the passes leading to Marwar, and whose family annals would furnish a fine picture of the state of border-feuds. The Solanki is divided into sixteen branches. The name of the Bhagela subdivision is from Bhag Rao, the son of Sid Rae ; though the bards have another tradition for its origin.—*Tod's Rajasthan, Vol.* i *pp.* 97-99. See Agni ; Komarpal.

SOLANUM, one of the natural order Solanaceæ. Upwards of 400 species of plants belonging to this genus have been enumerated, including many with apparently very opposite properties. The esculent tomato, the egg-plant, and the invaluable potato, with the various species of poisonous night-shades, are found united so closely by botanical characters that it is impossible generally to separate them. The properties of these plants, however, do not differ in kind but in degree ; and the berries and leaves, and even the tubers when uncooked, of the potato, possess in a mild degree the narcotic properties of the poisonous night-shades. Many of them have also very handsome flowers, and are much cultivated in English gardens and green-houses. S. jacquini is considered by the native practitioners of India as an expectorant ; S. bahamense is used as a gargle for sore throat in the West Indies ; S. mamosum, S. paniculatum and S. cernuum, have the reputation of being diuretic and astringent. In the Tenasserim provinces four species have been observed, but have not been determined, viz. :—

Khayan gywot,	BURM.	Kha yan khyen,	BURM.
Næpoo khayau,	,,	Kha yan pa mai,	,,

—*Eng. Cyc.* ; *Mason's Tenasserim.*

SOLANUM ÆTHIOPICUM, Æthiopian night-shade, is a native of Ethiopia, China, and Japan. There are two varieties recorded : one, the Æ. violaceum, is a native of China, and the fruit is frequently eaten in that country as a dessert. It has a large spheroid oval berry of a red colour. The other variety is the S. æsculentum, having a prickly stem, and small yellow berries of the size of peas.

SOLANUM CANESCENS, *Bl.*, *Rheede.* Syn. of Solanum indicum, *Linn.*

SOLANUM DIFFUSUM, *Roxb.*, Syn. of *var.* Solanum jacquini, *Willd.*

SOLANUM DULCAMARA.

Woody night-shade.	ENG.	Rooba barik,	HIND.
Bitter-sweet.	ENG.		

Stem shrubby, thornless, climbing, flexuous ; leaves cordate, upper ones jagged ; corymbs almost opposite the leaves. It is a native of Europe, Asia and North America, in hedges and amongst bushes. It is plentiful in Great Britain, and it or a variety of it is found on the Choor mountain, and in the Panjab Himalaya at 7,000 to 7,500 feet. Its leaves, &c., (or those of S. nigrum,) are officinal under the above name. It has purple flowers and crimson berries. It is a native of temperate climates, is a shrubby twining plant, with scarlet, oval, bitter and juicy berries, which latter may be mistaken by children for red currants, a mistake that has sometimes been attended with fatal consequences. These are acrid narcotics, and poisonous in moderately large quantities. The young stalks and tops have been much used in medicine as a diaphoretic and alterative, especially in the treatment of cutaneous diseases, and in asthma ; in lepra, psoriasis, and similar affections, it is said to be employed externally with good effect. It is on the whole, however, an unimportant article, and not likely to be much prescribed in Indian practice.—*Eng. Cyc.* ; *Royle* ; *O'Shaughnessy, p.* 462 ; *Dr. J.L. Stewart, M. D.*

Tomato, Love-apple,	,,	Thuckkali,	,,
Tamatie,	MALAY.		

This is chiefly cultivated by the European inhabitants as a valuable ingredient in soups and stews, also as a preserve and for sauces, chatnies, garnishing, soups, &c. It produces the best fruit when trained on a trellis; more a luxury than valuable as a vegetable. The large-lobed red and very succulent berries, contain much malic acid. The plant is a native of South America, but it is much cultivated and well-known in Southern Asia, United States of North America, and in France, Germany and Italy. Near Rome and Naples, whole fields are covered with it, and scarcely a dish is served up into which it does not enter as an ingredient. There are several varieties cultivated; the best are called the large and small cherry and pear-shaped, red, and the large and small or cherry-shaped, yellow.—*Don's Miller, Vol.* iv, *p.* 444 *Jaffrey's Hints*; *Riddell's Gardening.* See Vegetables of Southern India.

Several varieties of this are everywhere cultivated in the E. Indies. It is a native of the E. Indies, and also said to be of Arabia. The fruits large, ovoid, firm, innocent and insipid. It is one of the most useful of Indian vegetables; and is used in culinary purposes in various ways. The large Cape varieties are the best; require good soil and abundance of water. Stem herbaceous, woody at the base, clothed with star-shaped hairs; ovate serrated leaves; flowering peduncles reflexed; fertile peduncle solitary, sterile one racemose; calyx campanulate; corolla angular, purple flowers, and bears large, smooth, shining berries, which are the shape and size of a small hen's egg. S. ovigerum has the stem, calyx, and leaves without thorns; and in S. esculentum, these parts are more or less covered with thorns. Several sub-varieties of both these are recorded, varying in the shape and colour of the fruit. The berries are white, yellow, red, purple and black. The fruit of this plant, the oval-shaped white, the globular-shaped white, and the purple or violet-coloured of both forms are used by the French and Italians in stews and soups. The natives of the Panjab regard this vegetable as hot and dry, it is said to prevent sleep and produce unpleasant dreams, owing to vitiated bile. Leaves are said to be narcotic.—*Eng. Cyc.*; *O'Shaughnessy, p.* 463; *Gen. Med. Top., p.* 183; *Jaffrey*; *Riddell*; *Powell's Hand-book, Vol.* i, *p.* 363. See Vegetables of Southern India.

SOLANUM NIGRUM.

Fox-grape,		Canchie pundu,	TEL.

Solanum nigrum grows in waste places in most countries. Throughout Europe it is a weed in cultivated ground, and is also found in Africa and Asia. It has white flowers, producing small berries of a black colour, and is employed as a narcotic by the hakeems of

India. The fruits are very dangerous, and act in the same manner as those of the belladonna and mandrake. The extract of the whole plant, according to Orfila, acts like lactucarium. Ainslie says, the small black berry of a low growing species of night-shade, although it has been reckoned poisonous in Europe, is eaten by the natives of India, and as far as Ainslie learned, with impunity. It is sweetish, but not very palatable. Solanum nigrum is considered by natives cool and moist, and is used in fever, diarrhœa and ulcers, also in disorders of the eye-sight, and in hydrophobia, both externally and internally. It contains a small amount of solanine in the juice of the stem and berries, but it may be eaten as food, as in France.—*O'Shaughnessy, p.* 462 ; *Ainslie, p.* 228 ; *Eng. Cyc.*; *Powell's Hand-book, Vol.* i, *p.* 363. See Dulcamara, Mako.

SOLANUM SANCTUM, *Linn.*

Leimun lut,	AR.	Bari mauhari,	HIND.
Palestine egg-plant,	ENG.	Mahori,	,,
Lot's lemon,	,,	Tingi,	,,
Maraghune,	HIND.		

Grows in Palestine: supposed by Dr. Wilson to be the vine of Deut. xxxi, 32. Also grows west of the Indus and in the Salt Range. Stem shrubby, tomentose, leaves ovate-repand, oblique at the base, clothed with hoary tomentum on both surfaces. Berries nearly globose. In some places the fruit is eaten fresh and in pickle.—*Punjab Plants, p.* 160.

SOLANUM SODOMEUM.

Sodom egg-plant.	Apple of Sodom.

Is a native of the north of Africa and the south of Europe. Fruit white, and about the size of a walnut. It is very subject to the attacks of an insect which deposits its eggs within the germen, and as the fruit enlarges, the larvæ of the insect, as in the case of many other fruits, destroy and pulverise the whole of the interior whilst the rind is left unchanged and entire. When the fruit is gathered under these circumstances, it is crushed to pieces by the hand ; or if conveyed to the lips, the mouth becomes filled with an ash-like powder, exceedingly bitter to the taste. To these berries remarkable properties have been assigned by Josephus, Tacitus, and others. Mandeville, an old English writer, says, speaking of the Dead Sea, "And there besyden grown trees that baren fulle faire apples and faire of colour to beholden, butte whosoe breaketh them or cuttethe them in two, he shall find within them coles and cyndres." Milton finely alludes to this fruit in the lines :—

> "Greedily they pluck'd
> The fruitage fair to sight, like that which grew
> Near that bituminous lake where Sodom flamed.
> This more delusive, not to touch but taste
> Deceived ; they, fondly thinking to allay
> Their appetite with gust, instead of fruit
> Chewed bitter ashes."

It seems to be quoted in Deut. xxxii, 32, 33, and in Isaiah, who says of the future Israelites, their vine is from the vine of Sodom and from the fields of Gomorrah.—*Harris' Nat. Hist. of the Bible, p.* 187 ; *Voigt, p.* 512 ; *Hogg's Vegetable Kingdom, p.* 549.

is round and small, being not much larger than a marrow fat pea. It has a somewhat bitter taste not unlike that of its congener the choondaykai, and is commonly eaten fried, having been previously sprinkled with a little salt and water.—*Ainslic, pp.* 245-357 ; *Useful Plants, p.* 411 ; *Voigt, p.* 513.

SOLANUM TUBEROSUM, *Linn.*

Alu,	DUK. HIND.	Rata-inula,	SINGH.
Potato,	ENG.	Alu gaddalu,	TEL.
Ubi : Kantang,	MALAY.		

The common potato is one of the plants for which the world are entirely indebted to America. It is found native in the greatest abundance on the western coast of South America. Like most plants which are most cultivated, an abundance of varieties have been produced from the original plant, and in the leaves, colour of the flowers, shape, size, and colour of the tubers, it has a great tendency to depart from its normal character. Two other species of Solanum, namely, S. valenzuela and S. montanum, produce edible tubers, but they are little used. The potato is a useful esculent, contains a large amount of starch, and when dried it is used as a substitute for salep. It is cultivated throughout British India as a cold weather crop, and in the Himalaya up to 9,000 feet, where they are cooked and eaten with buckwheat.—*Eng. Cyc.* ; *Mason* ; *Powell's Hand-book, Vol.* i, *p.* 362 ; *Punjab Plants, p.* 160 ; *Voigt, p.* 510.

SOLANUM VERBASCIFOLIUM, *Linn.*

Fruit.

Katela,	HIND.	Bat-kateya,	HIND.

Grows common throughout the Panjab plains and occasional to 5,000 feet in the outer hills. The seeds are eaten, they are applied for bruises and earache, and the fruit is bruised and applied for pain. Considered an expectorant useful in coughs, asthma and consumption.—*Powell's Hand-book, Vol.* i, *p.* 363 ; *Panjab Plants, p.* 161.

SOLARA, HIND.

Cymbopogon iwaranchus,	*Schult.*	C. laniger.	*Desf.*

These plants grow abundantly in many parts of the E. Indies. The smell of C. iwaranchusa is that of lemons, but more turpentiny, and is sometimes very perceptible to passers by. It is said to be much more powerful at certain seasons than at others. Edgeworth supposes this to have been the Nardus of Arrian and mentions that the cattle in the Amballa tract much like it and Vigne states that near Hassan Abdul the people extract from it a stimulating oil, which is used externally in rheumatism, and is similar to the grass oil of Nimar.

SOLAR DYNASTY. In the northern part of the dominions, now called British India, there were, in ancient times, prior to the christian era, two dynasties, who strove for mastery, viz., the Solar dynasty descended from Rama, and the Lunar dynasty descended from Yadoo. The Solar dynasties at present remaining are three, viz :

Grahilote or Gehlote or Geholote with 24 Sahka or branches, of which the Sisodia is the most distinguished. The Rana of Udayapur is a Grahilote.

Rahtore, said to be descended from Rama by Kusa his second son. It has 24 branches, and the maharaja of Jodhpur or Marwar belongs to this tribe.

Kachwaha also sprung from Kusa. The rajah of Jeypur is of this tribe. It has 12 kotri or houses.

The Lunar dynasty is sprung from the moon, through Yadu or Jadu, and is called Yadu or Jadu. It has 8 branches, of which the Jhareja and Bhatti in Cutch and Jeysulmir are the most powerful.

The Agnikula have four tribes and 87 branches, viz :

Pramara	with	35 branches	Chalukya	,,	16 branches
Parihara	,,	12 ,,	Chouhon	,,	24 ,,

Among the 36 royal tribes there are some, the origin of which is not known, such as,

Chaura or Chawara,
Tak or Takshak,
Jit or Jat of the Punjab, Jumna and Ganges,
Hun,
Katti,
Batta,
Jhalamakwahana,
Gohil,
Sarwaya or Sari,
Aspa,
Jetwa,

Dahirya,
Dahima.

The following list of the thirty-six royal races of Rajasthan.

Ancient MSS.*	Chund Bardai.	Komar Pal Charitha.		Kheechie Bard.‡	Corrected list by. Colonel Tod
		Sanscrit Edition MSS.	Guzeratti Dilect MSS.		
Ichshwaca,	Ravya or Soorya	Icshwaca,	Gotchar Gohil,	Gehlote,	Icshwaca, Cacoostha, or Soorya,
Soorya,	Suhsa or Soma,	Soma,	Uni Gohil,	Pramara,	Unwye, Indu, Som, or Chandra,
Soma or Chandrâ,	Yadu,	Yadu,	Catti or Cat'hi,	Chohan,	Grahilote or Gehlôtesacha..24
Yadu,	Cacoostha,	Pramara,	Kisair,	Solanki,	Yadu 4
5. Chahuman, or Chohan,	5: Pramara,	5. Chohan,	5. Nicoompa,	5. Rahtore,	5. Tuar 17
Pramara,	Chohan,	Chalook,	Burbeta,	Tuar,	Rahtore......13
Chalook or Solanki,	Chalook,	Chunduk,	Bawurea,	Birgoojur,	Cushwaha or Cutchwaha,
Purihara,	Chunduk,	Silar (Raj Tilac,)	Maroo,	Purihara,	Pramara 35
Chawura,	Silar,	Chapotcut,	Macwahana,	Jhala,	Chahuman or Chohan....26
10. Dodia,	10. Abhira,	10. Pritihara,	10. Dahima,	10. Yadu,	10. Chalook or Solanki 16
Rahjore,	Macwahana,	Sukrunka,	Dodia,	Cutchwaha,	Purihara 12
Gohil,	Gohil,	Coorpala,	Balla,	Gor,	Chawura, Single
Dabi,	Chapotkut,	Chundail,	Bhagel,	These sub-divide: the following do not, and are called Yeka or Single	Tak, Tauk, or Takshac,
Macwahana,	Purihara,	Ohil.	Yadu,	Balla,	Jit or Gete,
15. Norka,	15. Rahtore,	15. Paluka,	15. Jaitwa,	15. Dahima,	15. Hun or Hoon,
Aswurea,	Deora,	Mori,	Jareja,	Dahya,	Catti,
Salar or Silara,	Tak.	Macwahana,	Jit or Gete,	Byce,	Balla,
Sinda,	Sindoo,	Dhunpala,	Solanki,	20. Gherwal,	Jhala,
Siput,	Anunga,	Rajpalica,	Pramara,	Nicoompa,	Jaitwa or Camari,
20. Hun or Hoon,	20. Patuk.	20. Dahya,	20. ———	Dewut,	20. Gohil,
Kirjal,	Pritihara,	Toorunduleeca,	Chawura,	Johya,	Sarweya,
Huraira,	Didiota,	Nicoompa,	Chourasima,	Sikerwal,	Silar,
Rajpali,	Karitpal,	Hoon,	Khant,	25. Dabia,	Dabi,
Dhunpali,	Kotpala,	Balla,	Khyera,	Doda,	Gor,
25. Agnipali,	25. Hool,	25. Hureal,	25. Rawuli,	Mori,	25. Doda or Dor,
Balla,	Gor,	Mokur,	Musania,	Mokarra,	Gherwal
Jhala,	Nicoompa,	Pokara,	Palani,	Abhira,	Birgoojur.... 3
Bhagaola,	Rajpalica,		Halla,	30. Kalchoruk (Hya race,)	Sengar, single,
Motdan,	Kani,		Jhala,	Agnipala,	Sikerwal, do.
30. Moha,	30. Kalchoruk or Koorchurra,		30. Dahiria,	Aswaria or Sarja	30. Byce, do.
Kugair,			Bahuria,	Hool,	Dahia,
Kurjeo,			Sarweya Chatrya tyn Sar,	Manutwal,	Johya,
Chadlea,			Purihara,	Mallia,	Mohil,
Pokara,			Chohan,	Chahil,	Nicoompa,
Nicoompa,					Rajpali,
36. Sulala,					36. Dahima, do.
					Extra,
					Hool,
					Dahirya.

Most of the cula or races are divided into numerous branches or sacha, and these sacha are sub-divided into immediate clans or gotra. A few of the cula never ramied: these are termed eka, or 'single': and nearly one-third are eka. Ikshwaku, was the first king in the Solar line, and, according to hindoo mythology, reigned at the commencement of the Treatu-yug. He was the son of the 7th Menu, or patriarch, the offspring of the sun. His posterity was called, in consequence, the dynasty of the Solar princes, in the same manner as Buddha was reputed the head of the Lunar line. Modern commentators bring the time of his accession down to the year 1320 before Christ. A passage in the Agni Poorana indicates that the line of Soorya, of which Ikshwaku was the head, was the first colony which entered India from Central Asia. But the patriarch Buddha was his contemporary, he being stated to have come from a distant region, and to have married Ella, the sister of Ikshwaku. Amongst the Arian hindoos, the Kshatriya was a warrior branch taking social rank after the hindoo brahmins. Manu writing of their duties says to defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification are in a few words the duties of a Kshatriya. How this soldier branch broke up is extremely obscure, but it is generally supposed that none of the races now in India can trace their lineage to that tribe of Aryans though most of the Rajput families doubtless belong to them. Their quarrels amongst themselves seem to have led to their own destruction. There seem to have been two branches of the Kshatriya tribe, the Solar who traced up to Ikshwaku and the Lunar who traced up to Buddha, who married Ila or Ella, daughter of Ikshwaku. These Kshaitrya soldiers do not appear to have adopted brahminism readily, and the brahmins to overcome them consecrated by fire, on Mount Aboo, a warrior body who still remain, and are known as the four Agnicula rajput tribes. A common spelling of the word is Kshatriya.

The sixteen chief nobles of Mewar, their Titles, Names, Clans, Tribes, Estates, number of Villages in each, and their value.

Title.	Names.	Clan.	Tribe.	Estate.	Number of villages.	Value A. D. 1760.	Remarks by Col. Tod in A. D. 1820.
Raj	Chundun Sing	Jhala	Jhala	Sadri	127	100,000	These estates are all diminished one-half in nominal amount; and their revenues still more.
Rao	Pertab Sing	Chohan	Chohan	Baidla	80	100,000	
Rao	Mokim Sing	Do.	Do.	Kotario	65	80,000	
Rawut	Pudma Sing	Chondawut	Seesodia	Saloombra	85	84,000	Would realize this if cultivated.
Thacoor	Zorawur Sing	Mairtea	Rahtore	Ganora	100	100,000	This chief ceases to be one of the 16 since the Rana lost the province of Godwar.
Rao	Kesudas		Pramar	Bijolli	40	45,000	Would realize this if cultivated.
Rawut	Gokuldas	Sangawut	Seesodia	Deogurh	125	80,000	Would realize more if cultivated.
Rao	Maha Sing	Megawut	Do.	Beygoo	150	200,000	This includes usurpations—now seized by Sindia. The estates would realize 70,000 if cultivated.
Raj	Kalian Sing	Jhala	Jhala	Dailwarra	125	100,000	Would realize two-thirds if cultivated.
Rawut	Salim Sing	Jagawut	Seesodia	Amait	60	60,000	Do. do. do.
Raj	Chutter Sal	Jhala	Jhala	Gogoonda	50	50,000	Would realize this if cultivated
Rawut	Futteh Sing	Sarangdeote	Seesodia	Kanorh	50	95,000	Would realize half if cultivated.
Mahraja	Zorawur Sing	Suktawut	Do.	Bheendir	64	64,000	Would realize this if cultivated.
Thacoor	Jeyt Sing	Mairtea	Rahtore	Bednore	80	80,000	Do. do.
Rawut	Salim Sing	Suktawut	Seesodiah	Bansi	40	40,000	These chiefs have lost all their influence and half their estates.
Rao	Soorajmul	Chohan	Chohan	Parsoli	40	40,000	
Rawut	Kesuri Sing	Kishenawut	Seesodia	Bhynsror	60	60,000	These chiefs have taken rank on the depression of the above—they never appear at court on the same day.
Rawut	Jowan Sing	Do.	Do.	Korabur	35	35,000	
Total number and estimated value of their estates sixty years ago, omitting Bhynsror and Korabur, then enrolled in the second grade of chieftains					1,181	13,10,000	

Vyasa gives but fifty-seven princes of the Solar line, from Vaivaswata Menu to Rama; and no list which had come under Colonel Tod's observation exhibits for the same period, more than fifty-eight, of the Lunar race. How different from the Egyptian priesthood, who according to Herodotus, gave a list up to that period of 330 sovereigns from their first prince, also the 'sun-born Menes!' Ikshwaku was the son of Menu and the first who moved to the eastward and founded Ayodia.

Buddha (Mercury) founded the Lunar line, but we are not told who established their first capital, Poorag, though we are authorized to infer that it was founded by Pooru, the sixth in descent from Buddha. A succession of fifty-seven princes occupied Ayodia from Ikshwaku to Rama. From Yayat's sons the Lunar races descend in unequal lengths. The lines from Yadu, concluding with Krishna and his cousin Kansa, exhibit fifty-seven, and fifty-nine descents from Yayat, while Yoodishtra, Sul, Jarasandha and Vahoorita, all cotemporaries of Krishna and Kansa, are fifty-one, forty-six and forty-seven generations, respectively, from the common ancestor, Yayat. The author, after the invocation to "the mother protectress," Om! sacombhari mata! says, "I write the name of the thirty-six royal tribes." The bard Chund says, "of the thirty-six races, the four Agnipalu are the greatest—the rest are born of woman, but these from fire."

Rama of the Ramayana is described as the son of Ikshwaku and grandson of Manu. His original abode is described as the mountains of the west. He was the first of the dynasties of Oudh.

There are, as above, three solar dynasties:—

Grahilote or Gehlote with 24 sakha or branches, of which the Sisodea is the most distinguished. The rana of Udayapur is a Grahilote.

Rahtore, said to be descended from Rama by Kusa, his second son. It has twenty-four branches, and the rajah of Jodhpur or Marwar belongs to this tribe.

The Kach'hwaha is a distinguished tribe of the solar race of Rajputs, who claim descent from Kusa or Kusha, the son of Rama, and form the ruling race in Amber of Jaypur, the rajah of which is of the Kach'hwaha clan. It has twelve kotri or houses.

An interesting ceremony took place in Oodeypore on the occasion of the installation of the young prince as rana of Mewar. He was the grand-nephew of the late maharana Suroop Singh, and was the first instance in which the adoption policy inaugurated by Lord Canning had been exemplified. The installation was held in the court-yard of the palace. General St. P. Lawrence, Governor-General's agent for the Rajputana States, was present and delivered a congratulatory address in the vernacular. Costly presents from the Governor-General were given to the young prince, and the ceremony was rendered more imposing by salutes from Royal artillery and the presence of a large body of British troops. · The race was, at an early period, divided into two great Solar and the Lunar dynasties, the former having its seat of empire in Oudh, and the latter in Delhi. The head of the solar line was Ikshwaku, son of Manu, whose father or grandfather bore the title of Soorya or the Sun: and the head of the Lunar line, was, Buddha, the son of 'Soma,' or the 'Moon,' who married Ila, a daughter of Ikshwaku. Struggles for the pre-eminence were carried on with sanguinary obstinacy between these tribes. Their wars reduced the numbers of the military class, and paved the way for the destruction which overtook it eventually. 'To fight,' was the duty of the Kshatriya, as Krishna told the hero Arjuna, smitten with sorrow at the idea of slaughtering his own kinsmen in battle. 'O Krishna, said the hero,' I seek not victory nor a kingdom. I will not fight! What shall we do with a kingdom or with life itself, when we have slain all these? Krishna had no such qualms. 'You belong,' he replied, 'to the military class, and your duty is to fight.' And Arjuna fought! The Kshatriya of all the Aryan immigrants were the successful opponents to brahminical pretensions, 'and to the grasping after power by the priesthood. To resist a brahmin whose prayers were sufficient to destroy kings with their powerful armies and elephants, was no light matter. Yet the Kshatriya and Visvamitra successfully opposed them, so did king Janeka, insisting on his right to sacrifice. In a Sanscrit drama entitled 'Chaunekya,' Chaunekya enters a royal chuttrum, and takes the place reserved for some brahmin or other of eminence; the princes shortly afterwards enter also, and observing Chaunekya seated, they order their servants to eject him, which they did with great indignity, seizing him by the lock of hair upon the crown of his head. The brahmin, maddened by rage, uttered a fearful imprecation, and vowed to wreak vengeance on the sacrilegious princes; but the only effect this produced upon them was to cause them to indulge in most uproarious laughter at his expense; but in the career he marked out for himself, he never once faltered, until he had destroyed the royal family, and placed on the throne of his king, a soodra named Chandragupta, the Sandracottus of the Greeks. Brahminism, eventually triumphed; the solar line first succumbed to its influence. The kingly power still remained with the Kshatrya race, but every office in the state was filled by a brahmin, so that all power was virtually in their hands. The very books which set forth the prowess, or the noble deeds of the Kshatrya were tampered with, and so altered as to suit the ideas of the brahmins, and to familiarize those ideas to the popular mind. The lunar line of Kshatrya resisted for a longer period, the pretensions of the brahmins, and this was due, in great measure, to the fact that it was constantly receiving fresh immigrants from the ancestral home of the Aryans, who kept alive the independent spirit of the warrior race but universal ascendancy came to the brahmins at last. Parasu Rama, the champion of brahmin interests, is represented as having cleared the earth twenty-one times of the Kshatrya race. This hero is now said to have been an incarnation of deity. That their extermination was so far complete as to render them powerless and insignificant, there can be no reasonable grounds for doubt. Making all allowance for eastern exaggeration, it is impossible to read the Mahabharata, without feeling that a great slaughter had overtaken them, and so great was it that Kshatrya widows and daughters were fain to lay their honor and their virtue at the feet of the triumphant brahmins. The pure Kshatrya caste has disappeared from the land of Bharata; in the Punjab and other places are still some, who affix 'Singh' to their names; and the class known as 'Rajputs,' claim to be Kshatryas, but their pretensions to the distinction are of a most questionable character. In Southern India, where the brahminical system was at no time so strong as it was in the north, it is doubtful whether the Kshatrya ever established themselves in sufficient numbers to render their race powerful or conspicuous; certainly there are no Kshatrya there at present. It is impossible to read the grand old Indian epics without regretting the destruction of the warrior race. In the whole range of Indian literature there is nothing so noble, or so inspiriting as these epics. While reading them, we are, as it were, brought face to face with men whom, we instinctively feel, that we could admire. Rama and his beautiful wife Seeta, are characters that it would be impossible to excel: in fact they are too good for this world of ours: but what a high idea the Aryan poet had of what human nature should be? This circumstance proves that, in that early period Aryan civilization had reached a high state of perfection. Again, there is the youthful Arjuna also, who, whether in the joust or tournament, or on the field of battle, is the very beau ideal of a hero. He is brave, generous, and high-minded. So long as the fight lasts, nothing daunts him, he is ever in the post of danger, he fights with right good-will, his blows descend rapidly and heavily, and in the spirit-stirring words of the poet, we almost fancy we hear the thud of his blow resounding from the shoulders of his foe-man. After the battle, however, the sight of the mangled corpses of his friends and foes, plunges him into deep grief, despite old Vyasa's attempt to place it to the credit of 'destiny;' and in Arjuna bowed down with grief for the loss of his kindred, we have the type of a true man. One cannot but experience regret that the race to which so great a hero belonged has passed away from India. Tod considers that the Solar and Lunar races, the Surya and Chandra, were established in India about 2,256 years before the Christian era, about which period (Egyptian, under Misraim, B. C. 2188; Assyrian, 2059; Chinese, 2207;) the Egyptian, Chinese, and Assyrian monarchies are generally stated to have been established, and about a century and a half after the flood. The Lunar dynasty of the Rajput races, sprung from the moon, Soma, or Chandra, through Yadu or Jadu, is called Yadu or Jadu. It has eight branches, of which the Jhareja and Bhatti in Cutch and Jeysulmir are the most powerful. The dynasties which succeeded the great beacons of the Solar and Lunar races, are three in number; 1st, The Suryavansa, descendants of Rama; 2nd, The Induvansa, descendants of Pandu through Yudishtra; 3rd, The Induvansa, descendants of Jarasandha, monarch of Rajgraha. The Bhagvat and Agni Pooranas are the authorities for the lines from Rama and Jarasandha; while that of Pandu is from the Raj-Taringini and Rajaoli. The existing Rajput tribes of the solar race claim descent from Lava and Cush, the two elder sons of Rama; and Colonel Tod does not believe that any existing tribes trace their ancestry to his other children, or to his brothers. From the eldest son, Lava, the rana rulers of Mewar claim descent: so do the Birgujar tribe, formerly powerful within the confines of the present Amber, whose representative now dwells at Anupshahr on the Ganges. From Cush, descended the Cushwaha princes of Nirwar and Amber, and their numerous clans. Amber, though the first in power, is but a scion of Nirwar, transplanted about one thousand years back, whose chief, the representative of the celebrated prince Nala, enjoys but a sorry district of all his ancient possessions. The house of Marwar also claims descent from this stem, which appears to originate in an error of the genealogists, confounding the race of Cush with the Causika of Canouj and Causambi. Nor do the solar genealogists admit this assumed pedigree. The Amber prince in his genealogies traces the descent of the Mewar family from Rama to Sumitra, through Lava, the eldest brother, and not through Cush, as in some copies of the Puranas, and in that whence Sir William Jones had his lists. Whatever dignity attaches to the pedigree, claimed by the Amber prince, whether true or false, every prince and every hindoo of learning, admit the claims of the princes of Mewar as heir to 'the-chair of Rama; and a degree of reverence has consequently attached, not only to his person, but to the seat of his power. When Madajee Sindia was called by the rana to reduce a traitorous noble in Cheetore, such was the reverence which actuated that (in other respects) little scrupulous chieftain, that he could not be prevailed on to point his cannon on the walls within which consent established 'the throne of Rama.' The rana himself, then a youth, had to begin the attack and fired a cannon against his own ancient abode. In the very early periods, the princes of the Solar line, like the Egyptians and Romans, combined the offices of the priesthood with kingly power, and this whether brahminical or buddhist. Many of the royal line, before and subsequent to Rama, passed great part of their lives as ascetics; and in ancient sculpture and drawings, the head is as often adorned with the braided lock of the ascetic, as with the diadem of royalty. Ferishta, also, translating from ancient authorities, says, to the same effect, that "in the reign of Mahraj, king of Canouj, a brahmin came from Persia, who introduced magic, idolatry, and the worship of the stars: so that there is no want of authority for the introduction of new tenets of faith. Even now the rana of Mewar mingles spiritual duties with those of royalty, and when he attends the temple of the tutelary deity of his race, he performs himself all the offices of the high priest for the day. In this point a strong resemblance exists to many of the races of antiquity. There seems to be no doubt that amongst the Aryans, whilst they were approaching India' and whilst the worship of nature under the Vedic system of religion prevailed; the householder was his own priest and performed all the religious duties, in sacrifices and worship. The head of the house was in fact his own household priest, and to the present day every head of a hindoo house performs all the religious sacrifices of his household.

SOLAR SYSTEM. The principal elements.

Planets, &c	Mean distance from the Sun.	Sidereal Revolution in Days.	Diameter in miles.	Mass (denominator of fraction, the Sun being 1.)	Density.	Time of Rotation.

The Solar, *i. e.* really, the sidereal year called the "Shubooor Sun," or vulgarly, the "Soor Sun," of the Mahrattas that is, the year of (Arabic) months, was apparently introduced into the Dekhan by Toghluk Shah, between A. D. 1341 and 1344, and it is still used by the Mahrattas in all their more important documents, the dates being inserted in Arabic words written in Hindee (Mahratee) characters.

	Days.	Hrs.	Min.	Sec.
The Anomalistic year is	365	6	13	49 3
A Sidereal year is.....................	365	6	9	10·7

A Solar (average) day is.		24	0	0
A Sidereal day is......................		23	56	4·09
A Lunar (average) day is............		24	50	28·32

Ravi, is a name of the Sun ; Ravi vara, Sunday. Ravi mandocha, sun's Apogee, Ravi madhya graha, mean place in the Sidereal Ecliptic, Ravi panchanga, the Solar Calendar, Ravi phala, Anomalistic Equation, Sayana, longitude.— *Warren's Kala Sankalita.*

SOLARA, Hind. Cymbopogon iwarancusa.

SOLARIUM, a genus of molluscs.

SOLASEE, a variety of magic square.

SOLAYMANEE, Hind. The onyx stone.

SOLDA also Barilha, Port. Barilla.

SOLE. The Plagusia, of Tenasserim, is a small fish of the sole family that grows to nine inches or a foot long. It has no pectoral fins, and the dorsal, caudal and ventral fins are united. The natives think that two of them always swim together, with their flat, uncoloured, sides united.—*Mason.*

SOLECURTUS, a genus of Mollusca.

SOLEGNATHUS BLOCKII, *Bleeker*, the Sea-needle of Block, a long spindle-shaped fish, with round needle-shaped body.

SOLEI, Hind, Plectranthus rugosus.

SOLEMYA, a genus of molluscs.

SOLEN, a genus of molluscs.

SOLENOSTOMIDÆ, a family of fishes of the order Lophobranchii : the order may be thus shown :

Order V.—Lophobranchii.

Fam. I. Solenostomidæ.
Solenostoma cyanopterum, *Blkr.*, Zanzibar to China.
„ paradoxum, *Pall*, Amboyna.
„ brachyurum, *Blkr.*
Fam. II. Syngnathidæ.
First Group. Syngnathina.
Syngnathus phlegon, *Risso.* Cape of Good Hope, Atlantic, Mediterranean.
„ acus, *L.*, Cape of Good Hope, Atlantic Mediterranean.
„ schlegelia, *Kaup.*, Japan, China.
„ alternans, *Gthr.*, Seychelles.
„ semifasciatus, *Gthr.*, South Australia, Tasmania.
„ temminckii, *Kaup.*, Cape of Good Hope.
„ pelagicus, *Osbeck*, Mediterranean, Mauritius, N. Zealand, China, S. Australia.
„ modestus, *Gthr.*, N. Hebrides, S. Australia.
„ brevirostris, *Rupp.*, Red Sea.
„ serratus, *Schleg.*, China, Japan, Siam.
„ longirostris, *Kaup.*, China.
„ intermedius, *Kaup.*, China or Japan.
„ ceylonensis, *Gthr.*, Zanzibar, Ceylon.
„ zanzibarensis, *Gthr.*, Zanzibar, China.
„ grayi, *Kaup.*, Japan, Australia.
„ tetrophthalmus, *Blkr.*, Cocos.
„ cyanospilus, *Blkr.*, Zanzibar, Mozambique, E. Archipelago.
„ margaritifer, *Ptrs.*, New South Wales.
„ penicillus, *Cant.*, Pinang.
„ tapeinosoma, *Blkr.*, West Java.
„ hunnii, *Blkr.*, South Sumatra.
„ spicifer, *Rupp.*, Indian Ocean.
„ pœcilolæmus, *Ptrs.*, S. Australia.
„ conspicillatus, *Jen.*, Africa to Pacific.
„ martensii, *Prts.*, Pulo-Matjan, Borneo
„ retzii,, *Blkr.*, Celebes.
„ bicoarctatus, *Blkr.*, Amboyna.
„ budi, *Blkr.*, Celebes, Batavia.
„ brachyrhynchus, *Kaup.*
„ sundaicus, *Blkr.*
„ vittatus, *Kaup.*
„ fucicola, *Benn.*
„ flavofasciatus, *Rupp.*, Red Sea.
„ punctipinnis, *Gill.*
„ tenuis, *Blyth.*
Ichthyocampus carce, *H. B.*, Malabar, Bengal, Assam.
„ belcheri, *Kaup.*, China.

Ichthyocampus scalaris, *Gthr.*, Australia.
„ filum, *Gthr.*, New Zealand, Australia.
Nannocampus subosseus, *Gthr.*, Freycenet's harbour.
Urocampus nanus, *Gthr.*, Manchuria.
Doryichthys heterosoma, *Blkr.*, Borneo.
„ boaja, *Blkr.*, Siam, China, Sumatra, Borneo.
„ deokhatoides, *Blkr.*, Sumatra, Borneo.
„ mento, *Blkr.*, Eastern Africa, Celebes.
„ cuncatus, *H. B.*, Malabar, Ganges.
„ caudatus, *Ptrs.*, Samar, Java.
„ bheekeri, *Day*, Malabar.
„ auronitens, *Kaup.*, Macassar.
„ bernsteinii, *Blkr.*, Halmaheira.
„ millepunctatus, *Kaup.*, Madagascar, Bourbon.
„ brachyurus, *Blhr.*, Eastern Archipelago, Pacific.
„ manadensis, *Blkr.*, Celebes.
„ pleurostictus, *Ptrs.*, Lucon.
„ sculptus, *Gthr.*, Fiji.
„ dactylophorus, *Blkr.*, Java, Amboyna.
„ excisus, *Kaup.*, Red Sea.
„ valenciennii, *Kaup.*, Bourbon.
„ deocata, *H. B.*
„ jagorii, *Ptrs.*
Cœlonotus liaspis, *Blkr.*, Java.
„ biocellatus, *Gthr.*, Eastern Archipelago.
„ argulus, *Ptrs.*, Johanna.
Stigmatophora argus, *Rich*, Australia.
„ nigra, *Kaup.*, „
Nerophis dumerilii, *Steindachner*, Bombay
Protocampus hymenolomus, *Rich*, Falkland Islds.
Second.Gronp. Hippocampina.
Gastrotokeus biaculeatus, *Bl.*, Indian Ocean to China and Australia.
Solenognathus hardwickii, *Gray*, Chinese and Australian Seas.
„ spinosissimus, *Gthr.*, Tasamania.
„ lettiensis, *Blkr.*
Phyllopteryx foliatus, *Shaw*, S.Australia, Tasmania
„ eques, *Gthr.*, Australia.
„ tæniophorus, *Gray*, Australia.
Acentronura gracillima, *Kaup.*, Japan.
„ tentaculata, *Gthr.*
Hippocampus abdominalis, *Less.*, South Australia, New Zealand.
„ antiquorum, *Leach*, Mediterranean, Atlantic, Australia.
„ breviceps, *Ptrs.*, Tasmania, Australia.
„ angustus, *Gthr.*, Freycent's harbour.

SOLETELLINA, a genus of molluscs.

SOLENOSTEMMA ARGEL, Arghel, of Egypt, a native of Syria. The leaves are purgative and are employed in Egypt to adulterate senna.—*Hogg. Veg. King, Vol.* ii, *p. 5*; *Simmonds.* See Cassia.

SOLFATO DI FERRO, It. Sulphate of iron, Green copperas.

SOLIGARU, according to Buchanan are a rude tribe inhabiting the southern ghauts, which separate Coimbatore from Mysore.—*Hindoos, Vol.* i. See India.

SOLI KORAWA, see India, Korawa.

SOLIMAN, a mahomedan merchant who travelled to India several times and who wrote A.D. 850. He notices the abstaining from wine of the hindoos. He voyaged to India and China, in the beginning of the ninth century. His principal establishment was probably at Busrah.—*Ell., Hist. p.* 7; *India in the 15th Century.*

SOLIMANI, is said to be the name by which the Arabs call the Affghans.

SOLIMAN MOUNTAINS. The Soliman range commences at the lofty mountain which has derived the name of Suffaid Koh, or White mountain, from the snow with which it is always covered. Suffaid Koh stands to the south of the projection of Hindoo Koosh, and is only separated from it by the valley of the Kabul river, from which it rises with a very steep acclivity. It is connected with Hindoo Koosh by the hills of the Otmaunkhail, and other subordinate ranges extending across the Kabul river, in which they cause numerous rapids, in some places almost amounting to cascades. On these grounds, the Soliman range ought, perhaps, to be regarded as a branch of Hindoo Koosh, and even as a continuation of Beloot Tagh, but it will, nevertheless, be convenient to consider it separately. From Suffaid Koh, the highest ridge of the range runs south-south-east, and passes through the Janjee country near Haryab, twelve miles south of which it is pierced by the river Koorrum. The Affghans more frequently call the Suffaid Koh mountain, Speengar. The former has the same meaning in Pushtu that the latter has in Persian. The height of the Soliman range, though much inferior to that of Hindoo Koosh, is still considerable. The part inhabited by the Wuzeeree clan, is probably as much raised above the surrounding country, as that which belongs to the Jadraun; but its absolute height is inferior, as the country at its base slopes much to the southward. In the southern part of the Wuzeeree country, where this range is passed through by the river Gomul, it is low in both senses, but it rises again in the Sheeraunee country, and forms the lofty mountain of Cussay Ghur, of which the Tukht-i-Soliman, or Solomon's Throne is the highest peak; snow lies on this peak for three months in the year, and on the surrounding mountains for two. The country of the Zmurree is certainly as high as most parts of Cussay

Ghur. There are two minor ranges parallel to the range of Soliman, which accompany it on its eastern side from the southern borders of Affghanistan, as far at least as Rughzee, in latitude 32° 20′. The first of these ranges is lower than the principal ridge. The second is still lower, and between it and the first is a rugged country which is cultivated by the Sheeraunee. All of these ranges are pierced by valleys which run from the high country on the west and send out streams into Damaun: other streams rise in the principal range and run through valleys which cut the lower ones.

The next branch, which may be called the Salt Range, shoots out from the south-eastern side of Suffaid Koh, and extends in a south-easterly direction, by the south of Teeree to Kala-bagh. It there crosses the Indus, stretches across part of the Punjab and ends at Jellalpoor, on the right bank of the Hydaspes. It becomes lower as it gets farther from the mountains of Soliman. This range is both higher and broader than the last. It abounds in salt, which is dug out in various forms at different places. To the eastward, it yields a rock salt of a brownish colour, which is imported into Hindustan, and known by the name of Lahore salt. Between the range of 34° and the Salt Range, lie some plains and valleys, belonging to the tribes of Bungush and Khuttuk. They slope towards the Indus, but are separated from the river by a low range of hills running north and south. In the northern part of the space between the Salt Range and that of Punniallee, the valleys of Dour, Bunnoo, Shutuk and Esaukhail, descend like steps from the Solimanee ridge to the Indus. The greatest of the rivers, which run through the west of Affghanistan, is the Helmund, or Etymander. It rises at Koh-i-Baba, twenty or thirty miles west of Cabul, on the eastern edge of the Paropamisan range. It runs through those mountains for upwards of two hundred miles, and then issues into the cultivated plains of the Dooranee. This tract, however, is not at the place alluded to, of any great breadth; and the Helmund soon enters a desert, which extends to its termination in the lake of Seestan. The immediate banks of the Helmund, and the country within half a mile or a mile of them, are everywhere fertile, and, in most places, well cultivated. The whole length of the course of the Helmund is about four hundred miles. Though fordable for most part of the year throughout the whole of its course, the Helmund is still a considerable stream: even in the dry season, it is breast-deep at the fords nearest to the place where it leaves the mountains; and, at the time of the melting of the snows, it is a deep and rapid river. The Furrah-rood rises near that last-mentioned, and is a much more considerable stream. It is uncertain whether it reaches the lake of Seestan or is lost in the sands; but, in either case, its course is not less than two hundred miles long. The plain of the Indus from the sea to Sungur is included in Sind. The part which extends from the sea to Shikarpore, is called Sind, by the British; more properly, Lower Sind. From Shikarpore, inclusive, to Sungur, is called Upper Sind. The part of it which lies to the west of the Indus, is chiefly inhabited by Beluches; and, with the exception of a small tract north of Shikarpore, is directly under the government of Cabul. Above Sungur, as far as the eastern branches of the Soliman range, is Damaun. The hills south of the Salt Range, and the plains and valleys which they enclose, are also generally included in Damaun. The plain, immediately on the right bank of the Indus, and north of Sungur, is inhabited by the Beluch; and is sometimes distinguished from Damaun, and called by the Beluch or Hindustani name of Muckelwaud. Damaun is then only applied to the skirts of the hills, which indeed is the original meaning of the word. In this sense, the southern part of Damaun is inhabited by the Stureeaunee, after whom, to the north, are the Bauboor, Meeaunkhail, Gundehpoor, Doulutkhail, and Murwut; all Affghan tribes. To the north of the latter, and along the utmost boundary of Damaun, in this extended sense, are the Affghan tribes, who inhabit Khost, Dour, and Bunnoo, and that of Esakhail. In the same extent of the Solimaun range, live the Zmurree, Sheeraunee, Wuzeeree, and Jadraun. The Jaujee and Toree inhabit a deep valley, which appears to be cut by the Koorrum in the Soliman range: between the salt range and that of 34°, are hills and valleys, inhabited by the tribes of Bungush and Khuttuk. The latter, in some places, extends to the south of the salt range, and even crosses the Indus about Muckud. To the north of the range of 34° is the rich and extensive plain of Peshawur, watered by the river of Cabul, and bounded on the east by the Indus. The Khuttuk extend over the south-eastern part of this plain. The northern part belongs to the Eusofzyes, who inhabit also the country among the hills of Boonere, Swaut, and Punjcora. Some of the Eusofzye tribes extend to the east of the Indus. The rest of the plain of Peshawur belongs to certain tribes, often comprehended in the name of the tribes of Peshawur. The plain of Peshawur is bounded on the west by the subordinate range, which crosses from Hindu

Koosh to Suffaid Koh. The southern part of these hills, which is naked and barren, belongs to the upper Momunds. The northern part is covered with pines, and belongs to the Otmaunkhail. To the west of this range of hills, is the spacious valley of Bajour, which runs into that of Punjcora, and which is surmounted on the west by the southern projection from Hindu Koosh. On the right bank, there is first the country of the Khyberee ; and, farther west, the rich plain of Jellallabad. West of Jellalabad, are Gundamuk, and Jugdilluk, which, with all the high country, extending from the plain of Cabul to the hills of the Khyberee, bounded on the south by Suffaid Doh, and on the north by the plain on the Cabul river, is called Nimgrahaur or Nungnehaur. The Cohistaun of Cabul has been described : south of it, is the plain of Cabul, which is spoken of as enchanting by all who have seen it. It has the Paropamisan mountains on the west, part of the Kohistaun on the north, the valley of the Cabul river, and the hills of Ningrahaur and Logur, connected with the range of Solimaun on the east. There is no marked limit between the bason of the Abistadeh, and the country west of the meridian of Mookkoor ; the latter, however, has a western inclination. It is included between the Paropamisan mountains and the range of Khojeh Amraun, and may be divided into the valley of the Urghessaun, that of the Turnuk, and the high country between those rivers. The former is not broad, nor remarkably fertile : it slopes to the north-west. It is inhabited by the Dooraunace ; and the mouth of it extends to the neighbourhood of Candahar. To the south-east of it, is a hilly and pastoral country, extending to Shorabuk. The country between the Urghessaun and Turnuk, is composed of the ranges of Mookkoor and Torkaunee, and the plains which they enclose. The general slope of the valley of Turnuk, from Mookoor to Kelauti, Ghiljie, is to the south-west. The breadth of this valley is about sixty miles, and the length of the part I have described is very little more. It is inhabited by Ghilzie. The whole of the country from Kelat-i-Ghilzie to Herat, except Seeahbund and Subzaur, is inhabited by the Dooranee tribe. Returning to the neighbourhood of Ghuznee, we find Zoormool divided from Sirufza on the south, by a branch from Koh-i-Soliman. Sirufza Oorghoon and Wauna have been described as descending in stages to the Gomul. They are divided from each other by branches of the Solimani mountains, and have little cleared plains among mountains, covered with forests of pines. They are high and cold countries ; but all these qualities are found less in the southern parts than the northern. Sirufza belongs to the Kharatee tribe of the Ghilzie, as does the southern part of the plain of Oorghoon, under the name of Seroba. Oorghoon itself belongs to the Fermoollees, a Persian tribe. Waunch belongs to an Affghan tribe called Dumtaunny. To the west of Waunch, beyond a range of hills, is the mountainous country of Mummye, the slope of which is east towards the Gomul. Mummye is divided on the west by the same branch which passes to the west of Sirufza, from the basin of the Abistadeh. Zawura is much narrower than Tul-Chooteeallee, but both are fertile, and inhabited by the Speen Tereen, a division of the Affghan tribe that possesses Pisheen. On the north-east, Zhobe opens on the valley of the Gomul, and on the east it has the hilly countries under the Solimaun range, the most northerly of which belong to the Hurrepaul division of the Sheeraunee, to the south of whom are a division of the Bauboor, and then Cauker, in some places mixed with Beluch.

Peshawur is situated on a low plain, surrounded on all sides except the east, with hills. The air is consequently much confined, and the heat greatly increased. In the summer of 1809, which was reckoned a mild one, the thermometer was for several days at 112° and 113°, in a large tent artificially cooled, which is as high as in the hottest parts of India. The duration of this heat is not, however, so great as that of an Indian summer, and it is compensated by a much colder winter. To the south of the Berdooraunee country, Bunnoo appears to be as hot as Peshawur, and the Esaukhail perhaps hotter. Khost and Dour, as they are higher than Bunnoo, are probably cooler. The Murwut country is made up of hills and plains, and consequently has not a uniform climate. The plains, at least, are very hot, and parched up, by the heat of summer. Largee was far from cool, even in January. The winter of Damaun is very agreeable, being colder than any part of Hindustan. Frost is common in the morning. The name of Affghan, is, probably, modern. It is known to the Affghans themselves only through the medium of the Persian language. Their own name for their nation is Pushtu ; in the plural, Pushtauneh. The Berdooraunee pronounce this word Pookhtauneh ; whence the name of Pitan, by which the Affghans are known in India, may probably be derived. All accounts agree that they inhabited the mountains of Ghore at a very remote period, and they seem early to have possessed the mountains of Solimaun ; which term, in its most extended sense, comprehends all the southern mountains of Affghanistan.—*Elphinstone's Kingdom of Cabul, pp.* 99-103, 115-16, 191-25, 132, 135, 151-52.

SOLLYA HETEROPHYLLA, one of the Pittosporaceæ, ornamental little shrubs with bright blue bell flowers, can be grown in a loamy soil, and are propagated by seed or cuttings.—*Riddell, John's Ind. Arch*, *Vol.* i, *p.* 289.

SOLIM, are supposed to be the aborigines of Siberia, and are described by Bell under the name of Tongusians.—*Staunton's Narrative, p.* 66. See India.

SOLO, Rus. Bacon.

SOLOMON, the son of David, was king over the Judah and Benjamin tribes of the Hebrews or Israelites. He is famed in history for his building of the temple of Jerusalem, for his great wisdom and great wealth. He began to build the temple B. C. 1014. He founded Hamath in the country of Galilee, and Tadmor in the wilderness, or Palmyra, and many other cities of store, (I Kings ix; v, 8,) (II Chron. viii; v, 4,) or emporia, for the commerce of India, and Tyre, Sidon, and all the surrounding nations. His father David had introduced the custom of a vast polygamy which Solomon continued. His commercial transactions extended down the Red Sea to India and the Aurea Chersonesus supposed to be Malacca.—*Arrian Periplus, p.* 152; *Pennant's Hindustan, Vol.* i, *p.* 4. See Hindu, Kamran, Saba.

SOLOMON'S POOLS, are three large reservoirs built on the slope of a hill about 7 miles S. from Jerusalem.

SOLOMON'S SEAL, Convallaria polygonatum.

SOLOMON'S TEMPLE, of Cashmere, stands on the summit of a little hill to the east of Srinagar city. Its height is 6,263 feet above the level of the sea.

SOLOMON'S TEMPLE in Jerusalem, was dedicated to Bal, and all the idolaters of that day seem to have held to the grosser tenets of modern hinduism,

> "Peor his other name, when he enticed
> "Israel in Sittim, on their march from Nile."

—*Tod's Rajasthan, Vol.* i, *p.* 76; *Paradise Lost, Book I.*

SOLO, or Sulo archipelago. North-eastern Indonesia comprises Formosa to the Solo Archipelago and Mindanao, all included, and embracing the Philippine and Bisayan groups, &c. From all historic times uninterruptedly to the present day, the sea basins whose ethnic influence has been in operation, are the China, Malacca, Java, Mangkasar, Solo, Mindoro, Molucca, Banda, Papua, Jilolo, Papuan, Papua Australian and Papua Micronesian seas, and the Archipelagian seas of Johore, the Trans-Javan or Timorean chain, the Bisayan group, the Moluccas, Eastern Melanesia and the different Polynesian and Micronesian groups. All of these are broad highways throughout the Archipelago, permit foreign navigators and the natives of the islands to traverse them freely and permit of constant intercourse with the rivers on the continent, thereby bringing the whole under the operation of foreign civilizations, and, opening as they do into each other, they are as broad highways traversing the whole Archipelago in different directions, and uniting it, both for foreign navigators and for the more advanced and enterprising of its native communities. The most important ocean stream of the western pacific is the Great Solo, which winds through a course of 356 miles, though traversing only 140 miles from its rise to the sea. Along the waters are floated flat-bottomed boats, bearing from 5 to 200 tons; some of them well-built, and furnished with cabins. Solo, or Sulu, is an island of the Sulu Archipelago. Sooloo equals Cagayan in beauty, surpasses it in the cultivated richness of its slopes, while an improved magnificence is communicated to it from the mountains in the interior. Its length, from east to west, is about ten leagues, and its breadth four. There is a good sprinkling on the sea of fishing and trading boats of picturesque build and rig. In 1775, the Sooloo people attacked and drove the British from Balambangan. Sooloo had, even then, long been an emporium not only of regular traders from most nations, but the head-quarters of piratical marauders who there found a ready market for enslaved victims and heterogeneous plunder, and whose descendants, to this day, are both proud and emulous of the deeds of their ancestors.—*Keppel's Indian Archipelago, Vol.* i, *pp.* 56-57. See India.

SOLOR, is an island lying to the east of Flores and to the north of Timor, under which presidency it is placed. The inhabitants of the coast of this island are mahomedans in name, but they are nevertheless hard arrack-drinkers, and gain their livelihood by fishing, the produce of which they exchange with the mountaineers for maize, the production of the ground, which the population cultivate for their subsistence, the soil there being of too volcanic a nature to grow rice. These inhabitants of the shore are hardy mariners and fishers, and think nothing of approaching the whale with their little boats, eight feet long, to attack the unwieldy monster and tow him to the shore. The village which most applies itself to the whale fishery is Lamakera on the north-east part of the island of Solor, and lying within the Strait. It is the largest, most prosperous and most populous. The four other mahomedan villages are Layayong, Andanara, Lamahala and Trong, of which the three last are situated on the island Andanara. The coast tribes of Solor are remarkable for their skill in managing their prahu and canoes, and are the most expert fishermen in these seas, frequently capturing the black-fish, a small variety of the cachalot, or sperm-whale, which no other fishermen in these seas will venture to attack. The blubber or fat obtained from them is used as food, and also as an article of barter with the inland inhabitants; and the oil and spermaceti is sometimes disposed off to the Bughi and Macassar traders, who prefer it to cocoanut-oil for burning in their prahus. Several Solor fishermen are always to be found at Coepang, the Dutch settlement on Timor, chiefly in the service of government, from whom they obtain a fixed allowance of rice and maize. These men, who are relieved by others every year, are sent in compliance with an old treaty, by which the coast natives of Solor agreed to furnish an annual quota of men for the public service. As all the youths have to take their turn, the system makes them accustomed to intercourse with Europeans, and is attended with very beneficial results.—*Journ. of the Ind. Arch., No.* xii, *Dec.* 1850, *pp.* 766-767; *Mr. Earl.* See Archipelago, India, Timor, Laut.

SOLOTO, Rus. Gold.

SOLTYKOFF, Prince, a Russian noble who travelled in India in 1841, and wrote Voyage dans l'Indie.

SOLV, Dan. Silver.

SOLUNKI, a Rajput tribe, see Khatri, Rajput, Solanki.

SOM, Beng. Sarcostemma viminialis.

SOM, also Sum, Ar. Allium sativum, *Linn.* Garlic.

SOMA, the juice of the moon plant, Sarcostemma viminialis, an intoxicating drink offered by the ancient hindoos to their gods:

The gods themselves with pleasure feel
King Soma's influence o'er them steal;
And Indra once, as bards have told,
Thus sang in merry mood of old.
This Soma is a god; he cures
The sharpest ills that man endures.
He heals the sick, the sad he cheers,
He nerves the weak, dispels their fears,
The faint with martial ardour fires,
With lofty thoughts the bard inspires,
The soul from earth to heaven he lifts;—
So great and wondrous are his gifts.
Men feel the god within their veins,
And cry in loud exulting strains;
“ We've quaffed the Soma bright,
“ And are immortal grown;
“ We've entered into light,
“ And all the gods have known.
“ What mortal now can harm,
“ Or foeman vex us more?
“ Through thee beyond alarm
'Immortal god we soar.”

Thus personified the Soma god, bears a certain analogy to the Greek Dionysus. The two verses above are a nearly literal translation of Rigveda, viii, 48, 3. The Soma plant of the Vedas is the Sarcostigma brevistigma, *W. & A.* It derives its name from the circumstance that it was gathered by moon-light. An intoxicating beverage was brewed or distilled from it. The Rig Veda, ix, says, The purifying Soma, like the sea rolling its waves, has poured forth songs and hymns and thoughts.”

It was gathered by moonlight, hence its name from Soma, Sans., the moon, and carried to their homes on carts drawn by rams, and a fermented liquor was prepared by mixing its juice, strained through a sieve of goat's hair, with barley and clarified butter or ghee. This beer or wine was used at all their religious festivals, and was used by the rishis, at their meals. The Soma sacrifice was an ancient Aryan rite, a sacrifice to Indra (Zeus). It was an intoxicating potion, consisting of fermented juice of plants mixed with milk. The Soma juice and its effects is repeatedly mentioned in the Vedas, (Vol. i, pp. 21, 139, Vol. ii, pp. 169, 233 and 260; and Vol. iii, p. 470. Indra, according to Bunsen, (iii, 587, 8, iv, 459), is the prototype of Zeus, and was a personification of ether. Soma was offered to him in sacrifice. The leafless asclepiad Sarcostemma viminialis, has white flowers in terminal umbels, which appear during the rains in the Dekhan. The Soma juice was the oblation, or libation, of the Vedic worship and the Homa of the Parsi; and allusions to it, are met with in almost every page, of the Vedas. The use of the Soma in their worship seems sufficient to indicate the original country of the Arians. Drinking the juice of the plant is a holy ceremony, to which constant allusion is made in the Vedas, and not unfrequently in Manu. Prof. H. H. Wilson (Introduction to the Rig-veda, p.36) says, “The great importance attached to the juice of this plant is a singular part of the ancient hindoo ritual. Almost the whole of the Soma-veda is devoted to its eulogy, and this is no doubt little more than a repetition of the Soma-mandala of the Rich Veda. The only explanation of which it is susceptible is the delight which the discovery of the exhilarating properties of the fermented juice of the plant must have excited in simple minds on first becoming acquainted with its effects.” The veneration of the Soma-plant does not appear to have proceeded from any worship of the moon or *planets, which are not, like* the sun, objects of special adoration in the Veda. The Soma is mentioned in the following passages of Manu, iii, 85, 158, 180, 197, 257 ; v, 96 ; vii, 7 ; ix, 129 ; x, 88 ; xi, 7, 12. All the ancestors of the brahmans are styled Soma-pa, 'moon-plant drinkers.'—*Bunsen's Egypt* ; *Budha-vara, Wednesday, p.* 6. Rig-Veda ; *William's Story of Nala, pp.* 247–8. See Budh, Chandra, Gayatri, Graha, Hindoo, India, Rajput, Solar Line, Lunar Line.

SOMA, or Chandra, the Moon : Budd'ha is one of the names of Mercury—also a godhead, also the founder of a religious sect, which is followed in different parts of India, and in all China. The epoch of the institution of Buddha's religion is referred to the year 540 before Christ. According to hindoo mythologies, one Buddha was the son of Soma (the Moon) and the head of a dynasty, called on that account, the Lunar line of princes. He flourished in the beginning of the Treta yug. Modern commentators place his birth in the year 1424 before Christ.

SOMA DEVA BHATTA of Kashmir, collected the popular stories current in his time and published them towards the beginning of the twelfth century under the title of Katha-sarit-sagara, the Ocean of the Rivers of Stories.

SOMAJH, From the religious septicism which is the most remarkable result of western education in British India, has sprung a sect of free-thinkers, among the more thoughtful and earnest of the hindoos, which, from the great progress it is making and the high character of its morality, bids fair to become a power destined to have a great influence over the future of educated India. Thinking men cannot rest in mere barren disbelief, but must carve out for themselves some system which, either from its intellectual charms, or its apparent suitability for enabling a man to find some moral rest among the difficult problems of human existence, will command at least their passive submission if not their active love. Just such a system of high but barren morality, well-fitted for the intellectual, forgetting and scorning the ignorant, has, under the name of Brahmoism or the Somaj, taken the place of the old Puranic superstition in the minds of the educated Bengalee people The Brahmo society resembles in its organization of preachers, members and hearers, the various sects of christians. They eschew idolatry in every form, build chapels on the model of a christian church, and except that the Bible is seldom referred to and Christ is only treated as a great and good man, would seem to be *an Indian form of a christian community.* They have fixed paid ministers, lay itinerating agents who receive no salary for their labour of love, and now have adopted the missionary agency of the European churches; the committee of the Calcutta Brahmo Somaj determined to send out a few trained missionaries for the propagation of theism. The chief difficulty they had to contend with so long, was the general unwillingness of devout Brahmos to accept a farthing from the funds of the church. To meet their conscientious scruples the president of the Somaj undertook to offer special contributions from his own pocket for that object. This arrangement, however, will not affect the gratuitous character of Brahmic ministration. The work of ministration will continue to be, as heretofore, a labour of love ; intelligent and pious men, destitute of means of livelihood, will be selected and employed on moderate pay for the propagation of Brahmic knowledge and worship. About the year 1870 the society had, as members, the most energetic, well-informed, and respected of their countrymen, many of them being men of high social position and great wealth. Sadagopah Charloo of Madras though outwardly a strict hindoo, mentally believed in something far higher and purer than the superstition of the masses around, and took refuge in what in Southern India is called Vedantism, which pretends to extract from hindoo fables a clear and worthy idea of God, and of the relation that man ought to hold towards him. This Vedantism only stopped one step short of Brahmoism at present, though it is one of the steps through which the latter has gone. The founder of the Brahmo Somaj was Rammohun Roy, a man of great abilities. He studied the Vedas in Sanscrit, the Koran in the Arabic, and the Bible in the original Greek and Hebrew. The result was that he became a believer in one great and pure God, whose will was revealed in the Vedas, but was most easily explained and illustrated in the Bible, which, though not the most sacred, was incomparably the most elevated in its relation to man. Hence he abjured hindooism in its modern form, with all idolatry and polytheism ; and, while publishing a book entitled 'The precepts of Jesus the guide to Happiness,' gave his assent to the Vedas as his religious guide. With wonderful industry and energy he then endeavoured to propagate his new faith, and for this purpose translated all the more religious portions of the Vedas into Bengalee, deliberately entering on the path of the reformer much in the same spirit as did Wyckliffe in England. His desire was to bring the people back to the pure faith of their ancestors, which had been corrupted by a hundred generations of brahminical forgeries. Wherever he went his faith was the theme of his course, while his house was a centre of discussion with all who chose to come. His energy and zeal were, however, lost upon his countrymen, who could not understand such feelings. Strange to say, however, he was more successful with Europeans and, by degrees, gathered round him a little circle of believers in the divinity of the Vedas, and purely human character of the Bible. Stranger still, one of his first converts was a missionary named Adams, who was for some years the high priest of the party, under the presiding genius of Rammohun Roy. According to Dr. Duff, to whom we are indebted for much of our knowledge of this sect, their first place of meeting was the office of the 'Harkaru,' newspaper, whose editor, we presume, was one of the initiated. Thus matters went on for some years with but little change. They called themselves "the Unitarian Church of Calcutta," and, when Rammohun Roy went to England, he was on the strength of this title, received by the Unitarians as a brother ; while most persons looked upon him as a christian, though of an heterodox section. The only bond between him and the English Unitarians, however, was one which mahomedans and many others might claim as common to them ; for in every other respect, except his belief in the unity of God, Rammohun Roy was altogether opposed to those of the same denomination of Britain. As time passed on the Somaj altered its character. Its European adherents fell away or went home, and in their place came, about the year 1840, a large influx of hindoo disciples. The sceptical movement had in the minds of the more thoughtful of the alumni of the Calcutta High School, gone through its cycle. Infidelity had found its need of something to believe—something to satisfy the craving of the mind for rest and peace. Hence, when Rammohun Roy came before them with his plausible scheme of vedantic purity, and asking from them nothing in the way of superstition or conformity with the debasing ceremonial of the hindoo religion, balting his views by their apparent return to the religion of their ancestors, they came to him in crowds. Debendra Nath Tagore, who joined in 1839, was, however, the first well-known man who openly adhered to the new school ; and it is only from this date that we can speak of the Somaj as an important institution. They now went fully into the cause of progress. The 'Indian Mirror', the best native paper in India, was established as the organ of the society, and by its moderation and ability it did much to extend its principles. Branch churches and good schools were now opened in different parts of Calcutta to catch both old and young, and the society turned the critical point of its existence, coming to the present time on a flowing tide. See Brahmo, Hindoo, Rammohun Rai.

SOMA LATA, Tel. Sarcostemma acidum, *Voigt.*

SOMAL or Beer-us-Somal, the country of the Somali, to the south of Cape Guardafui, an account of which, and of its inhabitants, was given in Lond. Geo. Trans. The Somali country lies between the equator and the 11th degree of north latitude, is high in the north, and on the west is separated from the Galla nations by the river Jub, a large and fertilising stream which rises in the mountains of Southern Abyssinia and debouches in the Indian Ocean. Capt. Speke states that the Somali are the descendants of a band of mahomedans who were driven from Mekka in A. D. 1413, and crossed over to their present site, from which the Galla and Abyssinians were subsequently dispossessed. Those at Aden are of a mixed race ; tall, slender, light and agile, with thin lips, Grecian noses, but curly woolly hair. They are boisterous and warlike. The Somali people in their own land are wandering pastorals, but have settled villages on the coast line with a patriarchal government. There are no ceremonies on birth-occasions, and no purification of women amongst these people. In the case of abortion or of a still-born child they say, "he hath returned," that is to say, to home, in earth. When the mother perishes in child-birth, the parents claim a certain sum from "the man that killed their daughter." Neither on the continent nor at Zanzibar do they bind with cloth the head of the new-born babe. Twins, here called Wapacha, and by the Arabs of Zanzibar Shukul, are usually sold or exposed in the jungle as amongst the Ibos of West Africa. If the child die, an animal is killed for a general feast, and in some tribes the mother does a kind of penance. Seated outside the village, she is smeared with fat and flour, and exposed to the derision of people who surround her, hooting and mocking with offensive jests and gestures. To guard against this calamity the Wazaramo and other tribes are in the habit of vowing that the babe shall not be shaved till manhood, and the mother wears a number of talismans, bits of wood tied with a thong of snake's skin, round her neck, and beads of different shapes round her head. When carrying her offspring, which she rarely leaves alone, she bears in her hand what is technically called a kirangozi, a "guide" or "guardian," in the form of two sticks a few inches in length, bound with bands of parti-coloured beads. This article, made by the Mganga or medicine-man, is placed at night under the child's head, and is carried about till it has passed the first stage of life. The kirangozi is intended to guard the treasure against the malevolent spirits of the dead ; that almost universal superstition, the Evil Eye, though an article of faith amongst the Arabs, the Wa-sawahili, and the Wa-mrima, is unknown to the inner heathen. A name is given to the child without other celebration than a debauch with pombe. This will sometimes occur at the birth of a male when he is wanted. The East Africans, having few national prejudices, are fond of calling their children after Arabs and other strangers ; they will even pay a sheep for the loan of a merchant's name. There must be many hundred Sayyid Said and Sayyid Majid now in the country ; and as, during the eighteen months' peregrination of the East African Expedition, every child born on and near the great trunk line was called Mhzungu—the "white"—the Englishman has also left his mark in the land. The period of ablactation, as in South Africa, is prolonged to the second or third year : which may account, in part, for the healthiness of the young and the almost total absence of debility and deformity ? Indeed, the nearest approach to the latter is the unsightly protrusion of the umbilical region, sometimes to the extent of several inches, owing to ignorance of proper treatment ; but, though conspicuous in childhood, it disappears after puberty. Women retain the power of suckling their children to a late age, even when they appear withered grandames. Until the child can walk without danger, it is carried by the mother, not on the hip, as in Asia, but on the bare back for warmth, a sheet or skin being passed over it and fastened at the parent's breast. Even in infancy it clings like a young simiad, and the peculiar formation of the African race renders the position easier by providing a kind of seat upon which it subsides ; the only part of the body exposed to view is the little cocoanut head, with the small, round, beady black eyes in a state of everlasting stare. Finally, the "kigogo," or child who cuts the two upper incisors before the lower, is either put to death, or is given away or sold to the slave-merchant, under the impression that it will bring disease, calamity, and death into the household. The Wa-Sawahili and the Zanzibar Arabs have the same impressions : the former kill the child ; the latter, after Khatmah or perfection of the Koran, make it swear by nodding its head, if unable to articulate, that it will not injure those about it. Even in Europe, it may be remembered, the old prejudice against children born with teeth is not wholly forgotten. The Somali are a purely nomadic race, totally unacquainted with agriculture, and subsisting chiefly on the produce of their inexhaustible flocks and herds. They trade in sheep, cattle, ponies, ghee, gums, hides, &c., which they bring from the interior to the great annual fairs held at Berbera and other places on their coast, or themselves bring to Aden during the north-east monsoon. At other seasons, when the sea is too dangerous for their small craft to venture across, they proceed inland to tend to their flocks, and collect gum, myrrh, ostrich feathers, ivory, &c., for the next season's trading. They are a good-tempered, though lazy and indolent race, but easily excited to anger ; on which account, in Aden, they cannot even be trusted to carry sticks. In their own country they are much addicted to plunder ; in Aden they are inveterate thieves and gamblers, and require to be watched with the greatest care. In person they are handsome, active, and long-limbed ; of a purely Caucasian caste of features, capable of undergoing great privation and fatigue, but not easily induced to engage in hard manual labour ; nevertheless some, tempted by high wages, take employment as out-door servants, and on board the coal vessels in the harbour. Their personal appearance is not unfrequently rendered extremely grotesque, from their habit of staining the hair of a red colour, and teazing it out into a woolly mass ; but their carriage is always graceful, and the drapery of their dress picturesque. Dr. Latham considers the Somali tribes as a member of the Galla or Ilmormo family, and this term to be the same as Suwahili and Sofala. The term Suwahili is doubtless from the Arabic plural, Suahil, Sea-coasts, whatever that of Somali may mean, though these are also dwellers on the coast, from a little to the south of Babel-Mandeb. In 1827, a British vessel trading at Berbera was attacked and plundered by the Habr Owul tribe of Somalee. Berbera is a port to the east of Zaila and Tajowra and nearly opposite to Aden. In consequence of unhealthy winds it is deserted for six months every year. During the rest of the year it is visited by caravans of different tribes from the interior of Africa. A vessel of war was sent to punish the tribe for the outrage which they had committed. On 6th February 1827 a treaty of peace and commerce was signed by the elders of the tribe. An expedition was sent in 1854 to explore the country between Berbera and Zanzibar. On the 18th April 1855 the party were suddenly attacked by Somalee of the El Moosa tribe; two British officers were wounded, one was killed, and the entire property of the expedition was carried off. The murderers were not delivered up but a treaty was entered into. In 1855 the elders of the Habr Gerhagi and the Habr Taljala tribes of Somalee entered into an engagement with the Political Resident at Aden to prohibit the slave trade.

The following are the chief of the Somali mammalia.

Canis variegatus, Ruppell. "The Somali Jackal." He carries off kids and lambs, rather disdaining garbage ; and unless driven away by dogs, he is capable of doing great damage to the flocks. The Somali call him Dowao.

Hyæna crocuta ? (Erxleben), var. ? Bright fulvous hyæna, with dark spots not very distinct, and a black tail-tip: probably of the race termed H. crocuta rufa by Fischer, and which Dr. Gray refers to H. brunnea, *Thunberg* (H. rufa, *Cuv.* and H. fusca, *Geoffroy*). This name more probably refers to the specimen in the Paris Museum described by Cuvier, Oss, Foss, vii, 318 (4th edition), and which is evidently H. villosa, *A. Smith* (Lin. Trans., xv, pt 1, 461) from South Africa (Port Natal); but which is not the 'Strand Wolf' of the Cape colonists (who term the common spotted hyæna the 'Tiger Wolf') or H. villosa, *A. Smith*, which Dr. Gray considers to be a S. African variety of H. striata, *Zimmerman*, the common striped hyæna of Asia and N. Africa. H. villosa is a distinct species, nearly affined to H. striata, but with the solitary true molar less developed, though more so than in H. crocuta. Vide also Cuvier, *Oss, Foss*, vii, 319 (4th edit.) Dr. Gray even institutes a genus Crocuta, to which he refers as species C. maculata (Canis crocuta, *Erxleben*, Hyæna maculata, *Humb.*, v. H. capensis, *Desmarest*), the ordinary spotted hyæna, and C. brunnea (with synonymes as before cited). The Somali animal is probably the latter. The Somali call it Waraba, or "Durwa." It is common to all the Somali country, whines about the camp all night, and devours anything it can find during the day, pulling down camels and even children. The natives have many superstitions about this animal, and a man is often called Waraba after his proper name, the idea being that by rubbing certain plants over the body the magician can convert himself like Mars into a wolf. In the cold season when the Waraba is hungry he attacks man. The Somali all declare this animal to be a hermaphrodite. (Vide *Pliny*, viii, 30; as cited by Cuvier, *Oss, Foss*, vii, 312, 4th edit.)

Mungos fasciatus ; Herpestes fasciatus, *Desmarest*: Viverra mungo, *Kæmpfer*; V. ichneumon, *Schreber* (from *Buffon*, iii, *t.* 19); H. zebra, *Ruppell*; Ryzæna suricata apud Children, (Appendix to Clapperton's Travels), called the kadaf. These animals run about in large batches, and defend themselves savagely when wounded. They inhabit the plateau, burrow deep, and when pursued endeavour to escape by hiding themselves: yet with characteristic curiosity, they must peep out of their asylum after a few minutes' concealment.

Felis caracal, Schreber, called by the Somali 'Jumbul,' is principally found in the plains.

Xerus rutilans ; Sciurus rutilans, *Ruppell*: X. brachyotus, *Hemprich* and *Ehrenberg*, apud Gray ; Ground squirrel, called Dabakalla. It abounds all over the country, burrows especially into deserted ant-hills and under dead trees. The testes of the male are enormous ; and the colour of the coat is glossy and brilliant.

Pectinator Spekei, Blyth, 'Common rat, Barabdubl. Inhabits stony ground, like the Hyrax.' This highly interesting rodent belongs to a peculiar N. African group, of which one species only appears hitherto be tolerably known, the Ctenodactylus massonii, *Gray.*, a notice of the anatomy of this animal, was given by Mr. Yarrell, in *Proc. Zool. Soc.*, 1831, *p.* 49. A second species would seem to exist in the Mus gundi, *Rothman*, or Gundi marmot of *Pennant's* 'Zoology,' which, being described to be of the "size of a small rabit," and of a "testaceous-red colour" can scarcely (as remarked by Dr. Gray) be specifically identical with Ct. massonii, even though from the same country, Barbary. The fur of Ct. massonii is pale yellowish-brown ; and its tail is described by Mr. Yarrell to be one inch long. The Gundi is merely stated to have a "short tail." Accordingly, the following (obviously another of the same group and region), with rudimentary tail "but just perceptible to the touch," is probably a third species, which was observed by Captain Lyon in the mountains north of Tripoli. That traveller informs us, that, it much resembles a Guinea-pig in form, but is of a light brown mouse-colour. Fur longer than that of a rat, and very silky ; eyes black, large and prominent. Orifices of ears, which are quite flat against the sides of the head, also black, and free from hair ; the tail, or rather a little stump in place of one, is just perceptible by the touch, and from it grows a tuft or bunch of long black hairs. The body is very round and fat, and particularly broad at the shoulders. These animals burrow amongst the rocks. They are eaten with great relish by the natives, and no doubt are very good, *as the flesh is exceedingly white and fat, and resembles that of a rabbit. The animals of this group are clad with delicately* soft fur, have very long moustaches, and four toes only on each foot. The palms and soles are naked, the latter to the heel or tarsal joint; and the entire length of the tarse is brought to the ground when walking. Over each claw is a curving tuft of stiffish bristles, more conspicuously developed on the hind-feet; and the innermost toe of the hind-foot has a peculiar combing apparatus, which has been described by Mr. Yarrell in the instance of Ctenodactylus massonii. "With this comb-like instrument," remarks that naturalist "the little animals were observed [in the London Zoological garden] to be continually dressing their soft fur; and the facility with which they managed to reach every part of each lateral half with the toe of the foot on that side, as well as the rapidity of the motion, were very remarkable." The muzzle is completely furred; and the rudimentary or short tail is furnished with long hair (as in the Sciuridæ). The rodential tusks are narrow and rounded; and in Ctenodactylus there are only three molars on each side above and below, and which are surrounded with enamel, the upper having one deep indentation externally, the lower being indented on both sides. In the new genus there is a small and simple fourth molar anteriorly above and below: and the next to it above is smaller than the third and fourth, and seems to have no distinct indentation (the molars being, however, much worn away by attrition in the specimen examined). The lower jaw of Pectinator is very remarkable for showing no indication even of a coronoid process; a fact not mentioned by Mr. Yarrell in his description of the anatomy of Ctenodactylus. The condyle is small, and articulates on a level with the crowns of the molars. The auditory bullæ are remarkably large and are seen from above (as in Chinchilla.) The antiorbital foramen is large. Palate contracted, narrowing to the front; and the post-palatal emargination is continued forward to a line with the middle of the last molar; externally, Pectinator is distinguished from Ctenodactylus by having the tail and ear-conch well-developed, a smaller eye; and apparently a general adaptation for more diurnal and less fossorial habits. The eyes are scarcely so large as in a common rat. The auricles are broadly ovoid, subnude, with a fringe of whitish hairs on their anterior margin, and a patch of dense whitish fur at base on their outer surface. Length of P. spekei, from nose to base of tail, about 6 inches; and tail probably 2¼ inches; or with hair 3¼ inches; *Tarse with toes* 1⅜ inches. Auricle (measured *posteriorly*) ½ inch. *The skull measures* 1⅞ inches in *length* and $1\frac{1}{16}$ inch in greatest breadth (at the zygomata posteriorly); between the orbits somewhat exceeding ½ inch. Fur, soft and moderately long, of a sandy grey-brown colour, slightly washed with rufous especially on the crown; the basal half of the piles pale dusky: at the nates, the fur is more dense and woolly, and rufescent-whitish or pale isabelline: the moustaches are chiefly black, and the longest of them measure about 3 inches; the hairs upon the tail are shorter towards its base, then lengthened as in the squirrels; these long hairs being of a sullied or isabella white for the basal half, and then black with a white tip: hence, in the living animal, the bushy tail would appear whitish along its middle, with broad black lateral and longitudinal bands, which again are fringed externally with dull white: hairs upon the feet whitish, the tufts or brushes over and impending the kind-claws showing conspicuously: the combing apparatus of the innermost hind-toe consists of some exceedingly harsh and stiff short bristles immediately impending (but shorter than) the claw, and above these again are some equally short bristles which are not quite so rigid; over which is finally the long incurved tuft of finer bristles, the lowermost of which are shorter and more rigid than the upper: on the next toe the same remarkable structure is seen, and more easily felt, but is considerably less developed. This discovery of a second generic form of a peculiar group, hitherto represented only by Ctenodactylus (which has long stood quite isolated among other Rodentia), will be hailed with some satisfaction by those who have paid attention to the classification of the order, and will tend to remove such doubts as may exist of the propriety of recognising this as a separate family (however limited, according to present knowledge), about equivalent to the Chinchillidæ of South America, to which, upon the whole, the Pectinatoridæ would seem to be more nearly affined than to any other known form. It is highly probable, however, that more species and even generic forms remain to be discovered of this peculiarly African family; and that it will prove to be at least as extensive as the Chinchillidæ; and perhaps that even Petromys should be admitted within its extreme confines. Capt. Lyon's Tripoli animal, with tail reduced to a mere tubercle, is certainly one species which has not yet been scientifically examined; and the Gundi marmot of Pennant is probably another: but these little mouse-coloured rodents seldom attract the attention of unscientific collectors ; unless, indeed, it should so happen that their attention had been especially directed to them.

Hyrax habessinicus, Hemprich and Ehrenberg : Ashkoko of the Appendix to Bruce's Travels ; recognised as a distinct species by Dr. Gray ; but referred by Dr. Ruppell to H. damar, *Cuvier, v.* syriacus of *Schreber.* Half-grown specimen. "The Somal call it Bauni. It inhabits rocky ground and delights in sunning itself, running about the rocks, and living in chinks and holes. Neither Lt. Speke nor I ever saw it in the plains. The Arabs here eat it, but the Somal do not.

Gazelle —— ? Heads of male and female, of one of the several species which have been more, or less confounded under G. dorcas ; and quite distinct from the common Aden Gazelle, which is frequently brought alive to Calcutta. One marked peculiarity consists in the ears being of an ash-grey colour, contrasting strongly with the hue of the neck and doubtless also of the body. Horns robust, curved backward and then upward, and diverging but slightly ; much longer, and with the annuli wider apart, than in the Aden Gazelle, though the animal would seem to be of the same size. The horns of the female are very much stouter than we have seen in any other female Gazelle, and follow the same curve as in the male, having rudimentary annuli. Muzzle whitish, with a strongly contrasting black nose-patch. The society possesses a species of Gazelle (habitat uncertain), which much resembles the Aden Gazelle except in being considerably larger, with proportionally longer and more distantly knobbed horns, much as in the present race : but both of these have the ears rufescent and not ashy. At present, we are far from being satisfied with the manner in which Dr. Gray has brought together sundry of these affined races of Gazelle, in the Proc. Zool. Soc. for June 11th, 1850. (Ann. Mag. N. H., viii, 1851, p. 131). It seems like cutting rather than unravelling of the tangled knot. Lt. Burton writes—"A kind of Gazelle called by the people Dera, as you may observe that there is an elevation of loose replicated skin upon the nose. It seems to live during the dry season without water, and affects the desert, not being very shy in presence of man, but avoiding jungle. They are found in flocks."

Madoqua saltiana ; Antilope saltiana, *Blainville* ; A. madoqua, *H. Smith.* A beautiful skin of a male ; and heads of two other males and of a female. This little antelope is called Sagaro, by the Somal ; Beni Israel in Abyssinia ; and Ghazalak by the Arabs. It abounds throughout the country generally in pairs, and is fond of ravines under hills, the beds of nullahs, and patches of desert vegetation. In the northern Somali country, these antelopes are caught in snares : elsewhere they are run down on foot, taking half a day on account of their great swiftness. The jackal (Canis variegatus) cannot catch them. They sleep by day under the trees ; and in the plains their dung (which becomes peculiarly fœtid with a musky odour in the sun) is found in heaps as if they assembled for that purpose. Many animals resort habitually to one place to deposit their dung ; among them the Indian rhinoceros, which in the Rajmahal hills is watched for and shot by the natives at such places ; and the Indian four-horned antelope exhibits the same propensity, when tame and loose in a large enclosure.

Oreotragus saltatrix ; Antilope oreotragus, *Forster* : A. saltatrix, *Boddœrt.* The 'Klip springer' of the Cape colonists. A kind of antelope called Alakrut. They live in the higher ranges of the mountains, only in pairs, and are not unlike the musk-deer in coat. They are by no means shy, seldom flying before the foot-fall is heard. They hop in an awkward manner on the points of the hoof at no great pace or distance at a time. The people of the country prize the venison.—*Treaties, Engagements and Sunnuds, Vol.* vii, *p.* 319 ; *Mr. Blyth in Beng. As. Soc. Jour., Vol.* iv, 1855, *Specimens sent by Capt. Burton from Somali country.*

SONALU, Beng. Cathartocarpus fistula, *Pers.*

SOMANATH, or Deo Puttun, also called Puttun Somanath or Somnath Puttun, is a town with a temple of great sanctity in the south of Guzerat ; its gates were carried away by Mahmud of Ghuzni, in 1024 and brought back from Affghanistan in 1843 by the British troops. Somanatha or Someswara, is the name of the type of Siva. The temple of the idol, was supported by 56 pillars in rows, the idol was of polished stone, about five cubits high, of proportionate thickness, and two cubits were below ground. Mahmud took the place by storm, and himself entering the temple he broke the lingum with a heavy mace. Some of the fragments he conveyed to Ghuzni and they were placed at the door of the great mosque. One portion brought back by the English soldiers, after the Affghan war, in 1842, was offered to the temple by Lord Ellenborough but the offer was not accepted. This idol is related to have been brought to India from the Kaaba, on the advent of Mahomed ; brahminical records, however, refer it to the time of Krishna. The Somanath idol, in fact, was one of the twelve great lingums then set up in various parts of India, several of which were destroyed by the early mahomedan conquerors. It seems established that the worship of Siva, under this type prevailed throughout India at least as early as the 5th or 6th century. When the Somnath temple was plundered by Mahmud of Ghazni in A. D. 1024, Byram deo, (Brahma deva) of Guzerat was deposed. The temple stood in the country of Soreth ; a province of the peninsula of Guzerat, which is now more generally known under the name of Kattywar; and which is celebrated in the Puranas for containing five inestimable blessings. First, the river Goomtee ; second, beautiful women ; third, good horses ; fourth, Somnath; and fifth, Dwaraka. Among the many places in Soreth that are held sacred by the hindoos, Somnath or Somnath Pattan, as it is more generally termed, has always been one of the most remarkable. It stands one or two miles from the sea, at the junction of three rivers, the Hurna, Kupula, and Sersutty, at a distance of three miles to the east of the port of Belawul. The idol itself, " Somnath, is one of the twelve symbols of Mahadeo, which are said by hindoos to have descended from heaven to the earth. The holy image was, according to mahomedan authors, destroyed by Mahmud, but in late years Ahela Bhai, the widow of a prince of the Mahratta family of Holkar, erected a new temple on the exact site of that which was demolished. A symbol of mahadeo has been placed in this temple, which is deemed peculiarly propitious to those who desire offspring ; not far from this, the hindoo pilgrim is shown a solitary peepul tree, on the bank of the Sersutty river, which he is assured stands on the exact spot where the Sri Krishen received the mortal wound from an arrow that terminated his incarnation. Mahmud left Ghuzni, on his expedition against Somnath, in September A. D. 1024 ; his numerous army was accompanied by crowds of volunteers, the flower of the south of Turkistan. Ajmir and Auhilwara fell before him. Advancing against Somnath, for two days, his most devoted followers were beaten headlong back by the valour of the Rajputs, fighting for hearth and altar. On the third day, Mahmud led a furious charge in person, five thousand hindoos lay dead and the day was won. When he entered the shrine of Som Iswara, he beheld a superb edifice of hewn stone, its lofty roof supported by pillars curiously carved and set with precious stones. In the adytum, to which no external light penetrated and which was illuminated only by a lamp suspended from the centre by a golden chain, appeared the symbol of Som-Iswara, a stone cylinder which rose nine feet in height above the floor of the temple and penetrated six feet below it. Two fragments of this object of idolatrous worship were, at the king's order, taken that one might be thrown at the threshold of the public mosque and the other at the court gate of his own palace of Ghuzni. Other fragments were reserved to grace the holy cities of Mecca and Medina. While Mahmud was thus employed a crowd of brahmans offered an enormous ransom if the king would desist from further mutilation :—Mahmud hesitated : but after a moment's pause, he exclaimed that he would be known by posterity not as the idol-seller but as the destroyer. The work of destruction then continued and was rewarded by the discovery in the vaults below the adytum of untold treasures. Thus fell Somnath. Its gates were taken to the mosque of Ghuzni from which they were removed when the British troops returned from the occupation of that country in 1842. On this occasion, Lord Ellenborough issued the following notice in the form of a Proclamation from the Governor-General to all the princes and chiefs and people of India :—My brothers and friends,—Our victorious army bears the gates of the temple of Somnath in triumph from Affghanistan, and the despoiled tomb of Sultan Mahmud looks upon the ruins of Ghuznee. The insult of 800 years is at last avenged. The gates of the temple of Somnath, so long the memorial of your humiliation, are become the proudest record of your national glory—the proof of your superiority in arms over the nations beyond the Indus. To you, princes and chiefs of Sirhind, of Rajwarra, of Malwa, and Guzerat, I shall commit this glorious trophy of successful war. You will, yourselves, with all honour, transmit the gates of sandalwood through your respective territories, to the restored temple of Somnath. The chiefs of Sirhind shall be informed at what time our victorious army will first deliver the gates of the temple into their guardianship, at the foot of the bridge of the Sutlej. My brothers and friends,—I have ever relied with confidence upon your attachment to the British Government. You see how worthy it proves itself of your love, when, regarding your honour as its own, it exerts the power of its arms to restore to you the gates of the temple of Somnath so long the memorial of your subjection to the Affghans. For myself, identified with you in interest and in feeling, I regard with all your own enthusiasm the high achievements of that heroic army, reflecting alike immortal honor upon my native and upon my adopted country. To preserve and to improve the happy union of our two countries, necessary as it is to the welfare of both, is the constant object of my thoughts. Upon that union depends the security of every ally, as well as of every subject, of the British government, from the miseries whereby, in former times, India was afflicted ; through that alone has our army now waved its triumphant standards over the ruins of Ghuznee, and planted them upon the Bala Hissar of Cabul. May that good Providence, which has hitherto so manifestly protected me, still extend to me its favour, that I may so use the power now intrusted to my hands, as to advance your prosperity and secure your happiness, by placing the union of our two countries upon foundations which may render it eternal. But the gates never reached their destination. Public opinion stopped them en-route. Some of the fragments of the lingum were conveyed to Ghuzni and placed at the door of the great mosque. One portion brought back by the British army after the Affghan war, in 1842, was offered to the temple by Lord Ellenborough, but was not accepted. When Somnath temple was plundered by Mahmud in A. D. 1024, Byram deo (Brahma deva) of Guzerat was deposed. Captain Postans says, the situation of this great fane of hinduism, is as imposing as it is itself magnificent, as a structure of other times. Crowning a bold promontory, the thundering and eternal surges lash the walls which protect it, and a wild expanse of ocean begirts the cliff on which it stands. The exterior is richly adorned with finely-chiselled sculpture, on which, unfortunately, the wing of time has not flapped harmless or the alternation of seasons left untouched. There is nothing in the vedas, puranas and other brahminical text-books, to illustrate the origin and history of the Somnath temple. The earliest notice that we possess of Somnath is contained in the brief account of the successful campaign of Mahmud of Ghuzni. According to Ferishta the fortified city of Somnath was situated on a narrow peninsula, washed on three sides by the sea. It was the residence of the rajah, and Naharwala (a transposition of Anhalwara) was then only "a frontier city of Gujarat." This agrees with the native histories, which place the close of the Chaura dynasty of Anhalwara in S. 998, or A. D. 941, when the sovereignty passed into the hands of the Chalukya prince, Mula raja, who became the paramount ruler of Somnath and Anhalwara. After the time of Mahmud, Somnath would appear to have been abandoned by its rulers in favor of Anhalwara, which is mentioned as the capital of Gujarat in the time of Muhammad Ghori and his successors Aibeq. It was still the capital of the kingdom in A. H. 697, or A. D. 1297, when the country was invaded by the army of Ala-ud-din Muhammud Khilgi, which occupied Nahrwala, or Anhalwara, and annexed the province to the empire of Delhi. About a century after their explusion from Balabhis, about A. D. 758, Bappa or Vappaka, founded a new kingdom at Chitor, and his son Guhila, or Guhaditya gave to his tribe the new name of Guhilawat, or Gahilot, by which they are still known. About the same time a chief of the Chaura tribe, named Ban raja, or the "jungle lord," founded a city on the bank of the Saraswati, about seventy miles to the south-west of Mount Abu, called Anhalwara Pattan, which soon became the most famous place in Western India. Somewhat earlier, or about A. D. 720, Krishna, the Pahlava prince of the peninsula, built the fort of Elapura, the beauty of which, according to the inscription, astonished the immortals. In it he established an image of Siva adorned with the crescent. Following this clue General Cunningham inclines to identify Elapura with the famous city of Somnath, which, as the capital of the peninsula, was usually called Pattan Somnath. According to Postans the old city of Pattan is built upon a projection of the mainland, forming the southern point of the small port and bay of Verawal. This name General Cunningham takes to be the same as Elapura, or Elawar, which, by a transposition that is very common in India, would became Erawal. Thus Nar-sinh has become Ran-si, and Ranod is used indifferently wtih Narod, and the ancient Varul is the modern Elur, or Elora. General Cunningham says Pattan Somnath was famous for a temple of Siva, which enshrined a figure of the god bearing a crescent on his head as Somnath, or the "lord of the moon." This appellation was therefore the proper name of the temple, and not of the city, which he concludes, must have been Elapura or Erawal, the modern Verawal, but Soma Nath is the title of Swayamnath, or Self-existing and the religion was, of old, common to Arabia and India, and there is reason for believing, what the early mahomedan authorities assert, viz., that the Lat, worshipped by the idolaters of Mecca, was a similar deity to the Swayam-nath of the hindoos.—*Postans' Western India, Vol.* ii, *pp.* 18, 19 ; *Hist. of Guzerat, translated by Dr. Bird* ; *Cunningham's Ancient Geog. of India, pp.* 318-320 ; *Prinsep, p.* 284 ; *History of Persia, Vol.* 1, ch. ix ; *Wilson* ; *Townsend's Outram and Havelock's, p.* 49. See Lingum.

SOMA SIDDHANTA, see Varaha.

SOMA YAGA, the Soma juice presented as an oblation and then drank.—*Wilson.*

SOMBREIRO, see Nicobar islands.

SOMBREROS, Sp. Hats.

SOMBU, Tam. Pimpinella anisum.

SOMENDILLA, Tam., Maleal. A tree yielding the best and most useful wood in Ceylon for naval purposes. It is commonly called Halmilile and Hameniel, by the Dutch and Portuguese. It grows straight, from twenty to forty feet high, and from twelve to thirty inches in diameter. This tree, with the satin wood is the most plentiful and valuable found in Ceylon; and can be obtained at a moderate rate: it may be considered superior to any wood for capstain bars, cross and trussel-trees, cask-staves, battens for yards, fishes for masts, boat-building, &c. At Madras, it is highly valued for coach work from the toughness and fineness of its grain. Halmilile is the Berrya ammonilla, the Trincomallee wood of commerce. —*Edye, on the Timber of Ceylon* ; *Mendis.*

SOMESWARA, or Somnath, 'lord of the moon,' a title of Siva; also applied to Surya, the Sun-god.—*Tod's Travels, p.* 508. See Kala, Priyanath, Katiwar.

SOMIDA MANU, Tel. Soymida febrifuga, *Ad. Juss.;* Swietenia febrifuga, *R.* ii, 398.

SOM-ISWARA, see Kattyawar, Somanath.

SOMINTA, Tel. Sesbania ægyptiaca, *Pers.* Æschynomene sesban, *R.* iii, 332.

SOMMACO, It. Sumach.

SOMAVALLI, Tel. Tenospora cordifolia, *Miers.*

SOMAVALLI, Hind. Jivanti manapala.

SOMBRE BAT, Eng. Nycticejus atratus, *Bly.*

SOMNATH PATTAN, its temple is the counterpart of Balbek. The ling or phallus, there was one of the twelve in several cities of India. Somnath gates, are now quietly laid up in a corner of the hall. The gates, eleven feet long by nine broad, verify Feristah's account of Somnath to have been five yards high. The beautiful arabesques carved on the marble, attest to the taste of Mahmud, acquired from the hindoo architecture of ante-mahomedan India, and the Cufic characters on the borders record his triumph over hindoo idolatry.—*Tr. Hind., Vol.* i, *p.* 403.

SOMNEE, a river near Mundesore, in Sindhiah's territory.

SOMNI, Hind. Dicliptera roxburghiana.

SOMPA, Tel. Anethum sowa, Aniseed.

SOM-RAJ, Beng. Vernonia anthelmintica, *Willd.* Seeds of Conyza (or Serratula) anthelmintica—a worm medicine often sold in the bazaar instead of Zeera seeah, or black carraway.—*Ben. Phar.*

SOM SHING, Hind. Pinus excelsa.

SON, also H'nyet, Burm. Horse.

SON. To have a son, a male child, is the great desire of the married hindoo, and if a son be not born to a hindoo, he adopts one. The sanscrit word meaning a son, is said to mean deliverer from hell. Since the son delivers his father from hell (Manu, ix, 138). This accounts for the extreme desire entertained by the hindoos for male offspring. Thus Bhima, like Dasaratha in the Ramayana, and many others, performed the holiest acts for the sake of obtaining a son. The son alone by the offering of the funeral libation (sraddha) is supposed to procure rest for the departed spirit of the father.—*Williams' Story of Nala, p.* 178.

SONA, Lepch. Ursus tibetanus, *F. Cuv., Bly.*

SONA, Duk., Hind. Gold.

SONA, Hind. Bauhinia purpurea, also Bauhinea variegata.

SONA GULLI, see Pir Panjal range.

SONA, a river near Puttureah, in the Saugur district.

SONAGARU, Tel. — ? Ochre.

SONAGIRI, one of the five hills of Rajagriha.

SONAI, a river near Mattee Cutta, in Sylhet. A river in Comillah.

SONAI KOLAWARU, see Korawa.

SONALI, also Sonalu, Beng. Carthartocarpus fistula, *Roxb.*, also Tetranthera quadrifolia.

SONA-LUTA, Beng. Common rue, Ruta graveolens.

SONA-MAKHI, Hind. Cantharis visicatoria.

SONA-MOOG, Beng. Phaseolus aureus.

SONA-PAT, Beng., also Sona-mookhee, Hind. Cassia elongata.

SONAPUR, see India.

SONAR, a river near Puttureah in the Saugor district, a river of Dumoh.

SONAR, Hind., from sona, gold, a worker in gold and silver. One of the five artizan castes of the hindoos, the other four being the iron-smith, brazier, stonemason and carpenter.

SONARI. A little village situated on a low spur of a sandstone hill between the Betwa and Besali rivers, six miles to the south-west of Sanchi, 21 miles N. E. of Bhupal. It contains numerous buddhist topes.

SON BALLAHA SENA, see Inscriptions.

SON-BALLI, Hind. Croton plicatum.

SON-BHANDAR, a cave at Rajagriha.

SONCHAL, of Ravi, Malva parvifolia, *L.*

SONCHAL, Hind. Pink clover of Kashmir.

SONCHUS CILIATUS, *Lam.*

S. oleraceus, *Roxb.*, *W. Ic.*

Sow thistle,	Eng.	Etrinta,	Tel.
Dodak,	Hind.	Adavi mullangi,	„
Ka't mulingi kiri,	Tam.		

A native of Europe, of the Panjab plains, and up to 8,500 feet, also of Peninsular India. It yields a milky juice on incision. Cattle are fond of it. Used in the Neilgherries as a pot herb by the natives. Also the Kashmir people are said to use it as a vegetable, and it is probably the 'dwarf sow thistle' the shoots of which the Ladaki use in a similar way, according to Moorcroft, though this may be the Tragopogon (q. v.)—*Jaffrey* ; *J. L. Stewart, M. D.*

SONCHUS ORIXENSIS.

Bhangra,	HIND.	Dughdika,	HIND.
Kala bhangra,	„	Sahadevi,	„

Bari (H.) Jangli-tamaku. Similar to Lactuca in its properties.—*Powell's Hand-book, Vol.* i, *p.* 355.

SONDALI, BENG. Cathartocarpus fistula, *Pers.*, also Tetranthera quadrifolia.

SONDELI, CAN. Sorex cærulescens, *Shaw, Blyth.*, also Sorex indicus, *Geoff.* Musk-rat or Shrew.

SONDI, a predatory tribe of Central India. The principal among the illegitimate, or, as they are often termed, halfcaste Rajputs, in Central India, are the Sondi, who have spread from Sondwarra (a country to which they give the name) to many adjoining districts. This tribe is divided into many classes or families, which take their names from Rajput ancestors ; but all intermarry. Second marriages among their women are very common, and from the strict usages of the Rajputs upon this point, there is none on which they deem the Sondi to have so degraded the race from which they are descended. The Sondi have been either cultivators or plunderers, according to the strength or weakness of the government over them ; but they have always had a tendency to predatory war, and have cherished its habits, even when obliged to subsist by agriculture. Their dress is nearly the same as that of the other inhabitants, though they imitate in some degree the Rajputs in the shape of their turbans. They are, in general, robust and active, but rude and ignorant to a degree. No race can be more despised and dreaded than the Sondi are by the other inhabitants of the country. Another tribe is the Bheelalah, who have sprung from Rajputs of the Bheel tribe : they derive their name from associating with the Bheels, among whom, from the superior rank of their sires, they obtain respect and consequence. The chiefs of the Bheels in the Vindhya mountains are almost all Bheelalah. This class combine with the pride and pretensions of Rajputs, the cunning and roguery of the Bheels ; and appear to be, almost without exception, a debauched and ignorant race, often courageous from constant exposure to danger, but invariably marked by an equal want of honour and of shame. We never see in them any of those gleams of generous and chivalrous spirit, which now and then break forth to redeem the feelings, and even the vices, of true Rajputs. The vanity of this race has lately been flattered by their having risen into such power and consideration, that neighbouring Rajput chiefs found it their interest to forget their prejudices, and to condescend so far as to eat and drink with them. The Bheelalah and Sondi chiefs were the only robbers in Malwa, whom under no circumstances travellers could trust. There are oaths of a sacred but obscure kind among those that are Rajputs, or who boast their blood, which are almost a disgrace to take, but which it is asserted, the basest was never known to break before Mundroop Singh, a Bheelalah, and some of his associates, plunderers on the Nerbudda, showed the example.—*Malcolm's Central India, Vol.* ii, *pp.* 15, 153 *to* 156. See Bangri.

SONDRI BRERI, or Sondi Breri. An ebbing and flowing spring near the Berengi river in Kashmir. It appears about the Vernal equinox. It seems to be an underground continuation of the Berengi river.

SONE. The fishermen settled along the coast from Gheriah to the north, near Surat, and at Colaba, in Bombay, are Koli of the Sone tribe ; a few of them, notwithstanding, enter on board of vessels, as mariners, but the vessels must be manned by natives, the Sone fearing to lose caste, which would take place did they sail with Europeans. The chief Patel of this tribe resides, at Angria ; he is looked on as a legislator, being endowed with power to adjust the affairs of the Sone Koli, settle their disputes, &c. The women of the Sone Koli wear choli, or jackets, and have a number of glass bangles on their left-hand ; they are frequently seen in Bombay assisting their husbands in fishing and importing fish into the fort and outside market. When they marry, the ornaments which were intended to adorn their right wrists are consecrated, and thrown into the sea, as an offering to the deity who presides over that element, and an invocation to defend her husband from the dangers of the ocean. Not a caste meeting of the Sone Koli can take place without large potations of mawa flower arrack being imbibed ; and they frequently give any quantity of fish for half a tumbler of raw brandy. The chief tribes of Koli are the Raj Koli ; Solesy Koli; Tonkry Koli ; the Dhour Koli ; Dungry Koli ; the Bhil Koli ; Mullar Koli ; the Aheer Koli ; Murvy Koli ; the Sone Koli and a few others. In Bombay, Tannah, Bhewndi, Kallian, Bassein, Daman, &c., are a great number of christian Koli, said to have been of the Sone section and to have been forcibly converted by the Portuguese, but, terrified by the cholera in 1820-21, a portion reverted to paganism.

SONE, a tributary to the Ganges : it rises on the Amarkantak table-land, lat. 22° 44′, long. 82° 7′ ; from 3,500 to 5,000 feet above the sea ; runs N. 30 m. ; N. W. 80 m. ; N. 40 m.; Dinapoor.—Length, 465 m. receives the Koel, 140 ; Kunher, 130 ; Johila, 100 m. Including the Phalgu and other rivers falling into the Ganges above Rajmahal, 42,000 sq. miles drained. The navigation of the river is not considered available for purposes of important utility higher than Daudnagud, 60 miles from the confluence with the Ganges. The plains of Rewah are fertile ; but the valley of the Sone to the south of the Kymore range is desolate. The people are indolent and untrustworthy ; though widely different in other respects, there is one characteristic common to the Baghel of Rewah, the Bundela of Bundelcund and the Rajput of Gwalior and Malwa, a dislike to labour or service away from their homes, they generally leave tilling of the soil to the inferior and servile classes, and are regarded as the heads of the local society. Many of the Rajputs in the states of Central India, give themselves up to sloth and the immoderate use of opium. Malwa and Gwalior are great centres of trade. In Malwa, the towns of Indore, Bhopal, Oojein, Mundipore, Rutlam, Dhar, Jowra, Augur, Neemuch, Shoojawulpoor and Bhilsa are the principal marts. The Sone river, traverses the province of Bahar.

SONEPUT, was one of the five pat or prastha assigned over to the Pandava brothers, and has derived its name from raja Sonee, the son of Bhoput, who reigned 920 B. C. A little image was here turned up in December 1864 when sinking a well. It is of clay, baked and polished like Chunar pottery. The figure is sitting cross-legged with a club in each hand. Below the left knee is observed a very short inscription in a very old Nagari character. General Cunningham has read this inscription and supposes the idol to be an Aditya or image of the sun. The age of it, he thinks, to be at least 1,200 years. This agrees with the period of the seventh century when the hindoo Puranism had assumed a hundred heads and forms to contend with buddhism. There were then followers of Brahma, Indra, Ganesha, Surya, Chandra, and a host of gods, all of whom succumbed to the powerful Shivites and Vishnuvites. The only trace of the worship of Surya found in the nineteenth century, in Northern India, is in Benares, where, in a corner of the quadrangle of the temple of Unna-poorna, is a small shrine dedicated to the sun. The idol representing that luminary, however, is seated in a chariot drawn by seven horses with a glory round his head, a representation of the old Sol of Homer.—*Tr. of Hind., Vol.* ii, *p.* 384.

SONERILA. The prettiest little annual in the neighbourhood of Tavoy is a species of of Sonerila. Its bright purple blossoms peeping up in the grass attract the attention of the most casual observer.—*Mason.*

SONF, HIND. Indian Fennel, Fœniculum panmorium, *Ben. Phar., p.* 226, also F. vulgare, Aniseed.

SONF, DUK. Pimpinella anisum. See Confection of black pepper, Perin-siragum.

SONF, DUK. Fennel. Nigella sativa.

SONG, ENG.

Sir,	HEB.	Sur,	SANS.
Geet,	HIND.	Gata,	,,

Out of the 64 sciences of the hindoos, five belong to music, viz., No. 22, The modulation of sounds ; 23, Art of playing on stringed instruments ; 24, Art of playing on wind instruments ; 25, Art of beating the tambourine ; and 26, Art of beating the symbals. The musical notation extensively used by Curwen, resembles the hindoo system.

The accessible sources of knowledge of Indian music are still only two—Sir William Jones' Essay on the Musical Notes of the Hindoos, published in the third volume of the Asiatic Researches, p. 55, and J. D. Patterson on the Gramal, or musical scales of the Hindoos, Ibid., ix, 445. The chief points established in these essays are thus given in the fourth volume of Lassen's Indische Alterthumskunde, ss. 832, 833. The native musical literature is tolerably copious, and the Indians are acquainted with four systems, whose founders, as usual with them, are mythical personages. The first system is ascribed to Devarshi Narada, who in the epic poetry appears as well-skilled in stories, and goes about between the gods and men, to recite tales to them. From him Isvara or Siva received this system. The author of the second system is Bharata, the mythic inventor of the dramatic art ; the author of the third, is the divine ape Hanuman, and that of the fourth, Kapila, the founder of the Sankhya-philosophy. These assertions of course only mean that the hindoos attached a high value to the practice of music ; and this view is confirmed by the circumstance that in the epic mythology the Gandharvas appear as musicians in Indra's heaven. For the antiquity of song amongst the hindoos, it is important to observe that the Udgatar, *i. e.*, the priest who sings the saman, belongs to the Vedic period. As to later times we may refer to the fact that, in the Mricchakatika, Rebhila is praised as a renowned singer. The hindoos are acquainted with the European scale of seven tones, and denote them by letters (*sa*, *ri*, *ga*, *ma*, *pa*, *dha*, *ni*). They admit, moreover, six raga or modes, and the musical treatises contain minute directions as to the employment of them in the six seasons into which the year is divided. The hindoos have also mythologised these ideas, and regard the six raga as god-li[illegible] beings, whose consorts are called Ba[illegible] [illegible]d are eight in number. These cou[illegible] [illegible]oduce forty-eight sons called ragaputra, by whom the various mixtures of the chief modes are denoted. This view furnishes a very striking example of the boundlessness of hindoo imagination, as it is impossible really to distinguish so many modes from one another. In some MSS. are found portraits of these two and sixty male and female genii.

Nearly the whole of Tamil literature, including works on medicine, arithmetic, grammar, and even dictionaries, is in poetry. With the exception of the commentaries on poetical works, prose composition may almost be said to owe its origin to European influence. Only a very imperfect idea of Tamil poetry can be given. In some respects natives alone can fully appreciate its excellence; while, on the other hand, they are blind to some of its defects.

Beschi, in an Appendix to his high Tamil grammar, remarks that "the Tamil poets use the genuine language of poetry. They rarely mention any object to which they do not couple some ornamental epithet. When they speak of a tree, they describe it either as green, or loaded with flowers, or shady, or majestically large, or as having all these qualities. They never mention a mountain, without representing it as rising among woods, or watered by fountains, or decked with flowers. Sometimes they employ this embellishment to excess. They are full of metaphor and allegory. They are at times extravagantly hyperbolical. In the Tamil Naishadam, it is said of Damayanti, the consort of the hero, that when Brahma had created her, her beautiful form had only one rival in the universe, and that was the fair moon. But Brahma, determined that every beauty should centre in Damayanti, took a handful of beauty from off the face of the moon, and threw it into that of Damayanti. The deformity thus made, is still apparent, in the moon. The Tamil poets delight in similes as all eastern poets do. They indulge in fiction, and pay little regard to nature. Their Parnassus is Pudiyamalai, near Cape Comorin. They have neither Apollo nor Mercury. Their Minerva is Saraswati. They invocate Ganapati. Pathos and sweetness rather than vigour, are the characteristics of Indian poetry. They are not 'thoughts that breathe and words that burn,' so much as thoughts that please and words that charm. Milk and honey flow, but such milk and honey, as to prove an unwholesome diet to some minds.

Dr. Caldwell observes that "Whilst an elevated thought, a natural expressive description, a pithy, sententious maxim, or a striking comparison, may sometimes be met with, unfortunately elegance of style, or an affected, obscure brevity, has always been preferred to strength and truthfulness, and poetic fire has been quenched in an ocean of conceits. Nothing can exceed the refined elegance and 'linked sweetness' of many Telugu and Tamil poems; but a lack of heart and purpose, and a substitution of sound for sense, more or less characterise them all; and hence whilst an anthology composed of well-selected extracts would please and surprise the English reader, every attempt to translate any Tamil or Telugu poem in extenso into English, has proved to be a failure. To these causes of inferiority must be added a slavery to custom and precedent at least equal to what we meet with in the later Sanscrit. Literature could never flourish where the following distich (contained in the 'Nannul,' or classical Tamil grammar) was accepted as a settled principle:—'On whatsoever subjects, in whatsoever expressions, with whatsoever arrangement, classical writers have written, so to write is denoted propriety of style.'—*Dravidian Comp. Gram., p.* 89; *Madras L. S. J., July* 1864; *Rev. H. Bower.*

SONG BIRDS. The European visitor to the E. Indies, is much struck with the prevailing silence of the jungle, and the paucity of small birds even in the cold season, so different from the woods and gardens and hedge-rows of Britain, teeming with small feathered inhabitants, among which are so many pleasing songsters of all degrees and merit. The chief families amongst whom the faculty of song is found, are Merulidæ; the Saxicolinæ; Sylviadæ, Larks, some finches, a few shrikes and fly-catchers, and some starlings. All of them, by their song, contributing to the gratification of man.

SONGPU, a rude tribe near the source of the Irawadi. The Koupooee comprise two tribes, the Songpoo and Pooeer-on. The Koupooce occupy the hills between Cachar and the valley of Munipore in their whole breadth, a direct distance of about forty miles; and from 25° north latitude, they formerly extended over nearly an equal distance to the south. The whole of the tract was formerly thickly studded with villages, some of them of considerable size, and Songpoo tradition gives, as the place of their origin, the mountain towards the south of the valley named Thungching. They and all the other races of hill people congregate in communities, composed usually of families connected with one another by blood-ties. The superior elevations being the most healthy; their villages are usually to be found on them. Before the subjugation of the Songpoo tribe to Munipore, almost every village was at war with its neighbour. On their subjugation this warfare was put a stop to, but the remembrance of their feuds remains, and, they would break out afresh to-morrow were the restraining hand of Munipore withdrawn. Munipore has been able to exert so much influence, amongst the Koupooee as to prevent feuds being openly carried on, but a state of active feud appears to be the one natural to all the tribes from Cape Negrais to as far north as we have any knowledge. The Koupooee are much attached to their villages, which are permanent. The village and its immediate precincts form their graveyard, and when, for a time, from whatever cause, they have been obliged to desert their village, they more often express their wish to return to it as being the grave of their ancestors than to it as being their own birthplace. Their attachment then to their village is created quite as much by its holding the tombs of their ancestors as by its being the place of their birth. The mountain-land around the Koupooee village, within certain fixed bounds, is usually the property of the village. This they cultivate with rice in elevations suited to it, and with other crops in situations unfitted for that kind of grain. The spot cultivated this year, is not again cultivated for the next ten years ; it having been found that that interval of time is required for the formation of a cultivable soil by the decay of the vegetable matter that again springs upon it. Every village has three hereditary officers, namely, Kool-lak-pa, Loop-lak-pa and Lum-poo, and officers, besides these, are elected. If the hereditary chief, or Kool-lak-pa, be a man of wealth, he will be also a man of influence. The Koupooee are sub-divided into families, Koomul, Looang, Angom and Ning-than-ja. A member of any of these families may marry a member of any other, but intermarriage of members of the same family is strictly prohibited. Though not attended to with the same strictness, this prohibition, in regard to marriage, and this distinction of families under the same designation, exists amongst the Munipooree race. All the hill-people are dirty, but amongst them the Koupooee is comparatively clean, he frequently bathes, though he does not devote much time to the purification of his skin. He is omniverous, and of course without prejudice of caste, but one species of food he never touches, milk to him is an abomination. In appearance, manners and customs, there is no essential difference between the two divisions of the Koupooee, the Songboo and Pooeer-on, but though so much alike in these respects, between their languages there is so great a difference, that when they wish to communicate with one another they have to resort to the language of Munipore. The Pooeer-on do not appear at any time to have been numerous, and they are at present confined to a few villages situated in the north-eastern corner of the space before indicated as the region of the Koupooee tribe. See India.

SONG-FAI, a money of account of Siam, the half of a fuang, and worth about 1½*d.*—*Simmond's Dict.*

SONG-SONG, also Paying bawat, JAV. Umbrella.

SONKHARSA, HIND. A kind of rice grown in Sirsa and elsewhere.

SONMAKKI, HIND. Properly copper pyrites, but usually applied to iron pyretis.

SONMEANY, a sea port of Lower Sind, advantageously situated on the southern bank of the Poorally river. In the early part of the 19th century it contained about 250 huts ; it is completely defenceless, and on the side towards Bela, is overlooked by hillocks of sand. The bar at the mouth of the river has only two fathoms on it at low water, but boats lie close to the village in six and seven : In the early part of the 19th century the inhabitants generally subsisted by fishing, and with the exception of a few hindoos were wretchedly poor.—*Pottinger's Travels, in Beluchistan & Sind, p.* 11.

SON-NADDY. A little gold is found in the bed of the Son-naddy, but, hardly repays the trouble of searching for it, as even after cleaning it is somewhat impure, and only fetches from ten to twelve rupees a tola.

SONNERAT. A French naturalist who settled at Pondicherry, and made immense botanical collections which seem to have been transmitted to France. These have not been described in any regular form, but such specimens as were presented to Lamarck, have been introduced into his Encyclopedie Methodique, a work from which much information is obtainable although its alphabetical arrangement renders it very difficult of consultation, particularly in those genera which have been much subdivided of late years, Sonnerat is well-known by his 'Voyage a la Nouvelle Guinee,' and his 'Voyages aux Indes Orientales et a la Chine.' He made known many new plants.

SONNERATIA, a genus of plants belonging to the natural order Myrtaceæ, so named by the younger Linnæus in compliment to M. Sonnerat. Dr. Hooker found Sonneratia, Heritiera littoralis, and Careya, forming small gnarled trees on the banks, in the Sunderbuns, with deep shining green-leaved species of Carallia, Rhizophora, and other mangroves. Occasionally the gigantic reed-mace (Typha elephantina) is seen, and tufts of tall reeds (Arundo). The pith of the roots of a species of Sonneratia are valuable for lining insect boxes, and making setting boards. S. Alba, is a species of the Moluccas, and S. apetala, a native of Burmah, near Rangoon, as well as in moist situations along the Burmese coast.

SONNERATIA ? *species ?*

Thaumma, BURM.

A small tree of Tavoy, wood not known.—*Dr. Wallich.*

SONNERATIA ACIDA, *Willde, Linn.*

Rhizophora caseolaris, *Linn.*
Mangium caseolare, *Rumph.*

Ta bu,	BURM.	Polai of Penang, Sinagporo	
Ta mu,	,,	Plye,	of Borneo.
La-moo,	,,	Blatti, MALEAL of Rheede.	
Orchaka,	BENG.	Gedde killala-gass,	SINGH.
Sour sonneratia,	ENG.	Tewar,	SINDH.
Paga-pato of Sonnerat,	,,		

This tree yields a light soft wood. Its branchlets are tetragonal; leaves oval, oblong; calyx 6-cleft ; petals 6; berry globose. The tree grows forty feet high, and is a native of New Guinea and the Moluccas, as well as of the Malabar coast and of the delta of the Ganges. It grows in Ceylon, on the coast at Caltura and Negombo and other places; grows also, on the western and eastern coasts of peninsular India, at Salsette and, in the delta of the Indus, the supply is said to be inexhaustible. It grows in the northern Circars and, also in the deltas of the Ganges and of the Irawady. In British Burmah, it abounds in the mangrove swamps and on the banks of almost every stream on the coast as far as tide-waters reach, the natives use it for various economical purposes, and it is said to be a better substitute for coal in steamers than any other kind of wood. It grows in Malacca, Pinang and Singapore: it has an acid eatable fruit. It is abundant in the delta of the Indus. In Ceylon it grows to a large handsome tree along the marshy banks of the large rivers. Spindle-shaped excrescences, called Kirilimow in Singhalese rise from the surface of its roots, four or five feet above the surface of the ground. They are of a firm and close texture, nearly devoid of fibrous structure and take a moderate polish, some of the transverse cuttings being two feet long and two to three inches wide. The finest pin passes in with ease, and the thin slices are invaluable for linings of insect boxes. The roots of S. acida and S. alba, spread far and wide through the soft mud of the marshy banks on which they grow; and, at various distances send up like the avicennia, extraordinarily long spindle-shaped excrescences four or five feet above the surface. These are invaluable for setting boards and for lining insect boxes.—*Hooker's Him. Jour., Vol.* ii, *p.* 355 ; *Wight and Arn., Vol.* i, *p.* 327; *Roxb. Fl. Ind., Voigt, Dr. Mason*; *Cal. Cat. Ex.* 1862; *Thw. En. Pl. Zeyl., Vol* ii, *p.* 123; *Hartwig.*

SONNERATIA APETALA, *Buch.*

Khoura,	BENG.	Thaum-nia,	BURM.
Keora,	,,	Myouk-guo,	,,
Kam-ba-la,	BURM.		

A pretty large and elegant tree, which grows in the western side of India, in the delta of the Ganges, and is found under the parallel of Rangoon. It flowers in the hot season. It yields a strong hard wood of coarse grain. It is the timber of which boxes for packing beer and wine are made in Calcutta, is of a red colour, strong and adapted for house-building. It grows in the low wet lands near the mouths of some of the Tenasserim rivers, and is well deserving of a place in our cities. It bears a strong resemblance to the weeping willow and is one of the most graceful trees in the country. The casuarina has been removed from the coast to our compounds, and the sonneratia is quite as deserving.—*Roxb.*; *Voigt*; *Drs. McClelland* ; *W. & A., Vol.* i, *p.* 327; *Mason.*

SONO KLING of the Malaya, a tree of Java, the colour of its wood is a deep brown, inclining to black, used for furnitures.

SONO KOMBANG of Java, used for furnitures, which has some resemblance to the lingoa wood of the Moluccas.

SONPAT, HIND. A kind of rice.

SONPUR, was formerly a chiefship subordinate to Patna, but was constituted a separate state by raja Madhukar Sa of Sumbulpoor about the year A. D. 1560. Since then it has been counted among the cluster of eighteen Garhjat states. It is now attached to the Sumbulpoor district, and is situated between 83° 20' and 84° 18' of E. long., and between 20° 41' and 21° 10' of N. lat. It is bounded on the north by Sumbulpoor proper and a portion of Rairakhol, on the south and south-east by Bod, on the east by Rairakhol, and on the west by Patna. The non-agricultural castes are Brahmin, Mahanti, Rajput; and the agricultural castes are, Tassa, Kolta, Agharia and Gond.

SON RAJA, Kesava Sena, see Inscriptions.

SONTA or Asa, HIND., a club carried by devotees.

SONTANA.

SONTH, DUK. HIND. Zingiber officinale, *Roscoe.* Ginger, dried ginger root.

SONTHAL, are the indigenes of Chota-Nagpore, and the parts about Palamow. Since the beginning of the present century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. They rose in rebellion in 1856, and gave much and prolonged annoyance to the British. The Sonthal, Munda, Bhumi and Ho speak languages nearly identical. They occupy most of the British districts of Chota-Nagpore, Singhbum, Manbhum and the hilly part of Bhagulpur, (the Rajmahal hills excepted) now known as the Sonthal pergunnahs; also, parts of west Burdwan, Midnapore and Cuttack—an extensive country west of Calcutta. The Sonthal are a simple, industrious people, honest and truthful, and free from cast prejudices. Their country is healthy, their numbers are increasing, and they are much sought after and prized as labourers, by the Bengal indigo planters, and on the railways, and other works of western Bengal, and in the Assam tea plantations. These tribes live apart in detached houses or isolated hamlets. The Sonthal are a branch of the Mundah Kol. They seem to have separated from the Mundah and fell back on Chota Nagpur from the Damudah river, which the Sonthal call their sea, and they preserve the ashes of their dead until an opportunity occurs of throwing them into that stream or burying them on its banks. The Sonthal are now most numerous in the Sonthal Pergunnahs but there are many in Mohurbunj, and there are several colonies of them in the Singhbum district. They are an erratic race; but, Lt. Col. Dalton thinks that they left their chief settlements on the Damudah river, from having been pressed by the Koormi. The Sonthal, Bhumij and Mundah tribes have long been known to be intimately connected, and they have affinities with the wild clan of the Korewah of Sirgujah and Juspur, the Kheriah tribe of Chota Nagpur and the Juanga of the Cuttack tributary mahals. Since the beginning of the nineteenth century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. The Sonthal and Bhumij races have suffered in esteem in consequence of the human sacrifices offered at the shrine of Kali as Runkini, but these races personally do not much care for this goddess, at whose shrine the establishment and ritual are essentially brahminical.—The Sonthal and Rajmahali are markedly different in habits, appearance, manners and national characteristics, and on the Chota Nagpur plateau these differences are very marked. The Sonthal are a very ugly race, with flat broad-nosed features. They are a more simple, mild, industrious race than the Rajmahali, Gond or Khond. Though the Sonthal are geographically near the plains, they seem to be more shy and more socially isolated than the Mundah, Bhumi and Ho. They have kept much to themselves, preferring locations surrounded by jungle and segregated from the world, and cultivating the lower lands of their country, but they have latterly taken to labour for hire.

The Sonthal and Male or Rajmahali are regarded by Mr. Logan as a displaced portion of the prior inhabitants of the country. The Male and Kol tribes are supposed by him to resemble the coarser Binua tribes of the Malay peninsula, more than the Burman the Malay, or other Indonesian tribes. But the same type as the Male and Kol are found amongst Malayas and Burmans, although generally softened, and the short and turned up nose are Binua, as also is the small stature and the vertical, turned up head. The Male or Rajmahali are described as mostly very low in stature, but stout and well proportioned. There are many less than 4 feet 10 inches and perhaps more under 5 feet 3 than above that standard, but 5 feet 3 inches is about the average height of the men. Their nose is flat and their lips thick, though less so than the Kafir of Africa, but their lips are thicker than those of the populations of the neighbouring plains. Buchanan Hamilton says that the features and complexion resemble those of all the rude tribes whom he had seen on the hills from the Ganges to Malabar. Their noses are seldom arched and are rather thick at the points, owing to their nostrils being circular, Bishop Heber says that the Male nose is rather turned up than flattish, but they are not so diminutive as the noses of the Tartar nations, nor flattened like those of the African Negro. Their faces are oval and not shaped like a lozenge, as those of the Chinese are. Their lips are full, but not at all like those of the Negro; on the contrary their mouths in general are very well formed. Their eyes, instead of being hid in fat and placed obliquely like those of the Chinese, are exactly like those of the Europeans. Their women, though hard worked are far from having harsh features. Bishop Heber says that the Malay or Chinese character of their features is lost, in a great degree, on close inspection. The Male head like that of the Kol has more of an elongated oval than that of a lozenge shape. The forehead is not narrow and the lateral projection of the zygomata is comparatively small. Nothing is said respecting the shape of the back of the head, a very important point in comparing Turanian tribes. The Male, or Hill man is described by Captain Sherwill as much shorter than the Sonthal and of a much slighter make. He is beardless or nearly so, is not of such a cheerful disposition nor is he so industrious.

In the mountains S. W. of Calcutta, are the Dhanga, Oraon, the Kol, the Lurka Kol or Ho, and the Khond. The Ho are a comparatively small tribe. Their country proper is the part of the Singbhum district, called Colehan, a series of fair and fertile plains studded with hills. It is about 60 miles from N. to S. and from 35 to 60 in breadth, and has, to the South and S. E., the tributary estates Mohurbhunj, Keonjur, Bonai and Gangpur, inhabited by Uryah speaking hindoos ; to the east and north, the Bengali pergunnah of Dhulbhum and district of Manbhum ; and to the N. and N. E. the Hindi district of Lohar laggah.

For the Male or Rajmahali, the most eastern dialect, and those which it might have been supposed, were longest in contact with the east Gangetic, we have vocabularies by Major Roberts (A. R., iv, 127) and by Mr. Hurder (in Mr. Hodgson's series, J. A. S., xviii, 553.) The Uraon vocabulary of Colonel Ousely (Hodgson's series) has so much resemblance to the Male that it may safely be set down as a dialect of the same language. It frequently agrees with the Male where it differs from the co-dialects, with which it is now in contact in Chota-Nagpore. This may be considered as confirming the tradition of the Uraon that their original country was Rotas and parts of Rewa, or the hills along the northern bank of the Sone (to the southward of Benares.) According to the tradition, they were driven across the Sone by the intrusion of Gangetic hindoos into their native land, and ultimately settled in Chota-Nagpore, the country of the Kol tribe of Munda or Ho. At a later period hindoos pushed into this territory, reduced the more civilized Uraon to slavery, drove the wilder Kol into revolt, and eventually forced them to migrate to the southward and eastward into the land of the Bhuian. The more northerly of the eastern emigrants passed out into the low country, and mixing with the Bhumij and Bhuian natives, formed the class of Tamaria. The more southerly moved into Singbhum and Kolehan, living at peace with the Bhuian pre-occupants until the intrusion of hindoos from Marwar, who first leagued with the Bhuian against the Kol and then with the Kol against the Bhuian, and finally appropriated Singbhum leaving Kolehan or Hodesam to the Kol or Ho, as this southern tribe call themselves. Remnants of the Kol are still found to the northward nearer Chota-Nagpore, and they appear to be also spread to the northward towards Rajmahal. One tribe, the Sonthal, is found in Chota-Nagpore and in the skirts and valleys of the Rajmahal hills. It is enumerated by Mr. Stirling in his list of the Kol tribes of Cuttack, and according to Captain W. S. Sherwill its range is from Cuttack through Chota-Nagpore to Rewa, thus embracing the territory of both divisions of the eastern Vindhyan.

The Male and Uraon languages are mainly Dravidian, and it is remarkable that although the Male are now confined to the N. E. extremity of the Vindhya, where the Ganges washes and bends round the chain, and are separated from the south Dravidian nations by the Kol race, their language is more Dravidian than the Kol itself. The pronouns and numerals, for instance, are Dravidian, while those of the Kol are Gangetic, Himalayan and Ultra-Indian. The explanation is probably to be found in the circumstance of the Uraon and Male having, originally, formed an uninterrupted continuation of the Gond tribes and dialects that extended from the Godavery to the N. E. extremity of the Vindhya. The Kol, again, must have formerly had a greater extension either on the north, breaking through the Male Gondian band, into the Gangetic valley, or on the south to the seaboard of Cuttack and the lower valley of the Ganges, where they would be exposed to the influence of the maritime visitors and settlers, Ultra-Indian and Gangetic. But as both the Kol and the Male-Uraon are physically Ultra-Indian more than Dravidian, and the occupation of the eastern Vindhya and the hills on the opposite side of the Gangetic valley by Ultra-Indians implies that the valley itself was at one time possessed by the same race, the simplest conclusion is that the Kol were an extension of the ancient Ultra Indo-Dravidian population of the Lower Ganges and the highlands on its eastern margin. The peculiarities of Kol, when compared with the S. Dravidian, and the Male-Goudian or purer north Dravidian dialects, are chiefly glossarial.

The Pahariah of the Sonthal pergunnah are arranged into two tribes, those who live in the Rajmahal hills, and the Naiga Pahariah on the plains to the west. The former live by grain crops reared on the slopes of the hills, and by bartering in the plains the hill bamboos, the grass and timber which grow in luxuriant profusion in every direction. The Pahariah are given to great lying and drunkenness. The Bhagulpore Hill Rangers are principally composed of this people. But since Mr. Cleveland's settlement in the beginning of the 19th century many of them receive pensions. The other body, the Naiga Pahariah, have more than all the vices of their tribe on the hills, but are worse off, having no right of forest or well wooded hills and readily take to brigandage. Both the Pahariah tribes are low in the social scale.

The Sonthal and Male or Rajmahali are regarded by Mr. Logan as a displaced portion of the prior inhabitants of the country. The Male and Kol tribes are supposed by him to resemble the coarser Binua tribes of the Malay peninsula, more than the Burmans, the Malays or other Indonesian tribes. But the same type as the Male and Kol are found amongst Malays and Burmans, although generally softened, and the short and turned up nose caused by it are Binua, as also is the small stature and the vertical, turned up head. The Male or Rajmahali are described as mostly very low in stature, but stout and well proportioned. There are many less than 4 feet 10 inches and perhaps more under 5 feet 3 than above that standard, but 5 feet 3 inches is about the average height of the men. Their nose is flat and their lips thick, though less so than the Kafirs of Africa, but their lips are thicker than those of the populations of the neighbouring plains. Buchanan Hamilton says that the features and complexion resemble those of all the rude tribes whom he had seen on the hills from the Ganges to Malabar, that is, on the Vindhya mountains. Their noses are seldom arched and are rather thick at the points, owing to their nostrils being circular. Bishop Heber says that the Male nose is rather turned up than flattish, but they are not so diminutive as the noses of the Tartar nations, nor flattened like those of the African Negro. Their faces are oval and not shaped like a lozenge, as those of the Chinese are. Their lips are full, but not at all like those of the Negro; on the contrary, their mouths in general are very well formed. Their eyes, instead of being hid in fat and placed obliquely like those of the Chinese, are exactly like those of the Europeans. Their women, though hard-worked, are far from having harsh features. Bishop Heber says that the Malay or Chinese character of their features is lost, in a great degree, on close inspection. The Male head like that of the Kol has more of an elongated oval than that of a lozenge shape. The forehead is not narrow and the lateral projection of the zygomata is comparatively small. Nothing is said respecting the shape of the back of the head, a very important point in comparing Turanian tribes, the Male, or hill-man, is described by Captain Sherwill as much shorter than the Sonthal and of a much slighter make. He is beardless or nearly so, is not of such a cheerful disposition, nor is he so industrious.

Captain Walter S. Sherwill, revenue surveyor, in his 'Notes upon a Tour through the Rajmahal hills,' says the Sonthal has the honour of being aboriginal to India. It was his forefathers who first occupied and inhabited the land then known under the name of Colar. From them the country was usurped by invaders from the Ariana of the Greek geographers. The Aryan followers of Brahma first settled in the Panjab, the Sapta Sindhoo of the Vedas and the Hupta-hindo of the Zendavesta, and the Sonthal is singled out by his short make, his thick lips, high cheek-bones, flat nose and small eyes. He has little or no beard. The Sonthal race are usually quiet, but in 1855 they were impelled by a sense of wrong to a headlong rebellion and then gave much and prolonged annoyance. In the suppression of the rebellion, half their numbers perished. They occupy the district surrounded by Bhagulpore, Berhampore and Birbhum, and are now ruled by a commissioner. The Kumea in the Sonthal pergunnahs was a person who for a period voluntarily bound himself to slavery. The Sonthal are truth-telling, patient, kind of heart, honest and ingenuous and characterised for their simplicity. They are reserved and phlegmatic. The Sonthal believes in Chandabunga, an all-pervading deity, to whom, once in 3 or 5 years, he sacrifices a goat on a Sunday. Holding the goat under his arm, he stands on one leg, and looking heavenward he calls on Chandabunga, kills the goat and eats it. They have four gods of the woods (Dryads) called Jaihirira, Monikoh, Marungburu and Gosaira, who seem to resemble the Lares and Penates of the Romans. These are represented by four stones buried in a clump of trees called the Jairthan and no Sonthal village can be settled till the Jairthan is established. A familiar deity is Manjiharam in the shape of a stone, which is buried in the centre of the village in a small open shed. The shed is called Buddhathan, for Manjiharam is also called Buddah Manji, a Manji and Sonthal being synonymous. The panchayets of the Sonthal assemble here. In the months of April and May, when the leaves are bare, 2,000 to 4,000 Sonthals assemble with bows and arrows, for their great Seudra or hunting expedition, during which they make great circles to enclose and kill all the smaller game. They eat the flesh of every animal. Their most solemn oath is taken when touching a tiger's skin. They dance in bodies of one or two hundred to the wild, gloomy, monotonous, music of flutes and drums. The men go round one way, while the women circle the other. The men step in time without much action, but the women drop their heels and toes in a double shuffle, and bend their bodies forward to a half-kneeling position, as though paying homage to the men. Peacock's feathers enter largely into the paraphernalia required in some dances. They marry at will, but can be divorced through the panchayet. When death occurs, the body is burned and the ashes taken to the Damudah. In the mission school in their neighbourhood about 300 boys were under education. The houses of the Sonthal are in enclosures made with the green boughs of the Sakua, planted in the ground and tied together: they keep each family distinct from its neighbours, they generally contain a Sonthal and his wife, several married children and their families, a pig-sty, buffalo-shed, and a dove-cot, a wooden stand holds the water-pots, the water from which is used for drinking or cooking, there is also a rude wooden press for expressing oil from the mustard seed. In a corner of the yard there will be a plough or a couple of solid-wheeled carts, whilst numbers of pigs and poultry are seen in every direction. Each of these enclosures contains on an average, ten souls.

The Sonthals worship a conspicuous hill called Marang Boroo. In times of drought they go to the top of the sacred mountain, and offer their sacrifices on a large flat stone, playing on drums and beseeching their god for rain. 'They shake their heads violently, till they work themselves into a phrensy, and the movement becomes involuntary.' They go on thus wildly gesticulating, till a "little cloud like a man's hand" is seen. Then they arise, take up the drums, and dance the kurrun on the rock, till Marang Boroo's response to their prayer is heard in the distant rumbling of thunder, and they go home rejoicing. They must go "fasting to the mount and stay there till there is a sound of abundance of rain," when they get them down to eat and drink. My informant tells me it always comes before evening. This curiously resembles the well-known scene in the life of Elijah, when he recalled Israel to the old faith by producing rain when the priests of Baal had failed to do.—*Tr. of Hind., Vol.* i, *p.* 181 ; *Journal of the Indian Archipelago, Nos.* iv *and* v, *April and May* 1853, *pp.* 196-98 ; *Major Dalton*; *Sir John Lubbock on Civilization.*

SONTHAL PERGUNNAHS, see India.

SONTHI, or Allam, Tel. Zingiber officinale, *Rosc.*

SOOBAHDAR, a native officer of the British Indian army in India (lit. a holder of provinces.)

SOO-BAN, Burm. A shrub exceedingly prized by the Burmans, as yielding the best red dye of any wood they have. It is sold at a tical per viss, and seems rather rare. The leaves are a favourite article for curry. —*Malcolm, Vol.* i, *p.* 191.

SOOBANREEKA RIVER rises in Chota, Nagpoor table-land, runs N. E., E., S. E., S. S. E., E., S. E., S., into Bay of Bengal.—Length, 280 miles ; receives the Karow, 80 miles. About 12,000 square miles drained.

SOOBHADRA, Sans., from soo, beautiful, and chadra, good.

SOOBHAGNA, (of good fortune).an only child, at once a maiden and a widow. It is related of her that having learned from her preceptor the solar incantation, incautiously repeating it, the sun appeared and embraced her, and she thence became pregnant. The affliction of her father was diminished when he discovered the parent ; nevertheless, (as others might be less charitable,) he sent her with a female attendant to Balabhipoora, where she was delivered of twins, male and female. When grown up the boy was sent to school ; but being eternally plagued about his mysterious birth, whence he received the nickname of Ghaibi ('concealed),' in a fit of irritation he one day threatened to kill his mother if she refused to disclose the author of his existence. At this moment the sun revealed himself: he gave the youth a pebble, with which it was sufficient to touch his companions in order to overcome them. Being carried before the Balhara prince, who menaced Ghaibi, the latter slew him with the pebble, and became himself sovereign of Saurashtra, taking the name of Silladitya (from silla, 'a stone or pebble,' and aditya, 'the sun') : his sister was married to the rajah of Baroach. Such is the literal translation of a fragment totally unconnected with the history of the Rana of Mewar's family, though evidently bearing upon it. The father of Silladitya, according to the Sanderai roll and other authorities of that period, is Sooraj (the sun) Rao, though two others make a Somaditya intervene. The Jessulmir annals affirm that the whole Turkish (Toorshka) race of Chagitai are of Yadu stock ; while the Jam Jhareja of Kutch traces his descent from the Persian Jamshid, cotemporary with Solomon

These are curious claims, but the Rana's family would consider such vanity criminal. In perusing this fragment we are struck by the similarity of production of these hindoo Heliadæ and that of the celebrated Tatar dynasty from which Janghiz Khan was descended. The Nooranyon, or 'children of light,' were from an amour of the sun with Elancua, from which Janghiz Khan was the ninth in descent. Authorities quoted by Petis de la Croix, in his life of this conqueror, and likewise by Marigny, in his history of the Saracens, affirm Janghiz Khan to be a descendant of Yezdegird, the last Sassanian prince. Janghiz was an idolater, and hated the very name of mahomedan. A courtier telling Aurungzeb of his celestial ancestry, gravely quoting the affair of the mother of the race of Timoor with the sun, the bigotted monarchy coarsely repiled, "Mama caba bood," which we will not translate.—*Tod's Rajasthan, Vol.* i, *p.* 234.

SOOBH-I-KAZIB, Pers. A false dawn, is a transient appearance of light on the horizon, which often appears about an hour before the soobh-i-sadik, or real dawn of day.

SOOBURNUK, Beng. Cassia fistula.

SOOCEY, Hind., a mixed striped fabric of silk and cotton in India.

SOOCOO, a name in Bencoolen for the fourth part of a real, and valued at 1*s*. 3*d*.

SOODALI, Beng. Cathartocarpus fistula, *Pers.*

SOODHANGSHOO, Sans., from shoodha, the water of life, and ung-shoo, rays of light.

SOODHANIDHEE, Sans., from soodha, the water of life, and nidhee, a treasure.

SOODOONIKKA GASS, Singh. Vitex negundo, *Linn.*, *Roxb.; W. Ic.*

SOODRA, see Sudra.

SOODURSHUN, Beng. Amaryllis, Crinum defixum. See Scokh-dursun.

SOOE-PAT, Beng., see Jogi or Yogi.

SOOFEE, mystices of the east ; mahomedan philosophers.

SOOGHEE, Can. Boiled coarse rice.

SOOGOONDHI, Uria ? A tree of Ganjam and Gumsur, supposed to be a Calophyllum, extreme height 25 feet, circumference 2 feet, and height from the ground to the intersection of the first branch, 7 feet. This tree is tolerably common, but no use is made of the wood except for firewood, the leaves are used medicinally for rheumatism and wounds of long standing.—*Captain Macdonald.*

SOOGRIVA, Sans., from soo, beautiful, and griva, the back of the neck.

SOOIA, a pickle prepared in Japan from the Dolichos.—*Simmonds.*

SOOJEE, the Semolina of Indian wheat, ground but not pulverized, the Italians, Rolong, Semola, Semoletta, and Semola rarita, are parts of wheat flour. See Wheat, Semolina.

SOOKASA, Sans. Cucumis sativus, *Linn.*

SOOK CHINA, Beng. China root, *Roxb.*

SOOKEYT MUNDI, a district in the Kohistan of Jullundhur.

SOOKHA, Hind., dry tobacco, eaten with betel leaf.

SOOKH-DURSUN, Beng., Hind. Crinum asiaticum, also Crinum zeylanicum, Singhalese crinum, and Crinum defixum.

SOOKHA-MAYA, Sans., from sookha, happiness, and maya, fulness.

SOOKNA, or Sookahna, a river near Munnimajra in the Umballa circle.

SOOKSMA, Sans. Very small.

SOOKSOEE, a river near Beeltriaganj in Azimghur.

SOOKTA, Panjab. Chaptalia gossypina.

SOOKTA, a river near Beeltriaganj in Sindhiah's territory, 13¼ miles from Azimghur.

SOOKTOWA, a river near Kaisla in Baitool.

SOOKUL PACHA, see Belanus.

SOOLOO ARCHIPELAGO, is that chain of islands which stretch across from the N. E. point of Borneo to the island of Mindanao. The islands are numerous. Sooloo island, from which the Archipelago is named, is high and of considerable extent, being 35 miles long and from 5 to 10 broad; it lies in long. 121° E. near the centre of the Archipelago. Great Sooloo is about fifty miles in length, and twenty-five in breadth, being the largest of the group of islands forming the Sooloo Archipelago. This group of islands is inhabited by a fierce and warlike race, bearing in their personal appearance a strong resemblance to the Malays, although the two languages differ materially from each other. Great Sooloo, the residence of the sultan, is very mountainous. Many of the mountains are wooded to the summit, while others are covered with patches of cultivation. These islands are thickly populated; and if the islanders do not practise piracy as a profession, they are always ready to aid, assist and protect those who do. The town of Sooloo is well known to be the principal rendezvous of pirates, who, whenever they have made a capture, resort there to dispose off their lawless booty. The great islands of Mindanao, Palawang, and the Sooloo group of islets, forming the southern limits of the Philippine Archipelago, contain many nations and tribes speaking many languages of which little has been published. Mr. Crawfurd on the information given by Mr. Dalrymple informs us that even in the little group of the Sooloo islands, a great many different languages are spoken, and he gives a short specimen of 88 words of one of those most current. Sooloo has for many years been the market where the Lanun and other pirates disposed of much of their plunder, and in former times itself was decidedly piratical. The mahomedan religion has made much progress in Mindanao and the Sooloo islands, as has the Malay language, the usual channel through which it has at all times been propagated over the islands of the Indian Archipelago. Mr. Crawfurd remarks that whether the principal languages of the Philippines be separate and distinct tongues or mere dialects of a common language, is a question not easy to determine. Certainly, the phonetic character of the Tagala, the Bisaya, the Pampangan, and Iloco are, sound for sound or letter for letter, the same. Words of the Malayan languages are to be found in the language of the aboriginal inhabitants of Formosa, or Taiwan; and as this large island, about half as big as Ireland, stretches as far north as the 25° of lat, this is the extreme limit in a northerly direction to which they have reached. The aborigines of Formosa are short in stature, of tawny complexions and lank hair. Although inhabiting a great and fertile island, affording to all appearance a fair opportunity of development, they never made any progress in civilization, and at present seem to live in a state of barbarism. They are thought by Mr. Crawfurd to belong to, or much to resemble, the brown complexioned race of the Archipelago of whom the Malays are the type.—*Horsfield*; *Journal of the Indian Archipelago*; *Marryat's Indian Archipelago, p.* 41.

SOOLTANA, BENG. Sweet-scented Calophyllum, Calophyllum inophyllum.

SOOLTAN SURWUR, oblations offered to this saint.

SOOLTAN SURWUR, a mahomedan saint whose shrine is at Balooch, four coss from Mooltan. He was distinguished for piety and purity of manners, and died as a martyr with his brother, fighting against a troop of idolaters, and was buried with his wife (who died of grief) and his son, in the same tomb. Several miracles are related as having happened at his tomb. A camel's leg, when broken, was forthwith made whole; the blind, the leprous, the impotent were cured. *Araesh-i-Mahfil.*

SOOM, BENG., HIND. Sarcostemma brevistigma. See Soma.

SOOMALEE, SANS. From soo, good, and mala, a necklace.

SOOMBOOL, HIND. Arsenic. See Sumbul.

SOOMCHOO, see Kunawer.

SOOMEROO, SANS., from soo, good, and meroo, a boundary mark.

SOOMRA RACE, entered Sind about A.H. 445, and became the rulers of Sind in A.H. 609, from which year they continued in power till A.H. 751, when they were overthrown by the Summa. The name was originally pronounced Samra. The tribes in Kurrachee district are the Kumeerpota; Meetopota, Budeepota and the Norungpota. In the Hyderabad district the Soomra are cultivators and oil manufacturers. See Sind.

SOOMUNA, SANS. Triticum æstivum, *L.*

SOOMURUN or Gujta, HIND. Bracelets made of coloured thread, worn at the Mohurrum, and of flowers worn on other occasions.

SOONA BIRTHA. The Nepal lands are divided into four classes of tenures—first, crown lands; secondly, Kroos or Soona Birtha, belonging to brahmins or Newars; thirdly, Kohriya or Bari, barren lands granted for cultivation; and, lastly (and this is the most extensive class of the four), Kaith, in which the proprietor is at all charges of tilling, dividing the produce with the cultivator.—*Oliphant's Journey, p.* 179.

SOONAMOOKI, see Tripati.

SOONAREE, URIA. Cathartocarpus fistula, *Pers.*

SOONDA, a district in the south of the Bombay presidency, bordering on north Canara. It contains large forests, which, up to 1855, were under the charge of the Bombay Conservator, but were then transferred to Madras. Dr. Gibson's Reports indicate that by A.D. 1850, the timber had greatly decreased in amount. In the transfer of Canara to Bombay, this district was re-transferred along with it.—*Gibson's Bombay Forest Report,* 1849 *to* 1856, *p.* 60, *also* 1857-60, *p.* 17.

SOONDANY, a river near Nebeenuggur in Purneah.

SOONDERBUNS, see Sunderban.

SOONDHI, BENG. Nymphœa cyanea.

SOONDOROGOYAN BANSO, TEL. ? URIA ? In Ganjam and Gumsur, circumference 3¼ feet, extreme height 30 feet, two species of bamboo which are not common.—*Capt. Macdonald.*

SOONDREE, BENG. Heritiera minor, *Lam.* Syn. of H. fomes. A gloomy-looking tree that may be distinguished from all others for many miles distant. It is remarkably characteristic of a peculiar soil. Wherever the tides occasionally rise and inundate the land, this tree is sure to be found throughout the whole Tenasserim Coast, but is never found either on the high dry lands on the one hand, nor in the wet mangrove swamps on the other. It was described by Dr. Buchanan Hamilton, who accompanied Symes' embassy, as Heritiera fomes. It is the toughest wood that has been tested in

India. When Rangoon teak broke with a weight of 870 pounds, soondree sustained 1,312 pounds. It is not a very durable wood, but stands without a rival in strength, although so common on the other coast, as to give name, as Captain Munro thinks, to the Soonderbunds, yet the tree grows much larger in the Tenasserim Provinces, and affords finer timber.—*Mason.*

SOONDROO, see Kunawer.

SOONDARA, SANS. Beautiful.

SOONGNA, gum of Moringa pterygosperma.

SOONGNUM, see Kunawer.

SOONISHUNNA, SANS. Achyranthes polygonoides.

SOONKASOOLA WOOD.

Sunkesur ke lakree, HIN.	Sookesooloo, TEL.
Vadee naroinin, TAM.	

SOONNEE. The Soonnee sect of mahomedans contend that the lawful succession to Mohamed rested in the four Imams, Aboobukur, Omar, Othman, and Ali, while the Shiah mahomedans strenuously contend that Ali alone, as the nephew and son-in-law of the Prophet, had that right.—*Pottinger's Travels in Beluchistan and Sind, p.* 61.

SOONNUT JUMMAUT, the doctrine of the Soonnee mahomedans is so called.

SOONNUT, the traditions of Mohamed.

SOONTAN, HIND. Circumcision.

SOOP, HIND. A winnowing basket.

SOOPAREE, HIND. Areca-nut, betel-nut. Nut or tree of Areca catechu. Penang nut. See Betel-nut.

SOOPLEE, HIND. A kind of basket for winnowing corn with.

SOO-PUDMU, or Soo-padma, SANS., from soo, good, and padma, a water-lily.

SOO-PURNU, or Sooparna, SANS., from soo, good, and parna, a leaf.

SOOR, a bass or drone to the shuhnaee.

SOOR, a mahomedan dynasty who ruled at Dehli, during the 15 years of Humayoon's displacement.

SOORA, AR. A chapter of the Koran ;

Soora-i Alhumd, or Soora-i Fateeha, the first chapter of the Koran.

Soora-i Alum, or Ullum-turkyf, or Feel, the 15th chapter of the Koran.

Soora-i-Buqr, or A. L. M. the 2nd. ditto

Soora-i-Char Qool.

Soora-i-Chahul Qaf.

Soora-i-Easeen.

Soora-i-Eezaja or Nusser.

Soora-i-Fateeha, or Alhumd.

Soora-i-Feel, or Ullum-e-turkyf.

Soora-i-Innafut-huna, or Inna.

Soora-i-Iqra, or Ulluq.

Soora-i-Qool hoo Allah.

Soora-i-Mozummil.

Soora-i-Ruhman.

Sooar-i-Tubut.

Soora-i-Ullum-turkyf, or Feel.

Soora-i-Ulluq or Iqra.

SOORACHARYA, SANS., from soora the gods, and acharya, a teacher.

SOORAH, a river of Purneah.

SOORI TREE, ENG. Cedrela toona, *Roxb.*

SOORI. The town of Zerni is forty parsangs from Herat, the population does not exceed twelve hundred, Soori and Taymooni, there are also a few Gheber families, the only ones Ferrier met with in Affghanistan.—*Ferrier's Journ., p.* 248.

SOORINJAN, HIND. A root in appearance like the pignut, imported via Pali, is bitter and sweet in taste, used as an aphrodisiac.—*Gen. Med. Top., p.* 150.

SOORIVA MARRA, SINGH. Under this name, Mr. Mendis describes, as a species of Mimosa, a plant of the central province of Ceylon, the wood of which is used for buildings and common furniture. A cubic foot of it weighs 42 lbs, and it is calculated to last 20 to 30 years.—*Mr. Mendis.*

SOORIYE. A hard, though somewhat coarse and open-grained, heavy Ceylon wood, of a deep chesnut colour.

SOORKH, PERS. Red.

SOORKH RUD, an affluent of the Kabul river.

SOORLA, a river of the W. Ghauts, rises in lat. 19° 54', long. 73° 24', runs W. S., into Indian Ocean. Length, 68 miles.

SOORMA, a river of Sylhet. About 70 miles up the river Soormah, the mountains on the north, which are east of Jyntea, rise 4,000 feet high, in forested ranges like those of Sikkim. Swamps extend from the river to their base, and penetrate their valleys, which are extremely malarious : these forests are frequented by timber-cutters, who fell the jarool "Lagerstrœmia reginæ," a magnificent tree with red wood, which, though soft, is durable under water, and therefore in universal use for boat building.

SOORMA, HIND. Preparations of antimony or of lead ore with which Indian women anoint the edges of the eyelids, the dark colour it imparts being thought to give brilliancy to the eyes, while its cooling qualities are supposed to be useful as a preservative. Any ointment for the eye, thus, has obtained the name of soormah.

SOORMA-DAN, a box for holding soorma.

SOORNAMOOKY RIVER rises in the table-land, lat. 13° 26', long. 79° 11' runs N. E. to Bay of Bengal, length 99 miles.

SOOROO, a river near the Cossyah hills.

SOORPA-NAKHA, SANS., from soorpa, a hand-winnowing fan, and nakha, the finger-nails.

SOORPUNNI, Can. Calysaccion angustifolia.

SOORPUR, an ancient city on the Jumna, the capital of the Yadu race.

SOORPUR, an ancient city, once the capital of the Yadu race, its site is on the Jumna.

SOORSAUT, is an allowance authorized by Government to be levied on the inhabitants of towns and villages, by travellers and others. It is supposed that a deduction is made in the collection of the revenue on this account whenever it occurs, but the cultivators never reckon upon any remuneration, for, even though it should be admitted, the chief of the place usually appropriates the advantage to himself. This ruinous system is peculiarly distressing, when a mission passes through the country, as all the followers fancy that they have a right to the same indulgence, and, if not checked, would not hesitate to help themselves. Pottinger saw the mules of one party driven into fields of standing grain, when the villagers refused to obey the warrant.—*Pottinger's Travels in Beluchistan and Sind, pp.* 235-6.

SOORUJ, Hind., the sun ; see Rajputs.

SOORUN, Mahr. Amorphophallus campanulatus, *Bl.*

SOORU-PATI, Sans., from sooru, the gods, and pati, lord.

SOORUN, Mahr., Hind. Colocasia esculenta, *Sch.*

SOORWAL, (prop. Shilwar).

SOOSEE EEZAR, trowsers made of soosee cloth. See Soo-ceq.

SOORYA, Singh. A timber tree of the central and western provinces of Ceylon, wood admirable for carriages, hackeries, and gun-stocks, also useful for blocks and buildings. A cubic foot weighs 49 lbs., and it is calculated to last 20 to 40 years.—*Mr. Mendis.*

SOORYA, Sans. The sun.

SOORYAVANSA, the race of the sun claim descent from Rama. The existing Rajput tribes of the solar race claim descent from Lava and Cush, the two elder sons of Rama. The present princes of Mewar, Jeypore, Marwar, Bikanir and their numerous clans, claim descent from Rama. See Solar dynasty.

SOORYA AYODIA, was the first city founded by the Soorya race.

SOOSHUNI-SHAK, or Soosni-shak, Beng. Marsilea quadrifolia, *Linn.* Four-leaved pepper wort.

SOOSUNI-ALOO, Beng. Dioscorea fasciculata.

SOOSWAH, a river near Khansroo Choki and Lucheewala in the Dhera district.

SOOT, or Soota-Naddi, or Yar Wafadar, a river near Moorshedabad and Bisowlee in Bareilly. A river near Aoulaganj in the Bareilly district and in the Moradabad circle.

SOOTEE, a river near Kaida in Nusseerabad.

SOOTHNEE, Duk. Dioscorea fasciculata, the Yam. Consists of many tubers, about the size and shape of an egg. They are covered with a light coloured thin skin ; internally they are white. They are not only eaten, but starch is made from the roots.—*Riddell.*

SOOTHSAYER of Ceylon, Mantis superstitiosa, *Fab.*

SOOTRA, Sans. To stitch.

SOOTREEAN or Chukolcean, a particular kind of cloth.

SOOTINOG, a river near Eetah Kollah in Sylhet.

SOOTRADHARA, Sans., from sootra, a cord, and dhree, to hold.

SOOVARNAKA, Beng. Cathartocarpus fistula.

SOOVARNA VANIK, Sans., from soovarna, gold, and vanik, a tradesman.

SOOWUNREKA, a river near Gwalior.

SOOJRYU-MUNI, Beng. Phœnician hibiscus, Hibiscus phœniceus.

SOORJMOOK-HEE, Beng. Sunflower, Helianthus annuus.

SOPHAGESENUS, the name given to Asoka by the Greeks. Evidence exists that Antiochus the Great was slain by an Indo-Scythian prince, called by the Greek writers Sophagasenus. See Kabul. Sophir or Sauvira.

SOPHORA, a genus of plants belonging to the natural order Leguminosæ, said to be so named from an Arabic name (Sophera) of one of the species. Some are ornamental shrubs and trees, found in central and tropical Asia, also in the warm parts of North America and the equinoctial and sub-tropical parts of South America. The species best known in England are S. japonica and S. chinensis, which, being from the northern latitudes of the countries from which they are named, are hardy enough to withstand the climate of England ; and it has been proposed to engraft the Nepaul S. velutina on the Japonica. Being handsome trees, with both leaves and trees differing much from European trees, they are well adapted for standing singly in lawns. They are raised from layers, but also from seeds and require a little protection when young. Wight gives Sophora glauca, heptaphylla, robusta.—*Eng. Cyc., Hogg, W. Ic., Voigt.*

SOPHORA GLAUCA, Lesch. Smooth-leaved Sophora. A Neilgherry plant, with middle-sized white flowers, tinged with rose colour.—*R. Brown.*

SOPHORA OCCIDENTALIS, *Linn.* Syn. of Sophora tomentosa, *Linn.*

SOPHORA ROBUSTA, *McClell.*

Theet wa gyee, BURM.

SOPHORA TOMENTOSA, *Linn.*

S. occidentalis, *Linn.* | Downy-leaved Sophora.

A shrub, native of Southern Asia, with pretty yellow flowers.

SOPHYTES, or Sophites, or Sopeithes, an ancient king of the western Panjab, including the Salt Range of mountains.

SOPILLA, IT. Crape.

SOPU, also Sompa, TEL. Anethum sowa, *Roxb.*

SORA or Chola, see Kurumbar, Paudiya.

SORAHEE, HIND. Gugglet, or goglet (prop. goblet.)

SORA-KAYA, TEL. Lagenaria vulgaris, *Serr.*

SORANI, a ferocious tribe, who call themselves Yezedi, after a caliph of Damascus of that name. They inhabit the mountains of Sindjar, a country to the north-west of Bilbos. They are the greatest robbers of all the Kurdish tribes.—*Porter's Travels, Vol.* ii, *p.* 450.

SORAPOOR, a town near the left bank of the Kistnah river, usually called Beder Sorapoor, because it was occupied by the Berder or Beder race. See Hindu, India.

SORBUS, see Kuhnar.

SORECIDÆ, the family of Shrews, viz :

Fam. SORECIDÆ, Shrews.

Sorex cærulescens, *Shaw, Blyth.*

Sorex indicus, | S. sonnerati, *Geoff.*
S. giganteus, | S. myosurus, *Gray.*

Sondeli, CAN. | Musk-shrew, ENG.
Musk rat, ENG. | Chachundi, HIND.

All India.

Sorex murinus, *Linn., Blyth.*

S. swinhæi, *Blyth.* | S. myosurus, PALLAS.
S. viridescens, ,,

Mouse-coloured shrew, ENG.

Sorex nemorivagus, *Hodgson.*

Nepal wood Shrew, ENG. | S. murinus, *Horsf.*

Nepal, Sikkim.

Sorex Griffithii, *Horsf.* Khassla hills.

Sorex serpentarius, *Is. Geoff.*

S. kandianus, *Kelaart.* | Rufescent shrew.

Ceylon, S. India, Burmah Tenasserim.

Sorex heterodon, *Blyth,* Khassya hills.

Sorex saturatior, *Hodg.* Darjeeling.

Sorex tytleri, *Blyth.* The Dehra shrew. Dehra Dhoon.

Sorex soccatus, *Blyth, Hodgson.* Hairy-footed shrew. Nepal, Sikkim, Mussoorie.

Sorex niger, *Ell., Horsf.* Neilgherry wood shrew. Neilgherry hills.

Sorex leucops, *Hodgs.*

Long-tailed shrew, ENG.

Nepal.

Sorex hodgsonii, *Blyth.*

Nepal Pigmy shrew, ENG.

Nepal.

Sorex perroteti, *Duvernoy.*

Neilgherry Pigmy shrew, ENG.

Mysore, Neilgherries, Dekhan.

Sorex micronyx, *Blyth,* small-clawed pigmy shrew of Western Himalaya.

Sorex melanodon, *Blyth,* Black-toothed pigmy shrew of Calcutta.

Sorex sikimensis, *Hodg.* Darjeeling.
Sorex homourus, *Hodg.* „
Sorex oligurus, *Hodg.* „
Sorex macrurus, *Hodg.* „
Sorex holo-sericeus, *Hodg.* „
Sorex tenuicaudus, *Hodg.* „
Sorex ferrugineus, *Kel.* Ceylon.
Sorex montanus, „ „
Sorex kelaarti, „ „
Sorex purpurascens, *Temp.* „
Sorex horsfieldii, *Tomes,* „
Sorex fuliginosus, *Blyth,* Tenasserim.
Sorex nudipes, „ „
Sorex atratus, „ Khassya.
Sorex albinus, „ China.
Sorex pulchellus, *Licht.* Central Asia.

Soriculus nigrescens, *Jerd.*

Corsira, *Gray, Blyth.* | S. soccatus, *Hodg.*
S. aterrimus, ,, | S. sikimensis, *Horsf.* ,,

Ting-Zhing, BHOT. | Tang-Zhing, LEP.

Mouse-tailed shrew of Sikkim, Nepaul.

Crossopus himalaicus, *Gray.*

Choopitsi, BHOT. | Oong-lagniyu, LEPCH.

The Himalayan water-shrew of Sikkim.

Corsira alpina, *Jerdon.*

Sorex caudatus, *Hodgson, Bly.* | Alpine shrew, ENG.

Europe, Sikkim.

Corsira Newera-elia, *Kel.* of Ceylon.

Feroculus macropus, *Kel.*

Sorex macropus, *Blyth.*

Ceylon.

The scaly tails of Myogalea (mygale) or Musk rat of N. America are imported into India. Mr. Edward Blyth says, that in general the shrews of tropical and subtropical countries are distinguished by their comparatively large size, and slaty hue of every shade from pale grey to black, with rufous tips to the fur more or less developed, though in some scarcely noticeable. In at least some species, the rufous tips would appear to increase with age; and, to a considerable extent, the colour of these animals is darker, according to the increase of altitude inhabited by a species. The ear-conch is conspicuously visible above the fur; the tail thick, tapering, and furnished with scattered long hairs, which certain species also exhibit upon the body; and the teeth are wholly white. To this there is a remarkable exception in the instance of Sorex melanodon, and of the following type of structure. The superior frontteeth are large and strongly hooked, and much longer than their posterior spur; while the inferior have rarely so much as a trace of serrated upper edge; of four upper præmolars anterior to the carnassiez, the first is large, the second and third are much smaller, the fourth is diminutive, and the third exceeds the second. This group of shrews is familiarly exemplified by the common large musk shrews of Asia and Africa, and constitutes the restricted Sorex, *L.*, or Pachyura, *de Selys Longchamps.* Certain small species of temperate climates were detached by Wagler from the ordinary shrews of those climates (with picious tipped teeth, &c.,) by the name Crocidura (or Suncus, *Ehrenberg,* apud *Gray*); viz., S. araneus, S. leucodon, S. etruscus, &c., but it is doubtful whether these are separable from the above; and certainly the various pygmy shrews of India are typical Sorices, except that some only of them want the odoriferous glands on the sides of the body. There is evidence of the existence of a small brown Sorex in Lower Bengal, about the size of S. araneus, the remains of one were found in the stomach of an Elanus, shot about 60 miles above Calcutta. In Ceylon four shrews are enumerated by the names Sorex murinus, S. montanus, *Kelaart,* S feroculus, *Kelaart,* S. macropus, *Blyth,* and S. ferruginous, *Kelaart,* the last described with fur soft, ferruginous-brown, washed with blue; smaller than the S. montanus; feet and legs naked. Large secreting glands in the pubis, odour very disagreeable. No sebaceous glands could be traced on the other two species, nor had they any of the smell. From this last remark, it is inferred that S. montanus and S. ferruginous of Dr. Kelaart are brought together under the name montanus. If so, Blyth still thinks them to be identical. With reference to the "large black shrew, Dr. Kelaart adds: "There are two other and larger black shrews than any of those now described—one in the possession of Mr. Thwaites of Peradenia, and the other has a very powerful musky odour, stronger even than in S. murinus, occasionally seen in the godowns at Kandy.

Sorex araneus, see Sorex.

Sorex atratus, Blyth. Of this, Blyth had only a headless specimen which was found impaled upon a thorn by some shrike, at Cherra Punji in the Khassya hills. The same fact he had observed in England of Lanius colluris and Corsira vulgaris: these diminutive shrews falling an easy prey to the "Butcher-birds;" while the larger members of the same genus are ferociously predatory upon any hapless birdlet they may chance to seize,—as is likewise the case with moles and doubtless other sorecidæ of adequate size and strength. The species is remarkable for its very dark colour, extending over the feet and tail which is even blackish underneath. Length of tail 1 inch.; and of hind-foot $\frac{11}{32}$ inch. Fur blackish-brown above, little tinged rufescent, and with dark greyish underneath; the feet and tail conspicuously furred, besides the scattered long hairs upon the latter.

The Museum of the Bengal Asiatic Society formerly possessed a specimen of one of the minute shrews, which was found in a cellar in Madras. Blyth formerly considered it identical with S. micronyx; so that it could scarcely be so with S. melanodon of Bengal: it was, however, darker than S. micronyx; and more probably S. perotettii, (*versus*) if not distinct from the whole of the foregoing. It is even probable that several more Indian species of these most diminutive of all mammalia remain to be discriminated. Upon minute comparison of five specimens in the museum, he immediately detected four well-marked species, and presently afterwards obtained the S. melanodon fresh. He once found the nearly digested remains of an adult small white-toothed Sorex, rather larger than a common mouse, in the stomach of an Elanus which was shot on the banks of the Hooghly, about 15 miles above Calcutta.

Feroculus. Another form of white-toothed shrew, with thick and tapering tail having scattered long hairs upon it, is exemplified by the Feroculus, *Kelaart.* Teeth small; the upper quasi-incisors shorter and less strongly hooked than in restricted Sorex with the posterior spur large; the lower quasi-incisors serrated, showing two depressions and therefore a row of three coronal points, four small upper præmolars preceding the carnassiez, the two medial being of equal size, the first rather large, and the fourth small. Feet remarkably large. The ear-conch scarcely visible above the fur.

Feroculus macropus.

Sorex feroculus, *Kelaart.* | S. macropus *Blyth, J. A. S.*, xx, 163.

Length about $6\frac{1}{2}$ in.; of which the tail is $2\frac{1}{4}$ in.; hind-foot with claws nearly $\frac{7}{8}$ in.; the fore-foot $\frac{1}{2}$ in. broad, with long and but slightly curved claws, that of the middle digit

¼ in. in length. Fur somewhat long and very soft, uniform blackish, very faintly tinged rufescent; the extreme tip of the tail naked and of a flesh-colour. Inhabits Ceylon.

Crossopus. Another white-toothed Indian shrew exists in the Crossopus himalayicus, *Gray*, but Blyth felt much doubt of its being correctly referred to Crossopus.

Myosorex, Gray, is founded on a Cape species, the Sorex varius, *Smuts*, with ear-conch concealed amid the fur, and a slender tail (without scattered long hairs?) the teeth white, and the dentition slightly modified upon that of restricted Sorex: lower quasi-incisors "with an entire sharp upper edge." The greater number of small shrews inhabiting the temperate regions of Europe, Asia, and N. America, have the teeth always tipped with ferruginous or pitch-colour, a slender mouse-like tail with no scattered long hairs upon it, and (save in Otisorex) the ear-conch concealed amid the fur. There are two distinct types of dentition. In one, the upper quasi-incisors are much longer than their posterior spur (as in restricted Sorex); and the lower have but a single posterior spur more or less rudimental: the lateral small teeth which follow in the upper jaw are four in number (as in restricted Sorex); the first two being equal, the third somewhat smaller, and the last (as usual in all shrews) minute. With this type of dentition Mr. Blyth distinguish.

Sorex cæcutiens, or S. Minutus, *Lam.*, has a wide range in India, for it has been obtained in the Neilgherries, in a cellar at Madras, from Almorah and from the Tenasserim coast.

Sorex cærulescens, Shaw.

S. pilorides, *Shaw.*
S. giganteus, *Is. Geoffry.*
S. murinus, *L.*, apud *Gray*: figured in Hardwicke's Ill. Ind. Zool, as S. indicus, *Geoff.*
S. myosurus, *Pallas.*
S. myosurus, apud, *Walker*, in Calc. J. N. H. iii.
Common Musk shrew 'Musk rat,' of Bengal, &c.

This is very different from the 'Musk rat,' or Mushquash—Fiber zibeticus of N. America, which is a rodent nearly affined to the Voles—Arvicola. The Musk rat of Bengal is described by Mr. Hodgson in the Ann. Mag. N. H., xv, 269, (1845); but the length of the tail (as given), 3⅛ in. is possibly a misprint for 3⅝ or 3⅞ in., or more than half of the length of the head and body, which is given as 6 in. Number of caudal vertebræ, 24. Total length of skull of adult male, with front-teeth in situbus, somewhat exceeding 1⅝ in.; of female, somewhat under greatest breadth of skull of former, $\frac{32}{16}$ in.; of latter, ⅝ in. Colour uniform pale-grey, slightly tinged with ferruginous, and more conspicuously on the lower parts; the naked parts flesh-coloured. This is the common large musk shrew of Bengal, Nepaul, and, we believe, the valley of Assam, becoming rare in Sylhet, and wholly disappearing in Arakan. In Nepaul, Mr. Hodgson styles it 'the common house shrew of the plains, and also of the hills, up at least to 6,000 feet. Mr. Blyth had seen specimens from the neighbourhood of Agra: but whether it be the common musk shrew of S. India is doubtful on present evidence; though Dr. Kelaart's description of the Singhalese animal corresponds. It certainly does not appear to inhabit the eastern coast of the Bay of Bengal, from Arakan to the Straits of Malacca. Dr. Horsfield gives as its habitat 'India generally, and the eastern islands;' and he notes a specimen from Bhutan, presented to the India-house collection by Major Pemberton. Blyth suspects that its reputed existence in the Malay countries, needs confirmation. In addition to the names above cited, Dr. Gray, in his catalogue of the specimens of mammalia in the British Museum (1843), refers the following name and synonymes to this species:—

S. murinus, *L.*
S. myosurus, *Pallas.*
S. indicus et capensis, *Geoffroy.*
S. sonneratii, *Is. Geoff.*
S. crassicaudatus, *Licht.*
S. nipalensis, *Hodgson*, and
S. moschatus, *Robinson.*

Sorex crassicaudus (nec crassicaudatus), *Lichtenstein*, refers to a musk shrew inhabiting Egypt, and stated to be common about Suez; which may therefore be presumed identical with Dr. Ruppell's S. indicus from Suez; and the description certainly seems to approximate that of S. cærulesceus (length 5½ in.; tail 2¾ in.): and S. capensis, *Geoffroy*, is termed S. francicus by Prof. Schinz, who gives Mauritius as its habitat (length 3" 8'"; tail 1" 9'").

Sorex caudatus, Hodg., Bly. syn. of Corsira alpina, *Jerdon.*

Sorex feroculus, see Sorex.

Sorex ferrugineus, Kelaart. *J. A. S.*, xx, 185: S. montanus apud Blyth. The dimensions of the specimen described in *J. A. S.*, xx, 163, accord with those assigned by Dr. Kelaart to the next species; and he states that the two are nearly of the same size, and that the smell of the present species is very powerful.

Sorex heterodon, Blyth. Very similar to S. soccatus in general appearance, but less dark-coloured, with shorter fur, and pale instead of blackish feet and tail underneath: the feet, too, are broader, especially the hind-feet; and they have a hairy patch below the heel. The skull, of the same length as in S. soccatus, and with equally large teeth, is much more narrow and the upper quasi-incisors are conspicuously less strongly hooked than in that and other typical Sorices. From Cherra Punji, in the Khasya hills.

Sorex indicus, Geoffroy, or S. Sonneratii, Is. Geoffroy, is accepted as a distinct species from S. cærulescens in Dr. Horsfield's Catalogue of the specimens of Mammalia in the India House Museum (1851) ; and a specimen is noted from the Dekhan, presented by Col. Sykes, and the following habitat given for the species, viz. : " Continent and islands of India." Col. Sykes terms it the Cheechonder of the Mahrattas, being the same name which is applied to S. cærulescens in Bengal, spelt Choochundr by Dr. Cantor (J. A. S., xv, 191), and the latter author gives " Chinchorot of the Malays of the Peninsula" as the name of the very distinct species referred by him and others to S. murinus, *L.* ; which latter was originally described from Java. According to Colonel Sykes, these troublesome and disagreeable animals are very numerous in the Dekhan, but much more so in Bombay. The sebaceous glands in an old male were observed to be very large, and the odour of musk from them almost insupportable ; while in an adult female the glands were scarcely discernible and the scent of musk very faint. It is tolerably strong in the female of S. cærulescens ; though more or less so, perhaps, with reference to sexual condition. " The Sorex indicus and S. Giganteus," it is added, " are regarded by Col. Sykes as specifically identical, he having killed them in the same room, and seen them *frequently* together." (P. Z. S, 1831, p. 99). Prof. Schinz accordingly assigns S. Giganteus, *Geoff.* Ann. du Mus, xv, pl. 4, of 3," as a synonyme of S. indicus : but the reference is erroneous, the Memoires du Museum, tom., xv, (to which Blyth had not access), being probably intended. S. giganteus, Is. Geoff, Voy de Belanger, refers to S. cærulescens of Bengal.

According to M. Isidore Geoffroy, the S. indicus (his S. sonneratii) is a smaller animal than S. cærulescens (his S. giganteus), with tail forming always a quarter of the entire length. Length of the head and body of adult, a little under 4 inches (Fr). Fur ashy, washed with russet-brown ; and pale ashy below. Inhabits the Coromandel coast, and also the Mauritius. If truly a distinct species from S. cærulescens, its natural habitat is probably W. India : but Mr. Blyth had vainly sought for information of such an animal.

In Dr. Ruppell's printed catalogue of the specimens of mammalia in the Frankfort Museum (1842) examples referred to S. indicus. *L.* (Fr. Cav. *Mamm.* 11, t. 28), are noted from Java, and also from Massowa and from Suez ; and a supposed variety termed by him S. indicus, var ; cinereo-ænea, from Shoa : and he elsewhere suggests that these animals have probably been introduced by the shipping from S. E. Asia and its islands, and so found their way over to Shoa, where a different climate had affected the colouring of the fur. On ship-board they could of course subsist on Blattæ.

Sorex kandianus, Kelaart. Sorex serpentarius, *Is. Geoff.*

Sorex macropus, Bly. Feroculus macropus.—*Kel.*

Sorex melanodon, Blyth, from the remarkable colouring of its teeth, which are piceous and white-tipped, exhibiting thus the reverse coloration of those of Corsira, &c. Length of adult female $1\frac{7}{8}$ inch ; tail $1\frac{1}{16}$ inch : hind foot and claws $\frac{5}{16}$ inch. Colour uniform fuscous, without any rufous tinge ; scarcely paler below : the feet and tail subnude, save the usual scattered fine long hairs upon the latter ; and with the ears and snout, of a livid colour, paler below ; claws white and distinctly visible. Procured in Calcutta.

Sorex micronyx, Blyth, of Kumaon and Landour, length of head and body $1\frac{5}{8}$ inches ; tail somewhat exceeding $1\frac{1}{8}$ inch ; hind-foot and claws $\frac{13}{32}$ inch : skull $\frac{1}{2}$ inch, teeth white. Claws with fine hairs impending them, and so minute as to be scarcely discernible without a lens. Fur of a paler and more chesnut brown than any other of these minute species examined, and also more silvery below. Feet and tail sub-nude, or thinly furred, showing the colour of the skin through ; browner above, whitish (or perhaps flesh-coloured) below.

Sorex montanus, Kelaart, (nec apud *Blyth, J. A. S.*, xx, 163.) Length of head and body $3\frac{3}{4}$ inches ; of tail $2\frac{1}{4}$ in. ; of hind-foot $\frac{2}{3}$ inch. Fur, above, sooty-black, without any ferruginous smear ; beneath lighter-coloured ; whiskers long, silvery-grey : lower part of legs and feet greyish, clothed with appressed hairs. Claws short, whitish. Ears large, round, naked ; the outer margin lying on a level with the hair of the head and neck, and being thus concealed posteriorly. Mountains of Ceylon.

Sorex murinus, L.

S. myosurus, *Pallas.*
S. cærulescens, var., *Raffles.*
S griffithii (?) *Horsfield.*

There is every reason to suspect that this species replaces S. cærulescens along the whole eastern coast of the Bay of Bengal, and thence through the hilly country northward, to that skirting the valley of Assam. Dr.

Horsfield mentions a Nepalese specimen, presented to the India-house museum by Dr. Hodgson: but this species is unnoticed in the latter gentleman's catalogue of Nepalese animals and especially in his descriptive notices of the Nepalese shrews. With the exception of the small S. tenuis, *Müller*, from Timor, it appears to be the only well-established species of shrew throughout the great oriental Archipelago. In the Tenasserim provinces, the Rev. J. Mason states—there are at least two species of musk shrew, both of which emit an offensive odour." (*Qu.*, S. murinus and S. serpentarius?) In S. murinus, according to Dr. Cantor, " the smell of musk, emitted by the adult animal, and which in the young is barely perceptible, is much less intense than in the Bengal musk shrew." S. serpentarius, according to Dr. Kelaart, has a powerfully offensive musky odour. S. murinus has larger ears than S. cærulescens; and Dr. Cantor describes it as—'Dark brownish-grey above' beneath light brownish-grey. Feet and tail flesh-coloured in the living animal, changing to cinereous after death. In the young the colour is more of a bluish-grey, slightly mixed with brown on the back. A stuffed specimen from the Khassya hills has the fur longer and less dense than in S. cærulescens, the piles somewhat curly: and colour dark-ashy at base, with rufous-brown tips which give the prevailing hue. Mr. Blyth suspects that S. griffithii, *Horsfield*, is S. murinus from the Arrakan and Khassya hills, although described from Affghanistan: S. griffithii is described to be allined to S. murinus, but differing essentially by the uniform deep blackish-brown tint, and the shortness, delicacy, and softness of the fur. Colour deep blackish-brown throughout, with a slight rufous reflection in a certain light. Length of head and body, $5\frac{3}{4}$ inches; tail $2\frac{1}{3}$ inches.

Sorex murinus, Horsf. Syn. of Sorex nemorivagus, *Hodgson*.

Sorex myosurus, Gray. Sorex cærulescens, *Shaw*, *Bly*.

Sorex myosurus, Pallas. Syn. of Sorex murinus, *Linn.*, *Bly.*

Sorex nemorivagus, Hodgson, differs from the ordinary type by a stouter make, by ears smaller, and less entirely nude, and by a longer and more tetragonal tail. Colour sooty-black with a vague reddish smear; the nude parts fleshy grey. Snout to rump $3\frac{5}{8}$ in.; tail 2 in.; planta, $\frac{11}{16}$ in. Found only in woods and copices.—*Ann. Mag. N. H.*, *Vol.* xv, *p.* 269.

Sorex niger, Elliot, described in Dr. Horsfield's catalogue (1851). Length of the head and body $3\frac{1}{2}$ inches; of tail $2\frac{1}{2}$ inches. Tail equal in length to the entire animal, exclusive of the head; gradually tapering to a point. Snout greatly attenuated. Colour blackish-brown, with a rufescent shade to the upper parts: abdomen greyish. From Madras, (*Qu.* Madras presidency?)

Sorex nudipes, Blyth, *n. s.*, remarkable for its naked feet and very large ears; also for the odoriferous glands on the sides being strongly developed, whereas we can detect them in no other of these minute species. Length of female, $1\frac{3}{4}$ inch; tail $1\frac{1}{16}$ inch; hind-foot $\frac{11}{32}$ inch. Ears conspicuously larger than in the others: tail almost nude, save of the scattered long hairs: and the fore-feet and toes of the hind-feet are conspicuously naked, and apparently flesh-coloured. Fur uniform brown above (like the back of Corsira vulgaris), a little grizzled and glistening; the lower parts with a silvery gloss: tail brown above, pale (probably flesh-coloured) below; somewhat thick and uniformly tapering. Specimen procured at Amherst in the Tenasserim provinces.

Sorex perottetii, Devernoy. Prof. Schinz's description of this species, is as follows:—" S. notæo saturate fusco-nigricante, gastræo canescente, artubus pedibusque pilosis, auriculis magnis, conspicuis. Long. corporis 1" 4"', caudæ 11"'. From the Nilgiris, but Mr. Blyth had a Darjeeling female which approximates this description, and may prove to be of the same species. Head and body $1\frac{1}{2}$ inch; tail 1 inch: hind-foot and claws $\frac{11}{32}$ inch. Skull somewhat exceeding $\frac{5}{8}$ inch. Teeth white. Colour uniform brown, with a slight tinge of chesnut; and scarcely paler below. Feet and tail distinctly furred, besides the usual scattered long hairs on the latter. Claws whitish and conspicuous. Tail brown above, pale and perhaps flesh-coloured beneath; more probably, however, of a livid hue; and tapering evenly throughout. If new, Mr. Blyth names it S. hodgsonii, *Blyth.*

Sorex pygmæus, Hodgson, nec S. pygmæus, *Pallas*: if the small European species referred by Schinz, Ruppell, and others to the latter be correctly identified, S. pygmæus, *Pallas*, apud *Schinz*, is placed by the latter Zoologist among the species with brown-tipped teeth, and in the division of them which corresponds to Corsira, *Gray*; and the description—cauda basi constricta auriculis brevissimis;—will certainly not apply either to Mr. Hodgson's animal, or to various other minute Indian shrews hitherto undistinguished from it: and therefore Mr. Hodgson's name for the present species may stand, as he states the structure of the animal to be typical. After writing the above, Mr.

Blyth saw the figure of Sorex pygmæus, *Pallas* and *Laxmaun*, (S. minutus, *L.*, S. exilis, *Gmelin*, and S. minimus, *Geoff.*) in the Act. Acad. Leop., Vol. xiii, pt. 2, t. 25 (1827) ; and he says the species is widely different from all the pygmy shrews here described, and is evidently a Corsira. The following is his description—'snout to vent, less 2 inches; tail, $1\frac{3}{16}$ in. ; head, $\frac{11}{16}$ in. ; palma, $\frac{1}{4}$ in. ; planta, $\frac{3}{8}$ in. Structure typical, save that no odorous glands were detected, nor had the animal any musky smell. Colour sooty-brown, paler below. Naked parts of a dusky-flesh hue. Hab. Nepaul, where it dwells in copices and fields, and is rarely found in houses.' Of numerous specimens of minute Sorices from various localities, the only one which approaches to the above description is a species which Mr. Blyth procured in Calcutta.

Sorex serpentarius, Is. Geoffroy, S. kandianus, *Kelaart*, described in J. A. S., xxi, 350, from a skin sent by Dr. Kelaart as ' the large godown shrew of Kandy ;' though scarcely corresponding with his indications. A second skin of precisely the same species, and also an adolescent specimen entire in spirit, were subsequently forwarded from Mergui by Captain Berdmore, as noticed in A. S. J., xxii, 412. In both adults, the tail (vertebræ) $2\frac{1}{8}$ inches ; and the head and body (allowing for some extension of the skin) about $4\frac{1}{2}$ inches. The Kandyan specimen is more rufescent than the others ; but Mr. Blyth could perceive no further difference whatever; indeed, to judge from the two Mergui examples, it would seem that this animal becomes more rufescent with age. Dr. Kelaart states that its odour is as offensive as that of the large musk shrew of Ceylon. The Coromandel coast and the Mauritius are given as its habitats. Colour duskyish-grey with dark rufous-brown tips to the fur, more or less developed according to age, and the under parts somewhat paler.

Sorex soccatus, Hodgson. A Sikim specimen which Blyth refers to this species, bears considerable resemblance to the last, but is a good deal darker, with well-clad feet and tail ; and the head and limbs are proportionally larger. Entire length of skull with front teeth in situbus, $1\frac{5}{16}$ inch ; breadth, $\frac{9}{16}$ inch, (nearly) ; entire range of upper teeth, $\frac{5}{8}$ inch ; ditto of S. serpentarius, barely exceeding $\frac{1}{2}$ inch. Tail (vertebræ), $2\frac{6}{16}$ inch; compressed towards tip, which is furnished with a pencil-tuft of stiffish hairs. Mr. Hodgson thus describes his animal. Size and proportions of S. nemorivagus, *H.* (nearly) ; but distinguished by its feet being clad with fur down to the nails, and by its depressed head and tumid bulging cheeks (mystaceal region). Ears large and exposed. Colour a uniform sordid or brownish slaty-blue, extending to the clad extremities. Snout to rump, $3\frac{1}{2}$ in ; tail, $2\frac{1}{8}$ inch ; planta, $\frac{13}{16}$ in. ; This animal was caught in a wood plentifully watered, but not near the water. It had no musky smell when brought dead. Hab. Nepaul and Sikkim.

Chinese northern sugarcane,	„	Jonna,	„

This is a plant of Northern China. About the year 1855 it was introduced into the south of France and England, and since then into the United States. It was introduced into the Madras presidency by the Editor in the year 1859. Dr. Birdwood, however, says it is simply the Shaloo of the Dekhan and the Deo-dhan of Bengal. But Roxburgh (i, 271,) doubts if his A. saccharatus or Deo-dhan, is the H. saccharatia of Linnæus and describes it as having seed oval, and Voigt calls it sadadeo-dhan, white, whilst the plant which the Editor introduced in 1859 has a black grain different from that of the Imphee and the Sorgho, which the Editor also introduced from the Cape of Good Hope, all of which was yellowish white. In China the black seeds are sown in April, but the plant is largely propagated by cuttings. It grows to the height of twelve to eighteen feet, with an ample inflorescence consisting of eight or ten separate stems, which group together to form the tuft of the plant. The large leaves, which make excellent green food or dry fodder, for cattle, spring from the nodes of the gradually tapering stems. The seeds, at first green, become brown, and finally of a purplish black colour, being produced only on the head of the plant. They are very nutrient and the colouring matter has been used in China to tint wine of a deep colour. The plant is not much cultivated in China. Dr. Birdwood says it is cultivated in the Bombay presidency, and that its seeds are there called shalloo. In Mysore, since A. D. 1870 it has been largely cultivated for fodder. In the Kangra district it is used as a valuable fodder for cattle, as it can be cut down, three or four times a year, and it sprouts again. Stalks have been seen there at least 12 feet high, and raw sugar (goor) is extracted from the same, but which has a less value in the market than that taken from country sugar-cane, and it seemed a doubt if the staple would pay. Professor Arduino, (*Journ. Botanique*, iii, 168,) gives an account of his experiments on the extraction of sugar from this species and they were extremely satisfactory. This has been lately recommended in the United States as a sugar-producing plant and for the sake of its juice. There its stalks furnish three important products, sugar, which is identical with that of cane,—alcohol, and a fermented drink analagous to cider. This juice, when obtained with care and in small quantities, by depriving the stalk of its outer coating or woody fibre and bark, is nearly colourless and consists merely of sugar and water. Its density varies from 1,050, to 1,075 and the proportion of sugar contained in it from 10 to 16 per cent., a third part of which is sometimes uncrystallisable. The Chinese merely chew the sweet stalks in place of the sugar-cane. According to Dr. Collins excellent beer spirit and vinegar may be occasionally made from the juice, one gallon of good alcohol coming out of twenty-three gallons of the juice. In the United States, good Sorgho sugar-cane can be produced for about five cents. the pound, whereas in S. Carolina sugar sells at from fifteen to seventeen cents. per pound. Paper has been made in the United States from the stalks, and in France they dye silks of a beautiful colour with the purple colouring matter of the hulls or bran, of the grain. It is so hardy as to grow from Florida to Maine, and produces abundance of syrup which according to Mr. Hogg, can be formed into dry sugar, as easily as from the syrup of the true sugar-cane. In the Report of the Commissioners of Patents, however, in which the Editor first saw mention of the Sorgo, the Commissioners mentioned that difficulty in crystallising it was experienced, and that it was sold in the form of syrup for sweetening. One grower stated that on ordinary soil, he had obtained from 346 to 468 gallons of syrup from an acre, and that every farmer can make his own syrup at a cost of not exceeding fifteen cents. per gallon. In Illinois, a grower procured 384 gallons from an acre, which he sold at one dollar a gallon. As a forage plant, cut while young, it is highly valuable and nutritious. The 'Indian Field' in 1858, writing of the Sorgho and Imphee, as sugar-yielding plants, says the Count de Montigny, the Consul of France at Shanghae, (who introduced several other useful Chinese plants into France) sent seeds of the 'sorgho' under the title of "the sugar-cane of the north of China," to the Geographical Society of Paris. Mr. Leonard Wray, (who had been several years previously residing in India as a sugar planter), forwarded also to France a quantity of seeds of a plant, having apparently the same properties, and almost the same appearance as the sorgho, from the south-east coast of Africa, in the country of the Zulu Kaffirs. Attracted by the appearance of the plant, and its great yield of saccharine juice, he was induced to investigate the subject more closely, and the result was the discovery, in Kaffir-land, "of no less than sixteen distinct kinds of imphee, of various degrees of saccharine richness, and differing very widely in the time required for their maturity." Mr. Wray, after introducing the plant into England, France, and other parts of Europe, conveyed it to the United States, where, it would appear to be much appreciated. The gift he made thus to agriculture, observes an American author,—may be estimated, when we reflect that we have almost every range of climate known in the world, from the torrid and fervent heats of the tropical zone, to the most rigorous winters of the north; and as Sorgho plants, require, in some instances, but ninety days to run through the whole course of vegetation and ripen their seeds,—others of greater saccharine richness requiring a more lengthened season than is necessary for the ordinary sugar-cane,—Mr. Wray has thus given to the farmers of every section of the country, the opportunity to select from out of his collection of varieties, some one peculiarly adapted to the latitude in which he resides. In his treatise, which forms an appendix to the American publication, Mr. Wray gives a minute account of the different varieties of imphee he met with in Kaffir-land ; the mode of cultivation adopted by the natives ; and the manner in which he recommends they should be grown. One peculiar characteristic of the plant is the perfect immunity it enjoys from the attacks of white ants. In Natal, the white ant, it would appear, is as numerous and fully as destructive as it is in this country, consequently none but low lying swampy grounds can be used in that colony for sugar-cane cultivation ; and this fact, Mr. Wray observes, places a restriction upon its extensive culture in Natal, which no human art can overcome,—whereas these most destructive insects never touch the imphee. "I have grown," adds the writer : "a fine crop of imphee on a sandy hill-top, where it would have been utterly impossible to grow sugar-cane on account of the white ants."

The writer next devotes a chapter to the production and value of Imphee, in com- [illegible] with beet-root and sugar-cane. His [illegible] states, will yield 2 tons of fair dry [illegible]er acre, and 20 bushels of grain ; the [illegible] useful not only for feeding animals [illegible] poultry, but also serviceable, in the form [illegible] flour, as food for man ; while the leaves and long tops form excellent food for horned cattle, sheep, horses, &c., "being much more delicate than the coarse leaves of the sugar-cane." He further observes that one crop of imphee occupies the ground from three to four months only ! and that as this comes off, another crop is immediately springing up from the same roots, to be ready in another three months ; and even a third crop will be produced, provided the weather be warm enough ; thus giving three crops in less than one year ! Whereas, as we know, it takes seven months to mature the beet, and about twice that time for the sugar-cane. Mr. Wray then enters into calculations, as to the comparative yield of sugar from imphee, cane and beet, into which we cannot follow him ; but proceed, in conclusion, to notice briefly the sorgho, the rival of the imphee, in the affections of the United States' planters.

Though only recently introduced into the United States by the year 1856, about fifty thousand acres of land are already under cultivation. Its hardiness is a great point in its favor, its standing uninjured, when Indian corn was destroyed by frost, is another ; its ability to withstand drought ; its nutritive qualities ; its rapidity of growth ; and, lastly, its saccharine richness, from 16 to 20 per cent., while the sugar-beet contains only 8 to 10 per cent. Of its value as a forage crop, the American farmers have not any doubts, and we now quote the words of the Patent Office Report of the United States, for 1855 :—"Aside from other economical uses, its value for feeding to animals alone, in every section of the Union, where it will thrive, cannot be surpassed by any other crop, as a greater amount of nutritious fodder cannot be obtained so cheaply in a given space, within so short a time ; and without wishing to present the question in an extravagant light, it may be stated, that this crop is susceptible of being cultivated within the territory of the United States, to an extent equal to that of Indian corn, say 25,000,000 acres per annum ; and estimating the average yield of dry or cured fodder to the acre at 2 tons, the yearly amount produced would be 50,000,000 tons, which, to keep within bounds, would be worth at least 500,000,000 dollars, besides the profits derived from the animals in milk, flesh, labor and wool." But it is not in the United States only that the sorgho is appreciated for its sugar-yielding properties. It has been grown, with more or less success, in various parts of France, specially in Provence ; in Algeria, its cultivation was commenced on a more extended scale, that it is likely to succeed there, the climate being, apparently, well adapted to it. Mr. Hardy, Director General of the Government Nursery at Hamma, in Algeria, reports very favorably of it, and the French Government proposed, in consequence, to take it up energetically. In India, this valuable plant it is said has hitherto been cultivated for its grain only, which forms so extensive an article of diet to the inhabitants of Behar and the Upper Provinces. Whether it can compete successfully with the sugar-cane and date-palm, as a sugar-yielder, remains to be seen. Major E. Boddam writing of it in the 'Bangalore Herald' on the 8th July 1872, says, this remarkable plant is a native of the north of China. Its giant growth, and it is beautiful and graceful appearance and refreshing greenness in the driest season, and the expectation of finding in it a rival to sugar-beet induced the French Consul at Shanghai to send some sorgo seed to his government. In 1854, Mr. Browne, Agent of the United States' Patent Office, took to America some French seed, which was distributed by the government. The plant was cultivated by a few farmers, but it received little attention until an ex-governor of South Carolina reported the results of his trials to a farmer's club, which brought sorgo into notice. Since 1855 its cultivation steadily increased, and it soon became one of the great crops of the country It is grown in France and Algeria for alcohol chiefly, but in America for seed, forage, sugar, syrup, alcohol, vinegar and beer. In the ten North-western States, where it flourishes, there were in 1864, 360,670 acres of sorgo, and sorgo sugar was selling at Chicago at 4½*d*. per ℔ For sugar, however, sorgo has turned out a failure. Its great merit as a forage plant is its principal recommendation, and on this point an official report of the United States Agricultural Department has declared that the value of sorgo for feeding stock cannot be surpassed by any other crop as a greater amount of nutritious fodder can be obtained by it in a shorter time within a given space and more cheaply. While grass yields a ton or a ton and a half of hay, sorgo will yield from 2 tons to 9 tons of dry fodder. Sorgo (Loo-tseh) flourishes wherever Indian corn flourishes.

In China, the seed is sown for transplanting on warm ground, finely broken, in the middle of April. The young plants are watered with liquid manure so soon as they appear, and in three or four days watering is repeated night and morning if the weather is dry. They are pricked out, when 6 inches high, in rows 3 feet wide and 6 inches from plant to plant, and are again watered with liquid manure when a foot high. Weeds are kept down by hoeing until the cane matures, about November. The crop begins to come to market, however, early in September, or as soon as the stalks are sufficiently sweet for chewing. A Chinese laborer earning 10*d*. a day, can cultivate about 2 acres during the six months that the crop needs his labor.

In America, sorgo can be successfully grown on all lands where a fair crop of Indian corn can be grown. Deep loose warm soil, even of poor quality, produces the sweetest and most juicy stalks. Irrigation is recommended, but can seldom be attained in the United States. In deep black loam sorgo reaches a height of 16 feet or 18 feet. The juice of the giant growth is not so sweet, nor is it easily crystallized. The seed should be soaked 24 hours in tepid water, in which 1 oz. of saltpetre is dissolved to every 6 gallons. It is then dusted with gypsum, and drilled 2 feet apart and 20 seeds per foot (for forage). In seven or eight days a horse sub-soil plough is put between the rows, up one side down the other. This cultivation is repeated as the crop advances, but the plants must not be earthed up. The upper roots spring from the stalk above the ground, and they must be left exposed. The first cutting may be made as soon as the crop is large enough for stock, and in ordinary seasons two others will follow. To dry the crop it should be set up in shocks, and the shock built with precautions for ventilation. One man with a sub-soil plough can cultivate 10 acres.

In Mysore, Major Boddam says, the Chinese and American methods of cultivating sorgo will answer each at its proper season. If the crop is to be sown in the early rains of April and May, the Chinese system is recommended, as there is less risk of failure from drought by sowing in a nursery bed and subsequently planting out in rows. Failure must sometimes occur when the seed is sown in drills at this season, as the rain often holds off for a fortnight or three weeks, and the sprouting seeds of seedlings perish from want of moisture. Later, when the rains are regular and copious, the American system will be more suitable with the following modifications: —

Plough the land well and deeply, apply manure liberally, say from 6 to 7 tons of farmyard manure per acre. and if saltpetre is procurable and cheap, add it at the rate of 100 lbs. per acre. Plough this manure crosswise to the first ploughing, harrow and level, then sow the seed in drills 26 inches apart, and 20 seeds per foot. In seven or eight days put a bullock hoe or cultivator, between the [illegible] up one side and down the other, or hoe the rows by hand. Continue the cultivation [illegible] the crop advances, but in no case earth [illegible] the plant stems, as they send out roots above ground, which must be left exposed. The first cutting should be made just before the canes show signs of flowering; the plants will send outside shoots 2 or 3 at a time for successive cuttings, affording a supply of excellent green fodder, extending over a period of six or eight weeks. If the crop is to be used for dry fodder, the canes when cut, should be set in shocks, and the shocks built with precautions for ventilation. If the crop is required for seed only, the leader of the canes should be left to flower and mature its seed, while all the side shoots may be cut for fodder. Under this system of dry cultivation and high farming at Hunasuru near Mysore, a plot of 1,296 square yards of every rich land which had long been under cultivation, and was heavily manured before-hand, produced 12,657½ lbs. of fodder and 1,498½ lbs. of seed, equivalent to 21 tons, 1 cwt., 1 qr. and 10 lbs. of fodder per acre, and 2 tons, 9 cwt., 3 qrs. and 5 lbs. of seed. This very large outturn is attributed to the extreme richness of the land, a favorable season and high farming. Again, in the Toomkoor district, in the rich black soil of Gubbi, where sorgo was tried, the canes attained the height of 18 feet, and a very heavy crop of fodder was cut. Unfortunately the weight per acre was not recorded. On the average light soil of Bangalore with a moderate supply of manure upwards of 10 tons of fodder were cut per acre. Even this last-mentioned crop far surpasses the out-turn of any grass grown in Mysore, and is superior to the average out-turn of an acre of the country jowar or cholam. So much for the results of high farming; no doubt in favorable seasons a fairly remunerative crop might be raised even under the native system of light ploughing, scanty manuring, and careless weeding.

The seed could be sown with the Sudiki, Sadde, or Kal-kurige (See Buchanan's Mysore, page 261, plate xi), or country pulse drill, three of these pulse drills tied to the native harrow and served by three men would do for the sowing process followed in due course by the country bullock hoe.

There are now known in the agricultural commerce of Africa, Europe, America and British India, a great many kinds of so called sorgo, (the two real sorts are the imphee or red seed already known in parts of India, and the black seed of North China,) the latter containing most saccharine matter. As the several kinds hybridise freely, they should be grown separately never near each other; when the seed is formed the crop must be watched and birds scared; parrots are particularly fond of the seed and destroy immense quantities if left undisturbed.

To sum up, the superior merits of the Sorghum saccharatum over grasses, these consist in (1) its heavy crop; (2) the rapidity of its growth; (3) its abounding in saccharine matter; (4) its power of standing heat and drought; and of being grown nearly all the year round, especially in the dry and hot months, when, every kind of grass is burnt up; and lastly, that with high farming it is a most remunerative crop.—*Powell's Hand-book, Econ. The stalk.

Karbi, HIND.

Sorghum vulgare grows on light sandy soils and requires little moisture. Its seeds are smaller than other cereals, but the numbers on each stalk counterbalance. The great millet is grown in Egypt, and in all the countries of the south and east of Asia, its grain being used as food for man, in the form of cakes and porridge, and for horned cattle, and its stalks, the karbi of India as fodder for horned cattle and horses. It is grown in all the table-lands of India, is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6,000 feet, but is grown in the N. W. Himalaya only in the valleys. It grows on a reedy stem to the height of eight or ten feet, and bears irregularly shaped clusters of innumerable round grains about twice as big as mustard seed. It is common all over the Levant, under the name of durra (or dourrah); and in Greece, where it is called kalamboki, there is likewise a coarse sort in Italy, called Melica rossa, or Sorgo rosso. This plant is mentioned in Macartney's Travels to China, Vol. ii, p. 157. On the south-east of Peking he saw fields of this saccharine plant (Holcus sorghum), which was of an extraordinary height. It grows to the height of ten or twelve feet, and yields, on a moderate calculation, many hundred fold. Major General Sir J. B. Hearsey, K.C.B., sent from Barrackpore, on 5th March 1858, the seed gathered from one plant which came up accidentally during the early rainy season of 1857, and grew to nearly eleven feet in height, he had it supported by a strong bamboo; it spread out four shoots from the stem close to the ground, and these stems also threw down roots. This often occurs with the Holcus sorghum, as also with the Zea mays.

The head from the principal shoot was very large; the side shoots also headed, but these were small. The number of seeds received from this one plant was 12,700. This millet is largely grown in the Chittledroog and in part of the Nuggur division of Mysore. It is sown during the thunder showers between the end of April and May; and the crop is reaped in September and October. The great defect in this grain is that it will not keep, being soon destroyed by insects; and the ryots have difficulty in preserving sufficient quantity of it for seed on the following year. The seed grain is mixed with ashes, and packed with paddy straw; in spite of which, however, insects obtain admittance. The stems or straw of this grain when well preserved from rain, will keep for about ten years, and are used as fodder. This is often grown by the Karens, and occasionally by the Burmese. This is the millet designated in Ezekiel iv, 9.—*Cleghorn's Punjab Report, p.* 66; *Elphinstone's History of India, p.* 12; *Timkowski's Journey to Peking, Vol.* i, *p.* 301; *Powell's Hand-book, Vol.* i, *p.* 383; *Indian Field,* 1858; *M. E. J. R. of* 1857; *Dr. Mason's Tenasserim; Macartney's Embassy to China, Vol.* vii, *p.* 157.

SOR-ALOO, Beng. Dioscorea nummularia.

SORI, Hind. Bignonia indica, *Linn.*

SORIAI-KAI, Tam. Lagenaria vulgaris, *Serr.*

SORICULUS, *Blyth.*, a genus of mammals, with the hind-feet of ordinary form and proportions, unadapted for aquatic habits; and the tail tapering and a little compressed at its extremity. See Sorecidæ.

SORICULUS ATERRIMUS, *Blyth.* Sori[illegible]escens, *Jerd.*

[illegible]ULUS NIGRESCENS, *Jerd.*

[illegible]igrescens, *Gray*, [illegible]ag. N. H., x. 261, (1842.)
Sorex sikimensis, *Hodgson*, Horsfield's Catalogue, (1851.)

Length of head and body, 3¼ inch; of tail, 1½ inch; hind-feet and claws, ⅝ inch. Number of caudal vertebræ 15 besides the extreme tip. Colour throughout blackish, a little tinged with rufous; the feet and the claws pale. Very common in Sikkim: and was formerly sent by Mr. Hodgson from Nepaul.

SORICULUS SIKIMENSIS, *Hod.*, *Horsf.* Soriculus nigrescens, *Jerd.*

SORICULUS SOCCATUS, *Hodg.* Syn. Soriculus nigrescens, *Jerd.*

SORICULUS CROSSOPUS, *Wagler.*

Hydrosorex, *N. Davernoy.* | Pinalia, *Gray.*

With the hind feet large and ciliated, and the tail also compressed and ciliated beneath towards its extremity; in adoptation to aquatic habits. S. fodiens, (v. Hydrophilus), *Pallas*, and other water shrews of Europe and N. America constitute the types of this division; and Dr. Gray refers to it a Himalayan species which, having white teeth, Mr. Blyth suspected will prove to differ in other and more important particulars; even though it may, exhibit the adaptive characters of an enlarged and ciliated hind-foot and compressed and ciliated tail-tip. It is thus described:

Crossopus himalayicus, Gray, Ann. Mag. N. H., x, 261 (1842). Length of head and body 5½ inches; tail 3 inches; hind-foot ¾ inch nearly. Slate-coloured black, with scattered long hairs, which are longer and white-tipped on the sides and rump: lower part of the throat and the middle of the belly rusty-brown: tail elongate, scaly, with appressed dark brown hairs above and elongated rigid whitish hairs beneath, and brown elongated rigid hairs near the tip: feet rather naked, whiskers numerous, elongate brown. Teeth white, probably from the neighbourhood of Simla or Mussuri.

In the other type of dentition the lower quasi-incisors are distinctly serrated, with three or four coronal points; and the anterior point of the upper quasi-incisors is not prolonged beyond a level with its posterior spur: the lateral small teeth which follow in the upper jaw are five in number, and diminish gradually in size from the first backward. Tail cylindrical, not tapering and furnished with a stiffish brush at its extremity. Such is the common British land shrew, S. vulgaris, *L.*, (formerly confounded by British writers with S. araneus, *Schreber*), and which is the type of Corsira, *Gray* (v. Amphisorex, No. 1, *Duvernoy*, apud *Gray*). There are many other species. Blaria. *Gray*, (v, Blarina, *Lesson*) is founded on S. talpoides, *Grapper*, Zool. Journ. v. 28, referred by Blainville to S. brevicaudus, *Say*: a N. American species, which, we believe, only differs from Corsira in the large size of its fore-feet, and in its very short tail:—and Oti-sorex, *Dekay*, is founded on two minute N. Ameri[illegible]es, which do not appear to differ from [illegible]-cept in having the ear-conch large a[illegible] cuously visible above the fur. We [illegible] it doubtfully.

Crossopus(?)*caudata*; the *So*[illegible]*udatus*, Hodgson, Horsfield's Catalogu[illegible]): the description seems to indicate a [illegible]losely affined to the European S. alpi[illegible]*z*; S. alpinus is ranged among the s[illegible]ving the Corsira type of dentition by [illegible]chinz in his Synopsis Mammalium: its tail however is naked and compressed at tip. Length of the head and body 2½ inch; of the tail the same, slender, nearly naked, and very slightly attenuated. Colour saturate bl[illegible]h-brown very slightly rufescent in certain aspects. Snout moderately elongated, furnished at the sides with long delicate hair.

SOSAN, or Sosun, HIND. Iris nepalensis, any of the lilies.

SOSANBAR, ARAB. Thymus chamædrys.

SOSIRATE, see Luristan.

SOSNI-RANG, HIND., lilac colour of iris or lily.

SOSSI, see Chronology.

SOSUN, PERS., PUSHTU. A small sweet smelling iris. Hence the English christian name Susan.

SOTER MEGAS, B. C. 70, the nameless great Soter king, had coins with an Arian legend which James Prinsep and Professor Lassen ascribed to Azes. On all is a peculiar monogram with three prongs. The same monogram was continued to coins of Kadphises and of the Kanerki, but it is not found in those of the Hercules type derived from Hermæus. Mr. H. T. Prinsep considers him to have been contemporary, but not identified, with Vickramaditya, and that he assumed the title of Soter Megas, which was continued down by the Kadphises kings. He considers that the nameless kings, with those on whose coins are the words Kodes or Hyrkodes, although mere local chiefs such as now rule at Kulm, Kunduz and Balkh, preceded the conquest of the Panjab by Vikramaditya, B. C. 56. See Greeks of Asia, Kabul.

SORINJAN, ARAB. Colchicum, Meadow saffron.

SORMA, HIND. Lepidium sativum.

SORO, see India.

SORON, or Sukara-Kshetra, an old town on the Ganges.

SOROO-POTTREE MOEE, URIA ? TEL. ? A tree of Ganjam and Gumsur, extreme height 40 feet, circumference 2½ feet, height from the ground to the intersection of the first branch, 18 feet. Used for planks, doors, boxes, posts and ploughshares. It is tolerably common.—*Captain Macdonald.*

SORREL, ENG. Oxalis corniculata, *Linn.* also the Rumex acetosa, used as spinach and salad, of little value, the French sorrel, R. scutatus is a very delicate vegetable, of easy culture in light soil. This is grown by sowing the seed broadcast and thinning the plants to the distance of eight or ten inches from one another. It may be sown at the commencement of the rains.—*Jaffrey, Riddell.*

SORU PENKA, TEL. Cuttlefish bone.

SORWARNA, HINDI. An offering of money, to a beloved friend or relative, to be distributed in alms.

SOTHALI, HIND. Æschynomene aspera.

SOTTAKLA, TAM. Flacourtia sepiaria, *Roxb., W. & A., Rh.*

SOUBAH, AR., PERS., HIND. A province, a district. According to the Institutes of Akbar, a soubah should consist of twenty-two circars, a circar of twenty-two pergunnahs ; a pergunnah of twenty-two tuppah ; and a tuppah of twenty-two villages ; but this divisional strictness was never carried out. According to this rule, a soubah would be about three times the size of Ireland.—*Malcolm's Central India, Vol.* ii, *p.* 6 ; *Adventures of a lady in Tartary, &c., by Mrs. Hervy, Vol.* iii, *p.* 249.

SOUBAIHA, an Arab tribe, in the Lahej district of Yemen, who have been termed the gypsies of Arabia.

SOUBALLI, BENG., HIND. Crozophora plicata.

SOUCAR, ANGLO-HIND. A banker, a money-changer, from sahoo and kar.

SOUDE, also Soudes brute, FR. Barilla. Soda.

SOUF, or Sonf. HIND., PERS. Fruits of Anethum graveolens, A. panmori and A. sowa. See Sonf.

SOUFFRE, FR. Sulphur.

SOUJIE, HIND., the hard inner part of the grains of wheat obtained by sifting the coarsely ground wheat.

Bread of wheat.—One process is first thoroughly to clean the wheat, and for this one woman will clean 430 lbs. in a day ; and in the evening the cleaned wheat is placed on a table and thoroughly wetted and the water left to drain from it during the night. The next morning the still moist grain is ground in hand-mills by women ; a woman grinding lbs. 40 in a day. It is then sifted and as much fine flour and soujie as can be obtained, are laid aside. The remainder, then termed "Naka," is subjected to a more powerful mill and an inferior kind of soujie and a second sort of flour obtained from it. The residue is then ground in a large mill, and yields a coarse flour and bran.

Bran is what remains of wheat after the flour and soujie is extracted.

Soujie is the heart of the wheat and is obtained by coarsely sifting the coarsely ground wheat with sieves and soopas by which all the small particles of the bran are separated from it. One woman can clean lbs. 50 a day.

Flour.—The first sort of flour is produced by finer sifting from the first grinding of the wheat. Second sort flour is sifted from the first grinding of the wheat. Second sort flour is sifted from the first grinding after the fine is extracted and also from the second grinding.

Bread.—The materials for bread are lbs. 60 of 1st sort soujie, lbs. 20 of 2nd sort or naka soujie, and lbs. 20 of 1st sort flour, lbs. 100 of these ingredients produce about lbs. 128 of bread.

Biscuit is made from 2nd sort soujie and flour mixed in the proportion of lbs. 75 of naka soujie, and lbs. 85 of 2nd sort flour. This produces only about lbs. 85 of biscuit, which, after being well baked is dried for two days in a kiln.

Barm or Yeast, sufficient for 800 loaves, lb. 1 each, is made of brown sugar lbs. 2; potatoes, lbs. 1½; hops, oz. ½, with half a gallon of water. Boil and mash the potatoes: boil the hops until none appear on the surface of the water, strain and dissolve the sugar in the liquid. The potatoes are then added and the whole is strained into a jar or small tub. This quantity produces about 3½ pints and is generally ready for use in 12 hours. The addition of a small portion of the old barm hastens fermentation. Bombay wheat is whiter and heavier compared with that from Kattywar, and produces a greater quantity of soujie and flour. That of Kattywar is smaller and darker, and produces good flour though smaller in quantity, with less soujie.—*McCulloch's Commercial Dictionary, p.* 1245.

SOULAMIA AMARA, bitter soulamia, is a shrub with crowded ovate leaves tapering to the base, quite entire and veiny. It is a native of the Moluccas, and has white racemose flowers, the size of those of the vine. The fruit is compressed, thin at the edges, dry, with 2 seeds in each cell resembling cucumber seeds, but smaller, each lying in a small cavity of the cell.—*Eng. Cyc.*

SOULIER, Fr. Shoes.

SOUM, Hind. Balanties ægyptiaca.

SOUMYA, or Soamya, Sans. The son of Soma.

SOUNG-YA, Burm. This plant grows six or eight feet high. Fruit, the size of an apple, elongated, deeply fluted, brilliant yellow, contains ten seeds in five apartments. Chiefly used to acidify curry.—*Malcolm, Vol.* i, *p.* 183.

SOUNG YA LÆ, Burm. Ancistrolobus cornea, *McClelland.*

SOUR, the ancient Tyre.

SOUR, Sowrah or Saur, is a term, identical with Sairea, and is given to populations occupying the fastnesses of the eastern ghauts, along with the Khond and Kol. The Soura are wholly within Telingana, and extend from the Godavery to the southern frontier of the Khond, a large district and dependency of Bustar, in Central India, is surrounded by the Tiling in the south, Khond and Mari Gond on the east, and hindoos to the north. Tod says they possess the same moral and physical properties as the Bhil, though without the bad qualities which mark the most degraded of this tribe in the west. The Sairea are almost omnivorous.—*Tod's Travels, pp.* 46-7. See Sowrah.

SOURABAYA, in lat. 7° 13′ S., long. 112° 46¾′ E., is one of the chief towns of the island of Java, situated on the main land on the shores of a narrow strait, which divides it from the large island of Madura. It is the only perfectly secure harbour on the north coast of Java, and the only one also in which the shipping can be well defended by batteries on shore; therefore, in the event of a war between Holland and any powerful maritime state, Sourabaya will be even of more importance than Batavia. The north channel into the harbour is defended by a strong fort erected upon a low island, about nine miles from the town, but the eastern channel is unprotected, except by the shallowness of the water. The town itself, which is a mile and a half from the sea, is divided by a river thirty yards wide, which is navigable by boats one hundred miles from the sea, and is sufficiently deep at the entrance to admit vessels of two hundred and fifty tons. The land in the vicinity is very low, being little above the level of the sea; but it is not of so swampy a nature as that of the site of Batavia. A considerable number of Arabs and their descendants are settled at Sourabaya; while Grissik, a sea-port town, about five miles distant, may almost be termed an Arab colony, for it is principally occupied by these people and their slaves. There are fish-ponds, extensive tanks of salt water, in which sea-fish are fattened for the table. These are highly prized by the Chinese, who spare no expense to procure them.—*Mr. Earl, pp.* 47 *to* 78.

SOUR LIME, Eng. Citrus bergamia—*Risso & Poit., Roxb., W. & A.*

SOURNA MAYHARI,' Sans. Cassia sophora, *Linn.*

SOURONTON ISLAND, an island lying off the south-west part of Caramata, 1,400 feet high, and visible from a distance of 27 to 30 miles.

SOUR SOP, Anona muricata, *Linn.*

SOURU or Soara, Sans. The disciples of Soorya.

SOUR WOOD OIL TREE, see Dipterocarpus.

SOUSEE, Hind., a striped cotton cloth: a kind of sousee is produced in France, blue striped, closer in texture than the Indian, perhaps, but belonging to the same class or category; and another called 'grivas,' in particular near Vichy, both excellent and fast-coloured fabrics, and both used for trousers and blouses. The Indian sousee are always striped or checked, woven in narrow patterns, with coloured yarns, blue and white, black and blue, red and blue yellow, white, and blue, green and chocolate, as detailed in Dr. Watson's list; and they are worn, fine and coarse, literally by millions of the people of the middle and lower classes. Sousee is manufactured principally in the towns of Tanjore, Trichinopoly, St. Thomé or Mylapore. Those of Tanjore and Trichinopoly are made of silk and mixed with cotton of various colours and sorts; but Mylapore weavers work only in cotton: they are 7 yards by 1, the silk pieces are sold at from 8 to 20 Rs., those of cotton at 2 to 7 Rs. each. These are used for undergowns, or lungahs, by the mahomedan women and as trousers for men. See Soucee.

SOU-SOU of India, Platanista gangetica.

SOUTCHEOU, see Kalkas.

SOURI, see Inscriptions.

SOUTH ARCOT, a revenue district of the Madras presidency, in which the chief town is Cuddalore. The best coarse grindstones are from Virdachellum in South Arcot, Triputty, and Ootramaloor in Chingleput, Kurse Mungalum near Vellore, Woontimetta and Chellamacoor in the Cuddapah district, and Podelay and Woodiagherry in Nellore. A soft sandstone suited for filters occurs at Rajahmundry, and hard gritty kinds, like the Bhurr-stone of France, in the Peddaredapully talook of Nellore and near Ghooty. Some of the sandstones of the Guntoor, Bellary, Madura and Mysore districts are very similar to those used as grindstones and flour mill-stones in England. The best dry whetstones are those of Nuggur, Matoor hill in Guntoor, Triputty, Arnee and Needacheria in Bellary. Fine grained sandstones of a sharp cutting quality occur at Gootemokoda and Dyda in Guntoor, at Chellumacoor and Chettywarreepully in Cuddapah and in the Pedelay talook and Woodingherry hill in Nellore. The finest specimens of common earthenware are the ancient funeral, domestic and cooking vessels, which been dugout of the old tombs in the districts of Coimbatore and South Arcot. This kind of pottery has been found in many parts of India in tombs usually arranged in circles, each tomb being built of six slabs of stone and occasionally surmounted by large mounds of loose stones and earth. They have been thought to resemble the Druidical tombs of England, and are supposed to be of great antiquity, there being no records of them extant. The pottery found in them usually consists of tall narrow cinerary urns of 18 or 20 inches in length, with three or four clumsy feet, four inches in length, and of a variety of round oval and flattened vessels of different shapes and sizes, some having apparently been used for cooking and others as drinking vessels. The tall urns usually contain burnt human bones, teeth and ornaments of brass, or copper, they are made of a coarse clay, and have not been finished with care, some of the flattened oval and rounded vessels are made of a fine dense clay that has been carefully prepared, the surfaces are variously ornamented with wavy or crossed lines of red and yellow, carefully painted. The pottery appears also to have been smeared (it resembles the potterie antique vernissee et lustree, figured by M. Brongniart.) There is great purity of form in most of the vessels which resemble the Etruscan in the precision of the curves and in the angles at which the different surfaces meet. The art of pottery appears to have deteriorated in India, since these samples were made and one branch of it is apparently lost, viz., the smearing or thin glazing on the surface.

SOUTHERN ABYSSINIA, see Somal, Beer-el-somal.

SOUTH ASIATIC, see India.

SOUTH BABYLONIA, the country east of the Tigris, Susiana.

SOUTH CACHAR, see Kuki.

SOUTH CANARA. The district lies between the sea and the high plateau of Mysore and Coorg; most of its rivers consequently take their rise in those provinces. South Canara has a sea board of 120 miles besides about 404 miles of estuaries. In Canara, fish are almost the sole meat food of the people. Hindu mythology says that the whole of South Canara was formerly under the ocean, the boundary of which was the edge of the Mysore plateau, and that the sea was dried up by a flaming arrow of the god Parasu Rama. More modern science robs the fable of its poetry, but leaves it its groundwork of truth, by ascribing the existence of Canara to volcanic action. There are also extensive littoral upheavings. Canara and its boundary hills are the first land that meets and receives the full force of the south-west monsoon, and the annual rainfall on the coast is 130 inches.

SOUTH-EASTERN ASIA. The ancestors of the present occupants of South-eastern Asia, reached the sites which they now occupy by the valley of the Indus, the passes of the Himalayas, and the valley of the Bramhaputra. Others of them have come from Arabia, Eastern Africa, Madagascar and the south of Persia, across the Arabian Sea. Amongst the races now occupying these regions some are of Mongol and Manchu origin, of the Negro, Tartar, Semitic and Aryan families of mankind. See India.

SOUTHERN CROSS is visible to 19° N. L.

SOUTHERN INDIA, is a term applied sometimes to all the peninsula of India, south of the Nerbudda river or to that portion of it lying south of the Kistnah river. In the latter restricted since, it is occupied by the Canarese, part of the Telugu, Tamil, Malyalam and Tulu-speaking races and comprises part of the circars, the kingdoms of Mysore, Cochin, and Travancore and the British provinces of Nellore, Guntoor, the Ceded Districts, Chingleput; N. and S. Arcot, Salem, Tanjore, Tinnevelly and Coimbatore all largely cultivated. In Southern India, tattooing is not unusual; almost all Sudra and Pariar women have tattooing marks on them. A blue line runs down the forehead to the root of the nose, a practice which some of the Sudra men and women of the Smartha brahmins also follow. The women also have their forearms tattooed with flowers, and the men put a scorpion on the hollow between the thumb and forefinger of right hand. These hand and forearm marks are for ornament, but the forehead mark is now regarded as a sectarian hindoo mark. The Khond, the higher Abor tribes tattoo, and the practice prevails among the Simang and Binua and other Ultra-Indian and Asianesian tribes. The architecture and ornamentation of the temples of Southern India have been made known by the representations and descriptions of Bejapoor, Dharwar, Ahmedabad and other cities, by Mr. Fergusson and Col. Taylor, [illegible] are by far the most in[illegible] and complete memorials of the [illegible] and regal grandeur of Southern India which are in existence: and give a striking impression of the former splendour of those empires. The Dharwar sculptures are the records of Chalukya, Hoi Sala, Bellal, and other local dynasties, some of the figures are clothed with defensive armour, and there is no trace of a sewn garment. All the men's figures have short waistcloths or dhotees, like kilts with an end in some cases cast over the shoulder. The women are in the same costume, but both in the earlier memorial-stones and on some of the profuse sculpture on the temple at Hullabeed in Mysore, (Dhara Samoodra, tenth to twelfth century, A. D.), they wear bodices, tied in front, as hindoo women wear them at present. Many temples in the south and west of India, as also in Guzerat and Orissa, &c., are known to belong to periods as early as A. D. 500. Groups of figures on them are numerous beyond description, the men wear head-dresses in the form of conical crowns richly covered with ornaments, their bodies are naked, and their breasts and arms show necklaces and armlets of very ornate patterns. From the loins to the knee, or middle of the thigh, they have in most instances kilts, as it were, also composed of ornaments, and many are altogether naked, both male and female, with a girdle of ornamental pattern round the loins. These figures abound among the sculptures of Ellora, and upon the hindoo temples of Dharwar and Mysore of the eighth to the thirteenth century; also upon the 'Chola' temples at Conjeveram and elsewhere, probably of the same era. In the Jain sculpture the male and female figures are invariably naked; but ornamented in general with necklaces, bracelets, armlets and zones of exceedingly intricate and beautiful patterns, in imitation, probably, of the chased goldwork of the period. The existing tank irrigation, in Southern India, is chiefly ancient, and comprises innumerable tanks of all sizes, from what might be termed lakes downwards. These may be divided into three classes: 1. Those formed by the closing of the passage of a considerable river through a narrow gorge, in a range of hills, by means of a high dam or "bund." 2. Those formed in the plains, by embankments carried across the drainage of the country, and impounding the water of one or more streams; these tanks being often of great superficial area but shallow. 3. Tanks which might be considered intermediate between the other two, having in general a great length of dam than the first, and a greater depth of water than the second. Few examples of the first kind remain entire. The ruined Mudduk Masoor tank, one of this class situated on the borders of Dharwar and Mysore, has a length of the main bund on the crest, 550 yards; present height from 90 feet to 108 feet; width at the base, from 945 feet to 1,100 feet; area of the lake at 90 feet depth, 40 square miles; contents about 1,400 million cubic yards of water. The area of the drainage basin, which was on the inner slopes of the western ghauts, was 500 square miles. Mr. Gordon was engaged on a proposed restoration of this tank; but it was found that the present average rainfall would not suffice to fill much more than one-half of its ancient basin, and it was suggested that the depth should be reduced from 90 to 70 feet. This diminution in the supply was supposed to be attributable partly to the diminished rainfall and partly to the construction of small tanks on some of the feeders, at a date subsequent to the completion of the Great tank, which was assigned, by tradition, to the 14th or 15th century. The main bund was supplemented by two smaller ones, placed on saddles at some distance from it, in the range of hills; and it was by the breaching of one of these that the tank [illegible]s the principal embankment re[illegible] There were no traces of a waste weir or byewash of any kind. Of the second and third classes of tanks, some are ancient ones of great dimensions, such as the ruined Poonairy Tank, in the Trichinopoly district, of which the embankment was 30 miles in length, and the Veeranum tank, still in action, with a bund 12 miles long.

Channel irrigation, only rivers of the larger class, which had a continuous flow for several months are available for extensive irrigation projects. The smaller rivers are merely torrents, which quickly carry off heavy falls of rain, and then became dry again. The water, however, is in many cases intercepted by chains of tanks, of the second or third class, built across these torrents.

The deltas of large rivers, being the most easily irrigated lands, have been so treated for ages, and the works have been much extended and improved under the British government, by the construction of permanent weirs of great lengths, at the heads of the deltas, such weirs being built on the sandy beds of wide rivers subject to heavy floods. This seemed to have been beyond the skill of the ancient native rulers. They, however, built many weirs on the large rivers in the middle part of their courses; the situations being skilfully chosen, but the construction was rude and imperfect. They were generally built on a reef of rocks, with loose rubble, faced with large blocks of granite laid dry, and sometimes fastened with iron clamps. The modern weirs in similar situations are of masonry, with a vertical or slightly battering face on the down-stream side, and with heavy copings. In rivers having sandy beds, it is usual to build the body of the weir on a foundation of brick wells, sunk to the low water level, and filled with concrete. On the lower side there is an apron, having a slope of 1 in 12 from the crest, with a toe wall; and if the slope be long, intermediate walls are also built on wells, and below all there is a broad layer of rough rubble of large dimensions.

The ancient irrigation channels were generally defective in design, being too small, and having much too great a fall. In consequence of these channels being so near the river, they irrigated only a narrow strip of land; and the current being too great, excessive annual repairs were required. This system necessitated numerous off-takes from the river, involving the expense of many weirs, and a great aggregate length of unproductive channel from the off-take to the point where the channel reached such a level as to command the surface of the country. On the other hand, a canal of large dimensions, taken off from one head, having a slower current and less fall, would soon so gain on the level of the river, that it would reach districts remote from it, and consequently more in need of artificial supplies of water; and it would also command a much larger extent of country than it could supply entirely with water. This was an advantage, because it would be many years before a district could be completely changed from dry to wet cultivation, as it would require to have its population trebled. It also afforded means of assisting dry crops in years of drought, and thus preventing famine. In many districts complete failure of the crops now grown occurred every few years, and a good crop was a rare occurrence. There should, therefore, be facilities for completely irrigating detached areas at considerable intervals, and of giving occasional irrigation to dry crops.

Distribution was effected from the second class of tanks directly, by means of sluices in the bund. From the third, and more especially from the first class, it was commonly effected indirectly; thus, the natural channels of the river or rivers, which had been dammed to form the tank, were used to carry part of the water for irrigation, weirs being built across them at suitable places, and artificial channels taken off from above them. By these means the surplus of the water, which was generally wastefully used by the ryots was saved, being collected by drainage into the stream, and redistributed at the next weir. Distribution was most economically effected from a canal, when the latter ran along a ridge; but as this could rarely be accomplished in the case of a canal taken off from a main drainage, it was next best effected by leading the main distribution channels down the ridges crossed by the canal. Distribution could be carried out in the Ceded Districts for 5*s.* per acre, including sluices in the main canal, and all necessary road and water crossings, but excluding the cost of terracing the land to prepare it for wet cultivation, this being done by the occupier. The nature of the ground was such, that, in many districts the drainage was effected naturally, no works being required for that purpose beyond small open trenches in the rice-fields.

The value of water to the cultivator is shown, first by contrasting the yield of dry crops with that of rice and sugar-cane, and second from actual experiments. From these it appeared that the net profit per acre on dry crops was 8*s.* 2½*d.*; on rice, £4 16*s.* 10½*d.*, and on sugar-cane, £18 6*s.* 6*d.* In the two last cases, a very low rate for the water was assumed, viz: 12*s.* per acre for each crop of rice, and 24*s.* per acre for each crop of sugar-cane, as provisionally fixed by government. A comparison has been made between dry crops and rice, and dry crops occasionally flooded, based on the average price of grain extending over five years, and deducting one-fourth from the gross value of the crop in the case of dry crops, and one-sixth in the case of wet crops, to cover loss in bad years. Without deducting the water-rate, the difference in the net value of the crops is as follows: between dry crops and rice, taking the most unfavourable comparison, 25*s.* 7*d.*; between dry crops and the same occasionally irrigated, 30*s.* 8*d.*; and between two dry crops and sugar cane (which occupied ten months of the year), £8 2*s.* 8*d.* But if water is stored, so as to allow a second crop of rice to be grown, the advantages are nearly doubled, and provided a water-rate proportioned to the value of the water were fixed, irrigation would benefit the cultivator to the extent of 8*s.* 6*d.*, or 50 per cent., and yield a gross return on the outlay of 14*s.* 9*d.* per acre; and if water were stored for a second crop, the gain to the cultivator would be 19*s.* 9*d.*, or more than 100 per cent., and the return to the agency supplying the water 37*s.* 3*d.* per acre, the cultivator not having to expend any capital in improvements. Of the 37*s.* 3*d.* per acre profit, 22*s.* 6*d.* was about the sum due to the storage of water, supposing such storage works to be added to distribution works already constructed. The cost of large works of irrigation might be safely reckoned at £7 per acre on an average, or £8 15*s.* if 5 per cent. on one-half the capital for ten years during construction were added. If the profits made by the application of the water were divided, in the proportion of one-third to the cultivator and two-thirds to the agency supplying the water, works of channel irrigation would benefit the cultivator, as above stated, to the extent of 50 per cent., and yielding a net return of 7·4 per cent. on the capital expended.

With respect to the cost of tanks, the construction of flat country tanks of the second class, or even of the third class, offer a very doubtful return, although in some cases it might pay the cultivators to construct them. Great profits had been made by government in several cases, by restoring or repairing tanks, and also channels which had become ruined; such net profits amounting to from 10 per cent. to 45 per cent., and in one instance, which was cited, to 250 per cent. The construction of large storage reservoirs would return a high per-centage on the outlay. Further, it appears probable that, in the most favourable localities, 7,000 cubic yards of water could be stored for £1, and in others 4,250 cubic yards, while the restoration (in part) of the ancient tank of Mudduk Masoor, would yield 9,600 cubic yards per £1.

The loss by evaporation in the reservoirs of 70 feet and upwards in depth would vary with their depth, and the time in which they were emptied. It was found, by observations of the evaporation in the locality of three proposed reservoirs, to vary from 5 per cent. to 7½ per cent. of their contents. A further loss from the same source would occur in the passage of the water to the country to be irrigated, varying of course with the distance, &c. For the purposes of calculation, the correction for evaporation was assumed at 12 per cent., and the quantity of water required for the cultivation of an acre of rice, at 5,000 cubic yards. At the most unfavourable rate of storage (4,250 cubic yards per £1, and adding, as in the case of the channel works, 25 per cent. for interest during construction) 3,400 cubic yards per £1, the prime cost after all deductions, would be £1 9*s.* 5*d.* per acre, for giving a second crop of rice, or a crop of sugar-cane; while the cost at the rate at which the restoration of the Mudduk tank was estimated would be 14*s.* 10*d.* per acre. An outlay of £1 9*s.* 5*d.* would yield a net return of about £1 1*s.*, allowing a large margin for the construction of reservoirs in still less favourable situations and supposing the reservoir to be constructed in addition to a system of distribution works already existing. With regard to the large and very remunerative works in the Kistna, Godavery, and Tanjore deltas, the works in the latter yielded, after deducting repairs and 5 per cent. on the capital, 23½ per cent. direct profit, and those on the Godavery from 50 per cent. to 60 per cent. All the deltas are occupied as to offer no opportunity for new undertakings on a large scale, while in other districts such enterprises would necessarily be more expensive. Mr. Gordon has arrived at the following conclusions: 1st, That irrigation would benefit the cultivator to such an extent as to enable him to pay a water-rate equal to two-thirds of the increased value of his crop, and still leave his own profits from 50 per cent. to 400 per cent. in excess of those derived from dry cultivation; 2nd, That the most profitable application of capital would be found in the construction of storage reservoirs as an addition to distribution works already in existence, and that these would yield a net return of 46 per cent., after paying one-third of the gross revenue to the existing works, and increasing the revenue of such works by 4¼ per cent.; 3rd, That the arbitrary water-rate of 12*s.* per acre was, on the data assumed by government, insufficient to yield a fair return directly on the average of new irrigation works, unless these included the storage of water for a second crop: 4th. That the profit [illegible] ment [illegible] gation dep [illegible] on th [illegible] f the pri [illegible] e w [illegible] e fixed w [illegible] ence to the [illegible] of the crop produced by and the cost [illegible] the works in each case, and that otherwise many very beneficial projects would remain unexecuted.

SOUTHERN MAHRATTA COUNTRY, constitutes the British zillah of Dharwar, and ought, likewise, geographically speaking, to include the small province of Sunda. The general boundaries are the rivers Kistnah and Bhima on the north and north-east; the Tumbudra river on the south; the Nizam's territory on the east, and the Syhadri range of mountains on the west. The latter are generally called the western ghauts; a term which however properly applies only to the passes leading through them. The general face of this tract is much diversified, and affords a great variety of elevation and of geological structure, thereby materially affecting the distribution and the habitat is a different species of animals existing within its limits. The whole of the western portion of the thick forest, extending from the outskirts of the mountainous region of the ghauts to their summits, and clothing the valleys that extend between their different ridges, abounds with the teak and various other lofty forest trees, festooned by enormous perennial creepers. The bamboo forms a thick and luxuriant underwood in some places, while others are entirely open, and the banks of many clear and rapid streams flowing through it, abound with the black pepper plant, the wild cinnamon and other odoriferous shrubs. Portions of this forest are often left entirely untouched by the axe or knife, forming a thick impervious shade for the growth of the black pepper, cardamom and Mari palm (Caryota urens). These are called kans and are favourite resorts of wild animals. To the east of the regular forest lies a tract called the Mulnad, or rain-country (though the natives of the plains often include the jhari, or forest, under the same denomination) in which the trees degenerate into large bushes, the bamboo almost entirely ceases, and cultivation, chiefly of rice, becomes much more frequent. The bushes consist chiefly of the karunda, the pallas, &c. It abounds in tanks and artificial reservoirs for purposes of irrigation. East of the Mulnad is a great extent of alluvial plain, producing fine crops of wheat, cotton, maizes, millet, Holcus sorghum, Panicum italicum, Cicer arietinum, &c. And on the Nizam's frontier are found a succession of low d [illegible] hills, with tabular summits, often risi [illegible] abrupt s [illegible] es, and inte [illegible] and trave [illegible] n various dire [illegible] They are [illegible] thorny jung [illegible] babul and acacia, and their bases, and [illegible] valleys between, composed of a light sandy soil, are cultivated with millet, vetches. Panicum spicatum, Panicum miliare, Phaseolus max, Phaseolus mungo, &c. The first or mountainous division consists chiefly of micaceous clay, and other schists, which to the northward are succeeded by basaltic or trap formation. The Mulnad is composed of undulating clay-slate hills, which become covered with basalt to the north. This trap formation extends in a slanting direction from S. W. to N. E. nearly coinciding with a line drawn from Sadasheghur on the coast, to Bejapoor and Sholapoor—and, what is remarkable, is almost coincident with that marking the separation of the two great tribes of the population using totally distinct languages, the Mahrattas and Canarese. The hills to the N. E. and E. are all of primitive sandstone sometimes resting on schists, sometimes immediately on granite, which latter is the rock nearest the surface in the central and eastern plains. A well-defined range of hills to the S. W., called the Kupputgud, is basaltic. The extensive plains lying between these different lines of hills and eminences are composed of the rich, black mould called regur or cotton ground, resulting from decomposed basaltic rocks. To the N. E. a considerable tract of limestone is found, resting on the sandstone, about Bagalcote, Badami, Hungund, Mudibihal, &c. The species of Mammalia found in the Southern Mahratta country, were described by Mr. Walter Elliot, of the Madras Civil Service in the Madras Literary Society's Journal, July 1839, and he gave the distribution in a tabular form, some of them being general, actions confined to one tract only.

SOUTHERN WHALE BONE WHALE of Nunn, Balæna australis, *Des Moulins.*

SOUTHERN WOOD, Artemisia abrotanum, *Linn.*

Downah,	HIND.	Dawanum,	TEL.
Marikolundoo,	TAM.		

The Tamil people sometimes mix the fine powder of it with gingillie oil and anoint themselves with it after bathing. The mahomedans prize it for its fragrance as a flower; and it is one of the many sweet smelling shrubs that are strewed before the hindoo gods at religious ceremonies.—*Ains. Mat. Med., p.* 44.

SOUTH POLE, Badabaunla, SANS.

SOUTH SEA ISLAND COTTON, see [redacted]n.

[redacted]THWELLIA[redacted]S, China [redacted]: seeds wh[redacted]hly pala-[redacted].

[redacted]OUTONG, a river near [redacted]brigunj in [redacted]ylhet.

SOWA, see Soya.

SOWA, also Shuta-pooshpa, Guz., Hind. Anethum sowa, *Roxb.* Dill seed ; or Bishop weed, Anethum graveolens, *Linn.*

SOWA, Hind., of Spiti, a kind of barley.

SOWAR, Hind. A trooper ; a mounted soldier, belonging to the irregular cavalry.

SOWAY DO, Burm. A tree of maximum girth 1¼ cubits and maximum length 10 or 12 feet, very abundant on the sea coast and on the banks of rivers in the Tenasserim provinces. When seasoned it floats in water. The wood is much recommended for gun-stocks with but one fault ; that it is crooked and therefore not more than ten or twelve feet can be procured between the bends. This wood is commonly sold to Burmese at half a rupee for a piece large enough to make one gun-stock.—*Captain Dance.*

SOWEAJYA, see Inscriptions.

SOVINDA, Tel. Æschynomene sesban.

SOW-YEW, Burm. The Egg-tree of the Karenese, Chisel-handle tree of the English in Burmah. This is stated by Dr. Mason to be a species of Dalbergia. Its maximum girth 2¼ cubits and maximum length 10 feet. Found scattered all over the Amherst, Tavoy and Mergui forests, inland ; always found in undulating ground only, not near water. When seasoned it floats on water. It is used by Burmese in preference to any other for handles of chisels and tools, also for helves of axes, and hatchets. It is a very hard, fine grained wood, which is strongly recommended for helves and handles of all kinds of tools, and is unequalled for those tools, such as chisels, which are struck with a hammer or mallet. This wood is of a yellowish white in colour with patches of black interspersed, looking as if iron had in some manner been drawn from the soil, and incorporated in the wood. Though widely scattered, it is in such demand as always to be procurable in the markets.—*Captain Dance.*

SOWRAH. A tribe inhabiting a small tract of country situated between 83° 30′ and 84° 30′ east longitude, and between 18° 30′ and 19° 30′ north latitude. Their name is also written Saur, Sour, and Saireah. In the Namalingāna Shāsanam of Amara, an ancient hindoo writing descriptive of the various races inhabiting the Indian peninsula, the Sowrah (Shabarah) are classed under the general head of Sudras, they are simply described as people who dress in leaves and are placed in a sub-family with the Kir[redacted] who dress in peacock's fea[redacted] the Puli[redacted] o[redacted]language. [redacted]is described [redacted]riety of the[redacted]s, out-castes. There is no distinct[redacted]aste among them, but by the progress of [redacted]ization ~~they have~~ gradually become divided into two bodies ; 1st, the Kapu *Sowrah* who are dispersed over those hills of Purlah Kimedy and Palkonda which are situated in the more open country, and who, from frequent intercourse with their neighbours, the Telugu and Oriya people have picked up their language and some of their civilization. Many of the Kapu Sowrah now live in villages in the plains and at the foot of the hills, and lead a quiet and industrious life ; 2ndly, the Konda Sowrah or hill Sowrah who inhabit the dense forest of hills to the north of Purlah Kimedy. These men are utterly uncivilized and retain all the customs, manners and instincts, which originally characterized the race, and to them therefore the following description will be confined. A large portion of these Sowrah are nominally under the control of the Bissoyi or hill chiefs of Goomah and Gibau, Soringhee, Ryagudda, Wogayagudda, Jeringhee and Coipooram. But the greater number who go by the name of the Omanyah Sowrah are independent of all control, and as far as is known, have no chiefs among themselves. The hills they inhabit are never visited by the inhabitants of the plains—they are bounded on the north by the country of the Khond, another hill tribe, on the east by the zemindaries of Pedda Kimedy and Chinna Kimedy, on the south by Purlah Kimedy, and on the west by Goonipooram, a taluk of the Jeypore country. As viewed from the summit of Mahendragiri, a lofty mountain on its confines, this country appears to consist of a continuous mass of hills which rise behind one another, range after range, like the waves of the sea. Cultivation of dry grains is carried on, on the slopes of the hills, often at an angle of 45 degrees with the plain, while here and there crops of paddy are raised on the small level patches between the hills, advantage being taken of the numerous springs and hill streams. Besides the forts or places of residence of the Bissoyi above-mentioned, there are a few villages of tolerable dimensions among the hills, and there is reported to be a large village called Tummalo in the Omanyiah Maliahs consisting of more than 200 houses, but the Sowrah generally live in huts perched singly on the hill sides or in small groups of 4 or 5. Of the language of the Sowrah, little is known. It is of course unwritten, and is entirely different from that of the Khond or any other neighbouring hill tribe. To the ear it sounds very monosyllabic, and is pronounced in a short quick way, the Sowrahs seldom indulging in long sentences. For the imperative "go" their word is "ma," and for "come," "ya." They sing a particular kind of song which they call "Kellangiya." They are not peculiar in what they eat. Flesh of all sorts, snakes, red ants, mice, monkeys, birds, fruit, vegetables and grain were all enumerated in a list of the articles of food given by one of themselves,—but like the Khonds, they have a peculiar objection to the use of milk in any of its forms. The dress of the Sowrah consists of a piece of coarse cloth manufactured among themselves by a set of persons who are called by the people of the plains the Arasi Sowrah. This cloth is fastened round their waists by the women, and reaches to their knees. The men merely wear a langooty, or piece of rag fastened to a string round their waists and passing between their legs. Their ornaments consist of nose rings and ear-rings, bangles, &c., made of brass or bell metal, and as many strings of coloured glass beads worn round their necks as they can accumulate. On festivals, the men decorate their hair with peacock and other feathers. The women in their own hills never wear anything above the waist. As the cold weather approaches, the Sowrahs up to the year 1855 were in the habit of making incursions into the plains of Kimedy and Goonipooram, in small parties of 5 or 10, and way-laying travellers to rob them of their cloths—and as they are utterly reckless of life, several murders occured annually. It was hoped that the newly organised police would do much to check these depredations, but it was thought that they can never be finally stopped till the Sowrah are brought into more frequent contact with the inhabitants of the plains, and opportunity is afforded them to possess themselves by honest means of those necessaries which they now obtain by plunder. There are openings into the Maliahs from Kimedy and Goonipooram which might be improved at no great outlay into good roads, and probably a route might be found leading from the former to the latter place at the back of the Maliahs, and thus placing the whole country within easy reach of the plains. Their religion is principally demonolatry. They ascribe every disease and other evil to the influence of a demon who must be propitiated to prevent their occurrence, or obtain their removal. They are also said to worship Rama and Bheema, and to have village goddesses, but the worship prevails probably only among the Kapu Sowrah. At the time of harvest, soon after the crops of gantelu, korralu, maize, &c., ripen, every individual Sowrah fetches a stone, fixes it in the ground a span upwards, and calls it by the name of "mountain god." He brings a little of each kind of crop and lays it before the stone; he then sacrifices a fowl, gets some toddy, and after dedicating to the god, he mixes them all together, and with his friends and relatives, enjoys the feast. When a child is born, they assign to it the name of the day on which it was born, or that of the presiding evil spirit, the latter being determined by a sort of soothsayer or priest called by them "Vejju." If born on Sunday, the child is called "Adya;" on Monday, "Somburu;" on Tuesday, "Mangada;" on Wednesday, "Budu;" on Thursday, "Lakya;" on Friday, ' Sukku," and on Saturday, "Sanya." These names of the days of the week are the same as those among the Telugu and Oriya people, Telugu Adivaram, Somavaram, Mangalavaram, Buduvaram, Laksmanavaram, Sukravaram and Sanivaram. The mother is not considered unclean for a period after the birth as among the hindoos generally. A stimulant prepared of roots and bark is administered to her immediately after the birth, and on the 4th day she is generally able to resume her ordinary occupations. The ceremonies observed at a marriage are as follows:—A young man, or his friends for him, having selected a bride, messages are sent to her parents, and finally the young man himself goes, bearing a pot of toddy or other present. If the consent of the parents is obtained, the ceremony is commenced by fixing 3 posts in the ground, between which the bride and bridegroom with their respective friends assemble, and a feast is commenced, at which nearly every person gets drunk upon toddy. The bride and bridegroom sit together while turmeric water is poured on their heads. Presents of cloth, beads, rings, &c., are exchanged. Fowls, and if procurable, sheep are sacrificed to propitiate the demons, and the flesh is then cooked, made up into balls with some sort of grain, and distributed among the party; on these occasions they all join in a dance which seems to consist principally in hopping from one leg to the other, at each movement snapping their fingers and uttering an ejaculation, while at intervals the whole of the dancers come bumping together and again separate. If the parents of the bride refuse to consent to the marriage, it frequently happens that the friends of the bridegroom watch their opportunity, and if the girl is found alone, they seize and carry her off. The relatives of the girl then pursue and attack the opposite party, but even though successful in retaking her, they are prohibited by their customs from giving her in marriage to any one else. Should such a thing be attempted, the parties would have to fight it out in a more serious manner with bows and arrows.

The Sowrah burn their dead, and the following day bury the ashes on the same spot over which they erect a rude pandal; on the 5th day the soothsayer or priest is called to the place and makes an offering of toddy, sacrificing at the same time fowls or animals according to their means, to the spirit of the dead. Another portion of the ceremony consists in placing round a pot of toddy a number of leaves to represent the ancestors of the deceased; upon each leaf the priest sprinkles a little toddy while pronouncing the name of the person represented, after which the toddy is divided among the party. At the end of the 1st and 4th years, ceremonies are observed which also consist in feasting on various articles of food which are first dedicated to the spirit of the deceased. Though the Sowrah race is considered far more wild and savage than the Khonds, they have no share in the Meriah or human sacrifices performed by the latter. The weapon in most general use among the Sowrah, is the bow and arrow. The bow is made of a section of strong male bamboo, about a yard in length, the string being made of a thin slip of the outer coating of the bamboo, firmly bound on at each end with sinews. The arrows are of light reeds, feathered, with a head of flat beaten iron, having two or three pairs of barbs. They generally aim at the stomach or thigh of their victims, and the wounds are consequently dangerous and very often fatal. Their mode of attack is to lie in wait in some bushes close to a road whence they shoot their arrows at any passer by. Some of them also carry rude iron knives, and a hatchet called "tungi." Besides carrying on cultivation, certain of them called Muli Sowrah work in iron, making arrow heads, knives, &c.; others called Medari Sowrah make mats out of bamboos, while the Arasi Sowrah weave coarse cloths. They are, generally speaking, extremely muscular, as an instance of which a man who was apprehended on suspicion of belonging to a party who had committed murder, seized the bayonet of one of the armed constables in his hands, and actually bent the blade double. A pleasing feature in their character is their complete truthfulness. They do not know how to tell a lie. They are not sufficiently civilized to be able to invent. The hilly tracts of India, from Moorshedabad down to Ganjam, and southwards on the skirts and in the valleys of the mountains as far as Cape Comorin, are peopled by hundreds of small tribes, who form amongst themselves independent nations, who have not yet felt the effects of civilization and, as with the Sonthal, the Sauriah and the Khond, occasionally rise in open rebellion against the British power. Since 1857, the Khonds of Kimedy have been surging up, from time to time, but the true objects are not known, though the reasons given are their hope of renewing the Meriah. It was known, in 1833, that the Khonds were addicted to the sacrifice of human beings,—Meriah,—to the earth goddess and, ever since then, the British government have made continuous efferts to suppress this rite. An insurrection in 1858 was neither aided nor led by Khonds. The principal actor in the affair was a man named Danda Sina, of Garbah Goomah, a village occupied by this Sowrah tribe of savages, armed with bows and arrows and battle axes, who occupy the hilly tract which extends from Purla Kimedy to Berhampore (Ganjam.) It is bounded on the east by the narrow belt which separates the hilly tracts from the sea, and on the west by the Khond clans of Chinna Kimedy and Jeypore. The Sowrah in habits and barbarism bear a strong resemblence to the Khond. Danda Sina was sometime before apprehended by the authorities of Ganjam, on a charge of dacoity. He was convicted, and sentenced, but the sentence required confirmation, and in the interim he contrived to effect his escape. Flying to his own village, he collected a large body of his clansmen, and with 10,000 followers attacked the manager of Purla Kimedy. Seven peons were killed upon the spot, and though the manager escaped, the whole country was immediately in a state of excitement. The Sowrah had previously been irritated by the execution of two of their number for murdering the headman of a village, and had openly threatened vengeance for their deaths. An old device also was employed to stimulate them to action, and give additional coherence to the movement. As in the Southal rebellion, an avatar descended. He was not, it is true, in the shape either of a cart wheel or of a piece of paper. The Sowrah appear to be advanced beyond that point in theology, and their idol is a little brazen image. But in all other respects the device was identical with that before employed among the Sonthals. The avatar issues, commands, the active leader is sole interpreter of them, and the commands authorise armed resistance to regular authority. The Sowrah are wholly within Telingana, and extend from the Godavery to the southern frontier of the Khond. The Sowrah country is one of the most difficult in the world, a hilly tract covered with a jungle as deadly to sepoys as the lowest swamp in the Southal pergunnahs.

Mr. Campbell observes that the Soor while described as small, mean, and very black, and like the Sonthals naturally harmless, peaceable, and industrious, are also said to be without moral sense.—*Mr. W. S. Hooper, Principal Asst. Agent to the Governor in Ganjam* ; *Mr. Campbell.*

SAURA or SURIA, are a hindoo sect and true worshippers of the Sun ; and some of them, adore the dormant and active energies of the planet conjointly. This sect, which is not very numerous, is distinguished by the use of red sanders for the horizontal triple line, as well as for the circlet on their foreheads.

SOY.

Tsiang-yu,	CHIN.	Soya,	JAP.

This well-known sauce is made from the Soja hispida which grows in China and Japan. In Java it is procured from the Phaseolus radiatus, the green gram, haree moong or putchay payroo of India. The beans are boiled soft with equal quantities of wheat or barley, and left for three months to ferment, salt and water are then added when the liquor is pressed and strained, 1,108 piculs of soy were shipped in Canton in 1844, for London, British India and Singapore ; 100 jars, or about 50 gallons of soy were received at Liverpool in 1850. Its price is about 6*s.* per gallon in the London market, and the Japan soy is superior to the Chinese. Genuine soy is well flavoured, thick, brown, and clear ; and when shaken in a glass, it should have a coat on the surface of a bright yellowish-brown colour. It is obtained from Canton ; but the best is exported from Japan, by way of Batavia. Soy, is made in some parts of the east, from a species of the Dolichos bean (Soja hispida) which grows in China and Japan. In Java, it is procured from the Phaseolus radiatus. The beans are boiled soft, with wheat or barley of equal quantities and left for three months to ferment, salt and water are then added, when the liquor is pressed and strained. Good soy is agreeable when a few years old, the Japan soy is superior to the Chinese. Large quantities are shipped for England and America. The Dolichos bean is much cultivated in Japan, where various culinary articles are prepared from it, but the principal products are a sort of butter termed mico, and a pickle called sooja. The flavour and ingredients of soy vary considerably, even among the people who make it, and much of that exported is supposed to be more or less
Leguminous and cruciferous
the largest part of the Chinese
many sorts of peas and beans are
and the pods and seeds of two species of
chos are eaten, and the beans of another specie made into soy by boiling and powdering the kernels and then fermenting them with yeast, and mixing other ingredients, according to the taste of the maker or purchaser. The dely diffused and extensive tribe of Leguminos[illegible] holds an important place in Chinese botany, affording many esculent vegetables and valuable products. Peas and beans form important objects of culture, and the condiment called soy (a word derived from the Japanese soya), is prepared chiefly from a species of Dolichos. One of the commonest modes of making this condiment is to skin the beans, and grind them to flour which is mixed with water and powdered gypsum, or turmeric. The common Chinese eat few meals, without the addition of one form or other of the 'bean' curd, or 'bean' jelly. The soy was at one time largely used as a condiment in the several countries of Europe but has latterly been displaced for others.—*Waterston* ; *Faulkner* ; *Simmonds'* ; *Commercial Products, p.* 313 ; *Williams' Middle Kingdom, Vol.* ii, *pp.* 283,402, 403 ; *Morrison.*

SOY BEAN, ANGLO-JAP. Soja hispida.

SOYA, or Sowa, HIND. Anethum sowa, *Roxb.* Dill, an umbelliferous plant cultivated in India. Its aromatic seed is much used by the natives in cookery, as well as for medicinal purposes ; the green parts also are cut down and sold in the bazaars, as the plant is used as a vegetable both by mussulmans and hindoos. The seeds are the shubit of Avicenna, which is usually translated Anethum ; by the Arabs it seems to have been considered the Anethon of Dioscorides.—*Eng. Cyc. Ben. Ph., p.* 226.

This large forest tree, is a native of several of the mountainous districts of India, in the Coimbatore and Cuddapah districts, of the Godavery forests and the Rajahmundry circars, the Chunar hills, and the jungles to the south of Hazareebaugh. Royle, indeed, states that it occurs in all the central and southern parts of India, also, in the northern

Bombay forests, where it is more com- inland, as on the Satpura the forests of the coast, nsiderable abundance, however, various parts of Guzerat, also at the Sindhwah ghaut and in the Adjunta and Jowar jungles. It is very abundant in Nagpore, and grows in the Chunar hills and in the jungles south of Hazareebaugh, indeed in all the central and southern parts of India. The wood is red-coloured, light and easily worked, and is reckoned durable and strong, and good for indoor or cabinet purposes, but not adapted to those requiring exposure to sun and weather. Captain Beddome, however, says it never rots underground. In the Cuddapah district it is much used in buildings. In Nagpore logs are obtainable from 17 to 20 feet long and 4 to 3½ feet in girth, at 5 annas the cubic foot. In weight, the wood is much greater than water, but by all native accounts it is, there far from a durable wood, on exposure splitting greatly, and when seasoned becoming extremely brittle. It has a fine straight grain, and is not so difficult to work as its great weight and compactness would lead one to imagine. But, notwithstanding this and the fact that it rivals the finest English oak in strength, Captain Sankey hesitates to recommend it as a building material. The bark is a useful tonic in intermittent fevers, exactly similar to the mahogany bark, useful where astringent tonics are applicable, but of very questionable efficacy as a true antiperiodic, for mild ague, in which doubtless like all other astringent tonics it will often succeed, it may be given in the form of extract in the bazaars in Bengal, Nux vomica bark is often sold for it, and from this Mr. Piddington, procured a salt, which Dr. O'Shaughnessy found to be one of Brucine. Dr. O'Shaughnessy never succeeded in obtaining an alkaloid from the true Rohun, which, it may be observed, is of a dull red-colour, with rough grey epidermis, and yields a red powder. The value of this bark as a febrifuge has been attested by Roxburgh, Duncan, Breton and Spilsbury. Dr. O'Shaughnessy does not think so highly of this bark as others do. He accounts it useful, like its congener, mahogany, where astringent tonics are applicable, but of very questionable efficacy as a true antiperiodic; he thinks it may succeed where other astringent tonics will so. From the reports of dispensaries it seems of considerable use, though by no means equal to the Berberis. The reporters say, that when taken beyond the quantity of 5 or 6 drachms in the course of the day it produced vertigo and other head symptoms." This is confirmed by Dr. Spilsbury, who says large doses were found to produce vertigo.—*Drs. Wight, Gibson, O'Shaughnessy, pp.* 247-9; *and Cleghorn, Voigt, Roxb. Fl. Ind., Vol.* ii, *p.* 398; *W. & A., Vol.* i, *p.* 122; *Captain Sankey*; *Eng. Cyc., pp.* 802, 859; *Ind. Ann. Med. Science*, 1856, *p.* 191.

SPALYGIS, see Greeks of Asia.

SPALYPIUS, B. C. 75, had many coins in two languages, he was a vice regent, son of Vonones and perhaps brother of Spalirisus. About this time, as indicated by his coins, was a ruler, whose name is not known, styled Soter Megas, B. C. 70, the nameless Great Soter king, who had coins with an Arian legend which James Prinsep and Professor Lassen ascribed to Azes. On all, is a peculiar monogram with three prongs. The same monogram was continued in coins of Kadphises and of the Kanerki, but it is not found in those of the Hercules type derived from Hermæus. Mr. H. T. Prinsep considers him to have been contemporary but not identified with Vikramaditya, and that he assumed the title of Soter Megas, which was continued down by the Kadphises kings. He considers that the nameless kings, with those on whose coins are the words Kodes or Hyrkodes, although mere local chiefs such as now rule at Kulm, Kunduz and Balkh, preceded the conquest of the Panjab by Vikramaditya, B. C. 56. Spalirisus, B. C. 85, sometimes read Ipalirisus, supposed a Parthian king. See Greeks of Asia.

SPANMAL, Sw. Corn.

SPARADRAP D'ANGLETERRE, Fr. Court-plaster, a thin coating of isinglass with a little tincture of benzoin spread on black sarsenet. Isinglass is also employed for giving a lustre to some kinds of woven fabric; but it is more extensively used for clarifying different liquors such as wine, beer, and coffee than for any other purpose. The inferior kind called cake isinglass being brownish coloured and having an unpleasant odour is only employed in the arts and for the purposes of glue. The great consumption of isinglass, necessarily however of the inferior kinds, is chiefly by the brewer in the process of fining. This he effects by the use of isinglass which he dissolves in sour beer to the consistence of thick mucilage. A little of the solution being added to the liquor to be clarified causes the subsidence of all the suspended matter in the course of a few hours when the liquor remains perfectly transparent. The sounds of cod fish are said to be employed for the same purpose, though the principal import into England is in a salted state for food.—*Royle, p.* 12.

SPARAXIS. Is a pretty flowering genus of plants, one of the Irideæ, and is cultivated by dividing the roots.—*Riddell.*

SPARIDÆ, a family of fishes.

First Group.—Cantharina.

9 Cantharus, 3 Box, 1 Scatharus 1 Oblata, 1 Crenidens, 1 Pachymetopon, 1 Dipterodon, 1 Proteracanthus, 4 Girella, 1 Doydixodon, 2 Tephræops, 1 Gymnocrotaphus.

Second Group.—Haplodactylina.

5 Haplodactylus.

Third Group.—Sargina.

17 Sargus, 1 Charax.

Fourth Group.—Pagrina.

22 Lethrinus, 2 Sphærodon, 12 Pagrus, 7 Pagellus, 18 Chrysophrys.

Fifth Group.—Pimelepterina.

Gen. 6 Pimelepterus, 1 Boridia.

The Sparidæ, or Sparoides, family of fishes belong to the section Acanthopterygii, which are distinguished by the possession of a single dorsal fin, the anterior half of which is supported by spinous rays, and which is not divided, nor is it protected by scales; the operculum is spinous, the palate destitute of teeth, the branchiostegous membrane has five or six rays, and the pyloric appendages are few in number. The body is usually of an ovate form and covered with large scales; the mouth is not protractile. The species of this family feed chiefly upon the animals of small shell Crustaceæ, &c., for crushing which their strong teeth are admirably adapted. The genus Pentapus is founded upon certain Sparoid fishes found in the India seas, and off the coast of Australia, which approach the genus Dentex, but have two strong canine teeth in front of each jaw, between which sometimes are two or four much smaller teeth; the other teeth are minute, prickly, close together, and arranged in a single row in each jaw. The genus Crenidens is distinguishable by the foremost row of compressed teeth being dilated at the apex and notched; behind these are numerous small globular teeth. There is but one species, the C. Forskalii, *Cuv.* and *Val.*, an inhabitant of the Red Sea.—*Eng. Cyc.*; *Gunter*, *Catal. of Fishes.*

SPARLEI-GUL, Hind. Arnebia echioides.

SPARROW. The cinnamon-coloured sparrow (Passer cinnamomeus) is often seen among the pine-woods of Kussowlee, and in the jungles along the lower hills. See Passer.

SPARROW-HAWK. The Sindian, like the English, sparrow-hawk, preys entirely upon birds. She flies exactly like the goshawk, low, and frequently takes advantage of a shelter to fall unexpectedly upon her quarry.

The Bashah, a kind of sparrow-hawk, and its mate the Bashin, a small, short-winged, low-flying bird with yellow eyes and dark plumage in her first year, which afterwards changes to a light ash colour, marked with large grey bars, are very much valued in Sind on account of the rapid way in which they fill the pot, especially with partridges. As they remain in Sind during the cold weather, and retire in summer to the hills around, those trained are "passage hawks," or "birds of the year;" their low price, 8*s*. or 10*s*., makes it scarcely worth while to mew them, so they are let loose when the moulting season commences.

The Shikrah and her tiercel the Chipak, are the common English sparrow-hawks. They are flown at partridges, and by their swiftness and agility afford tolerable sport. At the same time they are opprobriously called "dog-birds" by the falconer on account of their ignoble qualities, their want of staunchess and their habit of carrying the game. They may be bought ready trained, in most parts of Sind, for a shilling or two. —*Burton's Falconry Valley of the Indus, p.* 80.

SPARTA, see Polyandry.

SPARTO, see Esparto.

SPARTUM SCOPARIUM, see Coffee.

SPATHE (the Greek σπάθη), is a term applied to the sheathing involucrum of many plants, considered by most botanists to be a modification of the bract. It is seen in the greatest perfection in the flowers of Palmaceæ and Araceæ, where, during the flowering of the plants, it embraces the entire inflorescence.—*Eng. Cyc.*

SPATHIUM CHINENSE, *Lour.*

Aponogeton monostachys, *Linn. fil., Roxb. Corr., Rh.*

Gotti gaddi,	TEL.	Namma dumpa,	TEL.
Kottika,	„		

The roots are much prized as food by the Yanadi. In Tenasserim one or two species of Spathium, grow in the water; one of which, Voigt says, is found on the banks of the Irrawaddy, and has roots 'nearly as good as potatoes.'—*Mason.*

SPATHIUM ROOT, ANGLO-LAT. Spathium chinensis.

SPATHODEA, a genus of plants belonging to the natural order Bignoniaceæ. One Burmese species, the Thit-linda, BURM., has a white wood not much used. A cubic foot weighs lb. 63. In a full-grown tree on good soil, the average length of the trunk to the first branch is 50 feet, and average girth, measured at 6 feet from the ground, is 6 feet. It sells at 8 annas per cubic foot.—*Dr. Brandis.*

SPATHODEA ADENOPHYLLA, *Thw.*

Palol, SINGH.

A small tree, occasionally found in Ceylon gardens. It was introduced into the agri-horticultural gardens at Madrás.—*Thwaites, Cat. Madras Gardens.*

SPATHODEA ARCUATA, *Wight, Icon.*

Mer-singi,	MAHR.	Ran-palai maram,	TAM.

A small or middle sized tree, common in the Walliar forests of Coimbatore, and in the forests on the Bombay coast. It furnishes a strong wood, used by the turner.—*Dr. Wight, Dr. Gibson.*

SPATHODEA CHELONOIDES, *DC. Prod., W. Ic.*

Bignonia chelonoides.	Loonoo-madala-gass, SINGH.

The tree is very abundant in Ceylon, near the sea, but occurring up to an elevation of 2,000 feet.—*Thwaites.*

SPATHODEA INDICA, *Pers.* Syn. of Bignonia indica, *Linn.*, and of Calosanthes indica, *Blume., W. Ic.*

Nir pongilam,	MALEAL.	Wodi,	
Deya danga-gass,	SINGH.	Ganora karra,	
Kanpillay maram,	TAM. ?		

This small thin tree, a native of the west of Ceylon, in the hotter parts of the island and in the forests of the coast, is met with in the peninsula of India, in the forests of the Northern Circars and of the Godavery and in British Burmah. The trunk is very irregular. In a full grown tree on good soil, the average length of the trunk to the first branch is 30 feet, and, at 7 feet from the ground, the average girth is 7 feet. A cubic foot of the wood weighs lbs. 35. It is strong, of a whitish colour, and in Burmah, where it sells at 8 annas the cubic foot, it is used for yokes and cart poles.—*Mr. Latham*; *Roxb. Fl. Ind.*; *Eng. Cyc.*; *Dr. Brandis*; *Captain Beddome, Dr. Birdwood.*

SPATHODEA ROXBURGHII, *Spreng.*

Bignonia quadrilocularis, *Roxb., Fl. Ind.*, iii, 107. ?

Bare-kalagoru,	BENG.	Baro kala goru,	HIND. ? TEL.

A large tree, with a straight trunk and of considerable height. It is a native of the Northern circars, flowers in the hot season with spreading branches and large rose coloured and delightfully fragrant flowers, and is remarkable for its leaves. Roxburgh says its wood is used for many purposes by the natives, but other accounts describe it as worthless. Buffaloes are very fond of the leaves.—*Roxb., Fl. Ind., Vol.* iii, *p.* 107; *Voigt*; *Captain Beddome*; *Eng. Cyc.*

SPATHODEA SERRATULA, is the Ma-lwæ of the Burmese.

SPATHODEA STIPULATA, *Wall.*

Bignonia stipulata, *Roxb., Fl., Ind.*, iii, 108.

Bet-than,	BURM.	Palol,	SINGH.
Paet-than,	„		

A large tree of British Burmah, wood used for bows and spear handles, also for paddles and oars. A cubic foot weighs lbs. 48. In a full grown tree on good soil the average length of the trunk to the first branch is 20 feet and average girth measured at 6 feet from the ground is 4 feet.—*Roxb., Fl. Ind., Vol.* iii, *p.* 108; *Dr. Brandis.*

SPATHODEA SUAVEOLENS, *DC.*

Bignonia suaveolens.	Palol, SINGH.

Grows in the south of Ceylon, in the neighbourhood of buddhist temples, and Mr. Thwaites could not hear of its occurring truly wild. Its roots are much valued by the natives as a tonic medicine, and they attribute the same properties and give the same name ('Palol') to those of Spathodea adenophylla, which is occasionally found in gardens.—*Thwaites.*

SPATHODEA UNCINATA, a trailing creeper, this genus of plants are showy and handsome, the colour of the flowers being yellow, purple and red; they are easily propagated by seed or cuttings, and require a good garden soil.—*Riddell.*

SPATTALLA, a genus of the Proteaceæ, all Cape plants, and require the same treatment as other Proteaceæ.—*Riddell.*

SPATULA CLYPEATA, (Anas clypeata, Circuit of northern regions, N. Africa: tolerably common in India. See Shoveller.

SPAWN. In Canara, men search in the the rivers for hillocks wherein spawn has been left, gather the ova and make it into cakes, which are considered a delicacy. The eggs of the kari and kalmuri are highly prized. The quantity of spawn contained in each fish has been but slightly tested. So far as examination has been made, Indian fish seem to be as prolific as others. A mahseer of 6¼ lbs. contained 13,219 roe, which is 2,115 to the lb.; a mahseer of 11¼ lbs. contained 10,587.

SPEAR GRASS, Andropogon aciculatus.

SPEAR-MINT, Mentha viridis, cultivated for the fragrant leaves, which are used in sauces, tea, &c., requires rich soil, shade and plenty of water, propagated by division of the plant.—*Jaffrey.*

SPEETEE, see Kunawer, Spiti.

SPEK, DUT. Bacon.

SPEKE, a captain of the Bombay Army, a gallant soldier, who bore himself bravely in some of the bloodiest battles in the Indian wars, and a sagacious and enterprizing traveller, who by sheer pluck and endurance solved a problem which had vexed the curiosity of mankind since the dawn of history. It is not necessary to exaggerate the merit even of having solved the great geographical problem of the source of the Nile, and there is not claimed for Speke a precedence over the genius of Sturt, or Burke, or Wills; but his was a brilliant exploit. He had won the trophy, he was still battling for its possession against other candidates who would fain have taken it from him. A mixed crowd of curious and scientific folk were awaiting with forgone conclusions, or, at least, with a prepossession in his favour, to witness a great display of fence between him and his chief adversary. At the moment when every eye was turned in quest of him, word was brought that the great traveller, who had successfully confronted a thousand perils, who had been among the expecting multitude but a few hours before, and who was waited for as the disputant of the day, lay dead in a stubble field, shot to death by his own gun.

As a subaltern officer in the Indian army he had made the campaign of the Punjab, under Lord Gough, and, in the four successive victories of Ramnuggur, Saddelapore, Chillianwallah and Guzerat, acting throughout this terrible time with Sir Colin Campbell's division. He used to make hunting and exploring expeditions over the Himalayas, and in the untrodden parts of Thibet. A botanist, a geologist, and especially a lover of natural history, he toiled to collect specimens of every animal, every plant, and every mineral to be found in those wilds; shooting, collecting and mapping the country as he went, he taught himself all the knowledge which he required to enable the traveller to appreciate and utilize all he sees. He obtained his annual leave of absence easily, because he brought back such good proofs of the use he made of it. These were his preparations for his after travels in Africa, where he first struck upon the great lake which is the fountain of the Nile, reaching it from the north, and then proved what was at first but a sagacious conjecture by tracking the river upwards to this same lake from the south.

Capt. Burton was once slumbering under the shadow of the very highest prize of all. Speke and Burton were companions in the expedition during which the lake of N'yanza first became known to European science. Speke was more impressed with the importance of the intelligence than Burton was. In fact, Burton was ill and Speke was well; Speke was shooting Egyptian geese and catching perch in the lake while Burton lay in his hammock. Moreover, Speke had the happy sagacity to guess the vast importance of the discovery on which he had lighted. Burton was very near gaining this blue riband of the geographers, but he did not gain it.—*London Times.*

Zinc is a metal of a blueish-white colour and lustre. Cheap, light, and when superficially oxidized, long resists the further action of air and water; it is now employed as a substitute for lead in lining water-cisterns and roofings: alloyed with copper it forms brass; and several of its compounds are used in medicine. Zinc is obtained either from Calamine, a native carbonate, or Blende, a native sulphuret: it has never been found in a state of purity. Spelter, in China is used in the manufacture of brass; it is in plates of half an inch thick of a whitish-blue colour. There was formerly in China a monopoly of spelter, so that no foreigner could either buy or sell it.—*Morrison*; *Faulkner.* See Zinc.

Blanc de Baleine,	Fr.
Sperme de Baleine,	,,
Wallrath,	Ger.
Spermazet,	Rus.
Esperma de Ballena,	Sp.

The produce of a species of whale, Physeter macrocephalus, found chiefly in the South seas, called the Cachalot, or white whale, is of immense size, frequently 60 or more feet in length, of which the head constitutes one-third. This part is the chief reservoir of the spermaceti, which however is found in several other parts of the body, mixed with the sperm oil. It is mostly lodged in two large cavities of the upper jaw, one above and the other below, divided from each other by the nostrils. These cavities are sub-divided into numerous cells of unequal size by ligamentous or tendinous partitions ; these partitions are of the same nature as those which separate the fat in other animals, but, owing to the great size of the creature, of a larger and stronger kind. The purest spermaceti is contained in the largest and least ligamentous cells. The part in which it is lodged is quite distinct from the cranium containing the brain which spermaceti was at one time supposed to be. During the life of the animal the spermaceti is in a fluid state, and on the head being open has the appearance of an oily clear white liquid. On exposure to the air the spermaceti concretes and deposits from the oil. They are then separated and put into different barrels. Spermaceti is of a white colour, with a peculiar lustre, is brittle, smooth, but not greasy ; smell peculiar, but weak. It burns with a brilliant flame, without smell ; and is used in the manufacture of candles, also for medical purposes.—*Eng. Cyc.; Faulkner*; *History of Japan, Vol.* ii, *p.* 51. ; *McCulloch's Com. Dict., p.* 1072.

SPERMADICTYON, a genus of plants belonging to the natural order Rubiaceæ. The species form shrubs, with white and light blue very fragrant flowers, with leaves lance-shaped, shortly petioled ; stipules short. They are natives of Hindustan. S. suaveolens, the S. hamiltonia of Roxburgh, ascends the Himalayas to elevations of 3,000 feet, and has been cultivated in Great Britain as a stove-plant.—*Eng. Cyc.*

It is common near the Ana-Sagur ; used by the natives in medicine and near water banks at Ajmeer and in the Eastern and Central Punjab. Has a round pink blossom : considered heating : cleanses the blood : aphrodisiac : also opens the bowels : the flower and seed capsules are used. The small oblong seeds and receptacles of this low-growing herbaceous plant, (2) are reckoned by the Vyteans amongst their anthelmintics and are prescribed in powder. Rheede tells us that the powder of the root is considered as stomachic, and that its bark ground small, and mixed with whey, cures the piles. In the Panjab the officinal flowers are highly esteemed as alterative, depurative, cooling, and tonic. Roots anthelmintic.—*Gen. Med. Top., pp.* 135, 206; *Ains. Mat. Med., p.* 85 ; *Powell's Hand-book, Vol.* i, *p.* 358 ; *J. L. Stewart, M. D.* ; *W. Ic.*

SPHÆRIA, see Fungi.

SPHÆRIA MILITARIS, see Dry rot.

SPHÆROCARYA EDULIS. This tree is a native of the forests of Nepaul, and has alternate, ovate-entire, exstipulate leaves, with axillary and terminal villous racemes of small greenish-coloured flowers, which are without odour. Its fruit is eaten and relished by the Nepaulese, though not very palatable to a European taste.—*Eng. Cyc.*

SPHÆROCOCCUS, a genus of plants belonging to the natural order Algæ. A great number of species have been described including amongst them some of the most useful of the sea-weed tribe. These species have been distributed by later botanists into the genera Rhodomenia, Gigartina, Chondrus : Gelidium and Phyllophora and the genus Sphærococcus has now only one species, the S. coronopifolius. The genus Chondrus affords the Carrageen moss, which is so much used as an article of diet. It is a species of Gelidium, with which, as some assert, the swallows build their nests in the Eastern Archipelago and which are so highly valued as articles of food by the Chinese. The gelatinous substance of which the nests are composed, however, seems, really, to be a natural secretion from the swallow itself.—*Eng. Cyc.* See Edible Sea-weed, Gigartiva, Gracillaria.

SPHÆROCOCCUS LICHENOIDES, *Agardh.* Gracillaria lichenoides, *Greville.* Ceylon moss.

SPHÆROSACME FRAGRANS, *Wall.*, a tree of Nepaul with very small yellowish fragrant flowers.

SPHÆROSACME ROHITUKA, *Wall.* Syn. of Amoora rohituka, *W & A.*

SPHENOCLEACEÆ, *Martius*, Pongatium indicum, grows all over India ; Sphenoclea zeylanica, is an annual, with alternate entire leaves, without stipules ; found in marsh situations in all parts of India. It is the type of the order.—*Eng. Cyc.*

SPHEGIDÆ, the family of Wasps. See Wasp, Mason wasp.

SPHENOCARPUS GRANDIFLORUS, *Wall. Cat.*

Liriodendron grandiflorum, *Roxb. Fl. Ind.*, ii, *p.* 653.
„ indicum, *Spreng. Syst.*, ii, *p.* 642.
Magnolia pterocarpa, *Roxb. Corom.*, *Pl.* iii, *t.* 266.
Doolee-champa, BENG.

A shrub of Chittagong, Sylhet. Flowers large, white, fragrant.

SPHENURIDÆ, 24 gen., 78 sp., viz. :—
1 Spheuura ; 1 Megulurus ; 1 Sphenæacus ; 2 Dumetia ; 9 Malacocercus ; 10 Drymoica ; 6 Prinia ; 1 Neornis ; 3 Orthotomus ; 1 Horietes ; 2 Cisticola ; 1 Pellornium ; 1 Turdirostris ; 10 Pomatorhinus ; 1 Xiphorhampus ; 1 Turdinus ; 4 Trichostoma ; 2 Malacopteron ; 9 Alcippe ; 1 Macronous ; 2 Mixornis ; 4 Timalia ; 1 Chrysomma ; 4 Stachyri.

SPHINX In front of the pyramid of Egypt, lies the huge Sphinx, a lion with a man's head, the second in size, fifty yards long. Niebuhr mentions that, in his time, the famous Sphinx was sinking still deeper in the sand ; and a great part of the body was already buried. It seems to be formed out of the rock upon which the pyramid stands. He found the chin of the Sphinx to measure ten feet six inches in height ; and the whole length of the countenance nearly eighteen feet.—*Sharpe's History of Egypt, Vol.* i, *p.* 27; *Niebuhr's Travels, Vol.* i, *p.* 156.

SPHODRINIDÆ, a family of the Coleoptera. The genus Sphodrus occurs in Nepaul, and the anomalous form of Mormolyce in Java and Singapore ; which last has been ranged with this family, but appears to be sadly out of place, as it is most likely a subcortical feeder.

SPHONES, according to Plutarch, a name of the brahman Calanus who accompanied Alexander. See Calanus.

SPHOOTA, see Graha.

SPHOOTEE, BENG. Cucumis momordica.

SPICE ISLANDS, or Molluccas, in the Mollucca and Banda seas, consist of many islands with numerous languages. Next to Java, of which they form a sub-government, the Moluccas are the most important of the Dutch possessions in India. The islands to which this term is applied are Amboyna, Banda, Ternate, Tidore and smaller islands in their neighbourhood. The islands are small, volcanic, unproductive in grain, but fertile in fine spices. But the ruinous policy of the Dutch nation in their greed to secure a monopoly of this class of products, led them, for years, to root-up and destroy, at a great cost, often by force of arms, every nutmeg or clove tree not required for the production of that quantity of spices which they calculated they could dispose of. Rosingain, near Banda, was almost abandoned after the extirpation of its spice trees, its people emigrating to the neighbouring islands in search of a livelihood. The people are of the Malayan race, short, squab and darker in complexion than the Malays or Javanese. The Amboynese are of a middling height and well-formed. They are gentle, very sober, brave, easily managed, and make good mounted and foot soldiers and a considerable number of them have embraced christianity. Banda is very unhealthy, and is subject to frightful earthquakes. When first discovered by Europeans, the inhabitants had made considerable advance in civilization, but one still much inferior to that of the Malays and Javanese. Sir Stamford Raffles has furnished specimens of three of the languages of this furthest east portion, viz.: those of Ceram, correctly Serang, of Ternate, correctly Tarnati, and of Saparuwa, one of the Banda isles. Of the language of Ceram, nine of the words are Malay, two Javanese, 17 are common to these two languages. Ceram Laut is the great place to which the Bugis carry the Papuan slaves whom they steal from New Guinea. No kind of native writing can be traced to the Spice islands which, notwithstanding their rich native productions, are incapable of yielding corn, iron or cattle, the rough staples of early civilization, and without the presence of which, letters have never been invented or existed. In the great island of New Guinea, with its savage negro population, and with the same deficiencies, the presence of any kind of writing is not reasonably to be looked for. No trace of a written character has been found in the wide extent of the islands of the Pacific. Most of them are, probably, too small to have furnished a population, at once sufficiently numerous and concentrated, to generate the amount of civilization requisite for the purpose. In the great islands of New Zealand, with their comparatively energetic race of inhabitants, the discovery of letters would, most probably, have been made, as among some rude nations of Sumatra, had the civilization necessary not been precluded by the absence, as in the smaller islands, of the larger animals for labour, and of all the cereal grasses for food.—*Jour. Ind. Arch., Dec.* 1848, *p.* 774. See India, Moluccas.

SPICE LILIES, the Scitamineæ, includes the cardamom, turmeric (curcuma) and ginger.

Spices is the term applied to all pleasant or pungent aromatic vegetable substances, used for flavouring food and condiments, such as nutmegs, and mace, cinnamon, pimento, ginger, and pepper, cloves, allspice, cardamoms, &c. Spices and condiments are largely employed by the people of India. Some are imported and many of them are exported to a considerable extent. They are obtained from the barks, the dried seeds, the fruit, flower-buds, and root-stocks of different plants. The chiefly aromatic barks are the cinnamon and Cassia lignea; the seeds and fruits include pepper, cardamoms, coriander, cummin seed, star anise, nutmegs and chillies. The flower buds of some furnish cloves and cassia buds, and the roots supply ginger and turmeric. The English and botanical names of the principal of the series are given below and their descriptions will be found under their several heads:

Areca or betlenut,	Areca catechu.
Betle leaf or pan...	Piper betle
Cassia bark..........	Laurus cassia.
Cassia buds..........	Cinnamomum iners.
Cinnamon......... ...	Cinnamomum aromaticum.
Cloves............	Eugenia caryophyllata.
Mace & nutmegs....,	Myristica moschata.
Cardamoms..........	Elletaria cardamomum.
Do. wild...	
Pepper,..	Piper nigrum.
Do. long. ...	Piper longum.
Chillies.	Capsicum, (var. sp.)
Ginger.......	Zingiber officinale.
Turmeric............	Curcuma longa.
Coriander...........	Coriandrum sativum.
Cummin.............	Cuminum cyminum.
Mustard	Sinapis, (var. sp.)

SPIDER, Capt. W. S. Sherwill communicated to Mr. Blyth the following on the bird-devouring habit of the Epeira a species of spider. This interesting communication on the contested subject of bird-eating spiders originated in his request that the author would commit to paper the observations of which he had assured him in conversation. During one of my rambles, he says, in company with four other officers in the army, amongst the Karrapur hills, in the immediate neighbourhood of Monghyr, on the Ganges, I fell in with several gigantic webs of a large black and red spider, which, stretching across our path in many spots, offered from their great strength a sensible resistance when forcing our way through them. The webs are of a bright yellow colour, and we found them stretching from ten to twenty feet, that is, including the great ropes which are generally fastened to some neighbouring tree or a clump of bamboos, the reticulated portion being above five feet in diameter, in the centre of which the spider sits waiting for its prey, he is of a dark-black hue with red about him, but at this distance of time, now three years, I cannot remember his exact appearance. I brought one down with me from the summit of the mountain Maruk, which is eleven hundred feet above the Ganges, and he measured six inches across the legs when set up. It was in the web of this very spider that I found the bird entangled, and the young spiders (about eight in number and entirely of a brick-red colour) feeding upon the carcase. The bird was much decomposed and enveloped in web, but the beak and feet being visible I sketched them, a copy of which sketch I enclose for your satisfaction. The bird is a Nectarinia apparently, and probably N. asiatica: it hung with his head downwards, his wings were closely pinioned to his sides by the entwined web, and was nearly in the centre of the web. The old spider which I secured was above the bird about a foot removed. Had we not been a half-starved party, we should have bottled the bird, spider and young ones, but we were at the end of a five-days' roam amongst these steep hills, covered with wet grass, without beds or covering, in the height of the rainy season, so you may imagine our commissariat was at too low an ebb to afford brandy for such a purpose. This communication from Capt. Sherwill is the more interesting, since the total demolition of Madam Merian's account of a bird-eating spider in Surinam, by Mr. W. S. McLeay, in the 'Proceedings of Zoological Society,' 1834. The spider remarkable for the "bright yellow colour" of its web, is a species of Epeira, found by Captain Sherwill, 1,100 feet high, on the summit of Maruk, south of Monghyr. Some of the webs including the guy-ropes were from 10 to 12 feet in diameter, the reticulated portions being about 5 feet, in the centre of which the spider, of a formidable size and very active, sits waiting for prey. In one web, was found entangled a bird about the size of a field lark, and eight young spiders feeding on the body. It was near the centre of the web, and its wings has been completely pinioned by the entwined web. The old spider sat about a foot above the bird. It was six inches across the legs and had a formidable pair of mandibles. Walckenaer has described a spider of large size, under the name of Olios Taprobanius, which is very common in Ceylon, and conspicuous from the fiery hue of the undersurface, the remainder being covered with gray hair so short and fine that the body seems almost denuded. It spins a moderate-sized web, hung vertically between two sets of strong lines, stretched one above the other athwart the pathways. Some of the threads thus carried horizontally from tree to tree at a considerable height from the ground are so strong as to cause a painful check across the face when moving quickly against them, and more than once in riding. Sir J. E. Tennent had his hat lifted off his head by one of these cords.

There is a Ceylonese spider with legs which would span an ordinary-sized breakfast-plate; and it seems to be a fact, now pretty well authenticated, that they seize small birds. The webs of such spiders are strong enough to entangle and hold the small birds on which they are said occasionally to feed. Small house lizards will also be seized and devoured by these spiders.—*Builder*; *Mr. E. Blyth, in Beng. As. Soc. Jour., No.* vi, *of* 1850, *p.* 474; *Gosse, p.* 239; *Proc. Ent. Soc., November* 1, 1852; *Tennent's Shetches of the Nat. Hist. of Ceylon, pp.* 469-70.

SPIDER-WORTS. Several species of spider-worts are abundant in Tenasserim. One Commelyna cæspitosa, a creeping species of Commelyna may be often seen trailing up the sides of fences. Another Aneilema herbaceum with blue flowers like the former, but with a different habit, is sprinkled among the grasses at almost every door. There are also one or two other species common.—*Mason.*

The Nardostachys jatamansi of the Himalayas and mountains of High Asia is now generally recognized to be the spikenard of the ancients. Its root is of a blackish colour, and resembles the bushy tail of the ermine. Its odour is strong and fragrant; and is much esteemed by all eastern nations. The plant is a native of the mountains of the north of India, at very great elevations; and the roots are also brought to India from the Persian Gulf. Spikenard has enjoyed celebrity from the earliest period of the world's history. It was esteemed by the Greeks and Romans, and is mentioned in the Bible, the Nard of Scripture being supposed to be the same substance as the Nardos of the ancients called also Nardostachys (ναρδόσταχυς) and hence spikenard, the word stachys being rendered by the word spike. Dioscorides, in the first chapter of his first book, treats of the various aromatic and stimulant substances which were known to the ancients, and among these of the various kinds of Nard. Of the first kind, simply called Nardus (νάρδος), he notices two varieties, the one Syrian, the other Indian; the former so called, not because it comes from Syria, but because the mountains in which it is produced have one part turned towards Syria and the other towards India. This may refer to the Hindu-Kush. The other variety is called Gangitis from the river Ganges, near which, while flowing round a mountain, it is produced, bearing many hairy spikes from one root. These are strong-smelling, but those growing in moist situations less so than those found on the mountains. One variety, he further says, is called Sanpharitícon, from the name of a place. The second kind he calls Celtic Nard (νάρδος κελτική,) and the third kind a Mountain Nard (νάρδος ορεινή). Nardostachys jatamansi, is highly esteemed in the east, and is the spikenard of the ancients. The Valeriana officinalis, *Linn.*, the wild Valeriana is also a Nard, Valeriana celtica and Valeriana saliunca are imported into India through the Red Sea from Austria for perfuming the bath. On consulting Avicenna, we are referred from Narden to Sunbul, pronounced Sumbul, and in the Latin translation from Nardum to Spica, under which the Roman, the mountain, the Indian, and Syrian kinds are mentioned. This proves, as has been already stated by Sir William Jones, that Sumbul, &c., was always considered by Arabian authors as synonymous with the Nardos of the Greeks. In Persian works on Materia Medica, all translated from the Arabic, as, for instance, the 'Mukhzun-al-Adwiah,' or 'Magazine of medicines,' we have four different kinds of Sunbul:—1, Sunbul Hindee; 2, Sunbul Roome, called also Sunbul Ukletee, and Narden Ukletee, evidently the above Celtic Nard, said also to be called Sunbul Italion, that is, the nard which grows in Italy; 3, Sunbul Jibullee, or Mountain Nard: hence it is evident that the kinds described by Dioscorides are alluded to, and in fact the accounts given are merely translations of his descriptions. The fourth kind of Sunbul appears to be a hyacinth or polyanthus. But the first is that with which alone we are at present concerned. The synonyms given to it are—ARABIC, Sunbul-al-Teeb, or Fragrant Nard; GREEK, Narden; LATIN, Nardoom; and HINDEE, Balchur and Jatamansi. Dr. Royle when at Saharunpore, in 30° N. lat., about 30 miles from the foot of the Himalayas, learnt that Jatamansi, was yearly brought down in considerable quantities from the mountains, such as Shalma Kedarkanta, near the Ganges and Jumna rivers, to the plains. He planted them both in the East Indian Company's Botanic garden, and in the mountains, in a nursery attached to it. The plant produced was found to belong to the natural order Valerianaceæ, and has been named Nardostachys jatamansi by De Candolle, and formerly Patrinia jatamansi by Mr. Don, from plants sent home by Dr. Wallich, from Gossainthan, a mountain of Nepaul. Mr. Don obtained the additional corroboration that spikenard bought in a chemist's shop by this name exactly corresponded with the roots of the jatamansi. Hence there can be no doubt that the Nardos described by Dioscorides is the jatamansi of the hindoos, and probably the same substance which has been mentioned by such writers as Hippocrates; and there is nothing improbable in its being the Nard of Scripture, and it has been shown to be a plant belonging to the natural order Valerianaceæ. It is curious that the Celtic and mountain nards are also Valerians, the former being yielded by Valeriana celtica and V. saliunca, still exported from the mountains of Austria to Egypt, whence it has spread into both Africa and Asia, being valued for its fragrance, and hence employed in perfuming baths; and the other by V. tuberosa. Dr. Royle mentions it as a curious coincidence, if not allowed to be a sign of accurate knowledge, that the Persains should translate the φου of Dioscorides, which he also calls Wild Nard, Foo of the Arabians, by the term Bekh-i-Sunbul, Root of Sunbul. The plant correctly ascertained by Sibthorp has been named by him Valeriana dioscoridis. Dr. Smith says it is met with in Cochin-China and in China, and is the fifth of the five odorous plants of the Chinese, viz., lign-aloes, cloves, sandalwood, Aglaia odorata and spikenard. Sir W. Jones identified Nardostachys jatamansi as the spikenard of the ancients. In South India, the term is also applied to the sweet-smelling [redacted]s species of Cyperus, and in [redacted] lemon-grass (Schœnanthus) [redacted] of Andropogon, which are [redacted] the names of Askhar and Sikhunas (σχινος). Nard is twice mentioned in the Canticles, iv, 13, 14; St. Mark xiv, 3, tells of the ointment of spikenard very precious, and John xii, 3, mentions a pound of the ointment worth three hundred denarii.—*Harris', Nat. SPINACIA, a genus of plants belonging to the natural order Chenopodiaceæ.

SPINACEA OLERACEA, *Wight.*

Ispanaj,	Arab., Pers.	Sag-paluk,	Hind.
Common spinage,	Eng.	Isfanaj ; Isfanak,	,,
Paluk,	Hind.	Vusayley-keeray,	Tam.

Is well known on account of its use in the kitchen. It has an herbaceous stem, one or two feet high, branches, and hollow, arrow-shaped leaves ; male flowers in long spikes, abounding with pollen ; female flowers on another plant, axillary, herbaceous, and small. The fruit is a small round nut, which is sometimes very prickly. Both Spinacea oleracea and New Zealand Spinach are commonly cultivated in all gardens, as culinary vegetables. It grows in rich soil, requires plenty of water, should be sown thinly in drills or broadcast every month or six weeks, may be had during the hot months in sheltered situations, with attention to water.—*Jaffrey.* See Vegetables of Southern India.

SPINACIA TETRANDRA, *Roxb., W.I.*

Pinish,	Beng., Hind.	Dumpa bachchali,	Tel.
Choolai,	,,	Bachchali,	,,
Isfanaj,	Pers.	Mattu bachchali,	,,

The hindustani name is indifferently given to Spinacia tetrandra, Tetrandous spinach and Amarantus polygamus. The former is a common sort of native greens, and, when boiled, resembles spinach ; it is procurable nearly all the year round. The latter is much cultivated by the natives. It is sown broadcast in beds from June to March. The leaves are sold in the bazaar at one pie the seer. Used as a greens and also in curries.

New Zealand Spinage, is a hardy annual, with fleshy leaves and numerous branches, and as a spinage, it is as valuable as the orache. If watered, grows freely, and produces leaves in the hottest weather.—*Riddell, Jaffrey.* See Choolaee.

SPIN AGHZAI, Hind. Astragalus multiceps, Ballota limbata.

SPIN BAJJA, Hind. Withania coagulans.

SPINDLES, of the hindoos have been made from time immemorial from a species of Euonymus.

SPINDLE TREE OIL, Oil of Euonymus europæus.

SPINDLE TREES, or Spindle wood, species of Celastraceæ. See Celastrus paniculatus.

SPINEL, a precious stone, composed of alumina, magnesia, silica, protoxide of iron and chromic acid : it occurs in the bed of the river Maha-welli-ganga, at Kandy in Ceylon, also in Siam, the Malay peninsula, the eastern side of the Peninsula of India and in Sweden. It is of various shades of red, violet or yellow, and is sometimes black, the blue variety is called Ceylon stone. By lapidaries, the scarlet-coloured, is termed spinel ruby ; the rose-red, balas ruby ; the yellow or orange-red, rubicelle ; and the violet-coloured, almandine ruby. The first is the most valuable. Spinel is not so hard as the oriental ruby ; and is readily distinguished both by its colour and crystallization.

SPINELLE RUBY, see Ruby.

SPINIFEX SQUARROSA, *Spreng, Rh.*

Sea pink,	Eng.	Maha-Rawana-ræwula,	Singh.
Water pink,	,,	Ravana suruni misalu,	Tel.

This curious diœcious grass grows abundantly on the Coromandel coast. When the seed is ripe, the spherical head of the plant is detached and blown before the wind.—See Is. xv, 11 and 13 ; and Psalm lxxxiii and 13. Its great seed balls are known to the Singhalese as Maha-Rawana-ræwula, the great beard of Rawana or Rama. See Sand-binding plants.

SPIN KHALAK, Hind. Aristida depressa.

SPIN KHARNAR, Trans-Indus. Verbascum thapsus, *Linn.*

SPINNING, of yarn, for weaving, is practised by all classes of women in India ; even the highest at one time used to amuse themselves with the spinning-wheel. Among the agricultural classes the occupation is constant, or fills up time not required for other household occupations. At the latter part of the 19th century, the imports of yarn into British India, had increased enormously, and the weavers had also largely increased. But at the early part of the century, Dr. Buchanan, estimated the annual produce of yarn hand-spun in one district alone at thirteen lacs of rupees = £130,000. The spindle in use is not much thicker than a stout needle. It is from ten to fourteen inches in length, and attached to it, near its lower point, is a ball of unbaked clay to give it weight in turning. The spinner holds it in an inclined position, with its points resting on a piece of shell, and turns it between the thumb and forefinger of one hand, while she at the same time draws out the single filaments of cotton from the roll of cotton in the other hand, and twists them into yarn upon the spindle. Dryness of the air prevents the filaments of cotton from being sufficiently attenuated or elongated, and is therefore unfavourable to the spinning of fine yarn. A certain degree of moisture, combined with a temperature of about 82 degrees, is the condition of the atmosphere, best suited to the carrying on of this operation. The Dacca spinners usually work from soon after dawn to nine or ten o'clock, and from three or four in the afternoon till half an hour before sunset. The finest yarn is spun early in the morning before the rising sun dissipates the dew on the grass; or, when this is wanting, and the air is unusually dry, it is not unfrequently made over a shallow vessel of water, the evaporation from which imparts the necessary degree of moisture to the filaments of cotton, and enables the spinner to form them into thread. As a proof of the fineness of the yarn thus delicately spun, Mr. Taylor mentions that one skein which was carefully weighed, proved to be at the rate of 250 miles in length to the pound of cotton. Dr. Watson gives the result of microscopic examinations of French, English and Dacca muslins, in an elaborate table; and he reports that the diameter of the Dacca yarn is less than that of the finest European: that the number of filaments in each thread is considerably smaller in the Dacca than in the European yarns. That the diameter of the ultimate filaments or fibres of which the Dacca yarn consists is larger than the European. That it appears from the investigation that the superior fineness of the Dacca yarn depends solely on the fact that it contains a smaller number of filaments. These causes, combined with the ascertained result, that the number of twists in each inch of length in the Dacca yarn amounts to 110·1 and 80·7, while in the English it was only 68·8 and 56·6, not only accounts for the superior fineness, but also for the durability of the Dacca over the European fabric; and as already a very great advance has been made in the spinning of yarn by machinery, it may be possible, perhaps, to raise the standard of quality, both in fineness and strength, to that of Dacca. The manufacture of these very delicate muslins is, however, not confined to Dacca. At Nandair on the Godavery, and at Muktul, Dhanwarum and Amerchinta, all towns in his Highness the Nizam's dominions, and at Arnee near Madras—muslin, which rivals that of Dacca, is made in considerable quantities, and is sold in Madras and Hyderabad, as well as supplied to the west and south of India. In these localities, the process of spinning by the spindle is the same as that of Dacca; but as the climate is dryer, the spinners who are both men and women, work in partially darkened rooms, the floors of which are watered to produce the necessary amount of moisture. The manner of dressing the thread and weaving it, does not differ from the Dacca system in any great degree; and if the muslins are probably not so fine as the Dacca, they have an advantage in superior clearness and transparency. The hand-spinning of fine thread used for Brussels lace, according to Mr. Palliser's account of it, is spun by women in darkened rooms. The manufacture of muslins of such qualities as are produced at Dacca, and indeed in Europe, must necessarily be always of a very limited character, and their use confined to very rich purchasers. For the masses of the people, the British manufacturer sends to India the plain and striped dooria, mulmul, aghabani, and other figured fabrics, which have established themselves there, and which, both from their good quality and moderate prices are acceptable to the numerous classes who make use of them. Some of the chintzes of Masulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour. Printed cloths are worn occasionally, as in Berar and Bundlecund, for sarees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the lower classes in upper India; but the greatest need of printed cloths is for the kind of bed cover called palampore, or single quilts.

In the costlier garments woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the sarees, or women's cloths, made at Benares, Pyetun, and Boorhaupore, in Guzerat, at Narraiupett and Dhanwarum, in the Hyderabad territory, at Yeokla in Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey ; and in silk, black, shot with crimson and yellow, crimson, with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects ; but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country ; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as a lady of England or France.

Another exquisitely beautiful article of Indian costume for men and women is the doputta, or scarf, worn more frequently by mahomedan women than hindoo, and by the latter only when they have adopted the mahomedan loonga, or petticoat ; but invariably by men in dress costume. By women, this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head ; by men across the chest only. Doputtas, especially those of Benares, are perhaps the most exquisitely beautiful of all the ornamental fabrics of India ; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns of the ribbon borders or broad stripes. How such articles are woven at all, and how they are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colour ; the creamy white, and shades of pink, yellow, green, mauve, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation whether in gold or silver, or both combined. Many are of more decided colours—black, scarlet, and crimson, chocolate, dark green, and madder ; but whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing ; but the dyers and scourers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The doputtas of Pyetun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Deccan ; not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares. Scarfs are in use by every one—plain muslins, or muslins with figured fields and borders without colour ; plain fields of muslin with narrow edging of coloured silk, or cotton (avoiding gold thread), and narrow ends. Such articles, called 'sela' in India, are in every day use among millions of hindoos and mahomedans, men and women. They are always open-textured muslins ; and the quality ranges from very ordinary yarn to that of the finest Dacca fibres.

The textures of the dhotee, saree, loonghie, manufactured in Britain and sent to India, are not those required by the people ; nor what they are accustomed to. It is in general too close, too much like calico in fact, which of course makes the garment hot, heavy in wear, and difficult to wash. Again, the surface becomes rough, and, as it is generally called 'fuzzy,' in use, from which the native fabric remains free. Comparatively few native women of any class or degree wear white ; if they do wear it, the dress has broad borders and ends. But what all classes wear are coloured cloths ; black, red, blue, occasionally orange and green, violet, and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Narrainpett, Dhanwaram, and Muktul, in the Nizam's territories ; Gudduk and Betigherry in Dharwar ; Kolapoor, Nassik, Yeola and many other manufacturing towns in the Deccan ; Arnee in the south, and elsewhere send out articles of excellent texture with beautifully arranged colours and patterns, both in stripes and checks. The costly and superb fabrics of cloths, of gold and silver (Kimkhab), and the classes of washing satins, (Mushroo and Hemroo) even if European skill could imitate them with the hand-loom, it would be impossible to obtain the gold and silver thread unless they were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful and delicate manipulation. The gold and silver cloths, kimkhabs, are used for state dresses and trousers, the latter by men and women, and ladies of rank usually possess reg[illegible]or skirts of these gorgeous fabrics. are [illegible]and hemroo are not used for tunics, but [illegible]r men's and women's trousers and women's skirts; as also for covering bedding and pillows; they are very strong and durable fabrics, wash well, and preserve their colour however long worn or roughly used; but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. For example, a labada or dressing-gown made of scarlet mushroo in 1842, had been washed over and over again, and subjected to all kinds of rough usage; yet the satin was still in 1867 unfrayed, and the colour and gloss as bright as ever. Many of the borders of loongees, dhotees, and sarees are, like plain silk ribbons, in some instances corded or ribbed, in others flat. The manufacture of Cashmir shawls is peculiar to that province. Those formally issued from that province were exquisitely woven, with unrivalled elegance and chasteness of design, softness and finish in quality, arrangement of colours and use of dyes which the finest Paisley and French shawls do not approach. The exquisite shawls of Cashmir grow rarer and rarer every year, and their place has been usurped by hand embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Punjab and Delhi, of late years, workmen have commenced to embroider Cashmir cloth and not with floss silk and braid, but solely for sale to Europeans, who wear them as tunics, jackets, scarfs and the like. In the hand worked Cashmir shawls, as also in the Delhi work, wooden needles of hardwood are used slightly charred, with a hole in the centre of the needle to receive the yarn, *Dr. Watson.*

SPIN TERIN, or white Terin. See Affghan, Kaker.

SPIN WEGE, HIND. Aristida depressa.

SPIRÆA, a genus of plants of the natural order Rosaceæ. Thunberg names the following as plants of Japan:—

Spiræa callosa,	*Thbg.*	Spiræa japonica,	*Sieb.*
,, chamædrys,	,,	,, betulæfolia,	*Pall.*
,, Thunbergii,	*S&Z.*	,, palmata,	*Thbg.*
,, prunifolia,	,,	,, aruncus,	*L.*
,, chamædryfolia,	*L.*	,, salicifolia,	*L.*

Fortune mentions amongst Chinese shrubs the Spiræa callosa and Spiræa reevesiana, and he found Reeves's Spiræa and Spiræa prunifolia in great profusion. Several species of the Chimonanthus or Japan allspice, Forsythia viridissima, Buddlea lindleyana, and numerous Daphnes, Gardenias and Azaleas, were also met with. Many kinds of mosses and Lycopods were growing out of the crevices of the moist rock; amongst the latter, and very abundant, was a fine species, named Lycopodium willdenovii.—*Fortune's Tea Districts, p. 57.*

SPIRÆA KAMTSCHATIKA, used in Kamtskatka to make an ardent spirit.

SPIRÆA ROXBURGHIANA, *Wall.*, is a plant of China and Japan.

SPIRÆA HYPOLEUCA, S. cullosa and S. lindleyana, occur in the N. W. Himalaya.

SPIRÆA LINDLEYANA, *Wall.*

Kapru, Kurkni,	CHENAB.	Dodal,	RAMI.
Ranthul,	,,	Kangtar,	SUTLEJ.
Kikri,	JHELUM.	Boogli,	,,
Karkni,	KAGHAN.	Krust,	,,
Dor: Bat-Pis,	KANGRA.	Kanoori,	,,
Sarbashtai,	PUSHTU.	Sar-lakh-tei,	TR.-INDUS.

A shrub with fine white flowers, the handsomest and one of the commonest of the Himalaya. It resembles the English Meadowsweet, especially S. kamschadica S. Lindleyana grows from 4,000 to 10,500 feet, up to and beyond the Indus. Is of no special use. It is a plant of Kaghan.—*Dr. J. L. Stewart, M.D.*

SPIRÆA PRUNIFOLIA, see Edgworthia chrysantha.

SPIRAXIS, a genus of molluscs.

SPIRIT.

Ar'k,	AR.	Bram: Chu-ar'k,	MALAY.
Daroo, Ar'k,	DUK.	Sopi gilang,	,,
Daru,	GUZ., HIND.	Shrab,	PERS.

All inflammable liquids obtained by distillation as arrack, brandy, rum, gin, votkey, whisky, &c., are comprised under this designation.

The arrack of Madras is made of jaggri and the bark of the Acacia leucophlœa. A spirit distilled from rice is the only distilled spirit used by the natives of Ganjam and that only by those of the lower classes. It is the same to the use of which the wild tribes of Orissa, the Khond, Sahar, and Kol are so addicted. It is unpalatable and nauseous. It is made 25 below London proof, 1 maund of rice making 8 gallons. An intoxicating spirit is distilled also in the Sumbulpore district, chiefly from the fruit or flower of the Bassia latifolia, met with throughout the forest jungles. Its sweet flower is a favourite food of wild animals, especially the bear, and it is believed that the saccharine matter, which apparently abounds in the flower, might be turned to the very best account.

Rice arrack, from Penang rice, is made at Penang.

The country spirit, Joobabee, is made at Calcutta.

An ardent spirit distilled from sugar-cane is used by the hindoos of the lower order. Backerkatee is the spirit distilled in which cardamom is put and weakened with water, and called 'Allachee,' 'Cumlaka' with orange peel: 'Joobabee,' and 'Pattaha', are adulterated with tobacco leaf and 'Atturee' is scented with uttur. 'Annish' is the only pure spirit distilled from aniseed.

Mango spirit is prepared from the mango fruit. The taste of the spirit is not unlike whiskey, and far superior to anything of the sort sold in the Indian bazaars for every purpose to which the latter is applied.—*Dr. Thompson* ; *Cat. Ex.* 1862 ; *Faulkner*.

SPIRITO ARDENTE, IT., also Spirito divino, also Aquarzente, IT. Alcohol.

SPIRITS OF HARTSHORN, ENG. Liquor Ammonia.

SPIRIT OF SALT, ENG. Muriatic acid.

SPIRIT OF VINEGAR, ENG. Vinegar.

SPIRITS OF VITRIOL, ENG. Sulphuric acid.

SPIRITUS LETHALIS, LAT. Carbonic acid.

SPIRIT-WORSHIP, has been practised by all races and up to the close of the 19th century continues to be a form of belief, everywhere in the south and East of Asia. Ancestor worship is a recognition of the existence of spirits freed from the body. This faith was exhibited, from early times, by the Egyptians, it was as a faith deeply-seated also, in Greece and Rome it has always been and still is the popular religion of the Chinese, and it forms the belief of all the aboriginal races and of most of the hindoo religionists of India. The Egyptians were the first to teach the immortality of the soul. The Egyptian belief in the transmigration of the human soul into the bodies of animals, was connected with it. Animal-worship, there, dates from the earliest times in Egypt and soon after the time of Menes (B. C. 3,400,) it became the established religion throughout the empire. This form of faith had evidently its origin in their belief in the identity of the principle of life in all living beings, and in the identity of the soul with life ; grounded in a consciousness of moral responsibility and a belief in the personal indestructibility of the human soul. At the point of death, the deeds of this life are examined, judged and rewarded or punished, in the latter case condemned to be degraded from human to animal life, and one regulated by brutal instincts. In Virginia and Florida, the evil spirits were worshipped and not the good, because the former might be propitiated, while the latter was sure to do all the good he could. The Balinda of South Africa look on the dead as vindictive spirits whom they regard with more fear than love. Ask the negro, says Mr. Du Chaillu, where is the spirit of his great grandfather, he says he does not know ; it is done. Ask him about the spirit of his father or brother who died yesterday, then he is full of fear and terror ; he believes it to be generally near the place where the bod[illegible] men buried, and among many tribes the [illegible] and removed immediately after the death of one of the inhabitants. According to Thomson the natives of Cambodia assumed that the deity did not understand foreign languages. The Kyoung-tha of Chittagong are buddhists. Their village temples contain a small stand of bells and an image of Boodh, which the villagers generally worship morning and evening, first ringing the bells to let him know that they are there. The Sin-to temples of the Sun-goddess in Japan also contain a bell, intended to arouse the goddess and to awaken her attention to the prayers of her worshippers. According to the brahmans two things are indispensably necessary to the sacrificer in performing the religious ceremony, several lighted lamps, and a bell. The Chinese of Kiatka thought that eclipses were caused by the evil spirit placing his hand on the moon, in whose defence they immediately made as much noise as possible. The Stiens of Cambodia, like the Cambodians themselves, account for eclipses by the hypothesis that some being has swallowed up the sun and the moon ; and, in order to deliver them they make a frightful noise, beat the tomtom, utter savage cries, and shoot arrows into the air, until the sun re-appear. During an eclipse the Sumatrans also make a loud noise with sounding instruments, to prevent one luminary from devouring the other as the Chinese do to frighten away the dragon ; a superstition that has its source in the ancient systems of astronomy, particularly the hindoo, where the nodes of the moon are identified with the dragon's head and tail.

The natives of Mysore at the new moon observe a feast in honour of deceased parents. The Kurumbar of the Dekhan also sacrifice to the spirits of ancestors, and the same is the case with the Santhal, and all the aboriginal tribes of Central India. Among the Tipperahs of Chittagong, if a man die away from home, his relatives stretch a thread over all the intermediate streams, so that the spirit of the dead man may return to his own village ; it being supposed that without assistance spirits are unable to cross running water ; and the streams therefore are bridged. A somewhat similar idea existed in Europe, and it occurs also, in the Fiji Islands. Among the Kol of Nagpore, as Colonel E. T. Dalton tells us, all diseases in men and in cattle are attributed to one or two causes, the wrath of some evil spirit who has to be appeased, or the spell of some witch or sorcerer ; the Circassians and some of the Chinese have also the same belief. Hence it is that mad people are in many countries reg[illegible] are [illegible] with so much reverence, since they [illegible] looked on as the special abode of some deity. Dr. Mason remarks that when Thales taught that the whole universe is pervaded by spirits, he was proclaiming both the primitive and the existing faith of all India and China. They are not recognized as objects of worship; they are not thought to be gods, but beings subordinate to some greater power whose ministers they are and with whom men have to do, and the people are in the constant habit of offering them food. In Guzerat, in British India, Bhoots, are "perturbed spirits," who wander still in this world of men. The Bhoot and the Pret reside, it is said, in the place where funeral piles are erected, in trees which are not used for sacrificial purposes, such as the tamarind and the acacia, in desert places, at the spot where death occurred, or at crossroads, for which reason people set at these places food for the use of the Bhoot. He is most at a loss for water to drink. The pipe of his throat is, it is said, the size of the eye of a needle, and he is continually thirsty enough to drink twelve gallons of water. The watchmen of the god called Wuroon Dev, however, are stationed wherever there is water, to prevent the Bhoots from drinking, and their thirst is therefore as continual as it is intense. The Bhoots feed upon all kinds of refuse. The goblin of the best class, he, that is to say, whose funeral ceremonies have been duly performed, but who has been debarred from liberation by his own intense affection for earthly objects, is called a "Poorwuj Dev," and resides in his own house or in a sacred fig-tree. The Poorwuj Dev, like the Etruscan Lar, or the Grecian hero, is regarded as hovering about his former abode, averting dangers from the inhabitants and bestowing blessings upon them. He frequently appears in the character of a serpent, and is then treated with great respect by the inmates of the house near which he resides. It is a common belief in Guzerat, that serpents are always to be found wherever a hoard is buried, and that these are the Bhoots of the deceased owners who have remained upon earth from affection to their wealth. In the shraddhu or funeral ceremonies of the hindoo of Guzerat the son repeats before an image many incantations, to the following purport. Before thee, O bramhun, I perform my father's shraddhu. He next offers to his deceased parent, on a plantain-trunk dish, seven blades of kooshu and seven of doorva grass, flowers, dry rice, cloth, red paint, and a brass lamp. He next cleanses the place before him with his hands, and scattering upon it a few blades of kooshu grass, presents other offerings to his deceased father, repeating many incantations, which contain the names of the offerings, and an invitation to the deceased father to partake of them. From what remains of these offerings the son makes two balls, the smallest of which is offered in the name of those of the family who have not received the benefits of the shraddhu, and the other he presents to his deceased father, and then lays it on some kooshu grass as before, and worships it, presenting flowers, water, &c. He now places both hands open against a lamp which is burning, as though he were warming himself; after which he prostrates himself to the sun, and presents a fee of from one rupee to five to the officiating brahmin; salutes all the brahmins present, and makes prostrations to the shalgramu, which he afterwards sends into the house. All the offerings are sent to the houses of brahmins. The family now return home, where an entertainment is provided, both for brahmins and others, consisting principally of sweetmeats, milk, curds, sugar, cakes, &c. The brahmins eat in an enclosed spot, the uninvited brahmins near the house, and the poor in the street or road. At the close of the entertainment, if the person making the shraddhu be rich, he gives presents to all those who are not guests, whether brahmins or the poor, and thus dismisses them. The next morning he dismisses the learned brahmins with presents: to the most learned he gives five rupees perhaps, and to those less learned one. The brahmins who were invited are also dismissed with presents. About one o'clock a feast is provided for the relations who are dismissed the next morning with presents of money, cloth, &c., and on this day another dinner is provided for nearer relations. At the close of the shraddhu a number of mendicant musicians play on certain instruments of music, and sing verses celebrating the rivals of Krishna; they are often dismissed with large presents. The next day the family return to their accustomed diet; but the sons, for twelve months after the decease of the father, must refuse every gratification, and cook with their own hands, or eat what has been prepared by a wife, or some near relation dwelling in the house. Gunga Govindu Singhu, a person of the writer caste, head servant to Mr. Hastings, expended, it is said, 1,200,000 rupees at his mother's shraddhu; and Raja Nuvu Krishna of Calcutta, nearly as much in the shraddhu for his mother. This expense was principally incurred in presents to the brahmins, such as bedsteads, at two or three hundred rupees each; water pitchers of silver and gold, some worth a thousand, and others two thousand rupees; dishes of silver and gold, at five hundred, two hundred and one hundred. At the time of bathing, the person who will perform the shraddhu, purifies himself by putting water, seeds, fruits, &c., in parts of the trunks of four plantain trees, repeating incantations. He sends some of this water home to purify the family.

The monthly shraddhu for the first year after the death of the parent, is upon a very small scale, and the expense is from ten rupees to twelve annas. Besides these, there are other shraddhus for deceased ancestors, as, in every month at the total wane of the moon ; on the last fifteen, or ten, or five days of the moon in bhadru ; once during the first fifteen days of the moon in ugruhayunu ; and again in the same month, in poushu, and maghu, on the eighth of the wane of the moon ; in voishakhu and shravunu, on any of the first fifteen days of the moon. At some of these times all hindoos perform this ceremony ; at other times only a few persons. The expense is trifling, as scarcely any persons are entertained at them. In this shraddhu the flesh of cows was formerly offered in sacrifice. In the kali-yogu this is forbidden, and that of deer or goats is substituted, herbs, bread and barley are used, as also fresh rain water.

After death, the spirit of the hindoo is conveyed by the messengers of Yama through the air to the place of judgment. After receiving sentence, it wanders about the earth for twelve months, as an aerial being or ghost ; and then takes a body united to his future condition, whether he ascend to the gods, or suffer in a new body, or be hurled into some hell. This is the doctrine of several pooranas ; others maintain, that immediately after death and judgment, the person suffers the pains of hell, and removes his sin by suffering ; and then returns to the earth in some bodily form.

The facility with which the hindoo gods are formed is shown in many ways. An officer of the Bombay army, who died about 1830, and was buried near Siroor, on the Gor naddi, was worshipped by all the people near. The late Brigadier General Nicholson, who was killed at the siege of Delhi, while serving on the Panjab frontier was so reverenced by the people as a perfect embodiment of physical mental power that they formed a sect, to Nicher Singhi, in his name, recognising him as their Pir, and no harshness on his part sufficed to prevent their reverence of him. A little west of the village of Assaye, is a fine banyan tree, growing on the right bank of the Jin naddi, at the place where the left of Sindiah's guns were placed on the battle. Beneath it is a tomb, now in ruins, of some officer, at which, brahmins excepted, all the hindoo villagers both men and women worship on the full moon and on moonless days, the punnam and awar and on other days at their pleasure. They sacrifice goats and sheep at the tomb, they offer malidah, a mixture of ghee, and goor and flour, part of which they sprinkle at the foot of the tomb, they burn frankincense, the ood, and bow down there in reverence, paon parna. The person who was interred beneath is recognised by them as a deo, under the name of Assil Sahib maharaj (Russel Sahib) whose shade, (chuya) is ever present there. He is a beneficent deity.

Sacrificial offerings are taken home by the worshippers, and used as food as is alluded to by St. Paul, I Cor. ix. "Do you not know that they who minister about holy things live of the sacrifice ; and they who wait at the altar are partakers with the altar ?" and it is when such are offered to idols that christians are forbidden to eat them. In the northern districts of Bengal, if an infant refuse the mother's breast, and decline in health, it is said to be under the influence of some malignant spirit. Such a child is sometimes put into a basket, and hung up in a tree where this evil spirit is supposed to reside. It is generally destroyed by ants, or birds of prey ; but sometimes perishes by neglect, though fed and clothed daily. If it should not be dead at the expiration of three days, the mother receives it home again, and nurses it : but this seldom happens.

As an instance of the hindoo belief in the powers of demons, Col. Tod tells us that Oodi Sing died thirteen years after his inauguration on the cushion of Joda, and thirty-three years after the death of Maldeo. About A. D. 1645, when he was returning home from court he beheld a girl whom he determined to have. But she was the daughter of a brahmin, an Aya-Punti, or votary of Aya-Mata, whose shrine is at Bai-Bhilara. These sectarians of Maroo, he says, are very different from the abstinent brahmins of Bengal, eat flesh, drink wine, and share in all the common enjoyments of life with the martial spirits around them, and as there was no other course by which the father could save her from pollution but by her death, on that he resolved. He dug a sacrificial pit, and having slain his daughter, cut her into fragments, and mingling therewith pieces of flesh from his own person, made the 'homa,' or burnt sacrifice to Aya-Mata, and as the smoke and flames ascended, he pronounced an imprecation on the rajah : "Let peace be a stranger to him ! and in three pahar, three days and three years, let me have revenge !" Then exclaiming, "My future dwelling is the 'Dabi Baori !'

sprung into the flaming pit. The horrid tale was related to the rajah, whose imagination was haunted by the shade of the brahmin; and he expired at the assigned period, a prey to unceasing remorse.

Up to the close of the 15th century, it was customary to place food for demons. In the dialogue of Dives and Pauper, printed by Richard Pynson, in 1493, among the superstitions then in use at the beginning of the year, the following is mentioned:—'Alle that take hede to dysmal dayes, or use nyce observances in the newe moone, or in the new yeere, as setting of mete or drynke by night on the benche to fede alholde or gobelyn.' So in British India, to the present day with hindoos, Chitapinda or funeral cakes are offered at the pile, at the time of burning the body. On the 4th day after decease, Chaturtha-pinda, funeral cakes, are again offered. On the thirteenth day after decease the Pret, or newly-embodied spirit, is compelled by the emissaries of Hades to set forth on his journey towards Yampoor. Its attendants aggravate the miseries of the wicked soul by their threats and upbraidings. They cry to the Pret, "Come quick, evil one! We will carry you to Yama's door; we will cast you into Koombheepak, or some other hell!" The Bhut-bali of the hindoos is an offering to evil spirits, ghosts. On the 14th of the dark half of the month Aswin, the Bhuta Chaturdasi offerings are made to evil spirits, and the Bhuta devata is a spirit worshipped as a deity.

Mr. Forbes in the Ras Mala (p. 378), says, the Bhoot and Pret are said to reside, at the place where funeral piles are erected, in trees which are not used for sacrificial purposes, such as the tamarind and the acacia, in desert places, at the spot where a death has occurred, or at cross-roads, for which reason people set at these places food for the use of the bhoot. He is most at a loss for water to drink. The pipe of his throat is, it is said, the size of the eye of a needle, and he is continually thirsty enough to drink twelve gallons of water. The watchmen of Wuroon Dev, however, are stationed wherever there is water, to prevent the bhoot from drinking, and their thirst is therefore as continual as it is intense. The bhoot feed upon all kinds of refuse. The goblin of the best class, he, that is to say, whose funeral ceremonies have been duly performed, but who has been debarred from liberation by his own intense affection for earthly objects, is called a "Poorwuj Dev," and resides in his own house or in a sacred fig tree. The Poorwuj Dev, like the Etruscan Lar, or the Grecian hero, is regarded as hovering about his former abode, averting dangers from the inhabitants and bestowing blessings upon them. He frequently appears in the character of a serpent, and is then treated with great respect by the inmates of the house near which he resides. It is a common belief in Guzerat that serpents are always to be found wherver a hoard is buried, and that these are the bhoots of the deceased owners who have remained upon earth from affection to their wealth. The Arabian Jin also frequents cross-roads; and the fairies of the Scottish low-lands carry bows made of the ribs of a man buried where three laird's lands meet, as in "A Midsummer Night's Dream," (Act iii, Sc. 2:—)

> "Damned spirits all,
> "That in cross-ways and floods have burial."

"Desert places," in Guzerat, correspond exactly with the "dry places," (ανυδρων τοπων) assigned to the evil-spirits in Matthew xii, 43; Luke xi, 24.

The bhoot and pret can take possession of a corpse, and speak through its mouth; they exhibit themselves in the form which they possessed when living; they enter into a living man, and cause him to speak as they please; sometimes they afflict him with fever, or various other diseases; sometimes they assume the forms of animals, and frighten people by suddenly vanishing in a flash of fire; sometimes, remaining invisible, they speak in whispers. A bhoot has been known to come to fisticuffs with a man, and to carry a man off and set him down in a distant place. It is even said that women are sometimes found with child by bhoots.

The Jain shastras teach a different doctrine in regard to spirits from that which is taught by the purana. They assert that there are eight kinds of Vyuntur Dev, and eight of Wan-Vyuntur Dev, who reside below the earth. Each of these has two Indra, or sovereigns, ruling respectively the northern and southern regions, and who are in colour black, white, or blue. The Vyuntur and Wan-Vyuntur Dev appear upon earth, where they possess the bodies of men, exhibit themselves in various shapes, and perform many strange feats, whence their common name of Kootohulee (or surprising) Dev. Below them reside the Bhuwunputee Dev, who, also, sometimes appear on earth. Below them again are the Narkina or infernal spirits. Above this earth, in the atmosphere, five kinds of "Dev of splendour" reside:—the sun, moon, stars and others. Above them, in twelve Dev-Loka, the Dev who ride in chariots dwell; these, sometimes drawn by their own desire, or compelled by charms, appear in the world; but they do harm to no one. Above them are nine classes of Grivek, and five of Unootur Veemani. They are of great power and never visit the earth. Men who have lived a life of austerity and righteousness are born again in these classes of upper or lower Dev, but the sinner is not born in them. Of old, a man who had performed the rite of "Uthum" by fasting for three days, acquired the power of calling the Dev to him, but now, it is said, these Dev never visit the earth at any one's call.

In Guzerat, where people wish to prevent the removal of a jungle tree, they paint a trident upon it with vermillion, or, if that be inconvenient, they collect a number of stones and throw them down at the root of the tree. Whoever, after this, passes by, is sure to add a stone or two to the heap, believing the place to be the residence of a bhoot. Some, however, throw without taking heed to what they are doing. If the place be one where stones are not easily procurable, a bit of old rag is thrown so as to adhere to the tree, and every one who passes by follows the example once set. They call the spot the "Rag-uncle's." In places where trees are scarce these uncles are very common, and people are much annoyed with the dread of touching them. The name "uncle" is given to the bhoot by women as a term of respect. Men are less superstitious. Similarly, whenever in any place there is a hillock or mound upon which a few stones have been piled one above the other, every passer-by considers himself bound to add a stone to the heap, considering that the spot is the residence of some Dev, and that if any one raise a little temple there, his house will flourish. Such monuments are also set up in places where a person has been slain or wounded. "Cairns" of this kind are frequently connected with the dead—

"On many a cairn's grey pyramid,
"Where urns of mighty chiefs lie hid."

We may imagine man primeval worshipping the elements as spiritual existences, which benefitted him or injured him at their will, and which had to be propitiated with presents of food and drink such as he himself liked. Thus, with the Aryans, Agni, or fire, became the principal deity, because it consumed the butter and rice given to it, or carried them away to Indra and the other gods. But, the tendency of the human mind being to personify such conceptions, the elements became personified into gods and goddesses until they were shaped into tangible forms. The hymns in the Veda are simply invocations to those deities to give abundant harvests, plenty of children, and especially plenty of cattle, and to endow the worshipper with health, wealth, strength, good fortune, and victory over enemies. Then, again, the benefits supposed to be conferred by the elements were regarded as the achievements of the gods, whose praises were to be mingled with the invocations. The nature of these sacrifices, which appear to have been confined to the Arian race, were of a very simple character as compared with the bloody offerings, orgiostic worship, dancing, torturing, and other abominations practised by the Turanian or aboriginal races of India. The sacred kusa grass was cut and strewn upon the ground, which might be within the dwelling-house of the family or in the open air ; the logs of wood were brought for the fire, and the offerings in most cases appear to have simply consisted of melted butter and wine, which, under the names of ghee and soma juice, were poured upon the mysterious flame which was in itself an emblem of the deity. During this ceremonial the hymns of the Veda were chaunted or sung ; and perhaps we cannot do better than lay before our readers one of these simple prayers. It is an invocation to Indra, which will be easily understood from its simplicity, and which probably is one of the most ancient that have yet been published. It is from Wilson's translation, vol. i, p. 73 :—

1. Voracious drinker of the soma juice, although we be unworthy, do thou, Indra, of boundless wealth, enrich us with thousands of excellent cows and horses.

2. Thy benevolence, handsome and mighty lord of food, endures for ever : therefore, Indra, of boundless wealth, enrich us with thousands of excellent cows and horses.

3. Cast asleep the two female messengers of Yama (death) ; looking at each other, let them sleep never waking : Indra of boundless wealth, enrich us with thousands of excellent cows and horses.

4. May those who are our enemies, slumber, and those, O hero, who are our friends, be awake : Indra, of boundless wealth, enrich us with thousands of excellent cows and horses.

5. Indra destroy this ass, our adversary, praising thee with such discordant speech : and do thou, Indra, of boundless wealth, enrich us with thousands of excellent cows and horses.

6. Let the adverse breeze, with crooked course, alight afar off on the forest : Indra, of boundless wealth, enrich us with thousands of excellent cows and horses.

7. Destroy every one that reviles us ; slay every one that does us injury : Indra, of boundless wealth, enrich us with thousands of excellent cattle and horses.

Out of this ancient simple form of nature worship, acted on and moulded by the progress of history, sprang that wild and complicated mythology which is set forth in the Puranas, and forms the ground-work of the popular religious belief of the modern hindoos. The links in the chain of development are still obscure, though we believe they may be recovered by a rigid sifting of the ideas which find expression in the Epics and Puranas, and we predict that the results will prove to be somewhat as follows:—The Veda worshippers were originally Arians who invaded India from the North West at some remote period, and gradually penetrated towards the South. Of their early history, which must have spread over several thousands of years, three if not four great events took place, which have left a lasting impress upon the religion and institutions of the masses in British India, the first was a primeval struggle between the priests and the soldiers, of which, strangely enough, a counterpart is to be found in the history of Egypt as recorded by Herodotus ; in both countries the struggle terminated in the triumph of the priest over the soldier, or, to use Indian phraseology, in the triumph of the brahman over the Kshatriya; and which apparently led to that deification of the brahman caste which still exists though in a greatly modified form. The second event was the Arian conquest of the south, which is represented in the epic of the Ramayana ; and this event may have given strength and definiteness to the division into four castes which is scarcely recognized in the Vedas. The third event was the great civil war known as the Mahabahrata ; and the fourth was the introduction of Buddhism as opposed to the caste system, which, after maintaining a firm hold in India for many centuries was at length fairly vanquished in its turn and driven out by the persevering and ever-intriguing brahmans. These events added many heroes to the hindoo pantheon, who were regarded after death as incarnations of deity ; it likewise added many rites and ceremonies, and even forms of belief, which were borrowed from the aboriginal or subject races. Meantime, whilst hero worship, snake worship, monkey worship, &c., found their way into the hindoo ritual, that process of personification, which in the Vedas was apparently confined to the elements, or powers of nature, was extended to the human passions ; and love and anger, hope and terror, were transformed from mere affections into imaginary deities. But still from beneath this mass of error and superstition, the human soul obeyed that upward instinct which leads men to yearn for the spiritual and the pure ; but though they attained grand ideas they could not get out of the slough of speculation ; and such truths as they succeeded in apprehending were wanting in that inspiration without which the mass could not be even leavened, and certainly never could be purified. It was during this later development, when the caste rules, which are not to be found in the Vedas, were in full working order, that the code of Manu seems to have been compiled, not as a utopian body of laws, as some have supposed, but as a body of substantive laws suitable to the requirements of the age. It was, in fact, an abridged codification of the Puranas, and as such it should be considered more by the light of the Puranas than that of the Vedas.

The Revd. Dr. Caldwell in his work on the Devil-worship of the Shanars, has shown how continuously the people of India are making new deities or demons. Sir Bartle Frere mentions that he accidently found an order in existence at Government House, Dapoorie, handed down by each non-commissioned officer for the native sentry on guard to present arms if a cat or dog, jackal or goat entered or left the house or crossed near his beat during certain hours of the night, because it was the ghost of a former governor who was still remembered as one of the best and kindest of men. The rajah of Wanparty, one of the Reddi race who have founded small principalities along the banks of the Kistnah river, died in 1868, at Hyderabad. He had led a turbulent life and retained to the last much of the spirit of his youth. At the close of that year, an out-break of cholera occurred in that neighbourhood which the people attributed to the spirit of Wanparty, and they made a clay image of him, riding on an elephant, and placed near him the clay of a Binjarni, and worshipped all with the great Mahabala sacrifice. The superstitious fears of the hindoos extend to innumerable objects: they dread the wrath of the following invisible beings ; the messengers of Yama, bhoots, prets, pish-ache, dakinee, yoginee, hakinee, yukhshu, rakshusu, shunkinee, gooma, brumhu-doitya, aluya, &c. They also fear the cries of the following animals, at particular times, and in certain situations ; viz., jackals, owls, crows, cats, asses, vultures, dogs, lizards, &c. They also dread different sights in the air, and many kinds of dreams.

It is the universal opinion of the hindoos, that all the tricks of jugglers are performed by the aid of an attendant sprite :—

> "the fiend
> "Who dictates and inspires illusive feats
> "For knavish purposes."

King James I. thoroughly believed the same, and confesses it unblushingly in the preface in his Demonology :—"They (magicians) can suddenly cause to be brought unto them all kinds of dainty dishes by their familiar spirit, since as a thief he delights to steal, and as a spirit, he can subtilely and suddenly enough transport the same." To obtain such a sprite for a familiar, is, as might be expected, a work of no ordinary difficulty. The two following receipts were presented by a hindoo, of the peninsula, as having been tried and found efficacious.

In the dense darkness, at the time of new-moon, let the person who would obtain a devil, walk naked into a lake, and standing in the water up to his middle repeat the mantra (a charm previously taught him by some proficient), the appointed number of times, taking care of his reckoning by casting into the water a pebble, a jasmine flower, or a pepper-corn, from a collection which he has previously counted and brought with him. At every repetition of the mantra let him give himself a stroke with a rattan. The charm is to be repeated boldly, and without mistake, or the devil will certainly kill the charmer.

Or, go to the temple sacred to the demon whose services are required. Having closed all avenues by which so subtile a subject may escape, stand on the threshold of the temple and boldly conquer the demon by a powerful mantra. Then you must raise the pedestal on which the image of the demon is placed, and take from under it the money placed there when the image was inaugurated. Instead of this money place there a copper-plate on which you have engraved a kolam (magical inscription.) From that day the demon becomes your slave, and will perform for you any service, or bring you whatever you may require. Some say the spirit must, when caught, be confined in a little golden box, called a Simil.

A devil sometimes appears in visions of the night, and promises under certain conditions, to conduct the dreamer to hidden treasures and to become his servant for life. The usual condition is that a human sacrifice should be offered, and the more closely related, in kin or friendship, the victim is to the offerer, so much the more grateful to the demon is the sacrifice. All these demons are much under the power of spells, mantra and charms, and there are many tales of demons vanquished by the power of the poet. As grammar took the rank of 'grammorye' in the dark ages of Europe, it still holds a rank not much less mysterious in the vulgar opinion of India. And not altogether without reason, for to the uninitiated the Sutra (grammatical rules) of many of the vernaculars are, as Sir William Jones long ago observed of the Sanscrit, 'dark as the darkest oracles.' An examination of a manuscript book of spells, kolam and cabalistic figures, collected by a Tamil man of low caste, shows that very many of the incantations commence with the sacred syllable Om! or the mantra 'Nama Sivayah,' salutation to Siva. The invocation is never addressed to either Brahma or Vishnu. The following is a specimen of a charm given by Mr. Murdoch in his catalogue of Tamil books :—

> "Om ! Adoration to the Supreme power,
> Kali, ratri, black night !
> To whom the bloody flesh of man is dear ;
> Whose very form is fate and death
> Seize, seize on the life of such a one
> Drink blood ! drink blood !
> Devour flesh ! devour flesh !
> Make lifeless ! Make lifeless.
> Hum ! Phut !"

It seems to have been the practice of the brahmans (founded perhaps partly on the policy of conciliating the children of the soil, but more on a secret terror,) to adopt the local demons into their pantheon, disguised under Sanscrit names. Hence almost every town, high hill, green grove, and fountain of water throughout the peninsula, has its deity, its temple and its sacred legend (sthala purana.) And in process of time, so low did brahmanism sink, that every animal, be it beast or bird, was made either itself a god or the vahanam (vehicle) of some deity, so that, in fact, there was only the broom-stick left to serve as a vehicle for the witches of the west. Still, the pride of caste has never yet allowed the priestly tribe, openly and collectively, to worship the demons of the people as such. It has been computed that in South India, the number of Sivites to that of Vishnuvites is as four to one. The Sivite brahmans accommodated that system most to popular notions, especially in the adoption and worship of the Phallic emblem ; and hence they obtained a firmer footing in the south, the last stronghold of the aborigines. The greater part of the southern sudras have become converts to saivism, doubtless, from finding its genius more consonant than vaishnuvism with the fierce and bloody rites of their demon-worshipping forefathers. The highest brahman authorities have taught that the case of the devils themselves, is not altogether hopeless. There is a well-known aphorism in the Sankhya, which is illustrated by the story of a devil (Pisacha) who was enlightened and obtained felicity by overhearing the religious discourse between Krishna and Arjuna. Burns, it will be remembered, expresses a like hope for the 'puir de'ils :'—

> " But fare ye well, auld Nickie ben !
> O wad, ye tak'a th thought and men !
> Ye aiblins might—I dinna ken,
> Still ha'e a stake,
> I'm wae to think upo' your den
> E'vn for your sake."

But it is in the extreme south of the peninsula, that devil-worship is found least intermixed with image-worship or with any of the other forms of brahminical institutions. Indeed the whole race of Shanars (except in the christian villages), may be said to be wholly given to demonolatry. Though they acknowledge a Supreme Being, yet they never pay him any worship, and they seem to have no belief in the future life—the metempsychosis in which the other inhabitants of India so firmly believe. They dread the devils purely on account of the physical evils which they believe them to have power to inflict; and to avert these evils by propitiatory sacrifices and ceremonies, constitutes their religious worship. And it is worthy of remark, that every word in the Tamil language denoting an image, is from the Sanscrit, and therefore introduced by the brahmans, while the terminology of demon-worship is, in the south, pure Tamil. Among the Shanars too, are most common the devil-dances not unknown in other parts of India. The devil-dancer dances all but naked; the body being painted with stripes of black, yellow and red paint; bells dangle from the wrists, waist and ankles; sometimes a burning torch is placed under the left arm, sometimes pans of fire on the head. He dances, burning himself with the torch, cutting himself with knives and yelling. When at length he is fully possessed, he strikes in his frenzy the head from a goat, and then he is believed to be inspired with knowledge of the future. Women flock round him to ask for offspring; sick people to enquire about their diseases; and farmers to know whether their crops will succeed, or where they will be likely to find cattle or property, 'lost, stolen or strayed.'

It has been conclusively shown on the evidence of language, that the Tamil races belong to the great Scythian or Turanian family; therefore it is the less surprising to find such a similarity between the Shamanite demonolatry of High Asia and the Dravidian or Tamil demonolatry of South India. We are, at the same time, free to confess, that we should have considered such similarity, if it had been unsupported by philology, very unsatisfactory evidence to be adduced in proof of identity of race, for the rites of demonolatry have been practised by Arians and Semites as well as by Turanians from remote antiquity. The fear of demons and the desire to propitiate them, seem in fact, as Scott remarks, to be natural to the human mind and, like the common order of vegetables which naturally spring up in every climate, these naturally arise in every bosom. A tropical country will best favour the growth of such superstitions; and when we wonder most at what appears to us, the extraordinary credulity of orientals, we are apt to omit to take into account the peculiar influences to which they are subject. Striking the key-note which has since been sounded by Professor Kingsley, Humboldt says the forces of nature exercise a magical power over us so long as their action is shrouded in mystery and darkness." The inhabitants of tropical countries are brought into the most intimate communion with nature, and therefore in those climes this magical power will be most felt. Statistics too have shown that the natives of South India are peculiarly susceptible to nervous affections, to attacks of hysteria and epilepsy. When therefore we witness the extraordinary gyrations and paroxysms of the Tamil Shamans or devil-dancers, it is not necessary for us to suppose the existence of imposture or insincerity. These paroxysms, it is true, can, as Sir John Lubbock observes, be always apparently produced under given conditions; still there is a mystery, and the mystery is probably none other than the grand mystery of the pathology of the nervous system.

Col. Tod thus describes a custom in Harawati:—"Half way we passed a roofless shed of loose stones, containing the divinity of the Bheels; it is in the midst of a grove of thorny, tangled brush-wood, whose boughs were here and there decorated with shreds of various coloured cloth, offerings of the traveller to the forest divinity for protection against evil spirits. He adds, in a note, that the same practice is described by Park as existing in Africa. The mahomedans of the south of Asia believe in spirits, and in the science of dawat or exorcism, to which they have recourse to command the presence of genii or demons, who when it is required of them, cause anything to take place. The genii spirits are believed to reside in the lowest firmament, and possess the power of rendering themselves visible to human beings in any form they please. The evil spirits are called shaitan. The spirits of mahomedans are supposed to rest in the graves till the resurrection; on being laid in the grave, the two angels Nakir and Mankir, interrogate the departed as to his life: dogs, women and horses are not allowed inside the burial ground. Annually oblations called Ooroos are offered in the name of Mahomed, or in the names of the Pir or spiritual guides, or in the names of the Walli or saints. *Khajah Khizr*, a mahomedan saint often appears to travellers in different guises, but generally as an old man. The people of Sind believe in the Rijal-ul-ghaib; in the Jin or Genii; in Bhut, ghosts or disembodied spirits; in Ghool, or demons of the wilderness: in Pari, fairies, and in Dev, Rakas and Pap, powerful fiends, corresponding with the Arab "Marid." The Dakan or Dev, is the same as our witch, usually an old woman, decrepid, poor, of humble family, and angry disposition. She has the power of turning men into beasts, killing cattle, flying to any distance on a tree by reciting a mand (magical formula) and mounting a hyæna. Unlike the Arabian witch, she is, however, unable to ride a besom. The Bandh and Mann are frightful beings, half-female, half-hellish. They live in the hills and jungles where they frequently appear to travellers, are covered with hair like bears, have large pendant lips, and live on fruits and herbs. The Shir is a creature that partakes of the satanic nature. He, generally speaking, appears like a low caste man, very dark, tall, and frightful: sometimes as a headless body. He lives in the makam, or burial ground, where he lights fires, and amuses himself by throwing the brands about, frightening folk by vociferating their proper names, or pursuing them in the form of some beast. Hence the universal fear of approaching a burial ground by night. The shaitan (satan) curious to say, is only seen by learned and religious men, to them he appears as a young man of white complexion and handsome form which he can change at discretion. It is interesting to observe that in Sind, as nearly all the world over, popular superstition has created Marhun Machhi (mermen and mermaids), by mistaking some kind of fish for a human being. The science of Osteomancy is the Ilm-el-Aktaf (knowledge of the shoulder-blades) of the pagan Arabs and some Bedouin tribes of the present day, the Ilm-i-Shaneh of the Persians and Affghans, and is known to the shepherd clans of Sindhis and Beluchis by the name of Phannia-jo-fannu. The instrument of divination is the scapula of a sheep divested of its muscles and integuments. The dorsum is considered. The Ilm-i-Kaf, or Palmistry, is common among moslems and hindoos, but better known in Cutch than in Sindh. The "canons of true and catholic chiromancy" are much the same in Asia as in Europe, and the pages of Torreblanca, or the notable volume which boasts Aristotle's name, prove that the art is of purely oriental origin. The Sona-jo-Ilm, or knowledge of omens, taken from the flight of birds, the appearance of beasts, and other similar phenomena, closely resembles the art of the Indian Thugs. The Beluchis are considered great adepts in this branch of the occult sciences, and the Sindhis have a short treatise upon the subject called Sungun-namo. Isaiah viii, 12, says "Neither fear ye their fear, nor be afraid." Superstitions of the grossest type have always been known to take root and cling to India, after having been driven out of Europe and the greater part of Asia. The religious and social life of hindoos is but a reflection of superstition, in a great measure. Bishop Heber was right. To a native of India the famous "credo—quia impossibile," of Tertullian is, in effect, the most convincing argument after all. Friday night is a dangerous one, for these local ghosts go about intent on destruction. Each marsh has its unseen evil genius. The dryads of the wood are an evil company. The nymphs of the rushing streams delight to gaze upon the corpses of drowned men. In the south of the Madras presidency, especially, localized demons have exercised this mysterious, yet therefore not less potent, power for centuries. A man dies under the slightest exceptional circumstances -and lo ! his spirit goes abroad ! It lurks in yonder hut, it crouches under yonder banyan tree. It must be propitiated with plantains or fruit, rice or sweet toddy. There is an English ghost in Tinnevelly. It is the ghost of a certain gallant captain who died in the storming of the Travancore lines early in the 19th century. Mortally wounded, and retreating to the northward, his body was left behind by his affrighted servants. The poor man breathed his last near a village in which, latterly, a Mission of the C. M. S. has been established, and which is called Gospel town, Suviseshapuram in the vernacular. The dead man, after his death, was deified by the simple instincts of the neighbouring Shanars. He has a rude hut to his honour. And the offerings which appease him are brandy and cheroots. He may be invoked. His opinion may be elicited.—*Rajasthan, Vol.* ii, *p.* 662; *Burton's Sindh, pp.* 175, 176, 189, 194; *Ward's View of the Hindoos, Vol.* ii, *pp.* 140-7; *Forbes' Ras Mala or History of Guzerat, Vol.* ii, *pp.* 378-80, 386-87; *Sir John Lubbock's' Origin of Civilization.*

SPIRULA, a genus of molluscs of the family Spirulidæ. There are three recent species.

SPITI, a British province, forming portion of the Ladak country, comprises the whole valley of the Spiti river. Its mean area is 1,900 square miles, and mean elevation of its inhabited parts 12,986 feet The inhabitants of Spiti trade with their neighbours on the other side of the Himalaya; the exports are wool, borax, salt, and blankets; and the imports are articles from the plains, and a great deal of iron. In Spiti, in the N. W. Himalaya, when a person dies, the body is sometimes buried, or burnt or thrown into the river, or cut into small pieces and burnt, admonitions are made over the body to the departed spirit, such as do not trouble yourself, you cannot enter it (meaning the dead body,) in summer it quickly becomes corrupt, in winter it freezes and is too cold for you. Spiti has a peculiar importance as being the only portion of British territory bordering on Chinese Tibet. Spiti forms a valley in the extreme north-east angle of British India, the inhabited portion is said to have an elevation of nearly 12,986 feet. The valley of Spiti was annexed principally with the view of preventing the evils which would result from allowing a foreign territory to intervene between the districts of Kangra, &c., and the wool-producing valleys beyond. Spiti is approached, says Captain Hay, from our own territories and Kanawar, by six different routes, and from Ladakh and Tartary by three routes, through the two chains of mountains; many of the passes are at great elevations, varying from 14,000 to 18,000 feet. Spiti is bounded on the north by the Parang range, separating it from Ladakh to the north-east by inaccessible mountains; on the east, a valley called Kurateetakpo separates it from Chinese Tartary, on the south and west, it is enclosed by the portions of the snowy range, dividing it from Bishahr, Kulu, and Lahoul. The Ghoont is a hill-breed of horses of the Himalaya mountains, generally small, strongly made, hard-mouthed, and sometimes almost unmanageable. In ascending hill faces, or passing along the declivities of mountains, it is best to let them have their own way, for in an intricate passage they often show more sagacity than the rider; their common pace is a kind of amble, and they stop every now and then to breathe, when no application of the whip will move them; they are sure-footed, and sometimes halt at the edge of a precipice, to the terror of the rider; they are not so quick in ascending hills as the low country horses, but they descend with double the speed, and endure great fatigue. The ghoont, though a useful animal, seldom carries any burden but a man, the total number in Spiti is 295; they are bred chiefly for sale. They have two breeds, one a small ghoont, never above 12 hands high, peculiar to the country; and the other a large breed, from 13 to 13½ hands high, is bought from the Chinese, and usually comes from Choomoortee, for a Chinese ghoont two years old they give a Spiti ghoont four years old. All are equally hardy and kept out the whole winter, except the yearlings, which are housed. During winter the ghoont live on the roots of the stunted bushes, and are very expert at scraping the snow from off them with their fore-feet. The breed of ghoont might be improved with a little care. Many are killed during winter by wolves and leopards. A liquor is distilled in Spiti from barley, and called "Chang," and is sold at 30 puttahs for the rupee. A "puttah" is a liquid measure of 2 seers = ¾ of a pucka seer. "They consume," writes Captain Hay, "large quantities, and one man is said to drink on occasions of festivity as much as four puttahs." "Chang" can be made from other grains besides barley, that made from rice is superior, the wealthier classes in Spiti, &c., use a weak spirit, called arak which is distilled from rice. The Spiti river, rises near the Baralacha pass, the ranges to the north are 20,000 feet. Spiti is in 5 kothee or sub-divisions, each under a Gyatpo or elder.—*Powell's Handbook, Econ. Prod., Panjab, Vol.* i, *pp.* 124-25, 312; *Capt. Gerrard's Account of Kunawar, p.* 112. See India, Ladak, Maryul or Lowland.

SPITZEN, GER. Lace.

SPIUG, HIND. Arundinaria falcata.

SPIZAETUS ALBOGULARIS, *Tickell.*

Limnaetus kienierii. | Spizaetus limnaetus, *Horsf.*

The race of these birds in the Dekhan and Ceylon are rather more crested originating the Sp. cristatellus, of authors.—*Tennent's Sket. Nat. Hist., p.* 245.

SPIZAETUS MILVOIDES, *Jerd.* Syn. of Aquila pennata, *Gmel.*

SPIZAETUS NIPALENSIS, *Hodgson.* Peculiar, so far as previously observed, to the Himalaya.

SPIZALAUDA, see Mirafra.

SPLINT COAL, see Coal.

SPOGEL SEED, Plantago ispaghula.

Buzr kaluna,	AR.	Fusliun,	GR.
Barz-katuni,	„	Ispagul,	PERS.
Buzra kotuna,	„	Ispoghul verei,	TAM.
Esubgul, Ispagul,	HIND.		

The seed of the plant Plantago ispaghula, grown in the upper provinces of India, Guzerat, Persia, &c. The seeds are of a very cooling nature, and form a rich mucilage with boiling water, which is much used by native practitioners, and occasionally by European medical men in India, in cases with inflammation of mucous membranes. The seeds met with in Bombay are brought from the Persian Gulf, Guzerat and Sonmeeanee. In India the Plantago ispaghula is cultivated during the cold season for the seeds, the seeds are used as an emollient and light article of diet for convalescents. In making a decoction of Ispaghool take of Ispaghool seeds two drachms, distilled water one pint. Boil and strain; this preparation is a simple demulcent. That of Ispaghool is used in dysenteries, and was recommended by Mr. Twining.—*Faulkner; O'Shaughnessy p.* 510.

SPONDIACEÆ, *Kth.* The Hog-plum tribe of plants, comprising 2 genera, 7 species, viz., 6 spondias, 1 poupartia.

SPONDIAS ACUMINATA, *Roxb.*

Ambut, DUK.

A most elegant middle sized tree, with shining leaves. It grows on the western side of India, being sufficiently common in all the Bombay forests, both coast and inland. The wood, in its natural state, is not of any value, but could be creosoted with advantage.—*Roxb., Fl. Ind., Vol.* ii, *p.* 453 ; *Drs. Gibson and Riddell.*

SPONDIAS AMARA, *Lam.* Syn. of Spondias mangifera, *Pers.*

SPONDIAS DULCIS, is much cultivated in the Society Islands. Introduced into Bombay. In Fiji, *Ivi,* it yields a kind of Hog-plum, *Riddell.*

SPONDIAS ELLIPTICA, *Rottl.* Syn. of Buchanania latifolia.

SPONDIAS MANGIFERA, *Pers., Roxb., W. & A., Vol.* i, *p.* 173.

Spondias amara, *Lam.*

This is a large tree in the Coromandel mountains, but as a cultivated plant, it is small. It flowers in the hot season. It grows in various parts of India, in some, as in Ganjam and Gumsur, is sufficiently common. It there has a straight trunk and attains an extreme height of 30 feet, with a circumference of 2½ feet, and its height from the ground to the intersection of the first branch, is 7 feet. The wood is soft and of little or no use, except for firewood. From wounds made into the bark, in the beginning of the hot season, very large quantities of a transparent juice issue, which soon hardens into a mild insipid gum, like gum-arabic. The fruit got its name from its resemblance to a mango, but it is harsh and little deserving of notice : on the Malabar coast, the root is considered as emmenagogue ; the bark is supposed to be of use in dysenteric affections and a decoction of the wood serviceable in gonorrhœa. The Karens have a tradition that in those golden days when God dwelt with men, all nations came before him on a certain day, each with an offering from the fruits of their land, and the Karens selected the hog plum for their oblation ; which gave such offence, that God cursed the Karen nation and placed it lowest among all the nations by whom they are surrounded. The fruit is eaten raw when ripe, and before ripe is pickled, put into curries, made into tarts, &c. The fruit when fully ripe is of a pale yellow color of a pleasant flavour, but a little too acid. The sour leaves are used in chatneys.—*Ainslie, p.* 221, 222; *Roxb., Vol.* ii, *p.* 451 ; *Wight and Arnott, Vol.* i, *p.* 173 ; *Voigt, p.* 143 ; *Capt. Macdonald* ; *Mr. Jaffrey* ; *Drs. Sponges from the coasts of Asia Minor and Syria are dived for by the people of Calymnos, Chalee, Syme and other islands near Rhodes. In May a little fleet of caiques set sail from Calymnos manned by the greater part of the able-bodied of the male population and they return in the autumn and sell to their richer townsmen who trade in sponges, and these are despatched to Trieste, Syria or Smyrna. A diver can descend to thirty fathoms and remain for 3 minutes. A caustic fluid at the root of the sponge is apt to cause ulcers. They are cleaned and dried in the fields, and then filled with sand to ensure equality of sales. Numerous species are known, with soft porous bodies, traversed by tortuous canals; but the officinal sponge is imported from the Mediterranean and Red Sea; some of the coarser kind from the West Indies. Those of the British seas would probably answer equally well for burning. When collected, sponge contains numerous small fragments of corals and minute shells, from these it must be freed before it can be used. Sponge is composed of gelatine and coagulated albumen. When burnt, its ashes give carbon, and some silex, carbonate and phosphate of lime, carbonate of soda, chloride and iodide of sodium, bromide of magnesia, with a little oxide of iron. That known as Turkey sponge, the Spongia officinalis of Linnæus, of the natural order Spongiæ, is the peculiar skeleton whole, and is produced in southern and eastern seas, though imported into Great Britain from Turkey. The imports are in cases, each containing about 500 sponges of various sizes, averaging in value about 35*s.* per pound. The following imports took place into Liverpool in the years

1851....95 cases.	1854....163 cases.
1852...175 „	1855....146 „
1853...110 „	

Sponge is a zoophyte, a word made from the Greek ζωον animal, and φυτον a plant. The characteristic example of this creature is to be seen in the coral, and the best authors divide them into

i.—Protozoa, including Infusoria, Foraminifera, and Spongiadæ.

ii.—Polypifera, including the Hydræ, Sertularia and Pennatularia.

iii.—Echinodermata or Sea-urchins and Star fishes.

The Protozoa class of Zoophytes, are divided into Rhizopoda and Infusoria. The Amibæ, Foraminifera and Noctilucæ, are three orders of Rhizopoda. The Infusoria exist in all waters. They are said to have 71 species. The Ganges annually transports them to the ocean, to the extent of six or eight times the size of the great pyramid of Egypt. And the waters at a depth of 22,000 feet between the Philippines and Marianne Isles, yielded 116 species. Polypifera, the polypi, correspond with the Polype of science and the Acalephous Zoophytes of Cuvier. In nearly all the polype, the sexes are separate. They are arranged into the classes, Sponge, Alcyonidæ, Zoantharia, Discophora and Ctenophora. The sponge animal lives at the bottom of the sea, and consists of a mass of light elastic tissue. Nearly three hundred species are known, amongst them are the Feather, Fan, Bell, Lyre, Trumpet, Distaff, Peacock, Tail and Neptune's Glove sponge. River sponges are irregular sandy masses, piled on plants and solid bodies in fresh water. The sea sponge is found in the Mediterranean, Red Sea and Mexican Gulf, attached to rocks, at from 5 to 25 fathoms deep. The Syrian fishermen fish for sponges from June to October. In the Red Sea, the Arabs dive for them and sell them in Egypt and at Aden. The Spongia, Calcispongia, Halispongia and Spongella constitute a group of which the constituent structure is known. The Geodia, Cæloptychium, Siphonia, Myrmecium, Scyphia, Eudea, Halirrhoa, Happalimus, Cnemidium, Jerea and Tethium constitute another group, depending on characters of surface and general figure. Sponge is gathered from the rocks of Vizagapatam, at about 12 feet below the sea.—*Newton's Levant, p.* 293; *Hatchett; Royle; Figuier, pp.* 116-121; *Madras Ex. Jur. Rep.*

SPONGE TREE, ENG. Vachellia farnesiana, *W. & A.*

SPONGIA, a genus of Zoophytes, from which as also Calaspongia and Halispongia, the sponges are obtained.

SPONGIA OFFICINALIS, see Sponge.

SPONGITEÆ, see Corallinaceæ.

SPONIA ? *Species ?*

Tella kaka mushtee, TEL., of Circars.

Captain Beddome says that this appears to be Celtis wightii of Wight's Icones, and has one of the hardest woods he had ever met with—light coloured and well worthy of attention.—*Captain Beddome.*

SPONIA ORIENTALIS, *Voigt.*

Papyrus sphærica, *Kæmpf.*
Celtis orientalis, *Roxb, Fl. Ind.*

Chicolee,	BENG.	Morali chettu,	TEL.
Jeebun,	„	Bndu muru,	„

A small erect tree of Ceylon, the Coromandel coast, common along the foot of the ghauts, and occurring in the Kennery forests, Salsette, in Nepaul, Bengal, Sylhet and Assam. Roxburgh says it is neither useful nor ornamental. Voigt mentions that the under bark consists of numerous reticulated fibres, and forms a natural cloth used by the Garrow race, and that its leaves are used for polishing horn.—*Roxb. Fl. Ind.*, ii, *p.* 65; *Voigt, p.* 294; *Flor. Andh.*; *Mr. W. Jacob.*

SPONIA WIGHTII, *Planch.*

Marni,	BEAS.	Kanghi,	UMBALLA.

A small tree found very sparingly in the Siwalik tract up to the Beas, and occurring also in the Salt Range, occasionally west of the Jumna, in some parts of India its exceedingly harsh rough leaves are employed to polish wood and horn.—*Dr. J. L. Stewart's P. Plants, p.* 210; *Powell's Hand-book.*

SPOOKDIER VAN MENADO or the Ghost animal of Menado, which is adapted for climbing in trees, being provided with sharp-nailed toes on its four legs. The animal is about eight inches high, covered with greyish hair, has large flabby ears, piercing eyes, and a long thin tail on which the hair stands out at right angles.

SPOROTRICHUM, Dry Rot.

SPORTING BUFFALO. In the thick forests which cover the Passdun Corle, to the east and south of Caltura, the natives of Ceylon use the sporting buffalo to assist in hunting deer and wild hogs. A bell is attached to its neck, and a box or basket with one side open is securely strapped on its back. This at nightfall is lighted by flambeaux of wax, and the buffalo bearing it, is driven slowly into the jungle. The huntsmen, with their fowling pieces, keep close under the darkened side, and as it moves slowly onwards, the wild animals, startled by the sound, and bewildered by the light, steal cautiously towards it in stupified fascination. "Even snakes, Tennent was [redacted] d, will be attracted by this extraordina t, and the leopard also falls a victim iosity.—Te nt's *Sketches of Nat. H* 55." SPOTTED DEER OF INDI a, SANSCRIT ; and Chittal, HINDI of n-tal India and Southern Mahratta ry of the Malayan peninsula, is the Axis maculata of Gray and Ham. Smith and the Cervus axis of Erxleben and Elliot.

SPOTTED HEMLOCK, ENG. Conium maculatum.

SPOTTED HOGDEER, of Hodgson, Axis maculatus, *Ham, Smith, Gray.*

SPRAT. The Bristle-finned sprat, Setipinna, a small fish of the herring tribe is found in Burmah seas. It is, however, easily distinguished by a long filament or bristle, which is attached to each pectoral fin. This and another species are often called sprats by Europeans, and they belong to the same tribe. —*Mason.*

SPREADING CYPRESS, see Evergreens.

SPREADING HOGWEED, Boerhaavia diandria, Boerhaavia tuberosa, Boerhaavia procumbens.

SPRENGEL, author of Systema Vegetabilium.

SPRENGER, a medical Officer of the Bengal army. A philologist, who contributed much to illustrate Persian and Arabic literature.

SPRINGS. The Tenasserim Provinces are well supplied with hot springs ; and some of them are probably not inferior in their medicinal qualities to the fashionable Spas of Europe and America. Though their waters have never been subject to any minute analysis, yet we know there is a great variety in the properties of different springs. They may be arranged in three different classes,—carbonated, sulphureous, and saline.

Carbonated Thermal Springs.—The hot springs on the Ataran, according to Dr. Helfer's description, belong to the carbonated class. They are situated within two miles of the old town of Ataran, and Dr. Helfer thus writes: "There are ten hot springs or rather hot water ponds, of which I could only examine the nearest, as the access to the others was through deep water at 130° Fahrenheit. This one was a semi-circular pond about fifty feet in circumference. In one place it was thirty-five feet deep. The quantity of carbonic acid which the springs evolve, seems to render the neighbourhood peculiarly adapted to support vegetable life. The ground around the spring is strongly impregnated with iron, and the water which runs over the ochre mud has a strong styptic taste. The springs on the Ataran approach in their composition nearest to the celebrated waters of Tœplitz. Their medical properties would render them excellent remedies in a number of diseases : liver complaints [redacted] find a powerful remedy in them. t should be selected as a resort f the hot springs on the Ataran y be turned to advantage. In a dire ne, they would be only four or five hours distant, and a roa [redacted] ld be cut through the country witho y, so that patients could be re nd bathe in loco." Dr. Morto sis, that the waters contain a id e quantity of calcareous matter, and t he tufa, which it deposits on the border of the springs, is a carbonate of lime. They appear to arise from the mountain limestone, and thus to hold a geological position similar to that of the hot springs of Great Britain, most of which rise from strata below the coal, and hence from, or through, the limestone.

Sulphureous Thermal Springs.—About four miles below Matah at the forks of the Tenasserim and a few miles north of the latitude of Tavoy, there are hot springs highly charged with sulphuretted hydrogen gas, so readily recognized by its smell which is precisely that of the washings of a gun-barrel ; the odour in both instances being produced by this same gas. All the stones in the springs are of a bright brass-colour, produced apparently by the deposition of the sulphur ; and although the virtues of these waters are hidden from man, they appear to be well-known to the beasts of the forest. To judge from the tracks around in the morning, the most incongruous parties held here every night. The delicate little tread of the chevrotain and barking deer, are seen side by side with the massive steps of the elephant and rhinoceros ; and the tiger, and the leopard seem to lay aside their fierceness, and peaceably walk away satisfied with a draught of the much coveted beverage. Dr. Helfer said these springs belonged to "the class of sulphureous mineral waters, tinged slightly with chalybeate, like the water of Brighton." Their heat above the atmosphere is not great. Mr Bennett at a recent visit, found the thermometer to rise in the hottest spring to only 119°. They rise from the slate rocks, like the warm springs of a considerable part of Germany.

Saline Thermal Springs.—On the margin of the granite range east of Tavoy, either near the junction of the slate and granite, or in the granite itself, is a series of the hottest springs in the provinces. I have visited, says Mr. Mason, four or five in a line of fifty or sixty miles, and found them uniformly of a saline character. Around one nearly east of Tavoy, the stones are covered with an efflorescence resembling epsom or glauber salt. Mr. Bennett found the thermometer in this spring, to rise to 144°. Major McLeod visited one of the series at [redacted] writes: "There are two spots [redacted] springs show themselves. One [redacted] on the right bank of the river, a[redacted] two or three minutes' walk to the north-east inland. There [redacted] 30 or 40 bubbling up along a line [redacted] feet by 20. The hottest [redacted]er 194°. No disagreeable [redacted]." The hottest springs are at [redacted]n or fifteen miles north of those visited by [redacted]jor McLeod, and according to Phillips they are hotter than any on record out of volcanic regions, with the questionable exception of three springs in China, which, probably exceeded the temperature of the air from 70 to 120 degrees. The principal spring at Pai,—for there are several,—is in a little sandy basin in the midst of granite rocks on the margin of a cold-water stream, where it bubbles up from three or four vents, and on immersing the thermometer into one, the mercury rises to 189°, within fourteen degrees of boiling-water. Its location is rather peculiar, not being in a valley like the others, but on the side of a hill more than a thousand feet above the level of the sea, and surrounded by large masses of coarse grained granite rocks, which seem to have been detached from the summit above.

The districts, richest in mineral waters, appear to be the Tenasserim provinces.

A mineral spring occurs in the Saugur talook, Nuggur division of Mysore. A district round Hazareebaugh stretching in almost every direction for about 130 miles, in many places literally teeming with hot springs, the upper part of the Jullundur Doab, or rather the hills beyond its northern boundary, the Salt Range and Northern and Western Sind; next is the Concan, and, though not to be compared with any of the foregoing, the peninsula of Guzerat. Sulphurous springs appear to be pretty equally diffused: several in Hazareebaugh, some in the Nerbudda, some in the Concan and Guzerat, some in Sind and the Salt Range, many at the base of the Himalaya, and in the upper part of the Jullundur Doab. Only one has been noticed in the Madras presidency, (Chittoor is scarcely an exception to this,) and no true one in Tenasserim. The great majority of them are thermal. The most frequent of all appear to be the hot springs without any very strong mineral impregnation, which are so abundant in the Tenasserim provinces and in the Hazareebaugh districts, in some parts of the Himalaya, [redacted] Concan, also in Sind, where, as in ma[redacted] places, an impregnation with carb[redacted] lime is common. O[redacted] such [redacted]en found in Rajpoot[redacted]e Dekhan.

[redacted]*lphuretted Spring* at Chaunch is on[redacted]ty miles from the terminus, and about three miles off the Grand Trunk Road. It is prettily situated, not far from the Pachete hills, and there is a colliery near. But there is a much more abundant and hotter one called Tauloie, on the banks of the Damooda, two or three miles off. Those at Bum Buklesir are about fifteen miles from Mungulpore and the same distance from Sooree: they are further off the high road, but are more powerful and abundant. The hot spring at Lakarakoonda is not far off, and there is said to be another near at Kisshun. The elevation of all them may be about 300 feet above the sea level. Of these places, Bum Buklesir, is particularly deserving of an early investigation, for no analysis of its waters has yet been made. There are four or five springs, the temperature at least of the hottest, which is 162°, exceeds that of the most popular springs of the kind, Aix la Chapelle, or Bareges and Cauterets in the Pyrenees. During the four cold weather months the climate is probably not inferior to that of any of those places in their short bath season.

Doctor Gerard notices a few mineral springs impregnated with salt, iron and alum, that may possess medicinal virtues, and the famous wells of Zungsum, at the meeting of the Speetee and Parati rivers, 4 miles north of Shealkhur, where inscriptions in the Tartar language on tablets of stone describe the particular virtues of each spring, are scarcely beyond the limits of Kunawur.

Within two days' sail of the port of Kurrachee, within a hundred yards of the sea, commences the group of mud volcanoes known by the name of the Koop of rajah Rama Chundra, believed to be of divine origin, and to be possessed of miraculous virtues. Three of these were visited by Captain Hart; a fourth was seen by him at a distance, and they are said to be very numerous, and to extend some way along the shore, and far into the interior. About two miles from the wells of Tilook Pooree, three hills, of extremely light-coloured earth, rise abruptly from the plain. The centre hill is conical, slightly flattened and divided at the top: it is about

400 feet high : its southern and western sides are more precipitous than the others. The second of the group is about half the heigh of the first ; the two are connected by a causeway about fifty yards in length. Th third covers a greater area than either ; its apex seems destroyed or broken off, otherwise the characteristics of the three closely resemble each other. They are all indented at the base with numerous chasms and fissures which run into the interior, and their sides are stroked from the summit down as if with sluices of mud or water overflowing from the crater. A basin of liquid mud about thirty yards in diameter occupies the whole summit of the largest of the three. Air bubbles and jets of mud arise from the basin continually, the semi-fluid mass within being constantly disturbed by them. The whole summit of the hill is crusted over with caked mud. The same appearances almost exactly are presented by the craters of the two other hills,—with this difference, that in the case of one of them the mud was said to rise and fall, occasionally overflowing the crater, sometimes sinking in it above 15 feet. A fourth hill, similar to those just described, occurs at some six miles off. The water and mud all round is salt. The ground at the base of the hills is full of cracks and rents. The same volcanic agency, most probably, which gives rise to the hot springs of Peer Muggen, that supply the famous crocodile tank, feeds or stimulates the mud volcanoes. Abundance of brimstone is found at no great distance, and one eminence some twelve miles off is known by the name of the sulphur mountain." Capt. Robertson describes the whole district, for an area of probably not less than 1,000 square miles, from the Hara range westward as covered with mud cones, active or quiescent. He spent a fortnight amongst them in 1849 and could discover no particular day on which they were unusually affected : Captain Hart had been told that on Monday they were more active than they were on other days. There is an aperture in the rock three inches in diameter, from which, until of late years, a jet of flame used to issue ; it was called the peri's fire by the natives, and is believed to have become extinguished on some infidel having bathed in the neighbouring well.

There is a very copious hot and sulphurous spring at Gurrumab or hot well, in the Bolan Pass, about 200 miles to the northward.

The area of the volcanic field of Beila has never been precisely determined : it extends some fifty or sixty miles inland, and at least three times as much along shore.

Vaypi island on the north side of Cochin, it is said rose from out the sea in the year 1341 : the date of its appearance is determined by its having given rise to a new era amongst the hindoos, called Puduvepa, or the new introduction. Contemporaneously with the appearance of Vaypi the waters, which during the rainy season were discharged from the ghaut, broke through the banks of the channel which usually confined them, overwhelmed a village, and formed a lake and a harbour so spacious that light ships could anchor where dry land formerly prevailed."

Some of the thermal springs, as the Seetakand, at Monghyr, the water of which is highly prized and often carried on long voyages, are probably slightly carbonated, and observers talk of Indian springs effervescing, for instance the so-called chalybeate at Bangalore.

There are hot springs in Ladak, Nepaul, and Sikkim, at Uchebul' in Cashmere, and hot sulphur springs near Rajourie, in Goolab Sing's territory.

The thermal springs of the southern Concan do not appear to be powerful, and they have no advantage as to climate.

At the Lukkee Pass, hot springs appear to be of exactly the same description as those at Peer Muggen their position in all likelihood due to volcanic influences of comparatively recent existence. The hot springs of Peer Muggen, attain a temperature of from 100 to 160, and yield a very copious discharge. The water is perfectly pure, and fertilises the soil around. The hot spring takes its name from Peer Muggen, a mahomedan saint, whose shrine is close by. The coincidence of the sound with the designation given to the long-snouted crocodile (muggur) has led to the inference that it was Peer Muggur, the crocodile saint. The crocodiles in the tank are of the kind called Garial : they are precisely similar to those of the Nile and Ganges. One of the tanks contains nearly 200 crocodiles : there is a spring at no great distance which affords large deposits of sea salt. At Hinglaj, are a series of mud volcanoes, very similar in point of form to those of Chedooba, along the sea board of Lus, and now n great activity. Here there is no appearance whatever of there ever having been any eruption of lava.

Almost all strongly carbonated springs in other parts of the world are found in the neighbourhood of extinct volcanoes, as in Auvergne, the Rhine provinces, the Caucasus, or near active ones as at Ischia, they are scarcely to be looked for in India. Hot springs are not necessarily indices of volcanic action ; they are most common at points of great displacement of strata, or at the junction of stratified and unstratified rocks.

Springs and fountains have with most races been objects of worship, and continue to be so in India. In the great majority of instances, they have been regarded by the natives of the country as emanations of a deity, and as objects of worship. Wherever there is a hot spring, there is pretty sure to be a temple, visited by pilgrims. Many waters have, however, been used medicinally. Some of those, which appear to be most resorted to, for their healing virtues, are the springs at Malacca, those at Sonah near Delhi, where considerable buildings have been erected for the convenience of bathers, at Munnee Karn, and at the Lukkee Pass. All of them are thermal, and except Munnee Karn, are sulphuretted, and natives have undoubtedly faith in them in certain cases. Such springs might easily at a small expense be made more extensively useful to natives. Europeans can scarcely be said to have ever made a fair trial of any of the mineral springs of India.

The worship of springs and wells was practised by the followers of Baal, the Scythians and their descendants, but also by the Hindoos, the Chinese, the Moors, the Mahomedans, the Celtic races and the Indian nations of North America. In England, under the reign of Canute and Edgar, edicts were promulgated against venerating devils. The Irish Celts suspended pieces of linen to the branches of trees as preservatives against the geasa-dravidect, or sorceries of the Druids, to keep their cattle from epidemics and to obtain the favour of the davini maithe or fairies. The Irish peasants throw pieces of butter into Lough Ciu as a preservation against the geasa dravidect. The fountain of Jobbar-na-Molcht at Tubrid, is one of the most celebrated in Ireland and is resorted to on Saturday to drink the water of the fountain. The Zunis of North America make annual offerings to the spirit of fountains. The Peruvians and Mexicans, like the red Indians worshipped the sun, the moon, the stars, the earth, the fountains and the rivers. The Lares of the Peruvians were generally stones.—*Mason ; Dr. H. R. Meerzwiebel,	GER.	Nurri vangayam,	TAM.

Squill is a perennial bulbous-rooted plant found on the shores of Spain, Portugal, North of Africa, and the Levant, and one species occurs on the coasts of India. The bulbs are pear-shaped, and vary in size from that of the fist, to the compass of a child's head. The root is very nauseous, intensely bitter, acrimonious, and causing inflammation when rubbed in the skin. As met with in the shops, squill is commonly in the form of the dried shreds of the root. It is one of the most useful remedies in the materia medica.—*McCulloch's Com. Dic., p.* 1077; *Faulkner.*

SQUILL, COUNTRY. Indian squill.

The Indian squill, scilla indica, resembles the true squill in medicinal virtues. Ainslie did not find the native medical practitioners employ it. Farriers are in the habit of using it, in conjunction with other articles, for horses, in cases of strangury and fever. It grows in abundance in waste, sandy soils.—*Ains. Mat. Med., p.* 44. See Scilla.

SQUILLA MACULATA, see Stomapoda.

SQUILLA STILIFERA, see Stomapoda.

SQUINANTHUM, a species of rush called Sweet rush or Camel's hay, sometimes brought into China from Turkey and Arabia, tied up in bundles about a foot long. The stalk, in shape and colour, resembles a barley straw. It is full of fungous pith, like the British rush, leaves like those of wheat. When in perfection, it has a hot, bitterish, not unpleasant taste, and a very fragrant smell. It was formerly used in medicine.—*Comp. Descr.*

SQUINE, also Esquine, FR. China root.

SQUIRRELS, belong to the genus Sciurus, of which the following are E. Indian species,

S. malabaricus.
S. maximus.
S. elphinstonei.
S. macruroides.
S. macrourus.
S. lokriah.
S. barbei.
S. europæus.
S. laticaudatus.
S. lokrioides.
S. palmarum.
S. tristriatus.
S. layardii.
S, sublineatus.
S. maclellandi.

Sciurus layardi, which eats the coffee berries, is common on estates, the pulp alone is digestible, and the coffee beans are dropped on logs of wood and on the ground. Two kinds frequent the mountains of Ceylon, one which is peculiar to Ceylon, is the Sciurus tennentii. Its dimensions are large, measuring upwards of two feet from head to tail. It is distinguished from the S. macrurus by the predominant black colour of the upper surface of the body, with the exception of a rusty spot at the base of the ears.

The long tailed Squirrel, of N. S. Wales is one of the Phalangistidæ.

The flying squirrels, are the genera Peteromys and Sciuropterus.

SRADADEVA, see Surya-vansa.

SRADDHA, amongst the hindoos, an obsequial ceremony, in which food and water are offered to the deceased ancestors of the sacrificer, or to the Petri or manes collectively. The Preta or Dasapinda Sraddha is an offering of a ball of rice to a deceased person, by the next of kin, increased by one, daily, for ten days, other Sraddha are

Ekadasi Sraddha.
Masika or Anwaharya Sraddha.
Sapindana and about 13 others.

The Ekoddishta, or Ekadasi is the obsequies for one (Ek) deceased individual. The Abhyu dayaka sradda, is an offering to deceased ancestors, or to the manes collectively, on some prosperous event, as the birth of a son or the like. The Adya Sraddha, is the first obsequial ceremony after a persons decease. The obsequies performed monthly, on the day of the new moon are called Anwaharya-sraddha. The social or legal uncleanness of the hindoo, is called Asauch, and occurs from the death of a relative or the like. The day preceding a sraddha, is held as a fast day, and called Ativasa. Srad'has, as commonly understood are obsequies paid by hindoos to the manes of deceased ancestors, to effect, by means of oblations, the re-embodying of the soul of the deceased after burning his corpse, and to raise his shade from this world (where it would else, according to the notions of the hindoos, continue to roam among demons and evil spirits) up to heaven, and then deify him, as it were, among the manes of departed ancestors. A hymn is recited among the ceremonies of the Srad'ha, and followed by the music of flageolets, lutes, &c. In the Srad'ha, in honor of deceased ancestors, Lakshmi is among most other deities, earnestly invoked, particularly when a votary, by gifts to brahmans, is "desirous of obtaining celestial bliss for the defunct."—*Coleman, p.* 162 ; *Moor, p.* 75 ; *Wilson's Glossary.* See Hindoo, Lakshmi, Narayana, Spirit worship.

SRADDHA DEVA, see Ravana, Surya-vansa, Yama or Dhermarajah.

SRADHA VEDA, see Yama or Dhermarajah.

SRADMA, or Sranma, TIBET. Peas of Zangskar.

SRAMANA, see Inscriptions, Shaman, Brahman.

SRAVAKA is the generic term of the Jain laity, and Savanga Dhamma laho hodu, for Sravaka Dherma labha bhavatu as used by Jivasiddhi in one place, is still the ordinary salutation a Jeti,or religious Jain,proffers to the laity. See Jains.

SRAVAN, see Rahtor.

SRAVANA, SANS. The fourth month of the hindoo solar year, when the sun is in the sign Carcataca, answering to the Tamil Audi ; also the fifth month of the Luni-solar year, owing to that sort of year beginning with Chaitra.

SRAVANA, SANS. The 22d Lunar mansion. See Serpent, Varsha.

SRAVASTI, in Pali Sawatthi, or Sewet, a famous city in ancient Oudh, now called Sahet-Mahet. It is on the Rapti, and is famous for Buddha's preaching. The position of this famous city, one of the most celebrated places in the annals of buddhism, long puzzled the best scholars. The ruined city of Sahet-Mahet is situated between Akaona and Balrampur at 5 miles from the former and 12 miles from the latter, and at nearly equal distances from Bahraich and Gonda. Sravasti is said to have been built by raja Sravasta, the son of Yuvanaswa of the solar race, and the tenth in descent from Surya himself. Its foundation therefore reaches to the fabulous ages of Indian history, long anterior to Rama.—*Cunningham's Ancient Geography of India, pp.* 408, 410-411. See Sakya Muni.

SRAWANI, see Hindu.

SREBRO, POL. Silver.

SREE-CHUND, a son of Nanuk, one of the founders of the Sikh faith. The Sikh sects are as under—

1st.—Oodasee, founded by Sree-Chund, a son of Nanuk. The Oodasee were rejected by Ummer Das, as not being genuine Sikhs.

2nd.—Behdee, founded by Lukshee Das, another son of Nanuk.

3rd.—Teehun, founded by Gooroo Unggud.

4th.—Bhulleh, founded by Gooroo Ummer Das.

5th.—Sodhee, founded by Gooroo Ram Das.

The Behdee, Teehun, Bhulleh and Sodhee are rather Sikhs of the sub-divisions of Kshutrees, so called (*i. e.*, of the tribes of certain Gooroos,) than distinct sects.

6th.—Ram Rayee, seceders who adhered to Ram Raee when Tegh Bahadur became Gooroo. They have a considerable establishment in the Lower Himalayas, near Hurdwar.

7th.—Bunda-Punt'hee, *i. e.*, of the sect of Bunda, who succeeded Govind as a temporal leader.

8th.—Mussundee, Mussund is simply the name of a sub-division of the Kshutree; but [illegible]is also specially applied to the followers of [illegible]ose who resisted Govind; some say as adherents of Ram Raee, and others as instigators of the Gooroo's son to opposition. The more common story, however, is that the Mussund were the hereditary stewards of the household of the several Gooroos and that they became proud and dissipated, but nevertheless arrogated sanctity to themselves, and personally ill-used many Sikhs for not defering to them; whereupon Govind, regarding them as irreclaimable, expelled them all except two or three.

9th.—Rungret'ha, converts of the sweeper, and some other inferior castes, are so called.

10th.—Ramdasee, *i. e.*, Rao or Raee Dasee. Sikhs of the class of Chumars, or leather-dressers, and whot race to the Rao Das, or Raee Das, whose writings are inserted in the Grunt'h.

11th.—Muzhubee, converts from mahomedanism are so called.

12th.—Akalee, worshippers of Akal (god), the most eminent of the orders of Purists or Ascetics.

13th.—Nihung, the naked, or pure.

14th—Nirmulleh, the sinless. One who has acquired this title usually administers the Pahul to others.

15.—Gheinnee, the wise, or perfect. A term sometimes applied to Sikhs who are at once learned and pious.

[illegible]6th.—Soothra Shahee, the true, or pure: [illegible] to have been founded by one Sootcha, a brahmin.

17th.—Sutcheedaree, likewise the true or pure: the founder not ascertained.

18th.—Bhaee, literally, brother. The ordinary title of all Sikhs who have acquired a name for holiness; and it is scarcely the distinctive title of a sect, or even of an order.—*Cunningham's Hist. of the Sikhs, pp.* 378-9.

SREE MUNGALAVADOO. TEL. Barber.

SREEPHUL, BENG. Bengal quince, Ægle marmelos.

SRI, SANS. All hindoo books are commenced with this word, written at the top of the first page, it is an invocation to Ganesh the god of learning, to favour the undertaking. It is similar to the ♃ Greek and Roman invocation of Jupiter, the alif, initial of the mahomedans, the Laus Deo of the christians. Sri is now a hindoo honorific appellation, answering to Lord when applied to deity, and Mr. when used for man. Sri Rangapatnam, is the hindoo name of Seringapatam: in all letters to hindoos, Sri is prefixed as an honorary appellation.

SRI, a name of Lakshmi, the goddess of prosperity but also very frequently used as an adjective, meaning illustrious. Sri, is the Venus Aphroditus of the Indians, born like the Grecian Venus from the sea. According to the hindoos, every city has its own Sri, its own fortune or prosperity, which in former times seems to have been represented by an image with a temple of its own. The practice amongst the ancients of considering a city under the protection of well-known divinity is more familiar to Europeans, but an analogous superstition with that of the hindoos also prevailed amongst the polytheists of Europe. Thus in the seven chiefs before Thebes, the Theban women seek their shrines of the gods who are the guardians of the city.—*Hind Theat., Vol.* ii, *p.* 64. See Lakshmi and Krishna.

SRI-AI-TAURKUM, SANS. Calotropis gigantea.—*Brown.*

SRI ANAND, see Vairagi.

SRIHASTINI, also Bhurumdi, SANS.? Heliotropium indicum.

SRI JAYA VARMA DEVA, see Inscriptions.

SRI-KAYA, MALAY. Anona squamosa.

SRI-KRISHNA is the 9th, and Sri-Rama the 7th incarnations of Vishnu, as a Kshetria and a Dwarf Brahmin, the anniversaries of which incarnation are observed.

SRIMAT LAKSHMANA, see Inscriptions.

SRINAGAR, the capital of Cashmir is 5,146 feet above the sea.

SRI-NAGAR, the ancient capital of Gurhwal, in lat. 30° 14' N., and long. 78° 37' E., was built in the 16th century, on the bank of Alakananda, the principal branch of the Ganges, formerly the residence of the rajas of Gurhwal.—*Cal. Rev., Jan.* 1871.

SRI NANDA RAJA, see Inscriptions.

SRINAT'H DWAR, see Rudra Sampradayi.

SRINATH GHOSI, see Inscriptions.

SRI NETRI BHANJA, see Inscriptions.

SRINGA TAKAMU, TEL. Trapa bispinosa, *Linn.*

SRINGAGRI GURU, see Bharati.

SRINGAVERA, the modern Sungroor. Sringavera was a city on the north bank of the Ganges (or more properly a village, as the country on both sides of the Ganges was here a forest), inhabited by Nishadas or wild tribes, of whom Guha was the chief, by whose assistance Rama, Lakshmana and Sita were ferried over to the south bank of the Ganges, a day's march above its junction with the Jumna.—*Hind. Theat., Vol.* i, *p.* 300.

SRINGERI, near the Tumbudra famed as a monastery established by Vyasa.

SRINUGGUR, is on the south bank of the Alacnanda, about twenty miles above its junction with the Bhagmuttee at Deo Prague, where a strip of level ground stretches along for three or four miles, forming the valley known by the same name as the town. The people of Gurhwal are Bhot, dwelling in the passes and their neighbourhoods, at heights above 6,000 feet. The passmen state that ridges which within the memory of man were covered with forest and pasture lands are now covered with snow, showing the extension of the snow zone. The Bhot, here, as elsewhere is an agriculturist, and is assisted by slaves who live under the roofs of their masters.

SRIPADA, or Adam's Peak, is in lat. 6° 51′ N., long. 80° 35′ E., in Ceylon.
Top of peak 7,385 ft., *F. & S.*, or 7,420 ft. *Tenn.*

Source of Kalu Ganga...	4,345	feet	*F. & S.*
Bangalow, foot of Sripada peak..................	5,114	„	*F. & S.*
Lower limit of Rhododendrons, on the slopes of Sripada..............	is 6,550	„	*F. & S.*

Sripada is the impression of the footmark of Buddha, on Adam's Peak, Ceylon, left on his departing. It is noticed in that part of the Mahawanso, written by Mahanaama, prior to B. C. 301. Models of this are shown in the Alu Wihara at Cotta and at other temples of Ceylon. The buddhists are the guardians of the Sripada, but the devotees of all religions meet here freely around the object of their common adoration. Christians, mahomedans and hindoos have reverence for the impressions of feet. This on the top of Adam's Peak in Ceylon, is a natural hollow artificially enlarged, said to be the impression of a foot of Budd'ha. It is, however, called by the hindoos, Sripada, or Sripad, meaning the divine footstep, Vishnu having, they say, alighted on that spot—in his avatara of Rama, although mahomedans and christians have also claimed that foot-mark as of their religious relics. Hindoos make pilgrimages to the Sripada in Ceylon and in other places, where similar proofs of an avatar or descent have been discovered. Christians and mahomedans ascribe the mark to Adam. See Serapada.

SRI PARVATA means the same as S Saila, the mountain of Sri or Lakshmi, a place of sanctity in the Dekhan, near the Krishna river. It still retains its sanctity, but has lost the splendour it formerly seems to have possessed by the extensive remains of sculptures, on the mountain, and great labour and cost bestowed on the causeways by which it is approached. It is described by Col. Mackenzie in the 5th and 6th Vol. of the Asiatic Researches, and was afterwards visited by the late Dr. Voysey. In this temple was one of the twelve great Lingas, the worship of which seems to have flourished particularly about the period of the first mahomedan invasion. Prior to the same date, also, it seems to have been a place of great resort for Yogis or saiva ascetics.—*Hind. Theat., Vol.* ii, *p.* 18, 277.

SRIPHAL, the fruit of Egle marmelos so called by the hindoo poets because it sprung, they say, from the milk of Sri, the goddess of abundance ; who bestowed it on mankind at the request of Iswara. The Anona reticulata, is called Ramphul, or the fruit of Rama. Another, the Anona squamosa, is named Sitaphul, after Sita. See Bhilva, Kurma, Lakshmi, Saraswati.

SRI-PHAL, HIND. Ægle marmelos. See Bhilva.

SRI-PUNJEMI, see Saraswati.

SRI RAMA, see Inscriptions.

SRI RAMPURA, see Topes.

SRI RANGA, a famous temple and place sacred to Vishnu near Trichinopoly. Of the great religious institutions in the south of India are Sri Sailam in Cuddapah, Conjeveram, Chellambram, Srirangam, &c. There are also many religious edifices of great architectural merit very worthy of being depicted and preserved for the beauty of their sculpture and elegance of their design, such as the stone mantapam in the Fort at Vellore since used as an Arsenal and Cutcherry, the temples at Tanjore, Gangondaram and Tribhuwanam, the ruins of Bijanagar, the pagodas at Leepichi in Bellary, and of Tadpatry in Cuddapah, with many others equally worthy of admiration, in secluded and desert places, little known beyond their immediate neighbourhood. Nearly all the finest buildings of early times have been constructed of stone, while the edifices of modern times, that is since about the fourteenth century, comprising some of the most stupendous piles at present to be met with, are of brick. See Sri Sampradaya.

SRI RANGA-PATAN, the town of Seringapatam.

SRI RUDRA SENA, see Inscriptions.

SRI SAMPRADAYA or Ramanuja, a vaishnava sect founded about A.D. 1150, by Ramanuja Acharya. He was born at Perumbur, and studied at Kanchi or Conjeveram, and afterwards resided at Sri Ranga, or Seringapatam. He then visited various shrines propagating his reformed views, and reclaiming the shrines for the worshippers of Vishnu, particularly the celebrated temple of Tripati. The sect worships Vishnu and Lakshmi and their several incarnations. They decorate their temples and dwellings with the Salagrama stone, and Tulasi plant, and set up in their houses, images of stone and silver, which are daily worshipped. The temples appropriated to Vishnu and his consort are resorted to, and the pilgrimages made to Lakshmi-Balaji, Ramnath, Ranganath, in the south of India, and to Badrinath, in the Himalaya, Jogannath in Orissa, and Dwaraka on the Malabar Coast. This sect in general prepare their food individually and in private, and if a stranger's look fall on the food, the cooking is stopped and the food buried. They must not eat in cotton garments, but having bathed, must put on woollen and silk. Their chief religious tenet is the assertion that Vishnu is Brahm, that he was before all worlds, and was the cause and creator of all. In opposition to the Vedanta doctrines, they deny that the deity is now of form or quality, but regard him as endowed with all good qualities and with a two-fold form. The supreme spirit "Paramatma," or cause, and the gross one, the effect, the universe or matter. Their doctrine is therefore called the Visishthadwaita or doctrine of unity with attributes. In these assertions they are followed by most of the Vaishnava sects. They assert three predicates of the universe, comprehending the deity: it consists of Chit or spirit; Achit or matter; and Iswara or god, or the enjoyer, the thing enjoyed, and the ruler and controller of both. Besides his primary and secondary form as the creator and creation, the deity has assumed, at different times, particular forms and appearances, for the benefit of his creatures. He is, or has been, visibly present amongst men in five modifications; in his Archa, objects of worship, as images, &c., in the Vibahava or avatara, as the fish, the boar, &c., in certain forms called Vyuha, of which four are enumerated, Vasudeva or Krishna, Balarama, Pradyumna, and Aniruddha: fourthly, in the Sukshma form, which, when perfect, comprises six qualities. Blood-offerings at the temples are prohibited by all vaishnavas. Their reward for good acts is laid down as the perpetual residence in Vaikunt'ha or Vishnu's heaven.—*Professor Wilson.* See Mantra, Hindoo.

SRUTI, SANS. Revelation.

SRUVA, SANS. The lustral spoon, figured as held in the hand of the god Brahma.

SSE-TCHOUEN, (Four valleys) also written See-chuen is the largest province in China, and perhaps also the finest. Its temperature is moderate, both in winter and summer, and neither the long and terrible frosts of the northern nor the stifling heats of the southern provinces are ever felt in it. The Yang-tse-kiang, one of the finest rivers in the world, traverses this province from south-west to north-east. Its fertility is such, that it is said the produce of a single harvest could not be consumed in it in ten years. Great numbers of textile and tinctorial plants are cultivated in it; among others the herbaceous indigo, which gives a fine blue colour, and a kind of hemp or thistle, from which extremely fine and delicate fabrics are produced. On the hills are fine plantations of tea, of which all the most exquisite kinds are kept for the epicures of the province. The coarsest are sent off to the people of Tibet and Turkistan. It is to Sse-tchouen that the pharmacists from all the provinces of the empire send their travellers to lay in their stocks of medicinal plants, for, besides that immense quantities are collected in the mountains, they have the reputation of possessing more efficacious virtues than those found in other countries. The wonder of Sse-tchouen, and one that deserves to be placed even before the famous Kouang-ti, is what the Chinese call the Yen-tsing and Ho-tsing, wells of salt and wells of fire. M. Imbert, long a missionary in this province, but subsequently appointed Vicar Apostolic in Corea, where he was martyred in 1838, says the number of salt wells is very considerable; there are some dozens of them in a tract of country of about ten leagues long by four or five broad. Every one here who has made a little money, looks out for a partner, and begins to dig one or more wells.

If there be a depth of three or four feet of soil on the surface, they plant in this a tube of hollow wood surmounted by a stone, in which an orifice of the desired size of four or five inches has been cut. Upon this they begin to work in the tube a rammer of three or four hundred pounds' weight, which is notched and made a little concave above and convex below ; a strong man, very lightly dressed, then mounts on a scaffolding, and jumps all day long on a kind of lever that raises this rammer about two feet, and then lets it fall by its own weight. From time to time a few pails of water are thrown into the hole, to soften the material of the rock, and reduce it to pulp. The rammer is suspended to a rattan cord, not thicker than finger, but as strong as the ropes of catgut. This cord is fixed to the lever, and a triangular piece of wood is attached to it. And at night these two are replaced by another pair of workmen. When they have bored three inches, they draw up the tube, with all the matter it is loaded with, by means of a great cylinder, which serves to roll the cord on. In this manner these little wells or tubes are made quite perpendicular, and as polished as glass. Sometimes the ground is not rock all through, but beds of coal and other materials are found, and then the operation becomes more difficult, and sometimes even entirely useless ; for, as these substances do not all offer equal resistance, it may happen that the well loses its perpendicularity ; but these cases are rare. Sometimes the large iron ring that suspends the rammer, breaks, and then five or six months' labour are needed before it is possible, with the help of other rammers, to break up the first and reduce it to a pulp. When the rock is good, the work advances at the rate of two feet in twenty-four hours, so that about three years are required to dig a well. To draw water from it, a tube of bamboo, twenty-four feet long, is put down, at the bottom of which there is a valve or sucker ; when it has reached the bottom, a strong man sits on the rope, and shakes it, so that every shake opens the sucker, and makes the water rise. The tube being full, a great spindle-shaped cylinder of fifty feet in circumference, upon which the rope is wound, is worked by two, three, or four buffaloes, till it is drawn up. This rope also is made of rattan. The buffaloes, however, are very ill suited to this labour, and they die in great numbers. The water of these wells is very saltish ; it gives, on evaporation, one-fifth, or even sometimes one-fourth. The salt is also of very acrid quality, so much so as often to inflame the throat to a painful degree ; and it is then necessary to make use of sea-salt, which is brought from Canton or Tonquin. The air that issues from these wells is highly inflammable. If when the tubeful of water is near the top you were to present a torch at the opening, a great flame, twenty or thirty feet in height, would be kindled, which would burn the shed with the rapidity and explosion of gunpowder. This does happen sometimes through the imprudence of workmen, or in some cases from a malicious desire to commit suicide in company. There are some wells from which fire only, and no salt, is obtained, they are called Ho-tsing, fire wells. A little tube of bamboo closes the opening of the well, and conducts the inflammable air to where it is required ; it is then kindled with a taper, and burns continually. The flame is of a bluish colour, three or four inches high, and one inch in diameter. Here the fire is not sufficient to boil the salt, but at about forty leagues off there are much larger fire wells. Showmen often fill bladders with it, and carry it about the country ; they make a hole in the bladder with a needle and kindle it with a taper, to amuse lookers on. This is no doubt what the chemists call carburetted hydrogen. Sse-Tchouen, the most remarkable of the eighteen provinces of China, is that in which christianity is the most flourishing. It counts nearly a hundred thousand christians, mostly zealous and faithful in the fulfilment of their duties.—*Huc's Chinese Empire, Vol.* i, *pp.* 288 *to* 303.

SSIPAN DAGH. The mountain called the Ssipan Dagh rises to the height of 10,000 feet, and lies between lake Van and the Murad Tchai or Eastern Euphrates. The river there is crossed on a raft, supported on inflated skins. The mountain appears to rise abruptly from the plain and is covered with perpetual snow.

STACHYS. A genus of plants of no great beauty, weedy nature and hardly worth cultivating.—*Riddell.*

STACHYS MALABARICA, *Sieb.* Syn. of Anisomeles malabarica.

STACHYTARPHETA JAMAICENSIS, *Vahl.*

Jamaica bastard verbain, ENG. | Rata-nil-nakuta, CEY.

An annual, with blue flowers in terminal spikes; common.—*Riddell.*

STACHYTARPHETA MUTABILIS. A shrubby plant with variegated scarlet flowers in terminal spikes ; propagated by cuttings.—*Riddell.*

STADMANNIA TRIJUGA, SPR. Syn. of Schleichera trijuga, *Willd.*

STAFF CORPS a system of officering the native army of British India, introduced into India by the Royal Warrant of 16th January 1861.

Statement showing the different grades in the Bengal, Madras and Bombay Staff Corps for the next 10 years, compiled from Army Lists, corrected to 31st Dec. 1871.

The promotions have been made to the end of each year.

JUBBULPORE,
March 1872.

139 Probationers in the 3 Staff Corps not included in the above.

STAFF, a staff with a crooked head is carried by Arabs. The Darvesh carry a staff.

STAFF TREE, Celastrus paniculatus, *Willde.* Staff-tree oil, oil of Celastrus paniculata. See Malkunguni.

STAG. The sub-family Cervinæ of the family Cervidæ, are the true stags, and comprise the Kashmir stag or Cervus wallichii; the Sikim stag or Cervus affinis.

Cervus wallichii, Cuv., Blyth, F. Cuv. The Kashmir stag.

C. caspianus, *Falconer.*	C. cashmiriensis, *Falconer*
C. elaphus, *Pallas.*	C. nareyanus, *Hodgson.*
Barasingha, HIND.	Maral, PERS.
Hangul; Honglu, KASH.	

The Kashmir stag is about 7 or 7½ feet long and from 12 to 13 hands high with a tail about 5 inches. It is found in Kashmir, and as far as the Blacl Sea in Central and Western Asia, and it is common in Persia. Its horns, in the adult are usually bifurcate in the extremities. In summer its hair is bright rufous, passing into liver-brown or bright pale rufous chesnut. It nearly approaches the red deer of Europe. It inhabits the magnificent pine forests, usually, in summer, at a height of 9,000 to 12,000 feet, but coming much lower in autumn and winter. The horns are perfect in October when the rutting season begins, and the stags may be heard bellowing in the woods all day long and they are then easily stalked. The females gestate till April. The Kashmir stag flies before the tare and markhor, when the two latter are driven by the rigors of winter to seek food and shelter in the deer forests, for it is seldom they leave the dizzy crags or the mountain-tops unless forced by severity of weather.

Cervus affinis, Hodgson, Blyth. Sikim stag.

Sia rupchu,	Shou, TIB.

The Sikim stag is about 8 feet long, and about 4½ to 5 feet high with pale smooth horns bifurcate at the tip. In summer it is of a pale rufous colour, in winter a fine clear grey with a moderately large white disk. It nearly resembles the Wapiti of Canada. It inhabits Eastern Tibet and the Choombi valley on the Sikim side of Tibet. It is probably the great stag of N. China, the Irbisch of Siberia and the Alain of Atkinson.

Cervus barbarus, Bennett. Stag of N. Africa.

Cervus sika, Schlegel. Japan stag.

Cervus mantchuricus, Swinhoe. Stag of Mantchurea.

Cervus taiouensis, Swinhoe. Stag of Formosa.

Tarandus rangifer, the reindeer of the glacial regions.

Dama vulgaris is the fallow deer of Europe.

Alces machlis, Ogilby. Is the elk or moose-deer from the marshy forests of the E. and W. continents, is six feet high.—*Adams, Jerdon.*

STAGMARIA VERNICIFLUA, one of the black varnish trees of China.—*O'Sh.*

STAGNATA, IT. Tin ?

STAGNO, IT. Pewter ?

STAGPA, HIND. Betula bhojputra.

STAHL, GER. Steel.

STAL, RUS., SW. Steel.

STALACTITE and Stalagmite. Stalactitic carbonate of lime occurs chiefly in long masses suspended from the roofs of caverns in limestone rocks. Stalactites appear to be continually forming ; water containing carbonate of lime held in solution by carbonic acid, trickling through crevices in the roofs of the caverns, gradually during its exposure to the air loses its carbonic acid, and consequently deposits its carbonate of lime ; the water passing over the portion first deposited gradually adds to it, and eventually gives the carbonate of lime its great length and stalactitic character. The latter deposits, called stalagmites, are formed on the floor of the cavern by the water there depositing that portion of its carbonate of lime which is not separated during the formation of the stalactite. Caverns are sometimes nearly filled with these deposits. Carbonate of lime, is a very abundant mineral in the Tenasserim provinces and embraces several varieties. Stalactical carbonate of lime is one of these. All the Tenasserim limestone caves have stalactites hanging from their roofs ; and stalagmites raised on their floors. The Siamese Karens often bring over bits of limestone of the shape of a shell, and when broken, a shell usually of the genus melania appears, that has been encrusted with carbonate of lime. Much of the alabaster of which ornaments are made is stalagmite ; but all the alabaster images of the Tenasserim coast are made of marble : and not of compact gypsum, which they much resemble.—*Eng. Cyc., Mason.*

STALAGMITES CAMBOGIOIDES, see Dyes, Clusiaceæ, Gamboge, Hebradendron, Oosara rewand.

STALAGMITES OVALIFOLIA, *Brown and Graham.*

Xanthochymus ovalifolius.

A native of the southern provinces of India and Ceylon. The seeds were sent from Ceylon by General Hay MacDowal, to the Calcutta garden, under the Singhalese name Ambul ghorka ; in 7 to 10 years the trees began to blossom during the whole of the hot season, and in July 1812, when ten years old, they produced perfectly ripe fruit. Dr. Wight was of opinion that this tree yields one kind of the gamboge of Ceylon.—***Roxb.*, *Vol.* ii, *p.*** 632 ; ***O'Shaughnessy*, *p.*** 236.

STALAGMITES PICTORIUS, *G. Don.*

Xanthochymus pictorius, *Roxb.*

Dampel,	BENG., HIND.	Kata Ghorka,	SINGH.

A native of the mountainous districts of India ; leaves opposite, linear, lanceolate ; flowers in lateral fascicles, berry ovate, pointed. Fruit ripens in November and December, and the tree yields a large quantity of inferior gamboge.—*O'Shaughnessy, p.* 236.

STAN, or St'han, SANS., PERS. A place, a country, as Hindustan, Affghanistan, Beluchistan, the country of the Hindoo, Affghan, Beluch.

STAN-GYUR, see Koros.

STANIZYE, are an agricultural, and the Ahmed Zye a pastoral, tribe of Affghans : these as also the Kaisur Kheil and Summulzye or Ismail Zye, who have migratory habits, but dwell to the south and east of Ghizni, are sub-divisions of the Suliman Kheil. The Shirpan are an associated body, formed out of the other kheil. Ghizni is a Ghilzye town. See Affghan.

STANLEY, a traveller who went in search of Dr. Livingstone into the interior of Central Africa.

STANLEY, Lord, was the first Secretary of State for India, and ex-officio President of the India Council. On the resignation of Lord Ellenborough, in May 1858, Lord Stanley resigned the Colonies into the hands of Sir E. Bulwer Lytton, and became President of the Board of Control. The latter board merged into the Council of State for India, the result of a bill to that effect introduced by Lord Stanley during the Parliamentary Session of 1857-58, and which received the royal assent in July 1858.

STANNUM, LAT. Tin.

STANNUM INDICUM, LAT. Zinc.

STAPELIA, an extensive genus of plants, belonging to the Asclepiadeæ with curiously marked flowers like a toad's back, they are star-shaped, and grow from the roots ; these plants being succulent, are apt to drop off if grown in too rich or moist a soil, they give seed and may be cultivated from it, but more readily from slips shaded partially, and watered sparingly.—***Riddell.***

STAPELIA BUFFONIA.

Kar alum, DUK.

Toad-like Stapelia.

STAPELIA GRANDIFLORA and S. variegata.—The species are stemless plants with fœtid flowers, star-shaped, colour resembling a toad's back : the plants should not have much water or be exposed to the sun ; easily propagated by seed or cuttings.—***Riddell.***

Serpent stick,	ENG.	Kaghania,	„

A small tree found by Dr. Royle in the Himalaya, at an elevation of 7,000 feet, not uncommon in Murree and Hazara. Bark of branches speckled, whence, on the doctrine of signatures, arises the belief that a branch or stick of it kept by one will drive away snakes. It is often found in the Himalaya from 6,000 to 9,000 feet, up to the Indus, and beyond it. Dr. Wallich, procured it from Srinuggur, Dr. Royle found it on Urukta, about 7,000 feet of elevation, also near Burkote, and had it brought to him from near Peer Punjal.—*Royle, Ill. Him. Bot., p.* 165 ; *Roule., Ill. Him. Bot., p.* 166.

STAR. Niebuhr considers that the stars are brighter in Norway than in the Arabian deserts. Burton says he never saw them so bright as on the Neilgherry hills.

STAR-ANISE.

Badian-i-khatai,	AR., PERS.	Anise d'etoile,	FR.

Pah-koh-hwin-hiang,	„	Skimmi,	JAP.
Anas-phool,	DUK.	Anasi-pu,	TAM.

Star-anise is the fruit of the Illicium anisatum of Linnæus, a shrub or small tree, which grows in several places in the south eastern parts of Asia, in China, Japan, the Philippines, and the countries extending from China to Japan from 23½° to 35 N. lat. The name is given from the clustering star like form assumed by the capsules or pods, five to twelve in number, joined together at one end and diverging in rays generally fine. These are used all over the east, as a condiment. They are prized for the volatile oil obtained from them, and for their aromatic taste. The barks have a more aromatic flavour than the seeds, but they are not so sweet. In China, their most common use is to season sweet dishes . In Japan they are placed on the tombs of friends and presented as offerings in the temples. They are chiefly exported direct to India, England, and the north of Europe, at the average value of 8½ dollars per picul. In 1850, 695 piculs were exported from Canton, valued at 8,200 Spanish dollars. In India they are much used in seasoning curries and flavouring native dishes, and large quantities are used in Europe in the preparation of liqueurs. 3,000 piculs of anise are exported annually from Cambodia, and, in 1848, 81 piculs of oil of aniseed, valued from 11,900 dollars were exported from Canton. In preparing a spirit of anise, the Star Anise, may be used instead of common anise. In England, it is from this fruit that the oil of anise is prepared, and it imparts the peculiar flavour of Anisette de Bourdeaux.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 308 ; *Morrison* ; *Simmonds* ; *Faulkner* ; *O'Shaughnessy, Beng. Phar., p.* 421 ; *Vegetable Kingdom,* 23. See Illicum anisatum.

The starch of commerce is procured generally from wheat flour and potatoes. The best kind is white, soft, friable, and easily reduced to powder. It is insoluble in cold water and alcohol, but readily affords a gelatinous solution in warm water, which is largely employed for stiffening articles of wearing apparel, and for dressing some descriptions of goods after weaving. It is also much employed by calico printers, and others. Starch is very generally present in the vegetable kingdom. It occurs in the forms of irregularly-shaped granules enclosed in the cells of plants. It is easily detected in the cells of plants under the microscope, by the addition of a small quantity of solution of iodine which immediately gives to the starch granules a blue colour. Starch can be readily separated from the tissues of plants, on a large scale by bruising them and stirring them in water ; when left at rest the cellulose of the tissue falls to the bottom of the vessel, and the starch floats in the water. If the water containing the starch be now poured off and allowed to stand a few hours, the starch will fall to the bottom of the vessel, and is easily collected. In this way it is obtained for commercial and dietetical purposes. Starch is thus found to be diffusible through water, but not soluble in it.

Starch differs from cellulose, on the one hand, by its diffusibility through water ; and on the other, from dextrine, sugar, and gum, by its insolubility. In composition it resembles these substances, and during the growth of the plant it is evidently converted into one or the other according to the necessities of the plant. Starch is easily manufactured, and is largely used in several of the arts, as well as an article of diet. It can be obtained from a great variety of plants, and many of the most productive of it are natives of the tropical countries in the East. Starch occurs in the forms of irregularly-shaped granules enclosed in the cells of plants, and can be easily separated from the tissues of plants, on a large scale by bruising them, and stirring them in water ; when left at rest the cellulose of the tissue falls to the bottom of the vessel, and the starch floats in the water. Starch is one of the constituent parts in all mealy farinaceous seeds, fruits, roots, and other parts of plants. In the West Indies, the Maranta arundinacea, allomyca, and nobilis and various species of Canna furnish this fecula. Two varieties of Cassava furnish a very superior quality, which is known in commerce as Brazilian arrowroot, the amylaceous matter from Zamia pumila and other species at the Cape of Good Hope has been sent as arrowroot, a similar product is obtained in Chili from Alstromeria pallida, and the Singhalese get a kind of starch from the nut of the Cycas circinalis by pounding the fresh kernels. The following are the chief fecula or starch-like substances of the East and may be consulted separately also under the heads Arrow Root, Food and Marantea.

,,	..Cycas circinalis.

The specific quantity of starch derived from several plants varies from 1·41 to 1·47, and probably those specimens prepared from dry seeds, such as wheat and maize starch, which, as commercial articles at least, are less pure than those prepared from recently dug roots, have also the lowest density. As an article of diet, the most tenacious varieties of starches are preferred, on account of the economy of employing an article of which a less quantity will suffice, and the same is true when applied to starching linen, provided the jelly be not deficient in clearness. In respect to tenacity, there is a very great difference between the jellies prepared from the different starches, a disc of jelly prepared from sweet Cassava breaking with 78 grains, while that of a jelly from the Tous les mois, of the West Indies did not break with a weight of 2,446 grains. Experiments of a similar kind are required to test the starches of India. When starch jelly is used for the purpose of starching or glazing linen, or cotton goods, the most transparent varieties are preferred, provided they also possess the requisite tenacity, but on this point, also experiments regarding the Indian starches are necessary. Starches from different plants are best distinguished from one another by examining either as transparent, opaque, objects, their grains or globules with a microscope, for though in the same species, there are considerable differences in size and form, the different kinds are on the whole quite distinguishable. This is of the more importance because the adulteration of starches is chiefly effected by mixing a cheap variety with a higher priced one, and in practice when the observer has a number of pure and authentic specimens before him to have recourse to as standards of comparison, the discrimination is by no means difficult. In making a decoction of starch for medicinal purposes, instead of European starch, Indian arrow-root (tikor,) can be employed. The mahomedans of lower India prepare starch from wheat as in Europe ; they also sometimes make it from some of the edible roots, such as the Kooa, a variety of Curcumaangustifolia.

Wild ginger grows everywhere in the Chittagong district; it is very difficult to eradicate it from land, as the smallest root or piece of a root that has an eye will spring up again. The plant dies off in December. The yield of starch from it was estimated at 1 ounce from 1 pound of the root. The supply of the root being inexhaustible, any quantity of starch might be extracted from it yearly, and it might be found a valuable article of commerce. There would be no expense for cultivation, and allowing for the cost of digging the root, and manufacturing the starch by bruising and macerating the root in water and drying the deposit, the product would be cheaper than Arracan rice, which is believed to be largely exported to Europe to be used, not as food, but in manufacture for glazing linen, &c.

Gluten is identical with fibrine, and is a form of protein. The straw of wheat, and the chaff, or the culm, and the flowers, also contain 79 per cent. of organic matter. This consists principally of unazotised vegetable matter, and may therefore be used as an article of diet for cattle. The culms of wheat are also used for the purpose of making plait from which straw hats and bonnets are made, a manufacture of considerable importance in some parts of Europe. The ultimate dietetical action of all starches is the same, and the preference given to arrowroot is due to its flavour alone. It makes a good jelly, but it smells and tastes slightly of linseed oil, and leaves a faint bitter taste upon the palate ; and unless this is due to want of care in its preparation and can be got rid of, it would not be acceptable to Europeans. As to the nutritious quality of starch, modern research has shown it to be deficient in flesh-producing properties, and that it can only be called strengthening when mixed, as it usually is with milk, or flour containing gluten. It would therefore appear to be a mistake to suppose that as an article of diet it can be equal to twice the quantity of flour of Panicum grossarium, which in all probability, besides its starch, contains a considerable quantity of gluten. The starch granules in C. tuberosa are compound, and they have in consequence a very different shape from the various arrowroot starches from which they can be easily distinguished with the microscope. They vary much in size, the smaller having a diameter less than 1-11,000ths of an inch. They dipolarize, and the usual black dot can be seen in granules of 1-5,000ths of an inch in diameter.—*Roxb.* : *Ainslie, p.* 336 ; *Revd. James F. Kearns, Missionary S.P.G.* ; *Captain J. STAR FLOWER, ENG. Callistephus Chinensis, *DeCand.*

STARGA, HIND. Juglans regia, Walnut.

STARLINGS, are birds of the genera Sturnus and Sturnopastor of the sub-family sturninæ and family sturnidæ. The spotted winged starling (Saraglossa spiloptera) a native of the hills, although not common, as many as half-a-dozen may be seen at one time among the woods and jungles of the lower hills during the hot months. In winter it may possibly retire to the hot Himalayan valleys. The Sardinian Starling or glossy black (Sturnus unicolor, *Marmora*) is likely, to be confounded with the common starling, to which it assimilates in habits as well as general appearance. It is glossy black without white specks. Sometimes both species are seen feeding together on dunghills and in fields ; and although the former is the more common, the latter was often observed by Dr. Adams during rambles on the banks of the river. It is found in the south of Europe, north of Africa, Western Asia, Sindh, the Punjab and Cashmere, and builds in holes of decayed trees.

The Common Starling.

Sturnus vulgaris, *Linn.*
Sturnus indicus, *Hodg.*
Sturnus splendens, *Temm.*

Telia-mina, HIND.
Tilora of Ghazepore, ,,
Nakshi telia of Agra, HIND.
Tilgiri of Cashmere, ,,

Is glossy-black with a pale whitish or brownish tip to each feather, giving the bird a pretty speckled appearance. It is found from Cashmere southwards to Purneah on the Ganges. It associates in large flocks feeding both on grain and on insects among cattle, associating with the common and black mynas and roosting on high reeds at night. In Cashmere it breeds in holes and bridges, of tall trees, &c.

The Pied Starling.

Sturnopastor contra, *L.*
St. capensis, *L.*
Pastor jalla, *Horsf.*

Ablaka gosalik, BENG.
Ablaq maina, HIND.
Guia-leggra, TEL.
Venda-gorinka, ,,

The pied starling is found throughout the north of India southwards to Hyderabad in the Dekhan. Its head, neck and the upper part of its breast are glossy-black, and back, wings and the tail, also black, slightly glossed. Ear-coverts white ; extending in a narrow line to the nape, upper tail coverts, also white, also an oblique bar on the wing. It has a pleasant song and is a great imitator of other birds.

Sturnopastor superciliaris, occurs in Malayana.
Pastor jalla, " "
,, tricolor, *Horsf.*, Java.
,, temporalis, *Wagler*, China.
Sturnus cineraceus, *Temm.*, Japan.

STAR OF INDIA, an order of knighthood, Commanders and Companions, established by Queen Victoria for British India. It consists of the Sovereign of the Order ; Her Majesty the Queen, of the Grand Master, the Viceroy and Governor-General of India of Knights Grand Commanders, Knights Commanders and Companions. In A. D. 1871, the Knights Grand Commanders, the Knight Commanders, and Companions of the Most Exalted Order of the Star of India, were as under :—

SOVEREIGN.
Her Majesty the Queen.
GRAND MASTER.
The Viceroy and Governor-General.
KNIGHTS GRAND COMMANDERS (G.C.S.I.)

The Prince of Wales.
The Duke of Edinburgh.
The Maharajah of Gwalior.

Lord Harris, (Madras.)
Dhuleep Sing.
The Maharajah of Cashmere.
Sir George R. Clerk, K.C.B. (Bengal c.s.)
The Maharajah of Indore.
The Guicowar of Baroda.
Lord Lawrence, G.C.B. (Bengal c s.)
General Lord Strathnairn, G.C.B.
General Sir George Pollock, G.C.B.
The Maharajah of Jeypore.
The Maharajah of Rewa.

Colonel Michael Dawes.
Baboo Shiva Persad.
Rajah Emy Kischen Doss.

STATICE, Sea lavender. Many of the species bear pretty purple, white and blue flower, and are much cultivated in Britain ; S. arborea is a very handsome shrub and requires a large space for its spreading roots, is propagated by seed, in good garden soil.—*Riddell.*

STATICE CORIARIA, see Dyes.

STATISTICS OF BATTLES. At Waterloo, the Duke of Wellington, lost in the proportion of 1 to 6. In that battle, out of a British force of 36,273, there were killed 1,417, making about 3·9 per cent. ; but, including 362 men killed of the King's German Legion, the ratio rises to 4·9 per cent. The total force, British and allied, under the Duke of Wellington, amounted to 69,686, out of which there was a total killed of 2,947, or a grand total killed of 4·2 per cent. British and allied. The Indian returns show the following ratios :—

1803...Assaye.......	1 to 3
1804...Dieg..... ...	1 „ 4½
1817...Mehidpore..	1 „ 6
1817...Sitalbuldy..	1 „ 4½
1818...Korygaum..	1 „ 3½
1845...Maharajpore..	1 to 6

1848.Chillianwallah.	1 „ 7

The loss of the defeated in every affair, except perhaps the last, greatly exceeded that of the British. Seringapatam, in 1799, was stormed and captured by 4,376 men, in two columns. The loss in the assault was

	Killed.	Wounded.	Missing.
European Officers..............	22	45	0
„ N. C. O. and Soldiers.	181	122	22
Native Soldiers..................	119	420	100

making a total, killed, wounded and missing, of 1,031 men. Of the above officers, 25 were killed and wounded in the assault. Lord Lake, with an original force of 9,000 men, augmented afterwards by the force from Bombay, according to Major Hough, appeared before Bhurtpore in January 1805. During four successive assaults, each increasing in desperation, Lord Lake was repulsed with losses of killed and wounded on each occasion, as follows:—

First assault............	456
Second do.	573
Third assault...........	894
Fourth do.	987

Total 2,910 men killed and wounded.

There were of officers killed 15, and 85 wounded, making a total of officers, killed and wounded, 100. Major Thorn gives the loss, in all the operations, at 3,100 men and 102 officers, killed and wounded. During the expedition to Walcheren in 1809, 1·67 per cent. of the entire force was killed in action, and 32·2 per cent. perished by disease, making a grand total of 34·69 per cent. in that fatal and ill-directed attempt. Of the losses in the earlier campaigns of the French revolutionary war we receive but the following general statements :—In 1794, says Mr. Fergusson, the French army in Flanders, composed principally of mere boys, many of them of five feet, three or four inches in height, kicked us before them like a foot-ball through Flanders and Holland into Germany, destroying in their course full three-fourths of our army. The same authority, speaking of the same campaign, says that "by disease, by famine, by the rigour of the season, and by the sword, out of a host of fully 30,000 men, when the retreat from Flanders first began, scarcely 8,000 remained to witness its completion." In the Peninsular army, again, under the Duke of Wellington, taking forty-one months during which the war was carried on with the utmost vigour, an annual mortality of about 4 per cent. occurred in battle and from wounds, and 12 per cent. was from disease, being nearly 16 per cent. of those employed : whereas, in the first year of the Burmese war 3½ per cent. of the British troops were killed in action, and 45 per cent. perished by disease, making a total loss of 48½ per cent.; consequently each person employed throughout that year encountered more risk of life than in three Peninsular campaigns. In the second year of the Burmese war, the losses in action, and by disease, were about one-half of what occurred in the first, making a total for two years of 5½ per cent. killed in action, and 67½ by disease, or a grand total for the two years of 72¾ of the European force employed under Sir Archibald Campbell. The official records exhibit a loss of 61 officers of the British army alone, killed, wounded and died of disease,—"a very heavy loss indeed," says Col. Tulloch, "considering that the average number of officers present did not probably exceed 150." The expedition to Rangoon, during the first Burmese war, was therefore the most fatal of which we have any record.—*Major Hough*; *War Office Statistical Report, presented to both Houses of Parliament, by command of Her Majesty* ; *The Lancet, No.* xi, *Vol.* ii, *Sept.* 10, 1853.

STAUNTON, Sir George Thomas, *Bart.* ob. August 10, 1858. Was born at Milford-house, near Salisbury, in 1781, and succeeded his father, the first baronet, in 1810. He was educated in Trinity College, Cambridge. After leaving, he was appointed chief supercargo for the East India Company, and was President of the Select Committee at Canton, and Commissioner of Embassy to

Pekin in 1816. In 1818 he was elected member for the borough of St. Michael's, which was extinguished by the Reform Bill. For St. Michael's he sat two years. In 1830 he was returned for Heytesbury, another borough abolished by the Reform Bill. In 1832 he was elected member for the southern division of Hampshire, which he unsuccessfully contested in 1835 and 1837. In March 1838 he was returned for Portsmouth, and sat for that borough 14 years—namely, until July 1852, since which time he had no seat in Parliament. Sir George was the author of a translation of the Penal Code of China, and wrote several works, which are held to be authorities on the subject, on British relations with that country. His father, the first baronet, was Secretary to Lord Macartney, Governor of Madras, and received his title after the negotiation of the peace with Tippoo Sultan in 1784. He was subsequently Secretary of Legation during Lord Macartney's well-known embassy to China in 1792. With the death of Sir George Staunton, the baronetcy became extinct. With the embassy of Lord Amherst, were present Sir Gorge Staunton, who made the well-known and well-done translation of the Chinese Penal Code ; and Sir John Davis, subsequently author of "the Chinese," and translator of several works, and who was then, as a young man, chosen to accompany the embassy precisely because he did know the language. Lastly the interpreter of the embassy was Dr. Morrison, author of the best Chinese dictionary in existence ; and whose knowledge of the Chinese language, people and institutions was great.

STAUNTONIA LATIFOLIA, *R. Br.*

Hollbollia latifolia, *Wall.*

Ramkela. | Gophla.

A twining shrub of Nepal and Kemaon, at elevations of 5,000 and 6,000 feet. The fruit has a sweetish pulp, and is eaten by the people.—*Voigt.*

STAUNTONIA ANGUSTIFOLIA, *R.Br.*

Hollballia angustifolia. *Wall.*

A plant of Nepal, *Voigt.*

STAWIN MAHR. Alstonia scholaris, *R. Br. Don.*

ST. BARBE, called Pulo Panecky Bessar, by the Malays, is in lat. 0° 7' N., long. 107° 16' E., 9 miles east of Gaspar Island. It is high, of a triangular form, about 3 miles long. When first discerned it appears like two or three islands, being lower at the centre than at the N. E. and W. parts.

ST. DAVID, or Free-will Islands, N. W. of New Guinea, in lat. 0° 55' N., and long. 134° 21' E., form a close group four in number.—*Horsfield.*

STEAM WOOD, see Ahvi maram.

STEARINE, the harder portion of animal fats : olein or elain being the softer one. Stearine yields an acid, called Stearic acid, having the form of brilliant, white, scaly, crystals, which is largely employed in soap and candle-making.—*Waterston ; Faulkner.* See Candles.

STEATITE is common in Southern Asia, and of all sorts and colours. At Kurnool and at Salem and near Mysore there are very fine and beautifully white soapstones, and near Chittoor there is a valuable description, (similar to the Cornish serpentine) procurable in large blocks and suitable for many statuary and decorative purposes. There is a quarry of excellent potstone at the Nagery Hills, which is likely to become a valuable addition to the Madras trade. The stone is of fine grain, easily worked with the chisel and susceptible of a high polish, when oiled this stone resembles in a great degree black marble. Some interesting specimens of manufacture in this material show a considerable advancement in design and execution.—*M. E. J. R.* See Soapstone.

Steel is iron combined with a small quantity of carbon. It is brittle, resists the file, cuts glass, affords sparks when struck on flint, and retains the magnetic virtue for any length of time. It loses this hardness by being ignited, and cooled very slowly. Steel is used for making razors, surgeon's instruments, swords, forks, &c.

Konasamoondrum Steel, is made at several villages in the Circar of Elgundel at Ibrahimputnam, and Konapore in the Karaolla purgunnah, and at Atmacore and Chintulpet in the Velloorla Talooka, it formerly was prepared at several other places, but the steel furnaces in them are now abandoned. The teepoor as it is called, the raw material of the steel, is manufactured at Maytpilly, a village twelve miles south of the Godavery, belonging to Balmookund, from a ferruginous sand procured from gneiss by roasting, pounding and washing. The whole process of the manufacture of this steel is detailed with accuracy and minuteness by Dr. Voysey in the first volume of the Asiatic Society's Transactions, and also by Dr. Malcolmson in the Geological Society's Transactions of 1839.

Both these gentlemen visited the steel furnaces at Konasamoondrum in the adjoining district of Neermul which supply the material from which the Damascus blades are manufactured. The steel manufactured at these villages is very inferior to the Konasamoondrum steel—and does not fetch half its price. Yet the teepoor is used for both, and the same care is apparently bestowed in the preparation, the only difference that could be detected was that the pure iron which along with the teepoor and the bran is placed in the crucible, as in the case of the Konasamoondrum steel prepared from the yellow clay iron ore, found in the laterite at Taatpilly, while at Ibrahimputnum and the other villages any iron without reference to the ore from which it is smelted is used. The exact chemical condition of the metal under the form of steel has as yet evaded scientific investigation which renders it probable that the inferiority of the Ibrahimputnum steel may be attributable to this one neglect. The Mogul who rented the Konasamoondrum furnaces would seem to be of this opinion as he holdsa strict monopoly over the Taatpilly iron, insomuch that Voysey had some difficulty in procuring a specimen of the metal. In the steel furnaces, five men are employed, viz., the principal workman who has the care of the crucibles, which he is continually moving about the furnaces by means of a long iron rake, and four bellows men. The daily pay of the chief is two seers of rice, and two annas a day. The others receive half the rice and money, if the steel comes out of the crucible at all blistered or unequal on the surface, it is rejected as worthless. There are two kinds of crucibles, the large and the small, each of which contains a lump of steel of from one to two pounds in weight. The cost of the furnace varies from four to six annas for the smaller pieces, and from eight to ten annas for the larger. The workmen complain that the Hyderabad market is now lost to them, their steel being undersold by steel from Europe, which is there preferred for the manufacture of arms. The chief consumption is confined to the country about, where it is used for hatchets, sickles, &c. At Lingampilly and another village, both close to Aimulwarrah, barrels for pistols and matchlocks are prepared. All kinds of old iron, old moat buckets, agricultural instruments, &c., are collected and formed into rods of the thickness of a man's finger. These are then twisted by an instrument for the purpose; three or four of these rods are joined together lengthways, another band of iron of the same breadth and of the thickness of a third of an nch is taken and welded to this, both being formed into a band which is twisted and afterwards beaten into a solid cylinder which is bored by a hard steel chisel. Pistol barrels are made after this manner, but less trouble is bestowed in the manufacture of a coarser kind of matchlocks—the process commencing with simply twisting a band of metal. Pistol barrels manufactured by the first process are sold for rupees twenty and upwards, and matchlock barrels so prepared for double that amount, the last made after the simpler manner are much cheaper. Swords, daggers, bullum and spear heads are manufactured at Elgundel from the country steel. The manufacture of steel is a branch of industry for which India has long been celebrated. This substance can be made of good quality in small quantities and at a comparatively trifling cost; the process is more carefully conducted than that of making iron and the results are on the whole more satisfactory. Some defects however are found in the cast steel of India, which interfere materially with its sale in the European market. These are the hardness of the external surface of the melted lumps, and their inequality, few being alike. The hardness is caused by the lumps cooling too rapidly on the surface from the small size and thinness of the crucibles. This branch of manufacture is susceptible of improvement in India, and there is a great abundance of rich ores, fluxes, and refractory clay in most of the districts of this Presidency. The great desideratum, however, is a bed of good coal that would convert into coke. Some of the black sandstones and band irons exhibited in this class with their accompanying strata of lime, fire-clay, white pipeclay and thick beds of yellow and red sandstone, are very similar to those found in the coal-bearing strata of Bengal and other countries.

The steel wire of Chinnapatam, in Mysore, has long been known: a specimen exhibited by the Superintendent, Bangalore Division, was worthy of honorable mention. The ore from which Wootz or Indian Steel is made is a magnetic oxide combined with quartz, generally in proportion of 48 parts of quartz to 52 of oxide of iron. It is found in many parts of the south of India, but Salem is the chief seat of the manufacture, and there the ore is prepared by stamping and separating the quartz either by washing or winnowing. The furnace in which the ore is smelted is from three to five feet high from the surface of the ground, and the ground is hollowed out beneath it to the depth of eight inches or a foot. It is somewhat pear-shaped, being about two feet diameter at the ground and tapering to about one foot diameter at the top ; it is built entirely of clay. Two men can finish one in a few hours, it is fit for use the next day ; the blast is furnished by a pair of bellows each being a goat skin with a bamboo nozzle ; a semi-circular opening about a foot and a half high and a foot in diameter at the bottom is left in the furnace, and before each smelting it is filled up with clay : the furnace is then filled up with charcoal, and kindled, a small quantity of ore, previously moistened to prevent its receiving the charcoal, is laid on the top of the fuel, and charcoal is thrown over it to fill up the furnace: in this manner ore and fuel are added and the bellows plied for four hours or thereabouts, when the process is stopped, and the temporary wall in front of the furnace having been broken down, the bloom is removed by a pair of tongs from the bottom of the furnace, and is then beaten with a wooden mallet to separate as much of the vitrified oxide as possible : and, while still red hot, it is cut through with a hatchet and in this state sold to the blacksmiths, who perform all the subsequent operations of forging it into bars, and making it into steel. The process of forging into bars is performed by sinking the blooms in a small charcoal furnace and repeated heatings and hammerings to free it as much as possible from the vitrified and unreduced oxide of iron : it is thus formed into bars about a foot long, an inch and a half broad, and about half an inch thick. In this state it is full of cracks and exceedingly red short. These bars are cut into small pieces to enable them to pack in a crucible. A quantity amounting to a pound and a half to two pounds is put into a crucible along with a tenth-part by weight of dried wood of the Cassia auriculata chopped small ; these are covered with one or two green leaves of the Calotropis gigantea or Obulus laurifolius and the mouth of the crucible filled up with a handful of tempered clay, which is rammed so as to exclude the air perfectly. As soon as the clay is dry, twenty to twenty-four of the crucibles are built up in form of an arch with their bottoms inwards, in a small furnace urged by two goat skin bellows, charcoal is heaped up over them, and the blast kept up without intermission for about two hours and a half, when it is stopped and the process is considered complete. The crucibles are removed from the furnace and allowed to cool, they are then broken and the steel which has been left to solidify is taken out in a cake having the form of the bottom of the crucible. When the fusion has been perfect, the top of the cake is covered with striæ, radiating from the centre, but without any holes or rough projections on it : when the fusion has been less perfect the surface of the cake has a honeycombed appearance, caused probably by particles of scoriæ and unreduced oxide in the bar iron, and often contains projecting lumps of iron still in the malleable state. The natives prepare these cakes of steel for being drawn into bars by annealing them for several hours in a charcoal fire actuated by bellows, the current of air from which is made to play upon the cakes whilst turned over before it at a heat just short of that sufficient to melt them ; by this means the excess of carbon is detached. The process of smelting iron differs according to circumstances in different parts. In some, the ore is collected in the form of sand from the beds of rivers ; the iron stone is collected either from the surface or from mines.—*Major Cuth. Davidson, Assistant Resident* ; *M. C. C. for Ex. of* 1851 ; *Rohde, MSS. Mad. Lit. Journ.* ; *M. E. J. R.*

STEEL, Sir Scudamore Winde Steel, K.C.B., an officer of the Madras army died at the age of 76. He entered the E. I. Co.'s service in 1806 ; was employed in the Mahratta country from 1808 to 1810 ; in 1812-13 with the field force in the Southern Mahratta country ; at Kurnool in 1815-16 ; served during the Mahratta war in 1817-18 as assistant quartermaster-general with the army of the Deccan ; present at the reduction of the hill forts in the Gung-terry, and at Rajdehr ; he was slightly wounded in the head with a matchlock ball, at the siege of Malleganm ; several times honourably mentioned in despatches ; served in Kandeish in 1819-20 as assistant quartermaster-general ; served as assistant quartermaster-general to the Madras troops throughout the whole of the first Burmah war in 1824-26 ; and was engaged in every action, assault, escalade, or operation from the commencement to the close of the war ; seven times thanked in despatches, and twice thanked by the Governor-General in Council ; employed as deputy quartermaster-general with the Nagpore subsidiary force from 1827 to 1833 ; received thanks, on leaving office, from the quarter-master-general of the army ; planned the campaign for the reduction of the principality of Coorg, and was present during all the operations of 1834 ; thanked in despatches by the Governor-General ; in 1835 appointed military secretary to the Government of Fort St. George, with the rank of lieut.-colonel, being the first officer in the army ever selected for that important post ; retained that office till 1856 ; repeatedly thanked by the Governors and the several members of Council ; was senior commissioner in Coorg in 1839-40 ; thanked for that service both by the Governor-General and the Honourable the Court of Directors ; appointed military auditor-general in 1845 ;

received the thanks of Government and the Court of Directors; promoted to brigadier-general on the staff in January 1849; placed in command of the Madras division of the army of Burmah in 1852; was present at the relief of Pegu in December 1852; twice thanked in despatches; in January 1853 detached in separate command of the Martaban column to Toughoo, through a country never before traversed by a disciplined force; thanked by the Governor-General in Council, and his despatches published in the *London Gazette*; in 1854 was specially appointed to command the Pegu division and Martaban provinces, which he retained till January 1856. Sir Scudamore Steel bore a prominent part in nearly every campaign in which the Madras troops were engaged in the first half of the 18th century. He received the India War Medal and two clasps for Nagpore and Ava, and the Pegu Medal; was nominated C.B., 20th July 1838 and on the 19th December 1853 K.C.B., for his services in the second Burmah war. His commissions bore date as follows:—Ensign, 27th June 1806; Lieutenant, 11th September 1806; Captain, 27th March 1821; Major, 15th December 1832; Lieut.-Colonel, 9th April 1838; Lieut.-Colonel Commandant, 13th September 1847; Colonel, 8th March 1849; Major-General, 28th November 1854; Lieut.-General, 2nd September 1861.

STEENKOOLEN, also Steenkull, DUT. Coal.

STEGOSTOMA, a genus of fishes see Squalidæ.

STEINKOHLEN, GER. Coal.

STEKLO, RUS Glass.

STEINKOHLEN, GER. Coal, ENG.

STELLARIA MEDIA, *Sm.*

Kaaray muntha kiray, TAM.

The genus Stellaria is one of the Alsinaceæ or Chickweed tribe of plants. S. media grows on the Neilgherries, and S. triandra, *Wall.*, in Nepaul. This chickweed is used by the natives on the Neilgherries as a pot-herb, eaten alone, and mixed with others, probably introduced.—*Jaffrey.* See Vegetables of Southern India.

STELLATES, see Galiaceæ.

STEMONOPORUS, *Thw.* A genus of Ceylon plants, small or large trees. The S. affinis, *Thw.*, is a large tree, growing in the Hunasgiria district, at an elevation of 4,000 feet. S. canaliculatus, *Thw.*, a moderate-sized tree, of the Hinidoon and Reigam corles, at no great elevation. S. gardneri, *Thw.*, a great tree, near Adam's Peak, at an elevation of about 5,000 feet. S. lanceolatus, *Thw.*, is a small tree near Ratnapoora, at no great elevation. S. moonii, *Thw.*, near Maturatte. S. nitidus, *Thw.*, at Pasdoon corle, a middle-sized tree, at no great elevation. Thwaites also mentions, S. oblongifolius, S. petiolaris, S. reticulatus, S. rigidus, and S. wightii, a great tree, the Vateria ceylanica of Wight, and S. apicalis, a great tree of the damp forests, at an elevation of 1,000 to 2,000 feet, the "Ooroo-kannoo gass" of the Singhalese. S. apicalis, *Thw.*, (the Urandra apicalis, *Thw.*, in Hooker's Kew Journal of Botany,) grows in the damp forests at an elvation of from 1,000 to 2,000 feet. It is a large tree, its Singhalese name is Oorcokannoo gass.—*Thw.*, *p.* 43.

STEMONOPORUS WIGHTII, *Thw.* Syn. of Vateria ceylanica, *W. Ill.*

STENACTIS, a showy purple flower and well adapted for borders; it is a native of California and propagated by cuttings or dividing the roots.—*Riddell.*

STENKOL, Sw. Coal.

STENO MALAYANUS.

Dolphinus plumbeus dussumier, Cuv.
Dolphinus malayanus, Lesson, apud Cuv.
Param puan, Laut., MALAY.
Dolphin ventre roux of Paris museum.

Inhabits the Malabar Coast and coasts of Penang. It is numerous and rather heavy in its movements, but is rarely captured, except by chance in the stake nets. It eats small fishes, Clupea and Glyphisidon cœlestinus.—*Cuvier.*

STENO FRONTANUS, inhabits the Indian Ocean and the Pacific.

STENOPS JAVANICUS, *Auctor.* Syn. of Nycticebus tardigradus, *Jerdon.*

STENOPUS, see Palemonidæ.

STEPHAN, a Byzantian writer, mentions Aden.

STEPHANOHYDRA, see Hydridæ.

STERCULIACEÆ, an order of plants of the E. and W. Indies, S. America, Mexico, Madagascar, all Southern Asia and New Holland. The order comprises 82 genera and upwards of 100 species. They are trees, or shrubs, sometimes climbing or twining plants, and are all remarkable for the abundance of their mucilage and the tenacity of their fibres.

STERCULIA, a genus of plants of the order Sterculiaceæ. One species, the kun-nun-nu of the Burmese, an enormous tree, grows at Tavoy, as also does another species, called in Tavoy Thi-ka-doo, a species of the genus is common in Wynaad on the higher elevations ; its bast called nar is as durable as ordinary Russian bast, but inferior to the best Russian bast. One species in Africa, and another in India, S. fœtida, yields a tragacanth-like gum. S. guttata, grows in Malabar, the bark of the younger parts of the tree gives very strong, white, flaxen, fibres, from which the Wynaad inhabitants fabricate a coarse cloth. The tree is felled when ten years old, cut into pieces, the bark stripped off and chopped, washed and dried in the sun and without further process it is fit for clothing. S. villosa, the 'Oadal' of Assam, is a native of the mountainous countries east of Bengal. Bags are made of its bark, and its fibres are made into cords to bind wild elephants with. The rope is very strong and lasting, and little injured with wet. Rope made from the inner layers of bark are finely pliable, and the outer fibres yield a coarse rope. Sterculia acuminata yields the Kola or Gonga nut, of which immense quantities are carried to the interior of Africa. Each nut of the Gonga variety sells for 100 cowries, and 2,500 cowries at Rabba on the Kevorra, value a dollar of 4*s.* 4*d.* Bitter Kola fruit is about the size of a peach, rose-coloured and very pretty. The bitter Kola nut is intensely bitter, not astringent like common Kola, and is used for medicinal purposes. Sterculia urens, is a native of the mountains on the coast of Coromandel, as well as of Hindoostan, and yields a gum exceedingly like tragacanth, which has been imported as such into England. S. guttata yields a bark that the Malabars convert into a flaxy substance of which the natives of Wynaad make a sort of clothing. As the seeds of Sterculia chicka are eaten by the Brazilians, so in India, are those of S. balanghas, S. urens and S. fœtida, after being roasted. A species called Kodalo in Telugu, not S. fœtida, is a tree of Ganjam and Gumsur, extreme height 39 feet, circumference 3 feet and height from ground to the intersection of the first branch, 8 feet. Gives a light wood, used for planks, doors, boxes and scabbards; it is also used for fire-wood, being tolerably plentiful. Six species of Sterculia, four of which, viz., Sterculia ramosa, S. fœtida, S. campanulata, S. piperifolia, are very plentiful throughout the Pegu province, yield a gum which is known in the bazaars of Bengal under the name of Kotheela. The other two species, Sterculia balangas and S. colorata, are not so plentiful. This gum is probably analogous to the tragacanth, which Dr. Lindley states is obtained from a species of Sterculia at Sierra Leone. S. Fœtida, *Linn.*; is a large tree very common in the central province of Ceylon, where a cubic foot weighs 26 lbs. It grows in the peninsula of India, generally, but chiefly on the western coast in Malabar and Mysore. On the Bombay side of India, it is not common in the forests, but more frequently found about cultivated holdings on the coast, where it grows up small and very straight. It is common on the hills and plains of British Burmah, where a cubic foot weighs lbs. 33. In a full-grown tree, on good soil, the average length of the trunk to the first branch is 50 feet, and average girth, measured at 6 feet from the ground is 10 feet. Dr. Brandis tells us that the wood is not used there. But, in Ceylon, it is used for common house-building purposes, on the western coast and in Mysore, it is applied to a number of useful purposes, and is one of the trees believed to furnish the smaller poon spars of that coast: indeed, Dr. Gibson tells us that it is used as a substitute for the true poon spars in small country vessels. It makes a good avenue tree. The seeds are eaten by the Singhalese. In the cells of this fruit there are contained certain white kernels which have a very pleasant taste inter carnem ossiculum locatur oblongo-rotundum nucleum continens candidum amarodulcem. The flower has a most offensive smell and hence the Tamool name. The fruit is used in the treatment of gonorrhœa. The leaves are deemed aperient, and a decoction of the fruit mucilaginous and astringent. The seeds are oleaginous, but are deemed unwholesome. The semi-solid oil obtained by expression from the seeds of this large jungle tree is thick at all seasons of the year, appears to contain a large per-centage of stearine, but it is doubtful if it can be obtained in large quantities: it was sent to the Great Exhibition of 1851 from Bombay.—*Mr. Mendis*; *Dr. Brandis*; *Dr. Gibson*; *Dr. Riddell*; *Wight and Arnott*, *Vol.* i, *p.* 63; *Thwaites*, *p.* 29; *Hort. Mal. Phar.*, *Vol.* iv, *p.* 75; *Ainslie*, *p.* 230; *Mason*; *Madras Agri-Hort. Gardens*; *Mr. McIvor*; *Eng. Cyc.*; *McClelland*; *Dr. Cleghorn*; *Captain Macdonald*; *Roxb.'s Fl. STERCULIA ALATA, *Roxb.*

Shaw-nee,	BURM.	Buddh's cocoanut,	ENG.
Dodeloe mara,	CAN.		

Grows to an immense height in Canara and Sunda, in deep ravines and sheltered places below the ghauts but is used there only as a support for pepper vines. The wood is said to be too spongy for spars, for which its height and straightness otherwise well fit it. It is a handsome tree in the Tenasserim provinces, bearing a large fruit whose winged seeds are sometimes eaten by the natives.—*Drs. Gibson and Mason, Roxb.*, *Vol.* iii, *p.* 152.

STERCULIA ANGUSTIFOLIA. *Roxb.*

Southwellia angustifolia.

A middle-sized tree, a native of Nepaul.—*Roxb*, *Vol.* iii, *p.* 168.

STERCULIA BALANGHAS, *Linn.* A tall and straight tree, of the hotter parts of Ceylon, common in the forests of the Bombay coast, where it may readily be distinguished, at certain seasons, by its large pink fruit. The wood is of open grain, so that it probably could, by being creosoted, be made useful in various ways. The seeds are described by Rumphius, as being roasted and eaten by the natives of Amboyna and the capsules burned for the preparation of the colouring matter called by the natives kusumbha.—*Dr. Gibson*; *Thwaites*, *p.* 29; *Eng. Cyc.*; *W. & A.*, *Vol.* i, *p.* 62.

STERCULIA COLORATA, *Roxb.*

Bhai?	DUK.	Karaka,	DUK.? TEL.

A large tree of the Dekhan and in the Godavery forests, which is deciduous in the cold season, and flowers in March and April. Grows at Courtallum, the wood is said to be useless. Palmated, five-lobed leaves; deciduous in the cold season; flowers in March and April; carpels of a bright red, somewhat resembling the broad pod of a pea opened, with the peas adhering; the tree when covered with them has a strange appearance.—*Dr. Riddell*; *Captain Macdonald*; *Captain Beddome*; *W. & A.*, *Vol.* i, *p* 63.

STERCULIA FOLIIS DIGITATIS, *Ains.*

Hill cocoanut,	ENG.	Konda than-kala,	TEL.
Malai taynga,	TAM.		

The edible seeds of this tree are eaten by the poor. They are contained in follicles, each of which is nearly as large as two hands joined.—*Ainslie, p.* 227.

STERCULIA GUTTATA, *Roxb.*

Goldar,	DUK.	Ramena pu maram,	TAM.
Pi maram,	TAM.		

A large erect forest tree, of Ceylon, and Malabar, but occurring in the Dekhan. It grows in Ambagamowa district, at no great elevation ; leaves long, petioled, villous underneath; flowers in simple terminal racemes, pubescent on both sides, outer and inner of a pale yellow colour, marked with purple spots, deciduous. Carpels the size of a large apple, three or more growing together, of a reddish colour ; seeds size of a chesnut, roasted and eaten by the natives. The bark of the younger parts of the tree abounds with very strong, white, flaxen fibres, of which the inhabitants of Wynaad manufacture a kind of coarse cloth, which derives its name from the first process of its manufacture, viz., the chopping the bark into small pieces, from auragoonoo, to cut. It is not usual to make use of the bark until the tenth year, when its size will be equal to that of most forest trees. The tree is felled, the branches lopped off, and the trunk cut into pieces, of six feet long, a perpendicular incision made in each piece, the bark opened, and taken off whole, chopped, washed, and dried in the sun, by these means, and without any further process, it is fit for the purposes of clothing. From Wynaad, Capt. Dickenson sent the seeds to the Botanic garden in 1802, and the young trees reared therefrom blossomed for the first time in December 1809. They were then about twenty feet high, and the trunk twenty-one inches in circumference four feet above the ground —*Th. En. Plant. Zeylanicum, p.* 29 ; *Dr. Riddell* ; *Mr. Rohde* ; *Dr. Wight* ; *M. Ex. J. R.* ; *Roxb., Vol.* iii, *p.* 149 ; *W. & A., Vol.* i, *p.* 62; *Useful Plants, p.* 339 ; *Royle Fib. Pl.* ; *W. et A. The gum.

Tshaw,	BURM.	Katila ka gond,	HIND.

This large tree is a native of Ceylon and of most parts of India, occurring in the peninsula, and on the western coast, common in the inland and coast forests of Bombay, growing in the Ajmeer hills and Kotah, and in the mountainous countries of India generally. It may always be recognised by its peculiar bark, which looks as if painted of a light-colour. Wood according to Roxburgh, is soft, spongy and loose grained, only fit for the most common purposes. According to Dr. Gibson, it is worthless. Its seeds are roasted and eaten by the natives, and the leaves and tender branches are of great use in certain cattle diseases. The leaves when soaked in water, render it ropy and glutinous. The bark yields a gum resembling tragacanth. Leaves round, cordate and five-lobed ; deciduous in the cold weather; flowers in February and March, very small ; the carpel is covered with rigid bristly hairs, which puncture like the Mucuna pruriens. The bark of the trunk is white, and gives the tree a dead appearance. The gum, called kutila gond, is obtained in great abundance from this tree ; the seeds of the stinging pods are palatable when roasted and very wholesome : many bushels must be yielded by one large tree, and the poor in famines should collect the seeds for food. The seeds are roasted and used by the natives as an article of diet and also as a dainty : the star-shaped pods are covered with stinging pubescence. The wood of this tree is soft and spongy, towards the centre of large trees, it is reddish. Mr. Rohde says, that the water in which he kept the green branches for examination became thick, like clean glutinous jelly. Bark exceedingly astringent, tinges the spittle reddish. It yields a gum not unlike tragacanth, and has been sent to London as such, but the artists, who used the gum, did not find it answer. The gum, which exudes spontaneously during the hot season, occurs in large, light-brown, or white, transparent tough masses. Immersed in water, these swell like a jelly, but do not dissolve unless by protracted boiling. The solution is not adhesive, and is destitute of the thickness of solutions of ordinary gum. The uses of this gum are very limited : the want of adhesiveness renders it unsuitable for the arts, while its difficult solubility renders it inferior to most other gums for medicinal purposes. A similar gum also called Kutira, is afforded by the Cochlospermum gossypium of Coromandel, Travancore and Ceylon, a large tree, with bright yellow flowers. The seeds, contain starch and fixed oil, when roasted, they have much the flavour of chesnuts, and are eaten by the natives of this country. The wood is soft and loose-grained, only fit for the most common purposes. The leaves when soaked in water have the property of rendering it ropy and glutinous. The white transparent gum is tasteless: swells exceedingly when placed in water but does not dissolve: in medicine is considered cooling and astringent, and given, in Ajmeer, in 'dai' and 'luddoo.' Sterculia ramosa, S. fœtida, S campanulata, S piperfolia, are very plentiful throughout the Pegu province, all yield a gum which is known in the bazaars of Bengal under the name of Kotheela. Other two species, Sterculia balangas and S. calorata, are not so plentiful. Tragacanth, Dr. Lindley states is obtained from a species of Sterculia at Sierra Leone. Kuteera gum was known as false tragacanth before the tree which produces it was correctly determined. This gum resembles a coarse tragacanth, and is employed in India as a substitute for the genuine gum, which is the produce of the south of Europe.—*Drs. Wight, Gibson and Riddell*; *Roxb.*, *Vol.* iii, *p.* 145; *Irvine's Gen. Med. Top.*, *p.* 202; *Rohde's MSS.*; *O'Shaughnessy*; *Bengal Dispensatory*; *Thwaites' Enum. Plant. STERCULIA VILLOSA, *Roxb.*

Gul-kandar,	CHENAB.	Kurdula,	MAHR.
Kuri,	,,	Osha,	SUTLEJ.
Gul-bodla,	HAZARA.	God-gudala,	,,
Oodbal: Oodial,	HIND.	Magsu,	SUTLEJ, RAVI.
Gul-kandal,	JAMOO.		

A large tree of the Dekhan and in the mountainous countries to the eastward of Bengal, common in many places in the outer hills of the N. W. Himalaya to 3,600 feet or more, up to the Indus, and occurs in the Salt Range. It has a straight trunk with a smooth bark, leaves palmated, five or seven lobed. The bark can be stripped off from the bottom to the top of the tree with the greatest facility, and fine pliable ropes may be made from the inner layers, whilst the outer yield coarser ropes. The rope is very strong and very lasting, wet doing it little injury, in Southern India, elephant ropes, and in Bombay bagging are made of it. In Dehra Doon good paper has been made from it.—*Drs. Riddell and Royle*; *Eng. Cyc.*; *Roxb.*, *Vol.* iii, *p.* 153; *Mr. Thompson*; *Cleghorn's Panjab Plants*; *Dr. J. L. Stewart.*

STERCULIA WALLICHII.

Wulena,	BEAS.	Ulan,	RAV
Kuri,	, CHENAB.		

A shrub of the Panjab occasional to 3,50 feet.

STEREOSPERMUM. Of this genus, Wigh gives, in Icones, S. chelonoides and S. suaveolens. The former is a large tree, common i Wynaad. The wood of which is used for bu ing and making cases.—*McIvor, M. E.*

STEREOSPERMUM CHELONOIDE *W. Ic.; DC.*

Bignonia chelonoides, *Linn.*

Tha-koop-poo,	BURM.	Vela-pathri maram,	TAM.
Padri,	HIND.	,, padri	,, ,,
Padul,	MAHR.		

This, though not a large, is a very handsome tree, with very fragrant beautiful pinkish flowers. It grows in Coimbatore, it is not common in the forests of the Bombay presidency, it is found, especially in those of the coast and ghauts, but has not been observed in the inland jungles. Its wood is there used for interiors of buildings, but is seldom procurable of a size fit for anything but posts. In British Burmah in a full-grown tree on good soil, the average length of the trunk to the first branch is 30 feet and average girth measured at 6 feet from the ground is 5 feet. It sells in Burmah at 8 annas per cubic foot, and is used in house-building, the flowers are very fragrant. It is probable there is some confusion in the trees called paderi, in Tamil. One padrie marum is reddish, and another is called the white padrie. The trees are very like, being principally distinguished by the colour of the flowers, yellowish on this, brownish-purple in that. Hence, perhaps the two names, black and white pautherie.—*Drs. Wight, Gibson aad Brandis*; *Cal. Cat. Ex.* 1852; *Rhode.*

STEREOSPERUM SUAVEOLENS, *W. Ic.*

Bignonia suaveolens, *Roxb.*

Anous tenuirostris, *Temm.*, White-headed Noddy, Indian Ocean.

Rynchops albicollis, *Swainson*, all India.

STERNOCERA CHRYSIS, its elytra are used in India, to embroider muslin.

STERNOPTYCHIDÆ.

FIRST GROUP.—Sternoptychina.
Gen. 4 Argyrpelecus, 1 Sternoptyx.
SECOND GROUP.—Coccina.
Gen. 1 Coccia, 4 Maurolicus.
THIRD GROUP.—Chauliodontina.
Gen. 1 Gonostoma, 1 Chauliodus.

ST. ESPRIT, a group of about 12 islands in the China Sea, in lat. 0° 36′ N. These islets are high, with deep clear channels between them.—*Horsfield.*

STEVENSON, Reverend J., D. D., Chaplain of St. Andrew's Church, Bombay, author of numerous publications. He wrote on the Anti-Brahminical worship of the hindoos, in Lond. As. Trans.. vols. vi, 239, viii, 330.—On the Mahratta language, Ibid., vol. vii, 84.—On the modern deities worshipped in the Deccan, Ibid., 105.—On the Bauddho-Vaishnavas of the Deccan, Ibid., 64.—On the intermixture of Buddhism with Brahminism in the religion of the hindoos of the Deccan, Ibid., 1.—Analysis of the Ganesa Purna, Ibid., vol. xiii, 319.—Remarks on the relation between the Jain and Brahminical systems of Geography, Bom. As. Trans. 1847, vol. ii, 411.—On specimens of Saurashtra coins found near Junir, Ibid., 377.—On the Brahminical manner of constructing their images, Ibid., 396.—Translation of Buddha inscriptions near Nassik, Ibid., 452.—Observations on the Grammatical structure of the vernacular languages of India. Ibid., 1849, vol i, 171, 1850, vol. iv, 1, vol. vi, 196. Dr. Stevenson has given some comparative lists of words of the Indian languages tracing analogies in the Mongolian, Celtic and Hebrew tongues. Dr. Stevenson says that there exists a great resemblance in the grammatical structure of the chief modern languages in the north and in the south of India, proofs of which he produces from the Hindi, Bengali, Gujerathi, Marathi on the one side, and from Telugu, Carnatica, Tamil and Singhalese on the other. He thinks that there is more agreement in the construction with the Turkish than with the Sanscrit, so that he thinks it likely that the original language of India may be the connecting link between what the Germans have called the Indo-Germanic family and the Turkish family of languages.—*Dr. Buist*; *Muller's Rep. Brit. Ass.*, 1847, *p.* 331.

STEVIA EUPATORIA, *Willd.*

S. hyssopifolia,	*Cav.*, *Lag.*	Ageratum punctatum,	*Oct.*
S. punctata,	*Pers.*	Mustelia eupatoria,	*Spr.*

A Mexican plant with purplish white flowers.

STEVIA PURPUREA, is a pretty, small flowering plant, native of new Spain and Mexico, propagated by seed, cuttings and division of the roots in any good garden soil.—*Riddell.*

STEWART, Charles, author of History of Bengal to its conquest by the English, London, 1813.

ST'HALI, SANSCRIT, arid or dry land, which in the corrupted dialect becomes t'hul, the converse of the Greek oasis, denoting tracts particularly sterile. Each thul has its distinct denomination, as the 't'hul of Kawur, the 't'hul of Goga,' &c. Maristhali, from the Sanscrit mri to die, and st'hali is a name of the desert of Rajputanah.

STHAN, Sans., a place or station, st'han, sthana, stan, istan or estan, added to the name of a thing, expresses the place wherein it abounds or is contained ; as Gulistan a flower-garden, or bed of roses ; Hindu-stan the country of hindoos or blacks ; Negaristan a cabinet or gallery of pictures.—*Ouseley's Travels, Vol.* ii, *p*, 74.

ST'HANESWARA or Thanesar, consists of an old ruined fort, about 1,200 feet square at top, with the modern town on a mound to the east, and a suburb called Bahari, or "without," on another mound to the west. The name of Thanesar, or St'haneswara, is said to be derived either from the Sthana or abode of Iswara, or from the junction of his names of Sthanu and Iswara, or from Sthanu and sar, a "lake." The town is one of the oldest and most celebrated places in India, but the earliest, certain notice of it under this name is by the Chinese pilgrim Hwen Thsang, in A. D. 634, although it is most probably mentioned by Ptolemy as Batan-ka-isara, for which we should perhaps, read Satan-aisara, for the Sanskrit Sthanes-wara. But the place was more famous for its connection with the history of the Pandus, than for its possession of a temple of Mahadeva, whose worship, in India at least, must be of much later date than the heroes of the Mahabharata. All the country immediately around Thanesar, between the Saraswati and Drishadwati rivers, is known by the name of Kuru—Kshetra, that is, the "field or land of Kuru," who is said to have become an ascetic on the bank of the great holy lake to the south of the town. This lake is called by various names, as Brahma-sar, Rama-hrad, Vaya, or Vayava-sar, and Pavana-sar. The first name is attributed to Brahma, because he performed a sacrifice on its banks. The second name is derived from Parasu Rama who is said to have spilt the blood of the Kshatriyas in this place. The last two titles are derived from the names of the god of Wind, on account of the pleasant breezes which blew over the waters of the lake during Kuru's period of asceticism. This lake is the centre of attraction for most pilgrims ; but all around it for many miles is holy ground, and the number of holy places connected with the Kaurava and Pandava, and with other heroes of antiquity, is very great indeed. According to popular belief, the exact number is 360, but the list given in the Kurukshetra Mahatyma is limited to 180 places, of which one-half, or 91, are to the north along the line of the venerated Saraswati river.—*Cunningham's Ancient Geography of India, pp.* 330, 331.

ST'HANOO, Sans. From St'ha, to stay.

ST'HAPATYA, see Vidya.

STH'NANUM, Sans., Tam., Tel. Bathing. Tacitus informs us that the first act of a German on rising was ablution, but it will be conceded, that this habit was not acquired in the cold climate of Germany, but must have been of eastern origin ; as were the loose flowing robe ; the long and braided hair, tied in a knot at the top of the head ; with many other customs, personal habits, and superstitions of the Scythic Cimbri, Jut, Catti, Suevi, analogous to the Getic nations of the same name, as described by Herodotus, Justin, and Strabo, and which yet obtain amongst the Rajput sacha of the present day.

STHUL-KUMUL, also Sthul-pudmu, Beng. Hibiscus plenus.

ST'HUPA, a buddhist tumulus or tope, an expression used for a mound or burrow as far west as Peshawur. See Cairn, Pagoda, Stupa, Tope, Tumuli.

STIBIUM, Lat. Sulphuret of antimony.

STICK INSECT, or spectre, the Phasmidæ, like the Phyllium, live on vegetables.

STILAGO, a genus of plants sometimes united with, at other times separated from the genus Antidesma, belonging to the natural family Antidesmeæ, which by some botanists is called Stilaginaceæ. The species are few in number, forming shrubs and moderate-sized trees, which are found in Madagascar and Mauritius, as well as in some of the Indian islands, and in India, where the species extend even to the northern parts. The leaves of the Antidesma alexiteria are employed in the Mauritius as an antidote against snake-bites. Cordage is made with its bark, as well as with that of A. zeylanica in Ceylon. The small fruits of both species are eaten and preserved: the fruits of A. pubescens (Stilago), Bunias, and Diandra, are eaten by the natives of India. Wight, in Icones, gives Stilago bunias, lanceolaria, pubescens, tomentosa.—*W. Ic.*

STILAGO BUNIAS, *Linn., Roxb.* Syn. of Antidesma bunias, *Spr. Sys. Veg.*

STILAGO DIANDRA, *Willde.*

Antidesma diandrum.

Tenguri,	Beng.	Tella gumudu,	Tel.
Asary pulie maram,	Tam.		

This tree, is a native of the mountainous parts of the Circars. Roxburgh says its wood is put to various uses. The berries are eaten by the natives when ripe. The wood serves for various uses.—*Rohde's MSS.*

STILLINGIA SEBIFERA, *Willde, Micheaux.*

Sapium sebiferum,	*Roxb.*	Croton sebiferum,	*Linn.*
Chelat pipul,	Beng.	China Tallow tree,	Eng.
Mom china,	„		

This tree, which Voigt says had been domesticated about Serampore, grows all over the eastern part of China and in Chusan, and when fully grown is a beautiful tree, resembling the aspen in shape and foliage, and with a straight trunk. It was introduced into India, and in Dr. Roxburgh's time was common near Calcutta. We learn from Dr. Jameson, that it grows luxuriantly in the Deyra Dhoon and Lower Himalayas. There is some reason to believe it to be indigenous in the hills of Kumaon, especially about Almora. The tree has now been successfully acclimatized in the Punjab and its extended cultivation would be extremely advantageous from the quantity of tallow and oil extracted from the seeds. It grows to the height of a pear tree, with trunk and branches like the cherry and foliage like the poplar Its kernels are coated with a pure white tallow, which is steamed off and collected. It is used for candles and as oil for lamps, but Dr. Roxburgh says it is not equal to coconut oil. At one time it attracted considerable attention, and was introduced into various European colonies in the East and West Indies. It may be met with in English hothouses. It is found in China on the borders of rivulets and is also cultivated. It grows to the height of a pear tree, having a trunk and branches like the cherry, and foliage like the black poplar, but which turns to red in autumn. It was met with in Chusan by the late expedition, and seeds sent home by Dr. Cantor, were sown in the Horticultural Society's garden at Chiswick. The seed-vessels and seeds are bruised, and then boiled in water. The fatty particles rising to the surface are skimmed off, and on cooling condense into tallow. To give it greater consistence some wax is added, together with linseed-oil in the proportion of three parts to ten of the tallow. The candles made with it are beautifully white. Sometimes they are coloured red by the addition of vermillion. These candles are sometimes said to be coated with wax procured from another Chinese tree (probably Ligustrum lucidum,) which forms an external crust and prevents them running. Stillingia tallow is also employed in medicine instead of lard. It consolidates through the cold to the consistence of tallow, and by boiling, becomes as hard as bees' wax. A similar fatty product is obtained from the Myristica (Virola) sebifera, a shrub in British Guiana. According to Mr. Williams the Stillingia sebifera occurs over all the eastern part of China, and when fully grown is a beautiful tree, resembling the aspen in its shape and foliage. The seeds grow in clusters like ivy berries, and are collected in November; when ripe, the capsule divides, and falling off discovers two or three kernels covered with the pure white tallow. When the tallow is to be prepared, these are picked from the stalks and put into an open wooden cylinder with a perforated bottom, in which they are well-steamed over boiling water. In ten or fifteen minutes, the tallow covering the seeds becomes soft, and they are then thrown into a stone mortar and gently beaten with a mallet to detach it. The whole is then sifted on a hot sieve, by which the tallow is separated from the kernels, though containing the brown skin which envelops the latter, and presenting a dirty appearance. The tallow in this state is enclosed in a straw cylinder, or laid upon layers of straw held together by iron hoops, and subjected to pressure in a rude press from which it runs clear in a semifluid state, and soon hardens into cakes. The candles from it become soft in hot weather, and are sometimes coated by dipping them in coloured wax. The Stillingia sebifera is abundant in the valleys of Chusan, and large quantities of tallow and oil are yearly extracted there from its seeds: tallow mills are erected in several parts of the island for this purpose. Dr. Rawes, of the Madras army, who was some time a resident in the island of Chusan, says the seeds are picked at the commencement of the cold weather, in November and December, when all the leaves have fallen from the trees; this he saw at Sing-kong when out shooting in the Sah-hoo valley close by army quarters, through the village. The seeds are in the first place taken to the building where the process of making the tallow is carried on, and picked and separated from the stalks. They are then put into a wooden cylinder, open at the top, but with a perforated bottom. This is placed over an iron vessel (about the same diameter or rather larger than the wooden cylinder, and about six or eight inches deep) containing water, by which means the seeds are well steamed, for the purpose of softening the tallow and causing it more readily to separate. The furnace had four or five iron vessels in a row, was about three feet high, four or five feet broad and eight or ten feet long. The fire was placed at one end and fed with the husk of the rice, dry grass, and such like cheap materials which make a great flame, and the flue was of course carried directly under the whole of the iron vessels. When the seeds have steamed ten minutes or a quarter of an hour, they are thrown into a large stone mortar and are gently beaten by two men with stone mallets for the purpose of detaching the tallow from the other parts of the seed. They are then thrown upon a sieve heated over the fire and sifted, by which process the tallow is separated, or nearly so, although they generally undergo the process of steaming, &c., a second time, that nothing may be lost. The other part of the seed is ground and pressed for oil. The tallow now resembles coarse linseed meal, but with more white spots in it and derives its brown colour from the thin covering over the seed (between it and the tallow) which is separated by the pounding and sifting. In this state it is put between circles of twisted straw, five or six of which are laid upon each other, and thus forming a hollow cylinder for its reception. When this straw cylinder (we may call it so) has been filled, it is carried away and placed in the press, which is a very rude and simple contrivance, but which, like everything Chinese, answers the purpose remarkably well. The press consists of longitudinal beams of considerable thickness, placed about a foot and a half, or two feet, asunder, with a thick plank at the bottom, forming a kind of trough, and the whole is bound together with iron. The tallow is pressed out by means of wedges driven in very lightly with stone mallets, and passes through a hole in the bottom of the press into a tub, which is sunk there to receive it. It is now freed from all impurities, and is a semifluid of a beautiful white colour, but soon gets solid, and in cold weather is very brittle. The inside of the tubs which collect the tallow are sprinkled or dusted over with a fine red earth, well dried, which prevents the tallow from adhering to their sides. It is thus easily removed in a solid state from the tubs, and in this condition the cakes are exposed for sale in the market. As the candles made from this vegetable tallow have a tendency to get soft and to melt in hot weather, they are commonly dipped in wax of various colours as red, green and yellow. Those which are intended for religious purposes are generally very large, and finely ornamented with golden characters. The cake, or refuse, which remains after the tallow has been pressed out of it, is used for fuel, or to manure the land, and so is the refuse from the other part of the seeds from which oil is extracted." Stillingia sebifera, grows luxuriantly in the Dehra Doon and lower Himalaya, and in the Kohistan of the Panjab. There is an interesting paper on it, by Dr. Macgowan in the 7th Vol., p. 164 of the Journal of Horticultural Society of India. It flowers in June and during the rains. In addition to the tallow obtained from its seeds and used in making candles, a black dye is obtained from its leaves.—*H.*; *Voigt*; *Roxb.'s Fl. Ind.*, *Vol.* iii, *p.* 693; *Dr. Rawes*; *Eng. Cyc.*; *Williams' Middle Kingdom*, *p.* 107-282; *Fortune's Wanderings*, *p.* 67. See Croton sebiferum, Dryandra cordata, Oils.

STIMMI, GR. Sulphuret of antimony.

STINKING-WOOD, ENG.

Chee neb, BURM.

This wood, of maximum girth 4 cubits, and maximum length 22½ feet, is abundant in Tavoy and Mergui. When seasoned, it sinks in water. The flowers of this wood have an intolerably fetid, sickening smell, hence its name; it is used by the Burmese for boxes, tables, &c., and is a long fibred, tough wood when new, but rots so readily that, with a whole tree in Captain Dance's possession, he could not cut out a decent specimen.—*Capt. Dance.*

STINK-TREE of Ceylon was called by the Dutch Strunt-hout, and by the Singhalese Urenne, on account of its disgusting odour, which resides especially in the thick stem and the larger branches. The smell of it so perfectly resembles that of human ordure, that one cannot perceive the smallest difference between them. Thunberg says the tree was neither the Anagyris fœtida nor the Sterculia fœtida.—*Thunberg's Travels*, *Vol.* iv, *pp.* 234, 235.

STIN-KULL, DAN. Coal.

STIPA, a genus of grasses belonging to the tribe Stipaceæ. It has stalked florets, the paleæ coriaceous, the inner entire. S. pennata, the only British species, has a very long twisted feathery awn, with a glabrous base. It is a very beautiful plant, and is common in English gardens. Found on rocks in long Seadale near Kendal, and is grown in gardens for the sake of the beautifully feathered heads. —*Eng. Cyc.*; *Riddell.*

STIPA TENACISSIMA, see Esparto.

STIPE-CLASPING BRAKE, Pteris amplexicaulis.

STIRRUPS were probably never used in Persia before the musselman conquest.—*Ouseley's Travels, Vol.* i, *p.* 246.

STIVOLI, RUS. Quills.

STIZOLOBIUM, a genus of plants which was so named by Persoon, from *στίζω* to prick, and *λοβός*, a lobe or pod, from the pods of the several species being covered with hispid hairs. The species have now been removed chiefly to Pachyrhizus (Dolichos) and to Mucuna.—*Eng. Cyc.*

STIZOLOBIUM ALTISSIMUM.

Assam bean. ENG. | Kalee seem, DUK.

This bean is grown like most others, and may be first sown at the commencement of the rains and continued during the cold season. —*Riddell.*

STIZOLOBIUM GIGANTEUM, *Spreng.* Syn. of Mucuna gigantea, *DC.*

ST. JOHN, two moderately elevated sloping islands in the Straits of Singapore.—*Horsfield.*

ST. JOHN'S BREAD, pods of Ceratonia siliqua, so named from the idea that it is the locust tree on which, St. John the Baptist fed in the desert.

ST. JULIAN, a small island in the China Sea, in lat. 0° 54' N., and long. 106° 48' E.—*Horsfield.*

ST. MARY ISLES, off the coast of Canara, extend from lat. 13° 28' to 13° 17' N., the outermost of the range being 5 miles from the shore.

ST. MATTHEW ISLANDS, in lat. 5° 18' S., long. 124° 16' E., are two islands extending 12 to 15 miles.—*Horsfield.*

ST. MATTHEW or Elephant Island, one of the Mergui Archipelago, is about 5½ leagues in length, extending from lat. 10° 4' N. to 9° 50¼' N. It is 14 miles from the continent, and the highest peak in the island is nearly 3,000 feet above the level of the sea. Hastings or Gage's Harbour on its northern part, is a spacious bay formed by the islands of St. Matthew, St. Luke and Hastings, is sheltered from all winds, and capable of containing the largest navy in the world.—*Horsfield.*

ST'NANUM. St'nanam abhiangana, amongst hindoos, a ceremonial, on the wedding day, when the bride and bridegroom are anointed with oil.

STOCKS, an officer of the Bombay Medical Service, ob. 1858. He was Superintendent of Forests in Sind. Wrote on the babool trees in Sind. His extremely valuable collections from Sind and Beluchistan, amounting to about 1,500 species.—*H. et T.*; *Bom. As. Trans.*, *Vol.* ii, *p.* 390; *Dr. Buist.*

STOCQUELER, J. H., was Editor, Bombay Courier, afterwards of the Bengal Hurkaru, and ultimately of the Calcutta Englishman till 1844. Author of Fifteen months' pilgrimage through untrodden tracts in Kurdistan and Persia, 1831-32, London, 1832, 2 vols., 8vo.—*Dr. Buist.*

STODDART, Colonel, a British officer whc was long imprisoned at Bokhara and ultimately beheaded along with Captain Conolly of th Indian Army.

STOIC, see Vedas.

STOKPO, LAD. Urtica hyperborea, *Jacq.*

STOMAPODA. M. Milne-Edwards comprises in the order Stomapoda all the Podophthalmous crustacea, which are deprived of thoracic branchiæ lodged in internal cavities. This division is entirely composed o Swimming Crustaceans, whose body is elongated, and whose general form often approaches closely to that of the Macrourou decapods; but in those animals the concentraion of the rings of the head and thorax is arried less far.

Lucifer typus, differs from L. reynaudii, which was found in the Indian Ocean by M. Reynaud) in the form of the median piece of he caudal fin, which is lamellar, and without ny notch below, in the more considerable ength of the middle blades, and in the apparent absence of a separation between the arapace and oculiferous prolongation.

Squilla maculata, length from 10 to 12 nches, inhabits the Asiatic seas.

Squilla stilifera, length about 3 inches, s a native of the island of Mauritius.

Gonodactylus chiragra, length about 3½ nches, found in all the seas of warm climates: the Mediterranean, American coasts, Seycheles islands, near Trincomallee and Tongataboo.

Gonodactylus scyllarus, length about 4½ nches, is found in the Indian Seas and on the coasts of Mauritius.

STOMATELLA, a genus of Molluscs. See Turbinidæ.

STOMATIA, see Haliotidæ.

STOMATOPODES, an order of crustacea.

FAM.—Cardioides.
TRIBE.—Mysiens.
Acetes indicus, *Edws.*, Ganges mouth.
Lucifer reynaudii, *Edws.*, Indian ocean.
,, typus, *Edws.*, Indian ocean?

STONE. Stones have been objects of worship of all nations and are largely so ised by the hindoos, generally smeared with ed-lead. In New Zealand, red is a sacred colour, and the way of rendering anything tapu was by making it red. When a person lies, his house was thus painted; when the tapu was laid on anything, the chief erected a post and painted with the kura; wherever a corpse rested, some memorial was set up; often times the nearest stone, rock, or tree served as a monument, but whatever object was selected, it was sure to be painted red. The Arabians down to the time of Mahomed worshipped a black stone, and this is now let into the wall of the Kaaba. The Phœnicians also worshipped a deity under the form of an unshaped stone. There was a sacred stone in Jura round which the people used to move 'deasil,' *i. e.*, sunwise. In some of the Hebrides the people attributed oracular power to a large black stone. In some cases, as for instance in India, it is far from easy to distinguish between a group of stone-gods and a sacred fane. In fact, we may be sure that the very same stones are by some supposed to be actual deities, while others more advanced regard them as sacred only because devoted to religious purposes. Some of the ruder Hindustan tribes actually worship upright stones; but Colonel Forbes Leslie regards the sacred stones as a place of worship, rather than as actual deities ; and this is at any rate the case with another group similarly painted, which he observed near Andlee, also in the Dekkan, and which is peculiarly interesting from its resemblance to the stone circles of Great Britain. Stone-worship, however, in its simpler forms, has, a different origin from this and is merely a form of that indiscriminate worship which characterises the human mind in a particular phase of development. The Asaga of Mysore worship a god called Bhuma Devam, who is represented by a shapeless stone. One thing is certain, says Mr. Hislop, 'the worship (of stones) is spread over all parts of the country from Berar to the extreme east of Bustar, and that not merely among the hinduised aborigines who had begun to honour Kandova, &c., but among the rudest and most savage tribes.' He is generally adored in the form of an unshapely stone covered with vermillion. Two rude slave castes in Tulava (Southern India), the Bakadara and Betadara, worship a benevolent deity named Buta represented by a stone kept in every house. Indeed in every part of Southern India four or five stones may often be seen in the ryots' field, placed in a row and daubed with red paint, which they consider as guardians of the field and call the five Pandu. Colonel Forbes Leslie supposes that this red paint is intended to represent blood. The god of each Khond village is represented by three stones. His Pl. iv, represents a group of sacred stones, near Belgaum in the Dekkan, from a figure given by Colonel Forbes Leslie in his interesting work. The three largest stood in front of the centre of two straight lines, each of which consisted of thirteen stones. These lines were close together; and the edges of the stones were placed as near to each other as it was possible to do with slabs which, although selected, had never been artificially shaped. Seating a king on a stone seems to have prevailed throughout Europe on inauguration. Monarchs of Sweden were seated upon a stone placed in the centre of twelve lesser ones, and the kings of Denmark were crowned in a similar kind of circle. The use of the Inaugural Stone is of Canaanitish origin. Abimelech was made king by the plain of the pillar of Shechem. Jehoash was anointed as he stood by the pillar as the manner was. The Gael used the standing stone, which was traditionally considered a supernatural sacred witness of any solemn covenant and especially of that between an elected king and his people. Jack Cade touched London stone and exclaimed " now is Mortimer, Lord of London city." Amongst the Irish, the inauguration of a chief was celebrated at a stone with the impression of two feet, believed to be the size of the feet of the patriarch chieftain who first acquired the territory. Every great tribe had its installation stone and other specialities such as sacred trees, and rath-hills or entrenched places of meeting dedicated to the inaugural rite. Herodotus shows that the practice of carving the impression of the feet of mighty heroes on huge stones was older than his time as he mentions that the Scythians showed the mark of the foot of Hercules upon a rock. Spenser the poet writes that some of the stones on which the chief lords or captains of the clan was placed had a foot engraven, which was regarded as the measure of their first captain's foot. On inauguration the new chief stood thereon and took oath to preserve all the former customs of the country inviolable. His feet were placed in the impression while the heads of the law relating to the clan were read to him.—*Lubbock's Origin of Civil., pp.* 207-10, 244. See Bethel, Binlang, Hindoo, Khassya, Salagrama.

STONE-CHAT. The pied stone-chat (Saxicola picata) may be seen hopping about in the Dekhan. It is plentiful in and around Kurrachee, and is, the " robin" of Sind.

STONE-CUTTERS. Workers in stone, polishing the hardest surfaces, engraving its surface with imperishable records, and sculpturing it into various forms, even excavating gigantic temples out of the solid rock, are all departments of sculpture and engraving to which the hindoos have paid attention from the earliest times ; and their buildings are conspicuous for a quality for which those of Egypt have often been admired, that is, the exquisite polish and glass-like appearance of some of the hardest granite, &c. Dr. Kennedy has fortunately given us an account of the process by which they effect this : "The tools," he says, " which the hindoos use are a small steel chisel and an iron mallet. The chisel, in length, is not more than about twice the breadth of the hand of the hindoo workman ; which, as is well known, is very small ; and it tapers to a round point like a drawing-pencil. The mallet, also in iron, a little larger than the chisel, but not weighing more than a few pounds. It has a head fixed on at right angles to the handle, with only one striking face, which is formed into a tolerably deep hollow and lined with lead. With such simple instruments they formed, fashioned, and scooped the granite rock which forms the stupendous fortress of Dowlatabad, and excavated the wonderful caverns of Ellora ; for it seems by no means probable that the hindoo stone-cutters ever worked with any other tools." Dr. Kennedy adds, "The traces of the pointed chisel are still visible on the rocks of Dowlatabad, as they are also on some of the great works of Egypt. The stone having been brought to a smooth surface, it is next dressed with water in the usual way, and is then polished in the following manner. A block of granite, of considerable size, is rudely fashioned into the shape of the end of a large pestle. The lower face of this is hollowed out into a cavity, and this is filled with a mass composed of pounded corundum-stone, mixed with melted bees-wax. This block is moved by means of two sticks, or pieces of bamboo, placed on each side of its neck, and bound together by cords, twisted and tightened by sticks. The weight of the whole is such as two workmen can easily manage. They seat themselves upon, or close to, the stone they are to polish, and by moving the block backwards and forwards between them, the polish is given by the friction of the mass of wax (and lac ?) and corundum." Nearly the same materials, and with a still greater degree of success are employed in polishing such delicate articles as beads and bracelets ; elegantly shaped cups, or the models of cannon. Of the processes employed a very interesting account, which is published in the "Illustrated Catalogue," is given by Mr. Summer of Cambay. The stones are first fixed on a steel spike, and there roughly rounded with an iron hammer, and then polished with a composition of lac and corundum variously applied. The holes are bored with a steel drill, tipped with a small diamond. Cups and saucers and similar hollow articles, are wrought, according to the required external shape, on the steel spike, and a rough polish given on the rough polishing stones. The cavity is formed by the diamond-tipped drill to the depth of one-fourth of an inch all over the space, until it exhibits an honey-combed appearance ; the prominent places round the holes are then chipped away ; and this process is repeated until the depth and form desired are obtained. They are then polished upon prepared moulds of convex forms, and of the same composition as the polishing-plates which are attached to the turningwheel.

The seal-engraver's wheel consists of a slight frame ballasted below to keep it firm, with two uprights about eighteen inches in length and eight inches between. Betwixt the two is a small spindle. This turns at one end on a screw or pivot, some times of cornelian : the shoulder is kept in its place by a neat iron clamp—it is steadied by a piece of rag wrapped round it and enclosed in the collar. Why so much pains should be taken to diminish friction by a cornelian pin at one end, while it was increased by this at the other, we cannot explain. A dozen or two spindles such as this, are made use of. The spindle is terminated by a small spike of iron about an inch long, ending in a little circular saw or button, from a tenth up to half an inch in diameter. To this, emery paste—that is, powdered corundum mixed with oil—is from time to time applied, while it is spun round with a bow. The engraver holds the seal up betwixt his fingers and thumb, and a sweep or two of the bow causes a mark on the seal. This is deepened and extended as desired—the larger discs being employed for long straight strokes. The work turned out is by no means very fine, but the celerity of execution is surpassing. Diamond dust is very rarely used in India,—corundum, koorund, or samda stone as it is called, being the chief material employed in polishing gems, marbles, and metals. This mineral is found chiefly in granite or the detritus of granite rocks in the Mysore country and in the neighbourhood of the south-western ghauts. It is brought in considerable quantity to Bombay, and is occasionally exported to Europe. It is packed in orange-shaped parcels with meridional cordings : the pieces are from the size of filberts to that of the hand : they are generally amorphous or fragments of crystals, often contaminated with felspar, mica, and other granitic minerals. Sometimes fragments of crystals perfectly pure are to be met with weighing from ten to twenty-five pounds, but these are rare. Though excessively hard, it is by no means tough—it flies in pieces after a few strokes of the hammer, and is easily pulverized in a mortar. The natives generally beat it on an anvil or stone, keeping it from flying about by a collar of cotton rope. The fine particles are separated from the coarse by sifting—it is not certain that the home process of lixiviation is resorted to. For sharpening swords or burnishing metal it is generally used like a whetstone or burnisher ; for polishing gems, it is either made up into a cake with lac or into a paste with oil or grease. It is never employed for the manufacture of emery.—*Royle's Arts, &c. of India, pp. 513, 515.*

STONEHENGE, a celebrated circle of stones, in England, is not a Druidical, nor a Roman, nor a Danish structure. It is a piece of buddhist architecture and is own brother to the circle of upright stones at Amravati on the Kistna, and to many others in the South of India.

STONE PINE, Eng. Pinus pinea.

STORACE, It. Storax.

STORAX, Eng., Fr.

Usteruk, Salajet,	Ar.	Storace,	It.
Meah,	,,	Styrax,	Lat.
Styrax broom,	Ger.	Azumbar,	Sp.

The produce of Styrax officinale, growing in the South of Europe and the Levant. It is usually met with in tears, which is pure ; and in lumps or red storax, which is mixed with saw-dust and other impurities. Storax has a fragrant odour, and a pleasant, sub-acidulous, slightly pungent, and aromatic taste ; it is of a reddish brown colour, and brittle.—*McCulloch.*

STORAX, LIQUID.

Sillarus, Miati-lubni	AR.	Sillarus, Meih-sila,	GUZ. HIND., PERS.
Meih-katar,	,,		
Rose malloes,	ENG.	Rasa-mala,	MALAY.

Liquid storax, a term in India given to Rose malloes, the sillaris of the bazaars : and the solid storax or salajit, is the solid Rose malloes. It is obtained from the Liquidamber altingia. Liquid storax is usually more or less opaque, of the consistence of bird-lime, grayish colour, warm balsamic taste, and peculiar vanilla-like odour, if pure. Small quantities are imported annually into Bombay from Suez and the Arabian gulf in skins ; it is re-exported to England and China under the designations of Rose mallows (Rasa-mallo) and Sillaris, in barrels of about four imperial gallons capacity each.—*Faulkner.* See Ambar, Liquid, Liquidambar.

STORAXWORTS, see Styraceæ.

STOREY, see Leedes.

STORIANI, a frontier tribe whose winter station is in Beluchistan and summer station in the high country belonging to the Musa Khel.—*Latham's Descriptive Ethnology.* See Affghan.

STORMS OF DUST, are caused by spiral columns of the electric fluid passing from the atmosphere to the earth ; they have an onward motion—a revolving motion, like revolving storms at sea—and a peculiar spiral motion from above downwards, like a cork-screw. It seems probable that in an extensive dust-storm there are many of these columns moving on together in the same direction, and during the continuance of the storm, many sudden gusts take place at intervals, during which time the electric tension is at its maximum. These storms, in the Punjab, mostly commence from north-west or west and in the course of an hour, more or less, they have nearly completed the circle, and have passed onwards. Precisely the same phenomena, in kind, are observable in all cases of dust-storms : from the one of a few inches in diameter to those that extend for fifty miles and upwards, the phenomena are identical. It is a curious fact that some of the smaller dust-storms occasionally seen in extensive and arid plains, both in the Punjab and in Affghanistan above the Bolan pass, called in familiar language "Devils," are either stationary for a long time, that is, upwards of an hour, or nearly so ; and during the whole of this time the dust and minute bodies on the ground are kept whirling above into the air, in other cases these small dust-storms are seen slowly advancing, and when numerous, usually proceed in the same direction. Birds, kites and vultures, are often seen soaring high up just above these spots, apparently following the direction of the column, as if enjoying it. They may be looking for prey, or involved in and unable to fly out of, the invisible part of the electrified aerial column, of which the lower part only is visible to us by the dust raised. The phenomena connected with dust-storms seem to be identical with those present in waterspouts and white squalls at sea, and revolving storms and tornadoes of all kinds : and they apparently originate from the same cause, viz., moving columns of electricity. In 1847, at Lahore, an observer being desirous of ascertaining the nature of dust-storms, he projected into the air an insulated copper wire on a bamboo on the top of his house, and brought the wire into his room, and connected it with a gold leaf electrometer and a detached wire communicating with the earth. A day or two after, during the passage of a small dust-storm, he had the pleasure of observing the electric fluid passing in vivid sparks from one wire to another, and of course strongly affecting the electrometer. The thing was now explained ; and since then by the same means he observed at least sixty dust-storms of various sizes, all presenting the same phenomena in kind. He commonly observed that, towards the close of a storm of this kind, a fall of rain suddenly takes place, and instantly the stream of electricity ceases, or is much diminished, and when it continues, it seems only on occasions, when the storm is severe and continues for some time after. The barometer steadily rises throughout. In the Punjab plains, the fluctuation of the barometric column is very slight, seldom more than two or three-tenths of an inch at a time. The average height at Lahore is 1,180, corrected for temperature, indicating, it is supposed above 1,150 feet above the level of the sea, taking 30 inches as the standard. A large dust-storm is usually preceded by certain peculiarities in the dew-point, and the manner in which the particles of dew are deposited on the bulb of a thermometer. The mode of taking the dew-point is to plunge a common thermometer in a little ice, and let it run down 20° or 30°. The manner in which the electricity acts upon the dust and light bodies it meets with in its passage, is simple enough. He supposes the particles similarly electrified and mutually repulsive, and then, together with the whirling motion communicated to them, are whisked into the air. The same takes place when the electricity moves over water. The surface of the water becomes exposed to the electric agency, and its particles, rendered mutually repulsive, are in the same way whirled into the air. At sea the waterspout is thus formed. First of all is seen the cloud descending and beneath may be observed the water in a cone.—*Beng. As. Soc. Jour., No.* v. *of* 1850, *p.* 790. See Dust Storms.

STOTULARI, Sans. Lagerstræmia reginæ.

STOURBRIDGE CLAY resembles potter's clay to a certain extent, but is far more refractory in the fire. It is of a dark colour, owing probably to the presence of carbonaceous matter. It is extensively used in making crucibles, glass pots, &c.

STOVIGLIE, also Terraglie, It. Earthenware.

ST. PANTENUS, see Christianity.

ST. PAUL'S MOUNTAINS, a chain of hills in Banca island are only 930 feet high, and are on the south of the island.

STRABO. mentions Ceylon in Lib. xv, p. 1013, noticing the awkwardness of the inhabitants in sailing and fitting their masts in their vessels. El. Edrisi, p. 31, also speaks of this island under the name of Serandib, and Marco Polo under that of Seilam. It is celebrated by each for its rich gems.—*Pennant's Hindoostan, Vol.* i, *pp.* 183-185. See Babel, Berenice, Inscriptions, Kartelania, Khuzistan or Arabistan, Kirkook, Kirman, Megasthenes, Okelis, Pandiya, Turan.

STRACCI, also Strazze, It. Rags.

STRACHEY, H., of the 66th Bl. N. I. Author of a Journey through Tibet, in 1846, to Rakas Tal and Cho Mapan, *i. e.*, Lake Manasarovara in Bl. As. Trans., 1848, vol. xvii, 99, and published in a separate form, 8vo., Calcutta, 1848.—On the frontier of Kumaon and Gurhwal, Ibid, 532.—He mentions that Manasarovara discharges its waters through a gravel bank into Rakas Tal, which, again, sends off a tributary to the Sutlej.—*Dr Buist.*

STRACHEY, Richard, an officer of the Bengal Engineers, who received the gold medal of the Lond. Geo. Soc. He wrote on the physical geography of the provinces of Gurhwal and Kumaon, in the Himalaya mountains in Lond. Geo. Trans., 1851, vol. xxi, 57.—On the Glaciers of the Pindur and Kuphinee rivers, in the Kumaon Himalayas, Edin. New Phil. Jl., 1847-48, vol. xliv, 108. —A trip to the Niti pass, 1849, in Bl. As. Trans., 1850.—On the snow-line of the Himalayas, Ibid, 1849, vol. xviii, 287.—Notes on investigations near Kumaon, Ibid, 240.—Geography of Kumaon, Ibid, 1851. Horary barometrical observations at 11,000 feet above the level of the sea. See Colonel Sykes on, in Phil. Trans., 1850, 299.—On the tertiary formations of the Himalayas, Rep. Brit. Ass. 1851.—See Dissertation on discoveries of both brothers in Sir R. I. Murchison's address to Lond. Geo. Soc., 1852. Captain Richard Strachey was appointed by the Indian government to make a scientific survey of the province of Kumaon, and was occupied on the task about two years during which time, in addition to the important investigations in physical science which occupied his attention, he thoroughly explored the flora of the province, carefully noting the range of each species. He was joined by Mr. Winterbottom in 1848, and they travelled together in Tibet. Their joint collections amounting to 2,000 species, were distributed in 1852-53 to the Hookerian Herbarium, the British Museum, the Linnean Society, and some foreign museums; and the scientific results are now in course of publication.

STRACHEY, Mr. J., had some shawl stuffs made under his own inspection, of wool procured at Umritsir. The manufacturers were pioneers belonging to the embassy under Mr. Elphinstone and they worked in a common tent ; yet they appeared to find no difficulty in their employment. A shop may be occupied with one shawl, provided it be a remarkably fine one, above a year, while other shops make six or eight in the course of that period. Of the best and most worked kinds, not so much as a quarter of an inch is completed in one day, by three people, which is the usual number employed at most of the shops, and it may be observed that it very rarely happens that the pieces, when completed, correspond in size. The shops consist of a frame-work, at which the persons employed sit on a bench : their number is from two or four. On plain shawls, two people alone are employed, and a long narrow, but heavy shuttle is used ; those of which the pattern is variegated, are worked with wooden needles, there being a separate needle for the thread of each colour ; for the latter, no shuttle is required. The operation of their manufacture is of course slow, proportionate to the quantity of work which their patterns may require. The Oostaud, or head workman, superintends while his journeymen are employed near him immediately under his directions. If they have any new pattern in hand, or one with which they are not familiar, he describes to them the figures, colours, and threads which they are to use, while he keeps before him the pattern on which they happen to be employed, drawn upon paper. During the operation of making, the rough side of the shawl is uppermost on the frame, notwithstanding which, the Oostaud never mistakes the regularity of the most figured patterns. The wages of the Oostaud (the employer furnishing materials) are from six to eight pice per day ; of the common workmen, from one to four pice in Cashmere, may be about three-half-pence. A merchant, entering largely into the shawl trade, frequently engages a number of shops, which he collects in a spot under his eye ; or he supplies the head workmen with thread which has been previously spun by women and afterwards coloured, and they carry on the manufacture at their own houses, having previously received instructions from the merchant respecting the quality of the goods he may require, their colours, patterns, &c. After the goods are completed, the merchant carries them to the custom-office, where each shawl is stamped, and he pays a certain duty, the amount of which is settled according to the quality and value of the piece. The officer of the government generally fixes the value beyond what the goods are really worth. The duty is at the rate of one-fifth of the price. Most shawls are exported unwashed, and fresh from the loom. In India, there is no market for unwashed shawls, and at Umritsir they are better washed and packed than in Cashmere. Of those sent to the westward, many are worn unwashed. The wool of which the shawls are made is imported from Tibet and Tartary, in which countries alone the goat which produces it is said to thrive. That which is brought from Rodauk is reckoned the best. Its price in Cashmere is from ten to twenty rupees for a turruk, (which is supposed to be about twelve pounds) : the whitest sort is the dearest. It would perhaps be difficult to determine with accuracy the quantity of shawls manufactured annually ; supposing, however, that five of all kinds are on an average made at each shop or loom in the course of a year, the number would be eighty thousand, which is probably not far from the truth. They accordingly marched out of their camp to attack the Dooraunees, on the 7th of January 1761. The Dooraunees got under arms, and the battle began a little before day.—*Elphinstone's King. of Cabul, pp.* 508, 509, 553. See Maryul or Lowland.

STRACHIA GEOMETRICA, a bug of a yellowish colour, but marked with grey and orange on the upper side, is found at Badulla. In Ceylon it feeds upon the juice of the young berries, three per cent. or more of which were said to have suffered from it. It is allied to the green or fetid bug, but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

STRÆMIA TETRANDRA, *Roxb.* Syn. of Cadaba indica, *Lam., W. & A.*

STRAITS OF BANCA, is rather more than 100 miles long, and in the narrowest part is seven miles from shore to shore. The Straits of Banca, between that island and Sumatra is the most frequented in the Indian Seas.

STRAITS OF BASEELAN, between Baseelan island and Mindanao.

STRAITS' SETTLEMENTS, comprise Singapore, Malacca, Provence Wellesley, and Penang. The Straits' Settlements ceased to be connected with India on 1st February 1867, when they became a Crown colony. The inhabitants are

	Singapore	Pinang & Provence Wellesley	Malacca.
Jakuns	....	... .	900

Totals...	90,700	126,700	71,600

The Straits' Settlements on the northern boundary of the Straits of Malacca, include under one government, Penang, Provence Wellesley, Malacca and Singapore, and were incorporated in one Settlement in 1826. Penang was obtained in 1786, by treaty, from the king of Quedah ; and 14 years later, Provence Wellesley was ceded by the same prince. Malacca, conquered by Albuquerque for the Portuguese about 1515, fell into the hands of the Dutch in the beginning of the 17th century, but was taken by the English in 1795. The English kept it until, in 1818, it was re-delivered to the Dutch under the provisions of the treaty of Vienna, but it again reverted to the English by the treaty of 1824. Singapore was first occupied in 1819 by the English Governor, Sir Stamford Raffles, then Governor of Fort Marlborough or Bencoolen, in Sumatra. The population of the Straits' Settlements is about 290,000. The Straits' Settlements lie along the northern boundary of the Straits of Malacca. The Straits' land revenue in 1863-4 was £13,260 ; and in 1864-5 was £13,359.

Penang is an island situated at the north-western entrance, of the Straits of Malacca, or in about lat. 5° 25′ N., and long. 100° 21′, and is about 13½ miles long with an extreme breadth of 10 miles, containing an area of nearly 70,000 acres.

Provence Wellesley is on the mainland of the peninsula, immediately opposite Penang, the water dividing them being about 3 miles broad at the narrowest point. It runs from north to south 25 miles, varying in breadth from 4 to 11 miles and containing an area of 15,000 acres.

Malacca has a sea-frontage of 43 miles, with a depth of 10 to 28 miles. The town is in L. 2. 16 N.

Singapore island is 24 miles long by 14 broad and contains an area of 206 square miles. The town is in lat. 1. 17 N., and long. 103° 51' E.

This tropical colony, comprises the island of Penang, (or Prince of Wales' Island, including Provence Wellesley,) the town and territory of Malacca, and the island of Singapore. The East India Company in 1786 came into possession of Penang by treaty with the rajah of Quedah, a native State on the west coast of the peninsula ; and fourteen years later the slip of land opposite Penang, now known as Provence Wellesley, was ceded to the company by the same prince. Malacca was conquered by the Portuguese under Albuquerque in A. D. 1515, and about 100 years afterwards fell by conquest into the hands of the Dutch, who retained it until 1795, when the British took it from them. It remained in our possession until four years after the conclusion of the treaty of Vienna, and in 1818 was re-delivered to the Dutch in conformity with the terms of that treaty ; but seven years afterwards it came finally into British possession in terms of the celebrated treaty with Holland of 1824. As for Singapore, it has never changed European owners. In 1819, Sir Stamford Raffles, then Governor of Fort Marlborough, or Bencoolen, in Sumatra, who had been long impressed with the importance of the position, came over and took formal possession of the then nearly uninhabited island.

In the Island of Java a most disastrou volcanic eruption began at about 5 o'clock on the evening of the 15th April 1872 The volcano Merapi, which had been quiet since 1863 began on the evening above mentioned to show signs of vigorous life Glowing streams of lava issued out of the mountain, and rushing furiously downwards buried whole villages in their fiery masses, fillec up ravines, and choked the course of rivers a river in the neighbourhood was filled witl lava to a depth of 15 feet. A great many lives were lost in the destruction of whol villages. As many as 200 dead bodies ha been found on one side of the volcano, whil thousands of Javanese had to fly for thei lives, their houses and their all being destroyed by the descending lava. In one village, a woman, who had escaped, reported that 160, being the whole of her fellow-villagers, had been destroyed. The coincidence in time between this outbreak and the last eruption of Vesuvius, is remarkable.—*Cameron's Malayan India* ; *Straits Times ; Indian Messenger, August 8th*, 1872.

STRAMONIUM.

Masil, methel,	AR.	Datura,	HIND.
Jouz masil,	,,	Datura stramonium,	LAT.
Thorn apple,	ENG.		

Of this species of Datura plant, all parts are poisonous. The leaves are used in asthma, or smoking.

STRANGERS' HOME FOR ASIATICS.

One of these was established in London in 1859. It offers to Indian sailors and other Orientals who are in England a comfortable and respectable lodging, with wholesome food, at a cost which shall render the institution self-supporting. Each lodger is to pay not less than 8*s*. per week, for which the lodger will be supplied with three meals a day, medical attendance, baths, washing, &c. ; so that they will have no other necessary outlay, but to furnish themselves with clothing, the means of doing which, on the most reasonable terms, are provided by the establishment of a store-room at the "Home." In addition to these benefits, arrangements have been made to take charge of their money and other property, to make remittances to their families and friends, to give them advice, and afford them information, to protect them from imposition, to procure them employment in vessels, to present them with copies of the Holy Scriptures, &c. From June 1857 to June 1858, the number of Asiatics, Africans, &c., who found a home at that institution was 884. The average weekly number of inmates for two years was 50. During that period the number of beds paid for was 857, by Asiatics entering as casual lodgers at 3*d*. per night. In 1857 the number of Asiatic servants and lascars shipped was 407 ; in 1858 the number was 307 ; and during the five months of the year 1859 the number was 122. During the year, the labours of the Scripture reader had been unremitting, and a great number of lascars and others had been visited and supplied with copies of the scriptures and tracts. The receipts from all sources for the year 1858 amounted to £3,728 3*s*. 5*d*., including £1,059 donations, £60 19*s*. subscriptions, and a loan of £600. The expenses amounted to £3,533 9*s*. 8*d*., leaving a balance in hand of £194 13*s*, 6*d*. At the opening of the institution the liabilities amounted to £6,371 11*s*. 8*d*. At the anniversary of 1859 the amount had been reduced to £5,456 1*s*. 4*d*. The amount then required to liquidate the debt was £5,328. Up to that time the institution had not been self-supporting.

STRANGE, *Sir Thomas, Judge of the High Courts of Madras and Bengal, and his* son Thomas Lumsden Strange, Judge of the

Sadr Adalut Court of Madras, Authors of books on Hindu Law: that of the son called a Digest of Hindu Laws was compiled partly from the smaller work on the same subject by his father, and partly from other eminent authorities, but amplified and elucidated by his own investigations.

STRAVADIUM COCCINEUM, *DeCand.* Syn. of Barringtonia acutangula, *Gært.*

STRAVADIUM RACEMOSUM, *Juss.* Syn. of Barringtonia racemosa.

STRAVADIUM RUBRUM, *Pers.* Syn. of Barringtonia acutangula, *Gært.*

STRAWBERRY is the English name of the plant and fruit of species of Fragaria, of which there are many species,

F. bonariensis, *Juss.*, Buenos Ayres.
F. chilensis, *Ehrh.*, South America.
F. collina ——? Switzerland, Germany.
F. elatior, *Ehrh.*, America.
F. grandiflora, *Ehrh.*, Surinam.
F. indica, *Andr.*, Mountains of India.
F. majaufea ——? France.
F. monophylla, *Duchene.*
F. nubicola, *Wall.*, Himalaya.
F. roxburghii, *W. & A.*, Khassya, Assam.
F. vesca, *Linn.*, cultivated.
F. virginiana, *Linn.*, North America.

Some species occur in India, wild, and others are cultivated. F. chilensis, *Ehrh.*, the Chili strawberry, was brought from South America. F. collina is also an introduced plant. F. elatior, *Ehrh.*, is the Haut-boy strawberry from America, and F. grandiflora and F. majaufea are also known, as also F. roxburghii, *W. & A.*, the F. indica and Malay of Roxburgh, which has also been classed with Duchesnea and Potentilla, growing in the Neilgherries, Dehra Dhoon and Kamaon.

Fragaria vesca, *Linn.*

Wild Strawberry,	ENG.	Paljor,	CHENAB.
Wood ,,	,,	Bunun also musrini,	RAVI.
Kanzar,	JHELUM.	Fraga,	LAT.
Ingrach, yang,		Bana-phul,	SUTLEJ.
tash,	KANGRA.	Tawai,	TRANS-INDUS.

This grows wild in most parts of the Punjab Himalaya, from 4,000 to 12,000 feet. The fruit is excellent when gathered dry but is largely improved by cultivation. It is cultivated by Europeans and market gardeners and in the Bombay Dekhan, a bed of a few square yards brings in from £15 to £20 the season. In Bangalore it is grown abundantly. The strawberry plant multiplies itself from runners and suckers; the old plant, after it has ceased bearing, throwing them out. In the Dekhan as soon as the rains have set in, these runners may be removed into a nursery bed, for their being more easily looked after, and should have the space of nine or ten inches allowed between them; they will throw out other runners, the whole of which may be separated and transplanted at the proper season. They thrive best in a light soil with good old stable and vegetable manure at first, and as soon as they show a disposition to flower, may have old goats' or sheep's manure added around each plant, a couple of double handsful being sufficient. In no part of the Dekhan, should the plants be put out for fruiting before the close of the rains, the latter part of September being quite early enough. Suckers planted for experiment at the commencement of August, grew to a good size, and did nothing for ten or twelve weeks but throw out suckers, which were continually removed, but, after all, fruited badly: the finest and most prolific crop were got from suckers put out in the beginning of October. Some strawberries were gathered in November from the plants put out in August, but they were so few as in no way to induce a trial of the experiment again. Varieties can only be procured from seed; and to procure the seed, select the finest ripe fruit, rub it on a sheet of paper, and dry it. When the rains commence, soak the seed in water, reject all that float, the remainder sow in baskets in a light loam, when they will be fit to remove in about six weeks, and should be put in other baskets four or five inches apart, and taken care of until ready to be transplanted into the beds where they are to remain. As these plants throw out suckers very fast, they must be constantly looked after, and removed. They will commence bearing in six months from the time of sowing the seed. As soon as the rains have ceased, put the suckers that have rooted into square beds, each not less than one foot apart, five in a row: this will give twenty-five in each bed—as many as can be easily looked after and gathered without trampling on the bed and thereby injuring the plants. When the earth is of a clayey consistence, Dr. Riddell has seen the strawberry cultivated on ridges. Some think this is a good plan, but he prefers the beds. It is sometimes necessary, in consequence of flooding the beds, to put tiles under the fruit to keep it clean, but it also attracts the notice of the birds: if straw or grass be used, then the chances are that white ants destroy the plants. This it is that makes some persons prefer the ridge system of growing, as they say the fruit is cleaner in consequence: fine fruit may be grown either way; and if on ridges, the same distance must be allowed between the plants as in beds—and even in the latter the plants may be put on raised cones of earth. The common vegetable manure is all that is required at first until near flowering, when a handful or two of goats' or sheep's dung should be put round the plant, opening the earth and scraping it together. Water during the evening and very early in the morning.—*Birdwood, Vegetable Product, pp.* 151-2, 209; *Drs. Cleghorn, Kullu and Kangra, pp.* 65, 81 ; *J. L. Stewart, Riddell, Hogg, Veg., Kingdom.* See Strawberry.

STRASS. Artificial gems by which many of the precious stones are well imitated. The colour of the emerald is peculiar, and called emerald green. The glass of bottle bottoms is, however, largely sold in Ceylon and other places as emeralds. Emeralds are rarely without defects, called flaws, "Rag," *Hind.*, and, with the hope of deceiving, the manufacturers, aware of this, make the false emeralds with flaws. Of all precious stones, the emerald is most liable to defects, and their absence should excite suspicion as they can be very easily imitated. Strass is a technical term for the base of the artificial gems, of which the following is the composition :—

	Strass.	Sapphire.	Emerald.	Beryl.	Topaz,	Sapphire another.	Sapphire another.

STREBLUS ASPER, *Lour.* Syn. of Trophis aspera, *Retz.*

STREPSICERÆ, see Capreæ.

STREPSILUS INTERPRES, the Turnstone. Inhabits all sea-coasts, from the equator to the poles: common along those of India and seems to be found on every sea-coast.

STREPSIPTERA, Parasites on various hymenoptera.

STREPTAXIS, a curious distorted snail, that feeds on worms.

STREPTOCARPUS, one of the Bignoniaceæ. This is a handsome plant from the Cape of Good Hope, produces abundance of pale, purple flowers, it requires a good garden soil, and is increased by seed.—*Eng. Cyc.*

STREPTOPELIA GRIMARDI, *C. L. Bonap.*, "with much narrower collar and much shorter toes" than Str. dussumieri, is described from the Marianne Islands; a fifth Asiatic species of Streptopelia is the Indian Humilis, remarkable for the diversity of the sexes.—*Mr. Blyth's Report.*

STREPTOPELIA DUSSUMIERI, see Turtur dussumieri.

STRI, SANS. A woman, wife.

STRIGIDÆ, the owls, a family of birds of the order Raptores or Birds of Prey :—

FAM.—Strigidæ.

Sub-fam.—Buboninæ, 1 Nyctea; 4 Bubo; 2 Asio; 2 Scops; 3 Ketupa.

Sub-fam.—Atheninæ, 1 Ninox; 8 Athene.

Sub-fam.—Syrniinæ, 3 Syrnium.

Sub-fam.—Striginæ, 1 Phodilus; 2 Glaux; 2 Strix.

Owls are found throughout the world, and many races, alike of Europe and of Asia, continue to entertain superstitious opinions regarding species of this nocturnal genus. The women of India, hearing the hooting of the Ghugu, shut the ominous sounds from their ears by wrapping their sarhis round their heads. Of the Barn owl, Strix flammea, a poet says :—

The white owl seeks the autique ruined wall,
Fearless of rapine ; or in hollow trees,
Which age has caverned, safely courts repose.

And Shakespeare notices the common superstition, when he says :—

It was the owl that shrieked, the fatal bellman,
Which gives the stern'st good night."

The Snowy owl, Stryx nyctea, has also been noticed in song—

When day declining sheds a milder gleam,
What time the May fly haunts the pool or stream;
When the still owl skims round the grassy mead
What time the timorous hare limps forth to feed ;
Then be the time to steal adown the dale,
And listen to the vagrant cuckoo's tale;
To hear the clamorous curlew call his mate,
Or the soft quail his tender pain relate ;
To see the swallow sweep the darkening plain
Belated, to support her infant train ;
To mark the swift in rapid giddy ring,
Dash round the steeple unsubdued of wing:
Amusive birds ! say where your hid retreat,
When the frost rages and the tempests beat;
Whence your return, by such nice instinct led,
When spring soft season lifts her blooming head ?
Such baffled searches mock man's prying pride,
The God of Nature is your secret guide!
While deepening shapes obscure the face of day,
To yonder bench leaf-sheltered let us stray,
Till blended objects fail the swimming sight,
And all the fading landscape sinks in night;
To hear the drowsy dor come brushing by
With buzzing wing, or the shrill cricket cry;
To see the feeding bat glance through the wood ;
To catch the distant falling of the flood;
While o'er the cliff th' awakened churn owl hung,
Through the still gloom protracts his chattering song;
While high in air, and poised upon his wings
Unseen, the soft enamoured wood-lark sings;
These, Nature's works, the curious mind employ,
Inspire a soothing melancholy joy;
As fancy warms, a pleasing kind of pain
Steals o'er the cheek, and trills the creeping vein :
Each rural sight, each sound, each smell, combine ;
The tinkling sheep-bell, or the breath of kine:
The new mown hay that scents the swelling breeze,
Or cottage chimney smoking through the trees,
The chilling night dews fall;—away, retire?"

Strix rosenbergii and S. javanica, owls of the Malay Archipelago, the latter is in all the islands up to Lombok.—*Jerdon's Birds* ; *White's Nat. Hist. of Selborne.*

STRI-HARIKOTTAH MUTTAH, a small forest tract on the north of Madras.

STRUTHIONUM PLUMÆ MOLLIORES, Estrich, Estridge.

STRUZZO also Struzzulo, IT. See Struthionidæ.

STRYCHNOS, a genus of plants, growing in the E. Indies. Mr. Thwaites mentions, as Ceylon plants, S. cinnamomifolia, *Thw.*, of the Hantani district. S. colubrina, *Linn.*, in the hot, drier parts of Ceylon. S. laurina, *Wall.*, at Galle and Korne-Galle. S. minor, *Blume*, at an elevation of 6,000 feet, S. nux-vomica. S. bicirrhosa, *Lesch.*, is a native of Tanjore. S. lucida, *R. Br.*, is from Tropical New Holland, S. madagascariensis, *Pet. Th.*, is of Madgascar. S. axillaris is of the Khassya Hills, and S. monogynus, *Roxb.*, in Sylhet. *στρὺχνος* was a name applied by Theophrastus and Dioscorides to a kind of Nightshade, and adopted by Linnæus for a genus of plants belonging to the natural order Apocynaceæ. The species are not numerous, and are found principally in the tropical parts of Asia and America. One has been described by Mr. Brown, a native of Australia.—*Eng. Cyc.*

STRYCHNOS LAURINA, *Wall.* grows in Ceylon, at Galle, Kornegalle, and other of the warmer parts of the island.—*Thw. Enum. Pl. Zeyl., p.* 201.

STRYCHNOS CINNAMOMIFOLIA, *Thw.*

Atta-kirindi-wel, SINGH.

A native of Ceylon, growing in the Hantani district, at an elevation of 3,000 feet.—*Thw., Enum. Pl. Zeyl., p.* 201.

STRYCHNOS COLUBRINA, *Linn.*

Modira canoram, *Rheede.*

Kuchila luta,	BENG.	Modira kaniram,	MALEAL.
Snake poison nut tree,	ENG.	Pao-de-cobra,	PORT.
Snakewood tree,	,,	Naga musada,	TEL.
Bois de couleuvre,	FR.	Naga musadi,	,,
Lignum colubrinum,	LAT.		

A scandent plant with a stem of a great size, often 8 to 12 inches in diameter, growing in the hot, drier parts of Ceylon and in Malabar. The wood is of a light grey-colour, hard and intensely bitter. The wood of this plant is the true Pao de Cobra of the Portuguese. That of the root is deemed a powerful remedy for the bite of the cobra capella. Several woods have however received the appellation of Bois de couleuvre, (Lignum colubrinum) in different countries, viz., the Ophyoxylum serpentinum in Amboyna, the Ophiorhiza mungos in Java, Polygala senega in North America, &c., all for their supposed virtues as antidotes to make poison. A very large proportionate quantity of strychnine exists in the wood of this root.—*Dr. O'Shaughnessy, p.* 442 ; *Eng. Cyc.* ; *Thwaites' Enum. Pl. Zeyl., p* 201 ; *Roxb.'s Fl. Ind., Vol.* i, *p.* 577, *and note, ibid.*

STRYCHNOS LIGUSTRINA.

Caju-alar,	MALAY.	Caju-badaira pail or laut,	MALAY.
Caju-nassi,	,,		

A tree of the Eastern archipelago, resembling the orange tree ; berries globose, yellowish-green, two to eight-seeded. This yields the Lignum colubrinum of Timor.—*O'Shaughnessy, p.* 443.

STRYCHNOS MINOR, *Blume.*

Var. a, parvifolia, *Benth., l. c.—c. p.* 341.

Grows in the warmer parts of the island of Ceylon, in the Central province, up to an elevation of 6,000 feet.—*A. Dc. Prod.*, ix, *p.* 14; *Benth. in Journ. Linn. Soc. Bot., Vol.* i, *p.* 100—*c. p.* 187; *Thwaites' Enum. Pl. Zeyl., p.* 201.

Falus mahi,	,,

A small or middling-sized tree, with a short crooked trunk, which grows in the hotter parts of Ceylon, common in every part of the Madras presidency; common in the south Konkan, particularly in shady ravines, but, on the Bombay side, does not re-appear either north of the Savitri or inland. It is a native, also of the southern parts of the Bengal presidency and near Midnapore, is a very common tree throughout the forests of Pegu and extends into the archipelago. In a full-grown tree, the average length of the trunk to the first branch, is 15 feet or 20 feet, and average girth measured at 6 feet from the ground is 3 feet, is a very common tree throughout the Pegu forests and on the rocky sides of the hill at the back of Maulmain. The timber is strong and close-grained, but never of very large size. Wood, white-coloured, adapted for fancy work and cabinet-making. In the hilly parts of the Konkans, the nuts are used for poisoning fish. The reputed property of the wood to cure the bite of venomous snakes, as stated by Lindley, is never heard of there, and is doubtless quite apocryphal. The seed is inodorous, but its taste insupportably acrid and bitter. It is very difficult to reduce the seeds to powder; they must be first rasped, the raspings steeped in mucilage, then dried and powdered: or what is preferable, the rasping should be exposed to the steam of water for an hour, and then stove-dried, and powdered in a covered mortar. The bark is of an ash-grey colour while young, thin, compressed, inner surface black, outer surface of the larger pieces spotted with red rust-like patches. Fracture brittle, taste intensely bitter; nitric acid gives a blood-red stain to the black parts, and changes the red to a rich grass-green. This bark is known to the European druggists under the name of the "false angustura." Its nature was long suspected, but first clearly ascertained by Dr. O'Shaughnessy. The same bark is commonly sold in Calcutta, under the name of "Rohun," and substituted for the harmless bark of the Soymida febrifuga. Dr. Pereira thinks that the Nux mechil of Serapion is Nux vomica; but in Persian works this name is applied to a Datura. The wood of the Nux vomica tree is said by Dr. Christison to be often substituted for the Lignum colubrinum, or Snake-wood. All parts of the plant, except the pulp and flowers, are exceedingly bitter especially the wood of the root, and the inner layers of the bark. The seeds are disk-shaped, circular, hard and thorny. It contains two powerfully poisonous alcaloids, strychnine and brucine; and an acid. It acts as a powerful excitor of the spinal chord and as a tonic. By Europeans it is principally used in paralysis and neuralgia, also in muscular tremors and incontinence of urine, and natives of India are now using strychnine as an excitatory agent. The tree is common on almost every part of the coast of Coromandel, and is in flower during the cold season. The wood is white, strong, close-grained and very hard, and used for plough-shares. The pulp of the poisonous fruits are the favourite food of the Buceros malabaricus or Hornbill. The hard and durable wood is used for many purposes by the natives. It is exceedingly bitter, particularly that of the root which is used by intermitting fevers and in case of venomous snake-bites, when that of Naga musini, S. colubrina, cannot be had. The seeds are employed in distillation of country spirits, to render them more intoxicating. The pulp of the fruit seems perfectly innocent and it is greedily eaten by many sorts of birds. Its timber is strong and close-grained, but never of large size: wood hard and of a white or ash colour, specific gravity 0·706. A cubic foot weighs 52 lbs. It is used for plough-shares, cart wheels, in Travancore for making cots, and is adapted for fancy work and cabinet making. It furnishes one of the snake woods of commerce. Iron tools are sharpened on blocks of this wood. White ants will not touch it.—*O'Shaughnessy, p.* 437; *Royle*; *Roxb's. Fl.*

Kathaven nar, TAM.

Grows in the mountains of India, in Bengal and the Dekhan, flowers in March and April, of a greenish yellow colour. The tree is of moderate size, larger than S. nux vomica, and furnishes a serviceable small-sized wood. In the Circars it is much scarcer than the S. nux vomica, being only found amongst mountains and woods of great extent. It flowers during the hot season. The wood is hard and durable and is used for various economical purposes. The pulp of the fruit when ripe is eaten by the natives, the taste is rather disagreeable. This tree grows in the drier, and especially the northern, parts of Ceylon. It is found in various parts of India and grows to a moderate and even large size, larger than the S. nux vomica and scarcer. It is found in Coimbatore and other parts of the Madras presidency, on mountains and in woods of great extent ; on the hills of the Satpoora range, near Arrawad and in the jungles of Doordi, on the Gutpurba river. In Ganjam and Gumsur, its extreme height is 40 feet, circumference 4 feet, and height from the ground to the intersection of the first branch, 9 feet. It is there, chiefly used for firewood, though bandy wheels and plough-shares are occasionally made of it. Clearing-nut has ovate or oval glabrous pointed leaves; a deeply-fissured bark ; and berries containing only one seed. It has shining fruit, which is black when ripe. When full-grown it attains a height of from 15 to 20 feet. The English name is derived from the use which is made of the seeds, which have the curious property of purifying muddy water, and are constantly used for that purpose by the natives who rub the inside of their lotas and brass pots with them. The impurities very soon fall to the bottom. This effect is so generally known that the seeds are usually carried by travellers in India. The nature of the action has not been clearly ascertained. It probably depends on astringency in the fruit. The fruit is used medicinally. Pulp, when ripe, eaten by the natives. The entire plant is destitute of the poisonous ingredients of the other species. Ainslie informs us that the ripe fruit is deemed emetic by the Tamools of Southern India, when given in powder to the quantity of about half a tea spoonful. On this point, Ainslie says, this fruit, though when very young, it is made into a preserve and eaten, is reckoned in its ripe state amongst the emetics of the Tamool practitioners. Dr. Hooker found the Strychnos potatorum, forming a dense foliaged tree, 30 to 60 feet high, and while some individuals are a pale yellow, others are deep green, yet both in apparent health. This seed can often be obtained when alum cannot be procured. The natives never drink clear well water if they can get pond or river water, which is always more or less impure.—*Drs. Wight, Gibson and Cleghorn* ; *Captain Macdonald, Thw., p.* 201 ;*Roxb.'s Fl. Ind., Vol.* i, *p.* 576 ; *O'Shaughnessy, p.* 443 ; *Ains. Mat. Med., p.* 119 ; *Hooker's Him. Jour., p.* 50; *Roxb.*; *Rohde's MSS.*

STRYCHNOS SANCTI IGNATII, *Berg.*

Ignatia amara, *Linn.*

St. Ignatius' bean,	ENG.	Papeeta,	HIND.

A branching tree, a native of the Philippine islands. The seeds are an inch long, the size of a large olive. According to the analysis of Pelletier and Caventon, these beans contain igasurate (strychnate) of strychnia, wax, concrete oil, yellow colouring matter, green starch, bassorine, and vegetable fibre. The strychnine is present in three times the quantity of that in the kuchila nuts, but there is no brucine. Its activity is consequently very great, its uses the same as those of nux vomica. Besides the symptoms therein described the papeeta nut purges in small doses, and is hence deemed, and believe correctly, to be an efficacious vermifuge medicine. It is by some usually considered as constituting a distinct genus, and called Ignatia amara, *Linn.*, its seeds are frequently made to yield their Strychnia. They are ovate, triangular, of a reddish-grey colour, and about twenty of them contained in a pear-shaped fruit. They are intensely bitter, used by the native doctors as a remedy in cholera, but administered in conjunction with Jehiree (Cocos maldivica). When given in over-doses the symptoms are those of poisoning by strychnia, as vertigo, convulsions, &c., and the remedy used for these effects is lemonade in large quantities, which is said to afford relief speedily.—*Eng. Cyc*; *O'Shaughnessy, p.* 441.

STRYCHNOS TIEUTE, *Lesch.*

Upas tjeute,	Jav.	Tjettik,	Jav.
Tshellik,	„		

Has elliptical, acuminate, 3-nerved, glabrous leaves, and simple tendrils, which are thickened opposite the solitary leaves. This plant is a climbing shrub, is a native of Java and is said to be the true Upas tree of that country. It is undoubtedly the most poisonous species of the genus, and yields the greatest quantity of strychnia, an exceedingly violent poison, which acts exactly in the same manner as strychnine, and is prepared from the bark of the root of this tree. The root is called Upas radja, but does not belong to the true Upas tree of Java, which is the Antiaris toxicaria Order Urticaceæ. There are several other which are called by the name of Upas in various parts of Asia. The natives of Java prepare from this species one of the most deadly of the various poisons that are used by barbarous nations for producing death by the wounds occasioned by their arrows.—*O'Shaughnessy, p.* 444; *Eng. Cyc.*

STRYCHNOS TOXIFERA, a native of Guiana, ascertained to be the basis of the celebrated Woorara poison.—*O'Shaughnessy, p.* 443.

ST. THOMAS. The tradition of St. Thomas having preached the gospel in India is thus related by Gibbon. "According to the legend of antiquity the gospel was preached in India by St. Thomas. At the end of the ninth century, his shrine, perhaps in the neighbourhood of Madras, was devoutly visited by the ambassadors of Alfred, and their return with a cargo of pearls and spices rewarded the zeal of the English monarch, who entertained the largest projects of trade and discovery. When the Portuguese first opened the navigation to India, the christians of St. Thomas had been seated for ages on the coast of Malabar, and the difference of their character and colour attested the mixture of a foreign race. In arms, in arts, and possibly in virtue, they excelled the natives of Hindoostan: the husbandmen cultivated the palm tree, the merchants were enriched by the pepper trade, the soldiers preceded the Nairs or nobles of Malabar, and their hereditary privileges were respected by the gratitude or the fear of the king of Cochin and the Zamorin himself. They acknowledged a Gentoo sovereign, but they were governed even in temporal concerns, by the Bishop of Angamala. He still asserted his ancient title of metropolitan of India, but his real jurisdiction was exercised in fourteen hundred churches, and he was entrusted with the care of two hundred thousand souls. Their religion would have rendered them the firmest and most cordial allies of the Portuguese, but the inquisitors soon discerned in the christians of St. Thomas the unpardonable guilt of heresy and schism. Instead of owning themselves the subjects of the Roman pontiff, the spiritual and temporal monarch of the globe, they adhered, like their ancestors, to the Communion of the Nestorian patriarch; and the bishops whom he ordained at Mosul, traversed the sea and land to reach their diocese on the coast of Malabar. In their Syriac liturgy, the names of Theodore and Nestorius were piously commemorated; they united their adoration of the two persons of Christ; the title of Mother of God was offensive to their ear, and they measured with scrupulous avarice the honours of the Virgin Mary, whom the superstition of the Latins had almost exalted to the rank of a goddess. When her image was first presented to the disciples of St. Thomas, they indignantly exclaimed, "We are christians, not idolators! and their simple devotion was content with the veneration of the cross. Their separation from the western world, had left them in ignorance of the improvements, or corruptions, of a thousand years; and their conformity with the faith and practice of the fifth century, would equally disappoint the prejudices of a papist or a protestant. It was the first care of the ministers of Rome to intercept all correspondence with the Nestorian patriarch, and several of his bishops expired in the prisons of the holy office. The flock, without a shepherd, was assaulted by the power of the Portuguese, the arts of the Jesuits, and the zeal of Alexis de Menesez, arch-bishop of Goa, in his personal visitation of the coast of Malabar. The synod of Diamper, at which he presided, consummated the pious work of the reunion, and rigorously imposed the doctrine and discipline of the Roman church, without forgetting auricular confession, the strongest engine of ecclesiastical torture. The memory of Theodore and Nestorius was condemned, and Malabar was reduced under the dominion of the Pope, of the Primate, and of the Jesuits, who invaded the see of Angamala or Cranganore. Sixty years of servitude and hypocrisy were patiently endured; but as soon as the Portuguese empire was shaken by the courage and industry of the Dutch, the Nestorians asserted with vigour and effect the religion of their fathers. The Jesuits were incapable of defending the power which they had abused: the arms of forty thousand christians were pointed against their falling tyrants; and the Indian Archdeacon assumed the character of a bishop, till a fresh supply of episcopal gifts and Syriac missionaries could be obtained from the patriarch of Babylon."—*Gibbon, Ch.* 47; *La Croze Christianisme des Indes*; *Geddes's Church History of Malabar.* See Adam's Peak, Nicolo-di-conti.

ST. THOME, or Mylapore, in lat. 13° 1' N., a southern suburb of Madras, in the district of Chingleput and about three miles from Madras to the south. St. Thomé was one of the most important stations of the Portuguese on the Coromandel Coast. It subsequently belonged successively to the French, the Dutch, the king of Golconda, the nabob of Arcot, and has been in British possession since the wars in the Carnatic. Its native name is Mailapur, often in traveller's accounts, written Meliapore.—*Cal. Rev.*, 18 *Jan.* 71.

STUART, author of a History of Bengal.

STUCCO, a compound of paris-plaster and lime, used in making cornices, &c.

STUCK-GOED, DUT., also Stuck-gut, GER. Bronze; Gun metal.

STUOJE, also Stoje, IT. Mats.

STUPA, the Sanscrit term for a mound or burrow, either of masonry or of earth. General Cunningham says the Pali form is Thupo, also Thupa, or Thuva, in the early Arian inscriptions from the Punjab. The term now used is Thup for a tolerably perfect building, and Thupi for a ruined mound, but writers have adopted the word Tope, which preserves neither the spelling nor the pronunciation of the native word. The great stupa or buddhist monument of Manikyala, was first made known by the journey of the Hon'ble Mount Stuart Elphinstone, and has since been explored by Generals Ventura and Court. The name is said to have been derived from Raja Man, or Manik, who is said to have erected the great stupa. Fa-Hian states that at two days' journey to the east of Taxila is the spot where Buddha gave his body to feed a starving tiger. But Sung-yun fixes the scene of this exploit at eight days' journey to the south-east of the capital of Gandhara, which is a very exact description of the bearing and distance of Manikyala, either from Peshawar or from Hashtnagar. General Cunningham has identified the great stupa of the "body-offering" with the monument that was opened by General Court, which, according to the inscription found inside, was built in the year 20, during the reign of the great Indo-Scythian prince Kanishka, shortly before the beginning of the christian era. Manikyala was, therefore, one of the most famous places in the Punjab at a very early period; but he thinks that it must have been the site of a number of large religious establishments rather than that of a great city. The people are unanimous in their statements that the c[illegible]s destroyed by fire; and this belief, w[illegible]based on tradition or conviction, is co[illegible] the quantities of charcoal and ash[illegible] amongst all the ruined buildin[illegible] also amply confirmed by the excavatio[illegible] he made in the great monastery to the no[illegible] of General Court's tope. He found the plaster of the walls blackened by fire, and the wrought blocks of kankar limestone turned into quicklime. The pine timbers of the roofs also were easily recognized by their charred fragments and ashes. General Cunningham discovered nothing during his researches that offered any clue to the probable period of the destruction of these buildings, but as this part of the country had fallen into the power of the Kashmirian kings, even before the time of Hwen Thsang, he was inclined to attribute their destruction rather to brahminical malignity than to mahomedan intolerance. Vaisali is supposed by General Cunningham to lie to the east of the Gandak, where we find the village of Besarh, with an old ruined fort which is still called Raja-Bisal-ka-garh, or the fort of raja Visala, who was the reputed founder of the ancient Vaisali. The ruined fort of Besarh thus presents such a perfect coincidence of name, position, and dimensions with the ancient city of Vaisali, that there can be no reasonable doubt of their identity. In one of the buddhist legends, quoted by Burnouf, Buddha proceeds with Ananda to the Chapala stupa, and seating himself under a tree, thus addresses his disciple: "How beautiful, O Ananda, is the city of Vaisali, the land of the Vriji," &c. In the time of Buddha, and for many centuries afterwards, the people of Vaisali were called Lichhavi; and in the Trikandasesha, the names of Lichhavi, Vaideha, and Tirabhukti, are given as synonymous. Vaideha is well known to the readers of the Ramayana as a common name of Mithila, the country of raja Janaka whose daughter Sita is also named Vaidehi. Tirabhukti is the present Tirahuti, or Tirhut. Now, the modern town of Janakpur, in the Mithari district, is acknowledged by the universal consent of the natives of the country to be the same place as the ancient Janakpur, the capital of Mithila. The correct rendering of the name is doubtful; but if the bearing and distance recorded by the Chinese pilgrims are correct, it is almost certain that the capital of Vriji in the seventh century must have been at Janakpur. Hwen Thsang gives the name of the country in its Sanscrit form, as Fo-li-shi, or Vriji ; but it is also stated that the people of the north called the country San-fa-shi. Navandgarh, or Naondgarh, is a ruined fort from 250 to 300 feet square at top and 80 feet in height. It is situated close to the large village of Lauriya 15 miles to the N. N. W. of Bettiah, and, 10 miles from the nearest point of the Gandak river. The ancient remains consist of a handsome stone pillar, surmounted by a lion and inscribed with Asoka's edicts, and of three rows of earthen barrows or conical mounds of earth, of which two rows lie from north to south, and the third from east to west. The stupas usually met with are built either of stone or of brick ; but the earliest stupas were mere mounds of earth, of which these are the most remarkable specimens that General Cunningham had seen. He believes that they are the sepulchral monuments of the early kings of the country prior to the rise of buddhism, and that their date may be assumed as ranging from 600 to 1500 B C. Every one of these barrows is called simply bhisa, or 'mound,' but the whole are said to have been the kots or fortified dwellings of the ministers and nobles of raja Uttanpat, while the fort of Navadgarh was the king's own residence. The word stupa meant originally only a "mound of earth," and this is the meaning given to it by Colebrooke, in his translation of the 'Amara Kosha.' The author of the Ceylonese 'Atthakatha' explains that they are yakhatthanani, or edifices belonging to Yakha, or demon-worship. The Yakha in Sanscrit Yaksha and Jaksha, were the attendants of Kuvera, the God of Riches, and the guardians of his treasures, and their chief residence was called Alakapura. Somewhere in the neighbourhood of the Gandak there was a city named Alakappo, inhabited by a people named Balaya or Buluka who obtained a share of Buddha's relics.—*Cunnigham's Ancient Geog. of India, pp.* 443, 444, 448, 450.

STURGEON FISH. Along the Asiatic coasts, the high price obtained for the superior and well manufactured isinglass affords inducements not to be expected elsewhere, but all the parts of fish, as the flesh, the roe, and the sounds, can be turned to account, much of the fish caught must be everywhere consumed for food, but considerable quantities are dried, and form articles of commerce, as do shark-fins and fish-maws. The sounds of many Indian fishes might, like sturgeons, yield isinglass, while fish-glue and fish-oil might be obtained from others.

STURNIDÆ, the starling family of birds, which are arranged into the *Sturninæ*, the Starlings or mynas. The *Lamprotorninæ*, glossy mynas, or grakles : the *Buphaginæ* or ox-peckers: the *Quiscalinæ* or boat-tails : the *Icterinæ* or hang-nests ; and the *Agelainæ* or maizes. The Sturninæ, Lamprotorninæ and Buphaginæ are peculiar to the Old World. The more frequently occurring genera and species of the family are as under :—

Fam. Sturnidæ.

Sub-Fam. *Sturninæ.*

Sturnus vulgaris, *Linn.*

St. indicus, *Hodgs.* | St. splendus, *Temm.*

Common Starling,	ENG.	Nakshi-telia,	HIND.
Telia maina,	HIND.	Tilgiri,	KASHMIR.
Tilora,	,,		

The glossy black starling of Europe, Asia, Africa, Azores, is common in the Himalaya and N. India, Kashmir, Affghanistan, &c., as in Britain. An Affghan specimen, assigned to St. unicolor, appertains to the present species, being an old male with the pale specks obsolete.

Sturnus unicolor, *Marm.*, of Sardinia, Barbary, &c., is very distinct and much less bright in its glosses than the common starling. It is said by Adams to be common in Sindh, the Panjab and Kashmir. .

Sturnus cineraceus, *Temm.* Japan.

Sturnopastor contra, *Linn.*

St. capensis, *Linn.* | Pastor jall, *Horsf.*

Ablaka-gosalik,	BENG.	Ablak-maina,	HIND.
Guia-leggra,	,,	Venda gorinka,	TEL.
Pied-starling,	ENG.		

found throughout a considerable part of India, but absent in the S. and S. W.

Sturnopastor superciliaris, *Blyth.*

Pastor jalla, *Horsf.*, Malayana.

Pastor tricolor, *Horsf.*, Java.

Pastor temporalis, *Wagler*, China.

Bahmani „	„	Kawanati,	„
Puhaia „	„	Papata gorruki,	TEL.

Occurs throughout all India.

STYLIDIACEÆ, *Lindl.* This small order of plants may almost be said to be confined to the East-Indies as both its genera, Alangium and Marlea (Stylidium, *Lour.*) are common in the southern parts of India, whence they extend along the Malayan Peninsula to Cochin-China, and northwards along the forest-clad base of the Himalaya. Marlea begonifoliæ extends beyond 30. of N. latitude while Alangium decapetalum spreads from the Central Range up to the western bank of the Ganges to Allahabad, and the banks of the Jumna. This is common in the Peninsula with A. hexapetalum, said to afford good wood and edible fruit.—*Royle's Ill. Him. Bot.*, *p.* 215.

STYLIDIUM BEGONIFOLIUM, *R.Br.*

S. chinense, *Lour.*
Marlea begonifolia, *Roxb.*

Khassya hills, extending northwards beyond 30° of N. lat., middle-sized, white, with large yellow anthers, March and April ; fr. July and August. Timber employed by the natives in the construction of their houses.—*Voigt*, *p.* 40.

STYLIFER, a genus of molluscs.

STYLOCEROS RATWA, *Hodgs.* Syn. of Cervulus moschatus, *De Blain*, the Barking deer, occurs at Siligorce, in the Terai—*Hook. Him. Jour.*, *p.* 399.

STYLOCORYNE WEBERA, *A. Rich.*

Webera corymbosa, *Willd.*, *Roxb.*, *Fl. Ind.* 2, *p.* 533.
Canthium corymbosum, *Pers.*, *Rheede.*
Rondeletia asiatica, *Linn.*
Cupia corymbosa, *DC.*
Tarenna Zeylanica, *Gærtn.*

Kommi chettu,	TEL.	Konda papata,	TEL..
Bomma papata,	„		

The wood of this shrub or small tree is small, but hard, prettily marked, and much esteemed by the natives. The tree is met with on the Godavery. Its leaves and fruit are used in medicine.—*Capt Beddome* ; *Roxb. Fl. Ind.*, *Vol.* ii, *p.* 533 ; *Voigt*, *p.* 377.

STYLODISCUS TRIFOLIATUS, *Bennett.* Syn. of Andrachne trifoliata.—*Roxb.*

STYRACEÆ, a sub-order of plants ; consisting of trees or shrubs, and comprising eight or nine genera, Symplicos ; Styrax ; Paralea ; and Diclidanthera. Of the E. Indian species are :

Symplocos ferruginea, *Roxb.*, Khassya
„ spicata, *Roxb.*, Khassya.
„ racemosa, *Roxb.*, Burdwan, Nepal, Kamaon.
„ sinica, *Kerr*, China.
„ pulcherrima, *Wall.*, Nepal.
Styrax benzoin, *Dryand*, Sumatra,
„ serratulus, *Roxb.*, Chittagong.

STYRAX BENZOIN, *Dryander.*

Lithocarpus benzoin, *Blume.*

Gum benjamin,	„		

This tree is a native of Sumatra, Siam and Java, and yields the gum benjamin of commerce : character of wood not known. Benzoin is obtained in Sumatra, by making incisions into the tree, in its seventh year. The juice hardens on exposure to the air, that which flows first being the purest and most fragant. It is also obtained in Siam and Bankok : it is supposed that Styrax finlaysonianum yields the last. It occurs in masses composed of white lumps, joined together by a brownish red substance. It has an agreeable odour and taste. It contains a resin mixed with a considerable quantity of benzoic acid, which may be prepared from this drug. A very useful stimulant, expectorant and diuretic. It is principally used in chronic bronchitis and laryngitis, also in jaundice and disease of the bladder.—*Voigt* ; *Birdwood* ; *Powell's Hand book*, *Vol.* i, *p.* 359.

STYRAX BROOM ? GER. Storax.

STYRAX OFFICINALE. *Linn.* A native of Asia Minor and Syria, common in Greece, and cultivated in the south of Europe. As this plant does not yield a balsamic exudation in all these situations some Storax has been thought to be yielded by Liquidambar orientale. Du Hamel, however, states having seen it flow from a tree near the Chartreuse of Montriau.

Storax, occurs in three different forms ; viz.

Storax in grains, the rarest and purest of all, in transparent, yellowish-white or reddish-yellow grains, the size of a small bean, the consistence of wax, and capable of consolidating into a thick mass. Odour strong, penetrating and very agreeable. Taste aromatic and bitter.

Storax in soft mass, or amygdaloid storax (Storax calamite, Lemery), softer than the preceding species, easily fusible, with brown fracture, displaying almond-like yellowish tears. Odour very sweet, like benzoin, taste sweet and perfumed.

Massive hard sterax, light brown, yellow, reddish brown and friable, sometimes slightly tenacious, softens under the teeth. Odour less than that of two preceding varieties, and resembling balsam of Tolu ; flavour sweet. This variety is very impure, being usually adulterated with saw-dust, &c.

The better kinds of storax burn with a white flame, and give a light, spongy, carbonaceous residue. It communicates to water a yellow colour and fragrant smell. It is soluble (except the impurities) in alcohol and ether. Storax is brought to Europe from Turkey in Asia ; formerly it was packed in bulrushes, at present it is sent in bladders. M. Fee deems the origin of this drug uncertain ; the styrax tree, cultivated in the south of Europe, affords no balsam, but this may be because the soil and climate differ from those of its native country. The strong resemblance between this product and the balsam copalm produced by the Liquidambar styraciflua, led to the idea that storax might probably be secreted by some congenerous tree, and Bernard de Jussieu pointed out the Liquidambar orientale, a tree common in Syria, as the most likely source of the article. It is now, however ascertained that storax is in reality produced by the Styrax officinale, a native of the Levant, Syria, Palestine, Greece, and the Peloponesus. The term storax or styrax, (Greek ρτυραξ Arabic estorak,) is a word of unknown origin.—*Ehenb. and Eberm.*, 210, *Fl. Græc. t* 375, *St. and Ch.* 47 ; *O'Shaughnesy, pp.* 429-30.

STYRAX SERRULATUS, *Roxb.*, a tree of Chittagong.

STYX, see *Saraswati.*

SU, see Swastika.

SU also Abar, a great Scythic horde who entered India, B. C. 126, and gave their name to the province of Indo-Scythia.—*Elliot.*

SU Tuisto (Mercury) and Ertha (the earth) were the chief divinities of the early German tribes. Tuïsto was born of the Earth (Ella) and Manus (Menu). He is often confounded with Odin, or Woden, the Buddha of the eastern tribes, though they are the Mars and Mercury of these nations.

The Suiones or Suevi, the most powerful Getic nation of Scandinavia, was divided into many tribes, one of whom, the Su (Yuchi or Jit), made human sacrifices in their consecrated groves to Ertha (Ella), whom all worshipped, and whose chariot was drawn by a cow. The Suevi worshipped Isis and Ceres (of Rajasthan), in whose rites the figure of a ship is introduced ; 'symbolic,' observes Tacitus, 'of its foreign origin.' The festival of Isa, or Gowri ; wife of Iswara, at Oodipoor, is performed on the lake, and appears to be exactly that of Isis and Osiris in Egypt, as described by Herodotus. On this occasion Iswara (Osiris), who is secondary to his wife, has a stalk of the onion in blossom in his hand ; a root detested by the hindoos generally, though adored by the Egyptians. The Suevi sung hymns in praise of Hercules, as well as Tuisto or Odin, whose banners and images they carried to the field ; and fought in clans, using the feram or javelin, both in close and distant combat. In all maintaining the resemblance to the Hericula, descendants of Buddha, and the Aswa, offspring of Bajaswa, who peopled those regions west of the Indus, and whose redundant population spread both east and west. In an inscription of the Gete or Jit prince of Salindrapoor (Sulpoor) of the *fifth* century, he is styled of the race of 'Tusta' (q. Tuisto ?). It is in that ancient nailheaded character used by the ancient buddhists of India, and still the sacred character of the Tatar Lamas: in short, the Pali. All the ancient inscriptions in the possession of Col. Tod, of the branches of the Agnicula*s*, as the Chohan, Pramara, Solanki and Puriharu, are in this character. That of the Jit prince styles him 'Jit Cat-'hi-da' (Qu. of (da) Cathay)? From Tuisto and Woden we have our Tuesday and Wednesday, In India, Wednesday is Budwar (Dies Mercurii), and Tuesday, Mungulwar (Dies Martis), the Mardi of the French. The Getic creed carried their veneration for the horse, symbolic of their chief deity the sun, into Scandinavia : equally so of all the early German tribes, the Sur, Suevi, Catti, Sucimbri, Getes, in the forests of Germany and on the banks of the Elbe and Weser. The milk-white horse was supposed to be the organ of the gods, from whose neighing they calculated future events : notions possessed also by the Aswa, sons of Boodha (Woden), on the Yamuna and Ganges, when the rocks of Scandinavia and the shores of the Baltic were yet untrod by man. It was this omen which gave Darius Hystaspes (hysna, 'to neigh,' aspa, 'a horse,') a crown. The bard Chund makes it the omen of death to his principal heroes. The steed of the Scandinavian god of battle was kept in the temple of Upsala, and always "found foaming and sweating after battle." "Money," says Tacitus, "was only acceptable to the German when bearing the effigies of the horse." In the Edda we are informed that the Getes, or Jits, who entered Scandinavia, were termed Asi, and their first settlement As-gard. Pinkerton rejects the authority of the Edda, and follows Torfæus, who from Icelandic chronicles and genealogies concludes Odin to have come into Scandinavia in the time of Darius Hystaspes, five hundred years before Christ. This is the period of the last Boodha, or Mahavira, whose era is four hundred and seventy-seven years before Vicrama, or five hundred and thirty-three before Christ. The successor of Odin in Scandinavia was Gotama ; and Gotama was the successor of the last Boodha ; Mahavira, who was Gotama, or Gaudama, is still adored from the Straits of Malacca to the Caspian Sea. "Other antiquaries," says Pinkerton, "assert another Odin, who was put as the supreme deity one thousand years before Christ." Mallet admits two Odins, but Mr. Pinkerton wishes he had abided by that of Torfæus, in 500 A. C. It is a singular fact, that the periods of both the Scandinavian Odins should assimilate with the twenty-second Boodha, Naimnath, and twenty-fourth and last, Mahavira : the first the cotemporary of Krishna, about 1400 years, the last 533, before Christ. The Asi, Getes, &c. of Europe worshipped Mercury as founder of their line, as did the Eastern Asi, Takshacs and Getes. The Chinese and Tatar historians say Boodha, or Fo, appeared 1027 years before Christ.—*Tod's Rajasthan, Vol.* i, *p.* 64 ; *Tacitus, Vol.* xxxviii.

SU or Shu in the Girnar inscription and in the Bairath stone, has been said to mean a personification of calamity. Sav ; Savath and Su are in the 7th Section of Girnar inscription. Theos θεος, Greek. God, Zeus, is merely deus in one syllable ; genitive dios. Deus is Theos. Zeu in pelasgic Greek is Jupiter. Seu ,Spartan. Seo, Sev or Siva Siva, Shiva.

SUALLA of Celebes. Biche de mar.

SUAR, Chensuar or Chenchwar, or Surah also Chentsu, are a wild, half-savage, forest tribe inhabiting the eastern ghauts of the peninsula of India. They are known to their settled neighbours as the Chenchu kulam, Chenchwar and Chensuar. Wilson names them Chenchu-vadu (vadu, TEL., a man.) They are about 1,200 in number, and dwell in the tract of jungle covering the westernmost range of the eastern ghaut line, between the Pennar river and the Kistnah, and known locally as the Nullamulla, and the Lankamulla. They inhabit clearings in the forest, live in beehive shape huts like the African, Nicobarian and many of the ruder Asionesian tribes. These are of wicker-work with walls about three feet high, and a conical straw roof, with a screen for a door. The men are almost nude, and have in general only a rag for covering. The women dress like the wandering female basket-makers whom they resemble in features. The features of the men are small, but the expression is animated, cheek-bones higher and more prominent than those of the hindoos in general, nose flatter, and nostrils more expanded ; their eyes black and piercing ; in stature they are somewhat shorter than their neighbours, and they are slightly, but well-made, except about the knee, which is large, and the leg. The colour of the skin is darker, and there seems a tendency to cutaneous eruption. Newbold characterises them as between a Tiling and a Jakun of the Malay peninsula. They have no language of their own, but speak Telugu with a harsh and pecular pronunciation. Brahmans say they formerly were shepherds of the Yerra Gola caste. They have large dogs, and a few are employed as hill police, in the pass from the Kuman to Badwail. The Nandial Chenchwar assert their ignorance of a god or a soul. They have no images. They are polygamists ; they bury their dead, but sometimes burn, and, like the Tartars, they carry the deceased's weapons to the grave. They use the spear, hatchet, the matchlock, or a bamboo bow and reed arrow tipped with iron. They look on weaving and other manufacturing arts with comtempt. They are patient and docile. It is suggested by Mr. Logan that the Chenchwar are a continuation of the wild forest Surah of the mountainous tracts further north in the line of the eastern ghauts. Vocabularies of six of the non-Arian tongues, the Kond, Savara, Gadaba, Yerukalu and Chentsu are given *at* p. *39, No. of 1856, of* Beng. As. Soc. Journal.—*Newbold, in R. As. Soc. Journ.,* 1865 ; *Logan, in Journal Indian Archipelago.*

SUBA, a province, a government, sometimes a smaller division, also the officer in charge of a suba.

SUBADAR, the governor of a province or suba. A commissioned rank in the native army of India.

SUBADHRA, sister of Krishna, her marriage was by seizure of the maiden by Arjuna at her brother's instigation near the Raibuta mountain, where she had gone to perform certain religious ceremonies. The mind of this lady is shown in her lamentation for her son after he was killed in battle. The lamentation was addressed to his spirit, and she prayed for its being associated with the holy and heroic in the heavenly sphere.—*Mahabharat, Cal. Review, No.* 109, *p.* 41. See Jaganath, Nat'h.

SUBAH, HIND. A province.

SUBAHDAR, HIND. A province holder, a native officer.

SUBAK, see Affghan.

SUBALI, HIND. Crozophora plicata, *Ad. Juss.*

SUBATHU, occupies the crest of a ridge at an elevation of 4,200 feet. It lies nine miles from Kussowlie on the road to Simla, the hills are bare of wood, the climate differs from that of Kussowlie in being hotter in summer, and warmer in winter; it is altogether more dry and sheltered, and has an advantage in being seldom visited by fogs. Subathu is noted for its nummulitic strata. See Kohistan, Sanatoria.

SUBBA DUMPA, Tel. Dioscorea tomentosa, *Kœn.*; *R., Vol.* iii, *p.* 805; *W. Ic., p.* 815.

SUBAKTAGIN, governor of Khorassan, declared himself independent at Ghuzni, in A. D. 975, he afterwards carried his arms across the Indus, forcibly converting the natives to Islamism. These inroads were repeated, and in the last (A. D. 997), he was accompanied by his son, the celebrated Mahmood, who became, upon his succession to the throne of Ghuzni, the scourge of India. When Mahmood, the successor of Subaktagin, the first sultan of Ghaznavi dynasty, turned his arms towards India, he subjugated the whole of the level district, west of the Indus, to the very foot of the Brahooee mountains. His son, Musaood, extended these conquests still more westerly into Mekran; he adhered, however, to his father's plan of not ascending the lofty ranges, and all subsequent invaders of Sind, seem to have been guided by their example. —*History of the Punjab, Vol.* i, *p.* 64.

SUB-BORAS SODÆ, Lat. Borax.

SUBER, Lat. Cork.

SUB-HIMALAYA, is a term originated by Mr. B. Hodgson, to distinguish all the mountains and their inhabitants below the snowy range. But the term is inappropriate, as it includes precipitous mountains, 8,000 and 10,000 feet high, and people dwelling in them, higher than the highest mountaineers of Europe. The Sub Himalayas comprised in Bhutan, Sikim and Nepal, are chiefly occupied by Tibetan or Botiah tribes, and by tribes more akin to the Gangetic race. The first fossil remains of the colossal tortoise, Colossochelys atlas, were discovered in 1835 in the tertiary strata of the Sewalik Hills, or Sub-Himalaya skirting the southern foot of the great Himalaya chain. They were found associated with the remains of four extinct species of Mastodon and Elephant, species of Rhinoceros, Hippopotamus, Horse, Anoplotherium, Camel, Giraffe, Sivatherium, and a vast number of other Mammalia, including four or five species of Quadrumana. The Sewalik fauna include also a great number of reptilian forms, such as crocodiles and land and fresh water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India: in particular to the Crocodilus longirostris, from the existing forms of which naturalists have been unable to detect any difference in heads dug out of the Sewalik Hills. The same result applies to the existing Emys tectum, now a common species found in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. Professor Thomas Bell, the highest authority on the family, after a rigid examination, confirms the result arrived at, viz., that there are no characters shown by the fossil to justify its separation from the living Emys tectum. There are other cases which appear to yield similar results, but the evidence has not yet been sufficiently examined to justify a confident affirmation of the identity at present.

The result arrived is, that there are fair grounds for entertaining the belief as probable that the Colossochelys Atlas may have lived down to an early period of the human epoch and since become extinct:—1st, from the fact that other Chelonian species and crocodiles, contemporaries of the Colossochelys in the Sewalik fauna, have survived; 2nd, from the indications of mythology in regard to a gigantic species of tortoise in India.—*Campbell, p.*46; *Jour. As. Soc. Ben., No.* 247 *of* 1855. See Dehra, Himalaya.

SUBHRAMANYA, Isvara's younger son a favorite with the Shanars. See Hindoo Serpent, Snake.

SUBINJ or SUG-BINJ, Arab., Guz., Hind.

SUBJUYA, Hind. Canna indica.

SUBLIME CORROSIF, Fr. Corrosive sublimate. Bichloride of mercury.

SUBUNREEKA. The principal cataracts or waterfalls in India, are those near Simorree, in Rohilcund; at Gokak, on the Gutpurba, the Gairsappa, where from top of fall to surface of basin is 888 feet, and the depth of basin is 300 feet—and from 300 to 600 feet across during the rains. Yena in Mahabuleshwar, 600 feet; Cauvery, 300 feet. Cataracts of Suboonreka, Chota-Nagpore, and Hurrorec Ghaut—the falls, 15, 20, and 400 respectively; about 500 feet across crest.—*Curiosities of Science, Dr. Bruist's Catalogue.*

SUBRAON, is in the neighbourhood of Ferozepore in the Panjab. It was the scene of a battle between the British and the Sikhs after the death of Runjit Singh.

SUBZA, Hind. Ocimum basilicum, *Linn.*

SUBZAH or Subjah, the Dukani name of

an intoxicating liquor prepared from Cannabis sativa, or hemp leaves ; black pepper, cardamoms ; Poppy seeds : Cucumis utilissimus and sativus. It exhilirates without injurious consequences.—*Ainslie's Mat. Med., p.* 268 ; *Herklots.* See Ganjah, Subji, Sidhi.

SUBZE KE BINJ ? Duk. Ocymum basilicum.

SUBZAWAR. The town and district of Subzawar, lies between that of Turbut-e-Hyderee and Irak, since the death of Nader Shah, it has been in the possession of a chief of a Turkish tribe.—*Malcolm's History of Persia, Vol.* ii, *pp.* 230, 231.

SUCCADANA, on the west coast of Borneo, in lat, 1° 7′ S., a place of trade with India.

SUCCADE, Ger. Citron.

SUCCINEA, a genus of molluscs.

SUCCINUM, Lat. Amber.

SUCCORY, Cichorium intybus, much used in France as a winter salad under the name of Barbe du Capucine. The common way to grow this plant is similar to carrots. When the tapering roots have attained some size, they are lifted, the leaves cut off, the roots are then planted in sand in a dark room or cellar ; where in consequence of the absence of light the roots throw out white leaves which make an excellent vegetable. This plant is the cichory of commerce used in the adulteration of coffee.—*Jaffrey.*

SUCCORY ROOT, Eng. See Kasni ki jar.

SUCCOTH BENOTH, an Assyrian deity, whom the Jews worshipped under the name of Astarte or Ashtaroth, and it is said that this deity was of both sexes. This physiological or cosmogynic union of the sexes is attributed to a form of Siva, the right side being male and left side female, and his female energy or sacti is fabled to have assumed both appearances as circumstances required. The Babylonian goddess identical with Succoth Benoth was Mylitta, meaning mother, and the term Mat'ha or mother is applied to the wife of Siva. Amongst the Assyrians, the women, once in their lives had to make a sacrifice of virtue to the goddess Succoth Benoth. Lempriere says that Succoth Benoth was a surname of Venus, in whose temples all the women were obliged to prostitute themselves to strangers. Amongst other names of the wife of Siva was Bali or Vali, under which appellation she assumed the form of a girl of twelve years of age. And in Madura, Balane and other places, beautiful virgins used to go to the temple once in their lives to offer themselves in honour of the goddess. It was the belief that a god had conversed with them.—*Roberts, p.* ix.

SUCH, Hind. Sticks for keeping extended on its frame, the "mir" or screen in paper making.

SUCHAL, Hind., of Chenab, Cichorium intibus.—*Linn.*

SU-CHAN, Chin. Oil pea.

SUCHI, Hind, Atropa belladonna.

SU-CHU, a town in China, proverbially an earthly paradise.

> "There's heaven above,
> Su-Chu below."

SUCK'HI, see Kameri.

SUCRA, or Bhrigu, see Graha, Vara or Vasara.

SUDAB, Hind. Euphorbia lathyrus, also Ruta angustifolia, Ruta graveolens, Euphorbia dracunculoides.

SUDANAPU-VEDSU or Sadanapa Vedru, Tel. Bambusa stricta.

SUDANANDA or Sadananda, Sans., from sada, always, and ananda, joy.

SUDAR, see Sudra.

SUDARSHAN, Hind. Hedychium coccineum, called Indian shot, its black seeds used for necklaces.

SUDASHEGHUR, there are two serious drawbacks to the many advantages presented by Sudasheghur as a shipping port. The first is the prevalence of heavy breakers outside, and across the mouth of the Bay, from Carwarhead to Deoghur island, and also throughout its interior (except close under the Head) during the height of the south-west monsoon:—rendering it dangerous at such times for inward-bound vessels to make the anchorage, and impossible for those outward-bound to put to sea. The second is the gradual silting up of Beitcul Cove, and evident decrease of the depth of water in some parts of the Bay.

SUDASHYA, or Sadashya, Sans., bystanders at a council, whose business it is to notice and correct mistakes. The Sudashya regulates the ceremonies of worship, but is not employed on all occasions.—*Ward's view of the Hindoos, Vol.* ii, *p.* 17.

SUDDSAF, Hind., mother-of-pearl.

SUDDAP, Arab., Duk. Rue.

SUDDAPA, Tel. Dill seed.

SUDDOZYE, an Affgan clan, see Kandahar, Khyber.

SUD-GOPA, Sans., from sut, good, and gop, cow-keeper.

SUDHO-DHANA, see Buddha.

SUDI MIRAPA KAYA or Golakonda mirapa, Tel. Capsicum frutescens, *L.*

SUDIMUSTRA, Sans., Tel. Tribulus terrestris.

SUDQA, Arab. Propitiatory offerings. Sudqee, or Sudqeejana, to become a sacrifice for the welfare of another.

SUDR DEWANI, see Prinsep.

SUDRA. The Parsees are invested with the sudra or sacred shirt, and the cord or kusti at the age of six years and three months. This investiture is the initiation of the child into the religion of Zoroaster, the "jubhla," being then discontinued. The sudra is made of linen or gauze or net, while the kusti is a thin woollen cincture or cord of seventy-two threads representing the seventy-two Has or chapters of the Izashne, one of the sacred books of the Parsees. The Sudra and Kusti are worn alike by men and women, but the latter likewise dress in the saree, generally of coloured silk and the short sleeved silk vest called the Kanchri or Choli.—*Parsees, p.* 70.

SUDRA or Sudar, is a term, which is now the caste appellation of the mass of the inhabitants of India, whether Gaurians or Dravidians, but seems originally to have been the name of a tribe dwelling near the Indus. Lassen recognises the name in that of the town *Συδρος on the lower Indus, and especially in that* of the nations of the Sudroi in northern Arachosia. He supposes them to have been with the Abhiras and Nishadas, a black long haired race of aborigines, subdued by the Aryans. It cannot be doubted that by the Aryans, the term was extended in course of time to all who occupied or were reduced to a dependent condition, whilst the name Mlechcha, continued to be the appellation of the unsubdued Un-Aryanised tribes. Lassen and Max Muller, suppose that the whole of the Sudras or primitive servile classes of northern India, belonged to a race different from their Aryan conquerors, but Dr. Caldwell thinks it probable that a considerable portion of them consisted of the slaves, servants, dependants or followers of the high caste Aryans, and like the latter belonged to the Aryan race. And the fact that the Brahmans, Kshatriyas, Vaisyas and Sudras, are all represented as having sprung from Brahma's body, though from different parts of it, is in favour of the idea that the Sudras differ from the twice-born Aryas, in rank only, not in blood. Sudras, otherwise Soodra, or Sudar are mechanics, artizans, and labourers of every description. But in the prosecution of the Sudra's avocations will be found persons of the second and third tribes, or classes, and, perhaps also of the first; but of the first comparatively few. "The natural duty of the Sudra is servitude." Many sects and sub-castes of Sudras burn their dead, like other hindoos. Others inter them decently clad, and in a horizontal position, while others, as the Lingaets, Gold-smith caste, &c., put their dead in a sitting attitude. The Sudras have numerous sub-divisions, in their castes. Aryyan hindoos burn their dead, abstain from eating flesh of horned cattle and from ardent spirits. They believe in the transmigration of souls follow brahmanism. Worship ancient heroes as demi-gods, are governed by municipal institutions in their villages and townships. The bad castes, which did not eat together or intermarry, viz., Brahmanical or priestly caste, Khetri or military caste, Vaisya or mercantile caste, Sudra or cultivator, or labourer, or, landholder caste. The prior races, have no prejudices against animal food of any kind, whether the animal be slaughtered or die a natural death. These have no laws of caste? Burn their dead. Have no race of regular priests, but select them from the lay party. They offer up bloody sacrifices. In Gondwana, Gumsur and Bustar, and in the Assam hills they continue to make human sacrifices. See Chandragupta, Hindoo, Jungum, Mlechcha, Poitu, Zonar.—*Wh., p.* 5.

SUDRAKAS, or Surakousæ.

SUDR-DEWANI, see Prinsep.

SUDR DIN, see Khajah.

SUDRA UPALI, see Sakya muni.

SUDULUNU, Singh. Allium sativum. *Linn.* See Garlic.

SUDU MOSTRA, Sans. Tribulus lanuginosus. *Linn., Roxb., W. & A., W. Ic.*

SUFFAID-SUMBAL, or Lal-kud-sumbal, Beng., Hind. Canavalia gladiata.

SUFFAID-MUHAMMA, Beng., Hind. Fluggea leucopyrus.

SUFFAID-MOOSLIE, Beng., Hind. Asparagus sarmentosus.

SUFFAID-TOOLSIE, Beng., Hind. Ocymum album.

SUFFAVI, a dynasty that ruled in Persia. See Kajar, Khorassan.

SUFFED SUMBULKHAR, Duk. White oxide of Arsenic.

SUFFEID GOOMCHEE KEE JUR.

SUFFUR, the 2nd month of the mahomedan year.

SUFI, Pers. The Sophists of the east, who indulge in religious erotic poetry. The Jalal-ud-din, says, in the Masnavi, in whatever place, we set our foot, we are always, lord, within thy resort. The Sufi creed is a philosophy, a pantheism. The whole visible creation is the outward manifestation of the invisible Being whose spirit is diffused everywhere through it. The first stage of a Sufi disciple is styled Sharyat or Law in which he practices all the external rites and ceremonies of religion. Tariqat from Tariq, meaning a path, way, or direction, is the second stage, in which the disciple discards the outward forms of religion and devotes himself to the mental worship of the deity. The third stage is

Haqiqat, from Haq, the all-righteous. It means the state of truth, and is a condition accompanied by a preternatural knowledge or meditation, obtained by the devotee through a long meditation on God. The fourth stage is the Marifat, from Arif to know, is attained by long and painful fasts, dwelling in solitary deserts, seeing only his teacher. Few survive the severities of this stage. But when it is reached, the soul absorbed into the divine essence is again with God. But the purified Sufi, may partake of the nature of God, which is termed Jamal: and signifies that mild and gentle beauty which loves to do good and hurts not. Or, he may be intoxicated with the wine of the divine love and absorbed in the contemplation of the Jetal or consuming glory of the deity; in which state, he is full of wrath with the iniquities of the world and if provoked to imprecations, they take immediate effect, or he may pass from one stage to another, may at one time assert that God is in his sleep and then fall back into the condition of ordinary mortals trusting that God will forgive him his sins and make his latter days righteous. The Sufi spiritualist is often almost with views appropriate to eastern pantheistic ideas, but with many almost atheistic, a sort of esoteric doctrine. The word comes it is said from Sufi, Ar., wool because of their use of woollen garments. Sufi spiritualism, though contrary to materialism, has in reality much in unison. Sufi doctrines are principally held amongst the partizans of Ali, and out of it grew the belief in the infusion of divinity in Ali. Evidences of its antiquity may be found in the annals of almost every ancient and civilized race. The Sufi were called by the Guebres, Wiyhah-darun, Roushan-dil, &c., by the hindoos, Gnaneshvar and Atma-gnani. Among the Greeks they became Platonists, and have continued up to the present time. The number of mahomedan sects is not great. As a broad distinction, they are generally classed as Shiah and as Sunni, but the six bodies of sectarians who oppose the Sunni are classed by them as Rafziah, Kharjiah, Jabriah, Kadriah, Jahmiah and Marjiah, each of whom are broken up into smaller bodies. Before the end of the first century, the ascetic turn and the theosophy inseparable thereform, a combination styled among the Arabs, Sufi, had arisen. This made rapid strides ; and in the end of the third century, was already, itself, the subject of learned works, and the mahomedan world has carried this system to the utmost extreme. Their Sufi outstrip in every point of view both the hindoo Jogi and the Christian monks. The asceticism of the Sufi is more systematic, their pantheistic teaching deeper and more consistent, and their vices more enormous, than those of any other people. Spinoza and Schelling are left far behind by Ibn Arabi. But, a deep metaphysical system may be found among all rude nations ; for the supernaturalist has no need of learning ; dreams suffice for him.—*Richard F. Burton's Sind, p.* 406 ; *Westminster Review, Oct.* 1869. See Priests.

SUDUSUDU, Malay. Euphorbia canariensis, *Linn.*

SUEVI, or Suiones, the origin of the Suevi, Su, or Yeut of Yeutland (Jutland) has been traced to the Yute, Gete, or Jit of Central Asia, who carried thence the religion of Budd'ha into India, as well as to the Baltic. There is little doubt that the races called Jotuer, Jætei, Jotun, Jaet and Yeut, who followed the Asi into Scandinavia, migrated from the Jaxartes, the land of the great Gete (Massagetæ) ; the leader was supposed to be endued with supernatural powers, like the budd'hist, called Vedianan or magician, whose haunts adjoined Aria, the cradle of the Magi. They are designated Ari-punta, under the sign of a serpent, the type of Budd'ha, or Ari-manus, the foe of man. The Suevi, or Suiones, erected the celebrated temple of Upsala, in which they placed the statues of Thor, Woden and Freya, the triple divinity of the Scandinavian Asi, the Trimurti of the Solar and Lunar races. The first (Thor, the thunderer, or god of war) is Har, or Mahadeva, the destroyer ; the second (Woden) is Budd'ha, the preserver ; and the third (Freya) is Oomia, the creative power. The grand festival to Freya was in spring, when all nature revived ; then boars were offered to her by the Scandinavians, and even boars of paste were made and swallowed by the peasantry. Similarly still, with the Rajput Hindoo, Vassanti, or spring personified, the consort of Har, is worshipped by the Rajput, who opens the season with a grand hunt, led by the prince and his vassal chiefs, when they chase, slay and eat the boar. Personal danger is disregarded on this day, as want of success is ominous that the great mother will refuse all petitions throughout the year. In Tamil countries, on the day that the sun enters Aries, bands of twelve young women, of the non-hindoo races, perambulate the streets. They have a basket of shavings which they surround, and bending low they circumambulate, clapping their hands and singing ; in this they represent the twelve signs of the zodiac, with the sun in the centre.—*Tod's Rajasthan, Vol.* i, *pp.* 570, 572-73. See Basant'h, Pongul.

SUEZ, is the ancient Sebaste, whence the

Arabic Suvas, and the English Suez. See Red Sea.

SUF, also Tisi, also Alsi, Guz. Linseed.

SUFAIDA, Hind., Populus alba.

SUFAID KOH, Snowy or White Mountains, near Attock, long. 72° 16' W. to long. 69° 36', proceeding nearly along the parallel of lat. 33° 50'; then sinking into a maze of hill stretching to the Kohistan of Kabool. There are three ranges, running nearly parallel to the S. of the Kabool river; they rise in height as they recede from the river, the highest between 69° 40' and 70° 3'; attaining an altitude of 14,000 feet. Covered with perpetual snow. Generally of primary formation, consisting of granite, quartz, gneiss, mica slate, and primary limestone. The Soorkh Rood, the Kara Su, and many other shallow but impetuous streams rush down its northern face, and are discharged into the Kabool river; which conveys their water to the Indus. The two lowest ranges are covered with pine forests; the highest and most distant has a very irregular outline, is steep and rocky, yet furrowed by many beautiful vales. *—Mohan Lal's Travels, p.* 339.

SUFAID MURGH-KES, Hind. Celosia argentea, *Linn., Rheede, Roxb., W. Ic.*

SUFDAR ALLY, a nabob of Arcot, who was murdered there, by Pathans and by Abyssinian slaves.

SUFEDA, Hind. Populus euphratica, Populus pyriformis.

SUFEDA, Hind., Pers. White lead.

SUFED-BARYALA, Beng., Hind. Sida rhomboidea.

Saccharum,	Lat.		

The commercial sugars of Asia are chiefly the products of the Saccharum officinarum, S. sinense, Phœnix sylvestris, Borassus flabelliformis, Cocos nucifera, Arenga saccharifera. Nipa fruticans and Sorghum saccharatum.

Coeval with the use of other vegetable products, for domestic purposes in India, appears to have been the employment of the juice of the sugar-cane; though it would not seem that the ancients possessed any knowledge of the process by which this saccharine matter is converted into a crystallized substance. Every mention made of it, from the various passages in Scripture down to the commencement of the Christian era, is simply that of a 'sweet cane,' or of a "fine kind of honey found in an Indian reed." Nearchus, the admiral of Alexander the Great, was the first who made known the existence of the sugar-cane, in the western-world ; and from his time we find frequent allusion to this vegetable product, by Theophrastus, Varro, Dioscorides, and others. Herodotus alludes to "honey made by the hands of men;" but enters into no details. Lucan speaks of the sweet juice expressed from reeds, which the people of India were fond of drinking, and which Pliny calls 'saccharine.' Still later, Arrian, in his Periplus of the Red Sea, alludes to the honey from reeds called sacchar, as an article of trade between the Indian ports and the countries of the Red Sea. The sugar-cane was found in the Crusades growing in the meadows about Tripoli in Syria; and mention is made by a writer of that day of eleven camels loaded with sugar being taken by the Crusaders. Marco Polo, who travelled in the East in the year 1250, found abundance of sugar produced in the province of Bengal; and from the almost universal growth of the cane in that province at the first occupation of the country by the British, there is good reason for believing that its culture had rapidly extended at a very early period. From the earliest European intercourse with India, sugar in a great variety of forms was met with in daily use. No hindoo lives without it, either as sugar, in its natural state, or in cakes called 'jaggery.' Upon the first possession of Calcutta by the E.I.Company there was a flourishing export trade in sugar to the Indian costs, some of the Eastern islands, and a few ports in Arabia and Persia, to the extent of about 1,500 tons; whilst the local consumption of the article was enormous. The quality of this sugar was, however, very inferior; and about the year 1776 some attempts were made to introduce into India the Jamaica mode of growing the cane, and manufacturing the sugar; but at that time these efforts were not attended with any success.

In China, from unknown times, the people have manufactured sugar both from the sugar-cane and from the sorgo-cane. In the reign of the emperor Tai-Tsung, of the Tang dynasty, the method of boiling the crushed cane was introduced into Sechuen and other parts of China from Turkestan or Central Asia. Hence, in China, sugar is called tang, the name of the dynasty being combined with the radical for food. Sugar of various quality, is largely manufactured in the Bengal, Madras, and Bombay Presidencies, from the sugar-cane. A large quantity of the sugar made in India is exported to the Arabian and Persian Gulfs, London, &c. China and Siam sugar is largely imported into Bombay, a good deal of which is re-exported to the above named ports. The value of the exports of this article, between the years 1850-51 and 1860-61, ranged from £1,006,514 to £1,823,789 as under:

Table showing the quantities (as far as can be ascertained) and the value of sugar exported from all India to all parts of the world from 1850-51 *to* 1860-61.

In the Punjab, the kinds of sugar usually met with are :—

Gur, Shakar surkh, Khand, or shakar tari, sugar, Bura or chini, amorphous, white moist sugar. Misri, refined sugar, more or less crystallized.—*Powell's Hand-book*, *Vol.* i, *p*. 306 ; *Cat. Ex*. 1862.

SUGAR CANDY.

Ping-t'ang,	CHIN.	Shakr-kand,	HIND.
Chini,	HIND.		

Is made in China by crystalizing the raw sugar ; the best comes from Fukien, called Chinchew, from which province, especially through the newly opened port of Amoy, the exportation is likely to increase. It was for the most part carried to India, but has ceased to be introduced since the customs duties have been altered : Pingfa sugar is the name given to the pounded sugar candy ; Pingfa means 'crystal flowers' and is applied to this sort, because it is the ping tang, or candied sugar made fine. It was formerly carried to the United States, and to India.

SUGAR-CANE. Saccharum officinarum.

The sugar-cane thrives from the equator to the 32° of latitude. It is one of the largest of the grasses, growing from 8 to 12 feet in height, and acquiring a diameter of one to two inches ; the sugar being contained in the loose cellular juicy pith, with which the stalk is filled. The sugar-cane, says Mr. Colebrooke, whose very name was scarcely known by the ancient inhabitants of Europe, grew luxuriantly throughout Bengal in the remotest times. From India it was introduced into Arabia, and thence into Europe and Africa. In the Lahore district is a purple cane, called, "kumad kala," a hard thin cane, called kumad lahori, another called "kata" and others the plants of which were obtained from Jalandhar and Saharanpur. In Gujranwalla, are three kinds of cane, "daula," "treda," and "chinkha." Daula, or white, is the best, treda is yellowish, chinka, which is reddish and small, produces good kand and chini, moist sugar. Sugar-cane, was brought to Ceylon from the Mauritius by a merchant of Colombo about 1832, and is the only article the manufacture of which has been introduced into Ceylon by Europeans. The first canes were planted in the Central province, in the valley of Dambera. At the Aska works, the mill is dispensed with, the cane being cut into thin slices and the saccharine contents of its cells being extracted by bringing the slices into contact with water at an elevated temperature. The water extracts only the soluble substances contained in the juice of the plant, while most of the impurities—which in the ordinary process pass into the juice, and must be subsequently removed at great expense—are left in the unbroken cells of the cane and do not contaminate the juice. By this process, it is said, the extraction can be carried so far that 95 per cent. of all the sugar contained in the cane is passed into the clarifier, while the best roller mills at present in use do not extract more than 75 per cent. of the sugar contained in the cane, and the average West Indian practice is an extraction of less than 60 per cent. The diffusion process thus not only improves the quality of the sugar but produces an increased out-turn of 20 per cent. In commerce, sugar is met with in different degrees of purity, from common brown, to double refined and crystallized ; each quality being generally characterised by a distinctive appellation.—*Cal. Cat. Ex*. 1862 ; *Mad. Ex. Jur. Rep.*; *Les Anglais et l'Indé*, *p*. 246 ; *Faulkner* ; *Ward on the Hindoos*, *Vol*. iii, *p*. 113 ; *Powell's Hand-book*, *Vol*. i, *p*. 304.

SUGAR OF BAMBOO, see Tabasheer.

SUGO DI REGOLIZIA, IT. Liquorice.

SUGORIA, HIND. Hyelaphus porcinus, *Sundev*, Axis porcinus, *Jerd*. See Hog deer.

SUGRIHITA NAMNA ARYA CRHANAKYASYA, is a phrase of constant occurrence in the Sanscrit dramas, and indicates the importance attached, not to well-sounding, but to lucky or propitious appellations. This superstition was common amongst the nations of antiquity ; and, according to Cicero, care was taken in the lustration of the people, that those who conducted the victims, and on the formation of the army that the first soldier on the muster-roll should have auspicious names. Cum imperator exercitum, censor populum lustraret, bonis nominibus qui hostias ducerent, eligebantur, quod idem in delectu consules observant, ut primus miles fiat bono nomine.—*Hind. Theat.*, *Vol*. ii, *p*. 160.

SUGRIVA, a monkey prince, and friend of Rama. See Vishnu.

SUGUDI KULLU, TAM. Amethyst.

SUGUNDI, SANS. See Kilioorum bark.

SUGUR GUSHT, HIND., dawn of day perambulation.

SUGARA, or Sagara, SANS., from sa, with, and gura, poison.

SU HERMÆUS, see Greeks of Asia.

SUHAILI, ARAB., from Sahilah, a sea shore, a name given to the African races dwelling along the coast to the south and north of the Straits of Bab-el-Mandeb, also applied to those on the Morocco coasts. See Semitic Races, Somali.

SUH-GING, *Less.* Nemorhœdus goral, *Jerd.*

SUHI GANDAL, HIND. Lahore, see Sittu.

SUHOKTEE, or Sahokti, SANS., from saha, with, and ooktee, a word.

SUHNUK, or Sanuk. See Fateeah.

SUHNUK K'HANAY WALAY, partakers of the lady's dish.

SUHOORA, HIND. Epicarpurus orientalis.

SUHOYUM, KASHM. The burning ground mentioned by Abul Fazl in the Ain-i-Akbari. It lies near the village of Nichi-Hama, in the pergunnah of Muchipora, at the north-west end of the vall [illegible] Kashmir, where the plain is about 6,100 feet in height. Flames frequently issue from the spot.—*Vigne.*

SUHRAI, PERS., water of the desert.

SUHUR, or Suhurgahee, HIND., dawn of day, breakfast during Lent, so called.

SUHASRANGSHOO, or Sahasrangshoo, SANS., from sahasra, a thousand, and angshoo, rays of light.

SUHASRAKSHA, or Sahasrakshoo, SANS., from sahasra, a thousand, and akshee, the eye.

SUHTONG, LEP. Felis tigris, *Linn.*

SUHU-TUM, LEP. Cuon rutilans.

SUHAI, or Sahai. There are four grand officers of the government of Mewar, viz., the Purdhan, or prime minister; Bukshee, commander of the forces; Soorutnama, keeper of the records; Suhaie, keeper of the signet, or rather, who makes the monogrammatic signet "Suhaie" to all deeds, grants, &c.—*Tod's Rajasthan, Vol.* i, *p.* 479.

SUI of Kangra, a tailor.

SUI, GUZ., HIND. Needle.

SUI-CHUKA, HIND. Anethum graveolens, *Linn.*

SUICIDE. The practice of 'traga,' or inflicting self-wounds, suicide, and the murder of relations, formed a strong feature of the manners of the people of Rajpootanah. The practice, was common in Kattiwar to the bhat and charan of both sexes, and to brahmans and gossein, and has its rise in religious superstition, and although tragas seldom wore a very formidable aspect, still they were sometimes more criminal, by the sacrifice of a greater number of victims. The traga ceremony borders much upon the brahman practice of dharna, but is more detestable. The charan, besides becoming security for money on all occasions, and to the amount of many lacs of rupees, also become what is called fa'il-zamin, or security for good behaviour, and hazir zamin, or security for the appearance.

SUIDÆ, the hog family of mammals. See Babirussa alfurus of the Archipelago. Boar; Sus.

SUIF, FR. Tallow.

SUIKER, DUT. Sugar.

SUIMINTA, properly Sominta, TEL. Æschynomene sesban, *Linn.* Syn. of Sesbania ægyptiaca, *Pers.*

SUIRA, HIND. Epicarpus orientalis, *Blume.*

SUJA O DOWLA, the vizier of Oudh, in 1764, under the pretence of assisting Meer Kassim Ally, invaded Behar, but his army was completely routed, and the vizier was obliged to throw himself on the generosity of the British. Nujum o Dowla, died on 8th May 1766, and was succeeded by his brother Syf ud Dowla, a youth of sixteen. Syf ud Dowla was succeeded in 1770 by his brother Mobarik ud Dowla, with whom a new engagement was made. By this engagement the nabob's stipend was fixed at 31,81,991 Rs. This is the last treaty which was formed with the nabob. The office of subadar had now become merely a nominal one, all real power having passed into the hands of the E.I. Company. In 1772 the stipend was reduced to sixteen lakhs a year, at which rate it is paid to this day. Bengal was declared to be the chief presidency on the 16th June 1773. By the treaty of 22nd February 1845 with Denmark, the British government obtained possession of Serampore.—*Aitchison's Treaties, &c., p.* 5.

SUJAKARA, CAN. Soda.

SUJANA, also Suhanjana, HIND. Hyperanthera moringa, Moringa pterygosperma. See Horse radish, Moringa.

SUJDAH, or Sijidah, AR. In the ritual of mahomedan prayer, a single 'prostration' with the forehead touching the ground. It is performed from a sitting position, after the Dua or supplication that concludes the two prostration prayer. Some of the Ulema, especially those of the Shafei school, permit this 'Sujdah of thanks' to be performed before the prostration prayer, if the visitor have any notable reason to be grateful.—*Burton's Pilgrimage to Mecca, Vol.* ii, *p.* 67.

SUJI, or Sooji, groundwheat. See Soojie. Wheat.

SUJNA, BENG., HIND. Hyperanthera moringa.

SUKA, MALAY, see Johore.

SUKA-KI-BIJ, HIND. Cannabis sativa.

SUKBINUJ, Arab. Sagapenum.

SUK-CHINA, Beng. China root.

SUKCHU, or Sucheu, in Kansu province, towards the Great Desert, called Sukchu by Shah Rukh's ambassadors, and Sowchick by Anthony Jenkinson.—*Yule Cathay, Vol.* ii, *p.* 268.

SUK-EL-SHUYUKH, see Chaldea.

SUKHADASS, see Oriza sativa.

SUKHA GHANS, Hind. Hay.

SUKHANAND, Hind. A kind of rice.

SUKHARA, Saiva mendicants, distinguished by carrying a stick three spans long. They dress in a cap and petticoat stained with ochery earth, smear their bodies with ashes, and wear ear-rings, of the rudraksha seed ; also over their left shoulder a narrow piece of cloth dyed with ochre, and twisted in place of the zonar. They use the word A-lakh. See Rukhara, Ukhara.

SUKHAT, Dan. Citron.

SUKHCHAIN, Hind. Pongamia glabra.

SUKH DARSAN, Beng., Hind. Crinum defixum, *Ker.*, also Crinum asiaticum, *Willd*, C. zeylanicum and Amaryllis grandiflora.

SUKHDAS, or Sudas, a variety of rice.

SUKHEE BHUVUS, see Mendicants.

SUKHET. The petty chiefships of Mandi and Sukhet were originally a single state, bounded by Kangra on the west and Kullu on the east, and by the Dhaoladhar mountains on the north and the Sutlej on the south. Mandi means the 'market,' and its favourable position on the Beas river, at the junction of the two roads from the west and south, must have ensured its early occupation, which was rendered prosperous and lasting by the existence of valuable mines of iron and black salt in its immediate vicinity.—*Cunningham's Ancient Geog. of India, p.* 143.

SUKHI HARI, Hind. Aconitum heterophyllum.

SUKH SEN, see Bengal.

SUKHTAWA, a river near Shapoor in Baitool.

SUKHUR, Pers. Pistacia terebinthus.

SUKH, or Sauk'h, Duk. Chank-shells.

SUKH, Turk. Horse.

SUKKA BUMMI, Tel. Catharanthus pusilla, *G. Don.* Vinoa parviflora, *Willd.*—*R.* ii, 1—*Rheede*, ix, 33.

SUKKAN KIRE, Tam. Rumex vesicarius.

SUKKAPAT, Hind. Monetia tetracantha.

SUKKARA VELLI-GADDA, Tel. Convolvulus batatas.

SUKKARE VALLI KALANG, Tam. Convolvulus batatas.

SUKKEE LURWAR, see Khyber.

SUKKU, Tam. Ginger.

SUKKUNAROO-PILLOO, Tam. Andropogon iwarancusa.

SUKKUR, a river near Bhowani in Gurrawarra.

SUKKUR, a town on the borders of Baluchistan, Sind and Affghanistan, near Bukker. Its heat is proverbial .Ai Allah ! duzakh chon sakhti keh Sukkur hasti ; Oh Lord why did you make hell, when you possess Sukkur. Opposite Sukkur is the old town of Rori, built high and overhanging the stream. In the centre of the stream, nearly opposite Rori, is the celebrated fort of Bukkur ; and on the western bank Sukkur now designated "Victoria on the Indus."—*Postan's Personal Observations, pp.* 30-31.

SUKKUR, Arab. Sugar.

SUKKUR-AL-ASHUR, Arab, see Calotropis.

SUKKUR-KUNDA-ALOO, Beng. Batatas paniculatus.

SUKMUNIA, Arab. Scammony.

SUKNAM, Lep. Ailurus fulgens, *F. Cuv.*, *Bly.*, *Hard.*

SUKRA, Shuni or Sani. See Brahminicide, Graha.

SUKTA, Sans. A division of a hymn, the worship of the Vedic race is briefly but comprehensively described by themselves, where it is said, 'the standers around associate with (Indra) the mighty (sun,) the indestructive (fire), the moving (wind,) and the lights that shine in the sky.'—*Asht. I, Adhy. I, Sukta*, 6. See Aryan, Hindoo.

SUKTI or Sacti, in hindooism, the female energies of the hindoo gods, the wives of the gods, thus the sacti of Brahma is Saraswati of Vishnu, Lakshmi and of Siva, Parvati.

SUKU, Lep. Cervulus aureus, *Ham.*

SUKU KADA, Tel. Bigelowia lasiocarpa, *W & A.*

SUKUM, Malay. Artocarpus integrifolia.

SUKUN-KHOR, Hind, Manis pentadactyla, *Linn*

SUKUR, a river of Nagpore.

SUKUR KUND, Duk. Convolvulus batatas.

Sweet potato, Eng | Nuttur Aloo. Hind.

A sweet-tasted nutritious root, of which there are two sorts, red and white. The tubers are long, and, when boiled or roasted, very wholesome. They are sown precisely in the same manner as a potato, after the hot season, and are fit to be taken up in six months.—*Riddell.*

SUKUS, Malay. Clans. See Johore.

SULA, Hind. A pointed stake or weapon, Trisula, a trident.—*Wils.*

SULAEE, Hind., a probe, needle, or piece of wire used for applying soorma to the eyes.

SULALI, Hind. Populus ciliata.

SULAM, Ar. Peace, a mahomedan salutation of which there are several kinds, viz.

Sulam Bundugee.
Sulam Koornish.
Sulam Tusleem, or Tusleemat.
Sulam Qudumbosee, or Zumeenbosee.
Sulam Sashtung (prop. Hashtang.)
Sulam Gullay-milna, or embracing.

Us-sulam-oon-alei-koom-Ruhmut-Oolahe,*ie.* The peace and mercy of God be with you all.

It is incumbent upon all mahomedans to return the words Aleikoom-us-salaam to the salutation "Salaam Aleikoom;" or, ("peace be with you!") of a true believer, whatever be his rank.—*Fraser's Journey into Khorasan, p.* 81.

SULAMBRA, Hind. Odina wodier.

SULAMEE, a present given on particular occasions to persons making a sulam.

SULEA, Hind. Polynemus sela, a fish of the Ganges river yielding isinglass. Russian isinglass is prepared from the sounds of the Sturgeon Accipenser sturio, found in the Caspian and Black Seas and their tributary rivers. In America, from the Labrus squetcague, the intestines of the cod, Morrhua vulgaris; and in Calcutta, from the sounds of the Polynemus sela, the Sulea of Bengal. The sounds of two Madras fish are so employed. The following are the principal species of fish from which Russian isinglass is derived—Acipenser huso or the Beluga, A. Gonldenstadtii or the Osseter, A. Ruthenus or the sterlet, A. stellatus or the Sewruga; Silurus glanis and Ciprinus carpio. In addition to the above isinglass is obtained in different parts of the world from several other kinds of fish. In New York from the Labrus squeteague of Mitchel. In New England it is procured from the intestines of Morhua vulgaris or the common cod. In the Brazils it is obtained from a large fish, probably a species of Silurus, and in Iceland from the cod and Lota Moloa or Ling.—*O'Shaughnessy, p.* 685.

SULEMANI, a range of hills near the Khyber.

SULFAH, Hind. A sort of hukka.

SULFURE d' ANTIMOINE, Fr. Sulphuret of Antimony.

SULFATE DE CUIVRE, Fr. Sulphate of Copper.

SULFATE DE FER, Fr. Sulphate of Iron, Green vitriol or Copperas.

SULFATE DE ZINC, Fr. Sulphate of Zinc, White vitriol.

SULFURE DE FER. Fr. Pyrites.

SULFURO d' ANTIMONIO, It. Antimony.

SULFURE ROUGE DE MERCURE, Fr. Cinnabar.

SULI, Hind. Euphorbia royleana.

SULIMAN, a merchant who made several voyages to India from the Persian Gulf, of which he wrote an account A. D. 851 (A. H. 237) and this was continued by Abu Zaid. He visited India when Balhara was ruled by the Ballabhi sovereigns.

SULIMAN MOUNTAINS form the western boundary of the British provinces west of the Indus and extend from Lat. 34° N., southwards for about 350 miles. The Takht-i-Suliman their loftiest peak rises 11,000 feet high. They run from near Koh-i-Baba peak, due south and form the water-shed between the Indus and the Helmand. The axis of this chain runs close to Ghazni, which is elevated 7,726 feet, and to Quetta 5,540.feet. The highest part of the chain is near the Koh-i-Baba. It is called the Safed Koh, and is 14,000 feet high. Near Ghazni it is 9,000 to 10,000, and near Quetta, the same, the peak of Chahal-Tan being 10,500 feet. The Takht-i-Suliman near Dera-i-Ismael Khan is 11,000 feet. From L. 33° 40', they run nearly S. in the 70th meridian of long. to the mountains about Hurrund and Kahun, in lat. 29°. The highest elevation, Takht-i-Suliman, is called also Khaissa-Ghur, lat. 31° 35'; 11,000 feet. The E. face dips rather steeply to the Indus, but the W. declivity much more gradual, to the table-land of Sewestan. The sides of mountains are clothed nearly to the summits with dense forests; valleys overgrown with a variety of indigenous trees, shrubs and flowers. From Tank down to Sind, the most important features in the range of hills are the three "Tokes." These Tokes are the narrow precipitous defiles separating the outer from the inner range. In places their gorges are so confined as to resemble fissures in the rock, not more than ten yards wide. The passage is most difficult, being interrupted by rocks running right athwart the defile; occasionally it widens out, and the bed thus formed is choked up with sand. These glens, almost impassable to strangers, can be easily footed by mountaineers and their horses. From these defiles, running parallel with the outer range, there are numerous outlets opening into the plains. The base of the hills is skirted by a "mehra," or open uncultivated plain from ten to twenty miles broad, having villages on either side; it becomes contracted towards the south, near Dera Ghazee Khan. In this vicinity it is overgrown with brushwood, but elsewhere it is generally a naked waste, without any sign of life or vegetation. The villages adjoining this sterile strip are far apart and more or less fortified. Their cultivation is scattered, and depends for irrigation not on wells, but on tanks, and on the mountain-torrents rudely trained to descend in steps and terraces. The alluvial line of the Indus differs little from that of the other rivers, except that the floodings are more wide spread and more impetuous. On the right bank are the Derajat, or encamping grounds of Ismael, Futteh and Ghazee Khan, all chiefs in the great Affghan invasion of the last century. Dera Ghazee Khan is a lovely spot, surrounded by date-groves. Besides these, are Kalabagh at the termination of the Khuttuk hills, and Mithunkote at the confluence of the five rivers.—*Rep. Roy. Com.*

SULIMANIA is the capital of a district now bearing its name, but which, formerly, was known by that of Kara-Choran, or that of Babana. It stands in lat. 35° 28′ 28,“ long. 45° 17′ 3,″ and is also the metropolis of South Kurdistan. The situation is central, being at the foot of the Shar-i-zool mountains, the ancient Siozuros chain, the remains of the old capital, which bore their name, lying in ruins on their eastern side. It was also the ancient city of Siazuros ; but having fallen into utter decay, the present town was built about A. D. 1,800 by Suliman, the celebrated pasha of Bagdad, and took his name. The people of this district are, in general, of low stature, but well proportioned, robust and healthy; and of a much fairer tint than the swarthy Arabs, or their Kurdish brethren in the neighbourhood of Kermanshah. Their physiognomies do not indicate the shrewdness which marks the tribes more to the southward. The plain of Sulimania appeared open to the south, where it has for its boundaries the snow clad mountains of Avroman, which are a part of Taurus and Zagros. These mountains are the frontier between the territory of Sulimania and that of Sinna, a province of Koordistan under the Government of Persia. That part of Mount Goodroon which is just over Sulimania is called Azmir. The summit consists of a hollow, or basin, in which the snow lodges and consolidates into ice. A perpetual store of ice is thus kept ready for the use of the inhabitants of Sulimania, who make great use of it during the summer to cool their fruit, sherbets, water, &c. Naphtha springs and a burning hill, are a little way out of the direct road to Sulimania, a range of low hills crowned, with a regular line of rock rising from their clayey and sulphurous brows. On the side of one of these hills, and which faces the north-west, Strabo describes the situation of the naphtha springs. They are ten in number. For a considerable distance from them the air is felt to be sulphurous ; but in drawing near, it became worse, and all were instantly struck with excruciating head-achea. The springs consist of several pits or wells, seven or eight feet in diameter, and ten or twelve deep. The whole number are within the compass of four or five hundred yards. A flight of steps has been cut into each pit for the purpose of approaching the fluid, which rises and falls according to the dryness or moisture of the weather. The natives lave it out.—*Porter's Travels, Vol.* si, *pp.* 440, 448-49 ; *Rich's Residence in Koordistan, Vol.* i, *pp.* 63-64 ; *Mignan's Travels, p.* 329.

SULIMAN KHAIL, a tribe of Affghans who occupy the district which ranges from north to south on the Ghuzni side of the pass. There are said to be about twelve thousand of them, nearly all thieves, but not so bloodthirsty or formidable as the Waziri of the mountains near Derabund. They will not kill a man in cold-blood without reason, and their attacks rather resemble those made by the nightly prowlers of India, who creep into your house or tent, and steal a ring from your finger, or take a sheet from under you, without waking you. The Suliman Khail were in possession, Vigne was told, of a million of sheep and they paid a yearly tribute of one camel, for every forty men, to Dost Mahomed Khan. Their country extends from north to south, for seven or eight caravan marches, between Ghuzni and Kandahar and for two or three from east to west. Once a year, in the winter season, they send a kafila of three or four hundred camels into the plains of Derabund and Derah-i-Ismael Khan. The Ghilzye is next to the Daurani tribe in importance. It has eight divisions or sub-tribes, or clans, viz., the

Hotuki,
Tohki,
Suliman Kheil,
Ali Kheil,
Subak,
Under,
Turruki, and
Kharoti.

Of these, the Suliman Kheil is the most important numbering from 30,000 to 35,000 families. General Cunningham thinks it not improbable that the district of Falana or Barana, may have some connection with that of the great division of the Ghilzye tribe named Buran, as the upper valleys of both the Kuram and Gomal rivers, between Ghuzni and the Sulimani mountains, are now occupied by the numerous clans of the Sulimani Kheil, or eldest branch of the Buran. But Vana, or Wana, as the Affghans call it, is only a petty little tract with a small population, whereas Banu is one of the largest, richest and most populous districts to the west of the Indus.—*Vigne's A Personal Narrative* ; *Cunningham's Ancient Geog. of India, p.* 85 ; *Records Govt. of India.* See Abdali, Affghan, Kaker, Kashmir, Kaysar, Khyber, Nasiri.

SULISADATTA, see Inscriptions, Junir, Karli.

SULJUK. In the beginning of the fifth century of the Hejira, the Suljuk Tartar appeared in Khorasan, and in the short space of ten years, wrested that kingdom from the house of Ghaznavi. It was ceded to Alp Arslan, and constituted a part of the Seljukide dominions, until the extinction of that race, about 150 years posterior to Togrul Beg having assumed the title of emperor.

SULKEA, a town on the Hooghly river.

SULLA, also Sullah, Surul, and Thausa, Hind. Pinus longifolia.

SULLA, a wood of Nepaul, see Bechia cori.

SULMA, a peculiar kind of gold tinsel for embroidery. Gold and silver thread used in making turbans, slippers and hookahs.

SULMANIA, see Kidder.

SULOOPHA, or Sulpha, Beng, Hind. Anethum sowa.

SULPHATE DE CUIVRE, Fr. Sulphate of copper, blue stone. See Copper.

SULPHATE DE FER, Fr. Sulphate of iron. See Iron.

SULPHATE DE MAGNESIE, Fr. Magnesiæ sulphas.

SULPHATE DE SOUDE, Fr. Sulphate of soda. See Soda.

SULPHATE DE ZINC, Fr. Zinci sulphas, white copperas.

SULPHATE OF BARYTA, Heavy spar.

SULPHATE OF COPPER, or Blue vitriol, is made at Umritsur by boiling sheet copper in oil of vitriol. Sells at 8*d.* per lb. It is the Nilatutya of the bazaars and is an impure pale blue salt, and might easily be purified by re-crystallizing ; but there is also in most bazaars some very pure sulphate of European manufacture. See Copper.

SULPHATE OF IRON.

Green copporas,	Eng.	Kahi,	Hind.
Green vitriol,	,,	Heera kasis,	,,

Is procured at Pind Dadun Khan, and is said to be dug out of the ground in large masses, alsosaid to be produced by concentrating the mother liquid, from which alumina has crystallized out, and it therefore contains much sulphate of alumina with sulphate of iron, and other impurities. A Belgium horticulturist, named M. Dubreuil, has recently discovered that wonderful results may be obtained by watering plants of every kind with a solution of sulphate of iron. Even the growth of fruits may be promoted in an extraordinary degree by the same process. M. Dubreuil brought fruits to enormous size by watering with sulphate of iron. The trees or bushes should be watered three times in succession, after the fruit has attained about one-quarter of its development, and when not exposed to the influence of the sun. The sulphate is used in the proportion of one gramme (about the 24th part of an ounce) to one litre (about a gill less than a quart) of water.—*Cat. Ex.*

SULPHATE OF LIME, Eng. Gypsum.

SULPHATE OF MAGNESIA, see Magnesia.

SULPHATE OF QUININE, see Cinchona.

SULPHATE OF SODA, Kharinoon, effloresces on the soil of Tirhoot and Sarun in the province of Behar. See Soda.

SULPHATE OF ZINC, see White copperas.

SULPHIDE OF ANTIMONY, or Surma, is used by the natives of the south of Asia as an application to the eyelids, either solely for appearance or with other substances as a medicine. But under the name surma many substances are supplied, especially the sulphuret of lead, the sesqui-oxide of iron, and occasionally bin-oxide of manganese ; while the name 'surma safaid' is usually applied to calcspar, carbonate of lime, and sometimes to sulphide of lime or gypsum. Men use the surma : women the kohl or lamp black.

SULPHUR, from Sal salt and pur fire.

The great repositories of sulphur are either beds of gypsum and the associated rocks, or the regions of active or extinct valcanoes. In the valley of Noto and Mazzaro in Sicily, at Conil near Cadiz in Spain, Bex in Switzerland, and Cracow in Poland, it occurs in the former situation. Sicily and the neighbouring volcanic islands, Vesuvius and the Solfatara in its vicinity, Iceland, Teneriffe, Java, Hawaii, New Zealand, Deception Island, and most active volcanic regions, afford more or less sulphur. The native sulphur of commerce is brought mostly from Sicily, where it occurs in beds along the central part of the south coast and to some distance inland. It is often associated with fine crystals of sulphate of strontian. It undergoes rough purification by fusion before exportation, which separates the earth and clay with which it occurs. Sixteen or seventeen thousand tons are annually imported from Sicily into Britain alone. Sulphur is also exported from the crater of Vulcano, one of the Lipari islands, and from the Solfatara near Naples. It is also found in the United States of America, on the Potomac, and in districts where sulphuretted hydrogen is evolved from mineral springs. Sulphuric acid is said to occur in the waters of the Rio Vinagro in South America, also in Java, and at Lake de Taal in Luzon in the eastern islands. About thirty miles north of Andipore in Upper Hindustan, it is met with, but of a quality inferior to that brought from the Gulph of Cutch and Persia. In Tenasserim, sulphur only exists in the ores that are found in the form of sulphurets, as the sulphuret of iron, the sulphuret of antimony, the sulphuret of lead, and the sulphuret of copper ; but native sulphur has not been found in the provinces. Sulphur from Canara and Nellore at the Madras Exhibition was of fair quality, and in pure though small crystals. This substance is found in small quantities, in several districts of the Madras presidency, as Salem, Masulipatam, Guntoor, Cuddapah and Trichinopoly ; it occurs along with Gypsum in marl and clay beds, and also very largely in the form of metallic sulphurets. The natives are acquainted with the modes of subliming sulphur, and they prepare it of indifferent quality for the manufacture of the gunpowder, which is used for engineering purposes, &c. Dr. Heyne met with sulphur in small heaps and in tolerable abundance, at the northern extremity of a lake which is near a small village called Soorasany yanam, about 12 miles east from Aumlapore, and not far from Maddepolem. It was in a loose soft form, or in nodules of a greyish yellow colour. The greater part of the sulphur, which is exposed for sale in the Indian provinces, is brought from Muscat, from Sumatra, or from the Banda island called Gonang-api, where it is a volcanic production. In China, Dr Abel had some most beautiful and splendid native sulphur brought to him from the crater of Gunang karang. The Chinese obtain their supplies from the volcanic districts of Turfan, Tangut and Seshuen and from Satsuma in Japan : but formerly it was brought as tribute from Siam and Sumatra. We know that it is a product of the Philippine islands particularly in the island of Zeyti, whence the gunpowder works of Manilla are supplied : most of the sulphur brought to Hindustan contains a considerable portion of orpiment, being much less pure than either that which is dug out of the Solfaterra near Naples, or that imported from Sicily, which last, Dr. Thomson says, contains seldom more of impurity than about three per cent. of a simple earth. A bright shining yellow sulphur is sold in the bazaars of Lower India under the Tamil name of Nellikoya gundagum. In Nepaul sulphur is plentiful: this useful article is also found in Persia in mountains behind Takran also in mountains south of Kelat in the province of Mekran. It is met with in Cabul, in the district of Balkh, it is also a product of China and Tibet ; also, according to Morier, at Balianka in Persia. Sulphur is found in all the volcanoes of the Archipelago in great purity, but the manufacture of gunpowder amongst the Malays is very imperfect. In the district of Oudipur in Upper India, it is to be met with, but of a quality inferior to that which is brought from the gulphs of Cutch and Persia. In Travancore it was discovered by Captain Arthur, of the corps of Engineers, in combination with iron, in the form of pyrites, and also in combination with alum. In Cotiole (in Canara) too, he was told, it may be procured. The greater part of the sulphur, however, exposed for sale in the Madras provinces, was in Ainslie's time brought from Muscat, from Sumatra, or from the Banda island Gonang-api. Sulphur is in the Malay balirang, and in Javanese walirang, essentially the same words. This name extends from Sumatra up to Celebes, where we find a new one for it, cholok. In one of the languages of the Philippines, the Tagala, strangely enough the name is sanyaya, which is, no doubt, a corruption of the Malayan word sandawa, saltpetre. In the Bisaya as well as in the Tagala, the name for gunpowder is maliling, doubtless a corruption of the Malay and Javanese name for sulphur. In the Madagascar, the name for it is sulifara, a corruption of the French soufre, from which it may be safely inferred that the article was unknown to the natives of this non-volcanic island until brought to their knowledge by Europeans. It is hard to say to what use the natives of the Malay Archipelago could have put sulphur, before the introduction of fire arms, unless to the manufacture of fire-works, known by the native names of marchun and rabok. The Malay and Philippine Archipelagos, the most extensive volcanic region in the world, must necessarily contain a vast supply of sulphur, but hitherto it has been very little availed of for economic use. From the Philippines alone it is exported, the export being to China only, and at the price at Manilla usually of about a Spanish dollar of 4*s.* 2*d.* a cwt. Among these islands, those which most abound in it are Luzon and Leyte, but particularly the last, where the article is of the best quality. A Spanish writer asserts that the quantity is such at the volcano of Taal, or Bombon, in the province of Botengas in Luzon, that many ships might be loaded with it. The difficulty, in all these cases, of obtaining a cheap supply, must arise from the absence of good roads, and the consequent costliness of transport. Sulphur, somewhat mixed with impurities, occurs in the Murree hills, and the Sulaiman hills near Dera Ismail Khan, at Kalabagh. It is found extensively throughout the salt range, and is manufactured also at Kubat. The valley of Puga, in Ladakh, from whence borax is obtained, yields also sulphur. The Puga sulphur mine is situated a short distance from the Rulangchu, a small stream which is full of hot springs and runs into the Indus, at the foot of a gypsum cliff. It is probable that the sulphur has been deposited in crystals, and is st [illegible] eposited in the same manner in the fissures of the mica schist by loaded aqueous vapours. Besides the numerous springs charged with sulphuretted hydrogen, and which deposit sulphur on the rock over which they pass, and on the grass and weeds by their sides, sulphur in a mineral form' occurs near the surface of the nummulite limestone at Jabba, a little above the petroleum springs, in a white porous gypsum, which has evidently been formed by the decomposition of the limestone, unaltered pieces of which are still imbedded in it. Sulphur also occurs near Panobar, 4 miles from Shadipur on the Indus. The crystals of native sulphur picked out of the rock are called "aunlisar." Mrs. Hervey visited the mines of sulphur and borax or sohaga, from which two hundred cutcha maunds of sulphur were annually sent to the maharaja of Kashmir, to whom these mines solely pertain. She saw the rocks whence the sulphur had been dug out, and she also went to see it manufactured into cakes, in the form sent to the maharajah. Two or three men were putting the sulphur into copper vessels, placed over a good strong fire, to dissolve and refine it. After being allowed to cool, these sulphur cakes are of a crescent-shape, and quite hard. There are numberless hot springs all over this valley, the temperature of the water varying from 130° to 169° Fahrenheit. Close to a hot spring, the rest of the water was quite cold, about 53°. A rather deep stream runs through the Puga valley. Sohaga, or unrefined borax, is also found all throughout this valley. It is in large quantites beneath a white, salt-like deposit, which covers the surface of the ground for a mile and a half in breadth, and a couple of miles in length. This is called the "Puga valley." This white stuff resembles snow at a distance; when examined closely, it is not unlike Sal ammoniac in appearance, as well as taste. Close to the hot springs it is curious to observe the sulphur forming in masses. The borax is sold in large quantities by the Roopshoo people, and if the trade were properly carried on, it might prove a source of great wealth. Considering these profitable resources, the tax levied on the wandering Tartars, by the Maharajah is less heavy (in proportion) than the imposts extorted from his Kashmirian subjects. This valley alone must bring the people of Roopshoo (even as they manage) fifteen hundred or two thousand rupees per annum. The sulphur mines, if diligently and properly worked, would yield thousands of "maunds," instead of the "two hundred" now exported, and they would be a great source of wealth in the hands of any able government. The people are not permitted to sell any of the sulphur, as it belongs exclusively to the Government. Near the little green plot at Puga on which travellers generally encamp is one of the sulphur and borax mines. Here she found several men and boys employed melting the minerals, the former in shallow basins. The hollow in the rock was only a few feet from the surface, and lined with beautiful octohedral crystals of sulphur, more or less mixed with white powder or crystallized borax. Sulphur is called in the Punjab, "gandhak," "gogird," or "kibrit." When in a vitreous state it is called aunlasar, which term means like the "aunla," fruit of the emblic Myrobalan. It is sometimes called "chachya," when in the form of "flower of sulphur," in which state it is first obtained from the ore by sublimation: roll sulphur is occasionally imported.

Immediately above the open plain in which Dr. Thompson joined the Indus, it would appear to have a very rocky and rugged channel. He followed up the left bank of the Indus, which gradually assumed a more northerly direction. The mountains on both sides approached more closely to the river and those on the right continued extremely lofty. The river now flowed more rapidly, and was often wider and more shallow, one rapid was not less than 150 yards in width. Banks all alluvial clayey conglomerate were usually interposed between the mountains and the river, forming cliffs which attained not unfrequently an elevation of fifty feet. Advancing up the stream he found that numerous hot springs rose on its banks, and sometimes under the water. The hottest of these had a temperature of 174.° From these springs gas was copiously evolved, smelling strongly of sulphur; he noticed fish in the water of Pugha, at an elevation of nearly 15,500 feet above the level of the sea, thus indicating that air at that elevation is not, from its rarity, insufficient for the support of life in animals breathing by gills. The whole of the lake plain of Pugha is covered, to the depth of several feet at least, with white salts, principally borax, which is obtained in a tolerably pure state by digging the superficial layer, which contains a little mixture of other saline matters, being rejected. There was then but little export of borax from Pugha, the demand for the salt in upper India being very limited, and the export to Europe almost at an end. It has long been known that borax is produced naturally in different parts of Tibet, and the salt imported thence into India was at one time the principal source of supply of the European market. Dr. Thompson, quotes Mr. Saunders (Turners Tibet, p. 496,) as describing from hearsay the borax lake north of Jigatzi as twenty miles in circumference, and says that the borax is dug from its margins, the deeper and more central parts producing common salt. From the account of Mr. Blane (Ph. Trans. 1787, p. 397), who describes, from the information of the natives, the borax district north of Lucknow, and, therefore, in the more western part of the coarse of the Sanpu, it would appear that the lake there contains boracic acid, and that the borax is artificially prepared by saturating the sesquicarbonate of soda, which is so universally produced on the surface of Tibet, with the acid. At least, the statement that the production of borax is dependant on the amount of soda, leads to this conclusion. Mr. Saunders does not notice any hot springs in the neighbourhood of the borax, but in the more western district described by Mr. Blane, hot springs seem to accompany the borax lake as at Pugha. It is not impossible that the three districts in which the occurrence of borax has been noticed, which are only a very small portion of those which exist, may represent three stages of one and the same phenomenon. The boracic acid lake may, by the gradual influx of soda, be gradually converted into borax, which, from its great insolubility, will be deposited as it is formed. On the drainage or drying-up of such a lake, a borax plain, similar to that of Pugha, would be left behind. Two miles from their ecampment in the Pugha valley he stopped and examined the spot whence sulphur is obtained, at the base of the mountain slope on the north side of the valley. Ascending a few feet over a loose talus of shingle, which skirted the bottom of the hill, he found two narrow caverns in the slaty rock, apparently natural, or only a little widened by art, roughly circular, and less than three feet in diameter at the mouth. One of these caverns continued a long way inwards, nearly horizontally, but it contracted considerably in diameter, and was so dark that he could not penetrate far. The rock was principally gypsum, interstratified with very friable mica slate. Sometimes the gypsum was amorphous and powdery, at other times in needles two or three inches long, perpendicular to the strata of slate. The sulphur was in small quantities, scattered among the gypsum, and was more abundant in the lower beds. It was frequently in very perfect crystals, not, however, of any great size.

The greatest quantity of sulphur of Japan is brought from the Province Satzuma It is dug up in a small neighbouring island, which from the great plenty it affords of this substance, is called Iwogasema, or the sulphur island. It is not above a hundred years since they first ventured thither. Even since that time this island brings in to the Prince of Satzuma about 20 chests of silver per annum, arising only from the sulphur dug up there, besides what he gets by the trees and timber growing along the shore.

In the island of Leyte, abundance of sulphur is met with, and thence the gunpowder works of Manilla are supplied at very reasonable prices.

Sulphur is brought from the mountains of Beloochistan, and from mines near Shoruns.

Sulphur is found in Formosa to a large extent. It is seen to effloresce in the ravines near the petroleum wells of Burmah. Sulphur, occurs in the province of Batanga, 60 miles east of Manilla.

In the volcanic district in the northern end of the island of Formosa are three solfataras. One of these is about five miles east from Tamsui and a superior one is three or four miles to the north-east. The pits are about 1,750 feet above the sea, in a rocky gorge in the mountains, and clouds of steam and sulphureous vapour issue from numerous vents in the rocks. Several hot springs and pools occur and a miniature geyser throws intermittent jets of boiling water to a height of fifty or sixty feet. A third solfatara is near the village of Kim-pao-li, 7 or 8 miles N. W. of Kelung. The sulphur is obtained by a rude process of melting when the frothy slag is skimmed of, the heavier impurities sink to the bottom of the shallow iron pan and the liquid sulphur is ladled out into wooden buckets which are broken up when the sulphur has become solid. Similar solfataras exist in Satsuma in the island of Kiu-siu, in Japan.

The ground is volcanic and impregnated with sulphur. At the southern extremity of Satsuma, is the burning Sulphur Island of Ivoo-sima, which supplies the Chinese with some of their sulphur for making gun-powder. In 1803, Dr. Voysey found sulphur in some heaps, at the top of a lake near the Godavery river the village of Sura Sany Yanam not Maddepollam and Amalapore about 12 miles east from the latter place. In Beloochistan it is got from the Suni mine, on the ridges separating Saharawan from Kach Gandava ; the great mart for its sale is Bagh in Kach Gandava. Sulphur and saltpetre are found in the mountains behind Tehran. In Mazanderaun and Kerman are mines of iron, copper and silver, and lead is procurable in the neighbourhood of Yezd. But these mines are not worked, more from the ignorance of the people than a scarcity of timber. The marbles of Tabreez and Khorassan are transported to the most remote quarters of the empire; and the turquoise is obtained in Persia.—*Mason's Tenasserim*; *Dr. Thomson's Travels in Western Himalaya and Tibet, p.* 168; *History of Japan, Vol.* i, *p.* 107; *Walton's State, p.* 37; *Mrs. Hervey's Adventures of a Lady in Tartary, Vol.* i, *p.* 163-65; *Adams, Naturalist in India*; *Powell's Hand-book, of the Punjab; Cat. Ghendaga travagum, TAM.

This acid is produced in small quantities in nature, as near volcanoes, in some acid springs, and exists in combination in numerous sulphates, especially those of lime (gypsum) and of magnesia, found as minerals, or in the water of springs. It was known to the Arabs, Persians, and Hindoos. Sulphuric acid appears, from its name, to have been originally made in Europe, and probably also in Persia, from the decomposition of vitriol or sulphate of iron, a practice still followed at Nordhausen in Saxony. The sulphate is first calcined, so as to expel nearly the whole of the water of crystallization it contains. The acid, distilled off in an earthenware retort at a red heat, comes over in vapours, which condense into a dark-coloured oily-looking liquid. This fumes when exposed to the air, and contains less than 1 eq. of water to 2 of sulphuric acid, has a sp. gr. of 1·9, and is known in commerce as the Nordhausen, Fuming, or Glacial sulphuric acid. Liquid sulphuric acid, a dense oily-looking liquid, usually colourless, devoid of smell, but intensely acid, and powerfully corrosive. Sulphuric acid used to be made in England by burning the imported sulphur with a little nitre. After the great increase which took place in the price of sulphur, some manufacturers employed that obtained from Pyrites, which often contains arsenic as an impurity. The proportion of nitre $\frac{1}{9}$ which was burnt with sulphur either in the same chamber, lined with lead, and having its bottom covered with water, or in a furnace, from whence the vapours produced were conveyed into a similar chamber. In the mode of making sulphuric acid now, sulphurous acid, from burning sulphur, nitric acid vapour, and steam, are simultaneously admitted in oblong leaden chambers, so partitioned that the vapours can only advance slowly, and thus allow the whole of the sulphuric acid to be deposited. Sulphuric, nitric, mixed nitric, or aqua regia, and hydrochloric acids are all made at Lahore and sulphuric acid is largely made at other parts of India.—*Royle.*

SULPHUR ISLAND, in lat. 24° 48′ N., long. 141° 20′ E., is five miles long.

SULPHUR SPRINGS exist in many parts of Java and Celebes, and in the Pekalongan district west of Mount Prau. At the base of a high volcanic peak in the island of Damma is another. Sulphur springs occur between Mbang-ka and Tam-suy in Formosa. The sulphur is deposited in crystals. As Jell, is a town in Beluchistan in the south-western part of Kach Gandava, in a district replete with monuments, remnants of a former people, which bear a great analogy to the ponderous Celtic vestiges of ancient Europe, a hot spring there, the Garm-ab, preserves its temperature throughout the year. The sulphureous spring of Lakha is some twenty miles south of Jell, there is another a little below Sehwan, on the hills west of the Indus, and again other very hot springs near Karachi. These several springs are found in the same line of hills, and those inferior ones at the base of the superior range dividing Sind and Kachi, from Beluchistan, Under the same hills, north of Jell and west of Suran and Sanni are sulphur mines, indications of the same geological formation. Jell and Shadia are the chief towns of the Magghassi, one of the Beluch tribes, who have been located for a long time in Kachi. They are divided into four principal families or clans, of which the Butani is the more illustrious, and furnishes the Sirdar of the whole. They boast of being able to muster two thousand fighting men, and when visited by Mr. Masson, had been engaged in endless hostility with their neighbours, the Rhind, an inextinguishable blood feud existing between the two tribes. The Magghassi and the Rhind are alike addicted to the abuse of ardent spirits, bang and opium. In China, sulphur springs are met with near Che-foo and waters containing sulphuretted hydrogen and sulphurous acid gases are not uncommon.—*Bikmore, p.* 126; *Masson's Journeys, Vol.* ii, *pp.* 124 *to* 149. See Jell.

SULS, an ornamental style of arabic writing.

SULTAN, ARAB. King. The Adal Shahi dynasty of Bejapore, the Bahmany dynasty of Beder, Kutub Shahi dynasty of Hyderabad, Tippu the son of Hyder Ali of Mysore, Kamran of Herat, the rulers of Johore and Palembang all took the Arabic title of Sultan.

SULTANA CHAMPA, HIND. Calophyllum inophyllum.

SULTANA RAZIA, the eldest daughter of Altamsh. After a six months rule of her brother she succeeded to the throne of India, A. D. 1235, and ruled with ability for three and a half years, but was then put to death by her nobles, through jealousy of an Abyssinian slave to whom she had shown a partiality. The eldest daughter of Altamsh reigned. She possessed many talents and great virtues. She is not the only mahomedan woman of celebrity. In 1265 Muhammed II, had only one queen, who was employed in performing every homely part of housewifery. In A. D. 1611, Nur Mahal or Nur Jahan cut a conspicuous figure as the queen of Jahangir. She exercised considerable influence on state affairs, as well as on matters connected with her sex for a period of twenty years. To her is attributed improvements in female drapery and the preparation of the attar of roses. Her extempore verses used to captivate her husband. In his military exploits she acted as his guardian angel, and herself showed uncommon heroism, Jahangir in his memoirs, says, there is scarcely a city in which the princess has not left some structure, some spacious garden, as a splendid monument of her taste and magnificence.—*Calcutta Review, No. 109, p.* 49.

SULTANIAH, was built as a royal residence by Oljaitu, son of Argon, the eighth of the Mongol khans of Persia, in 1305. Long after the destruction of the city by Timur, indeed into the seventeenth century, the tomb of Oljaitu was still magnificent, and especially noted for its colossal gates of damasked steel. The city was re-occupied by some of the Persian kings in the sixteenth century, till Shah Abbas transferred the seat of government to Ispahan. The ruins were of vast extent in Chardin's time. The present Persian dynasty has again adopted Sultaniah as a summer residence. Pope John XXII set up an Archbishopric at Sultaniah in 1318, in favour of Francis of Perugia, a Dominican, and the series of archbishops is traced down to 1425. During Major Porter's halt at Sultaniah, when accompanying Abbas Mirza to Teheran, he observed an exemplary custom of the inhabitants in the manner of taking the honey, and at the same time saving the bees. The hives were constructed like long thin barrels thrust through the mud walls of the house ; one end opens to the air for the ingress of the bees, and the other projecting more than a foot into the inhabited rooms. That extremity was closed with a cake of clay. The proprietor explained that when he wanted to take the honey, he had only to make a continued noise for some little time on this shut up end, to set all the bees to flight out at the other. He then removed the cake, and during their absence, cleared the hive of the honey ; always leaving them sufficient for their store. The seal was then re-fixed, and the little labourers soon after returned to their homes to commence anew.—*Yule Cathay, Vol.* i, *p.* 49 ; *Porter's Travels, Vol.* ii, *p.* 471.

SULTANPOOR, a town on the upper Beas river, the capital of Kulu, a hill-state in the N. W. Himalaya. This province consists of the mountain basin of the Beas, and the west bank of the Sutlej. Sultanpoor, its capital, is elevated 4,584 feet. The chain bounding the Sutlej on the west, is considerably higher than that on its east bank, and is crossed into Suket, by the Jalauri pass, elevated 12,000 feet. The province of Chamba bounds it on the west, and the physical features of Kulu and Chamba are similar. The poorer Kulu people wear only a blanket, wound around the waist and one end flung across the shoulders and pinned across the chest, men and women often dress alike, but the long hair of the women is plaited in one tress. The natives of Busahir, Sookeyt-mundee and Kulu, in the Kohistan of Jhullundhur, have all sallow complexions and seem all of the same race. In the hills of Kulu and Kangra are the 'Goojura' and 'Guddi races,' who cultivate little, and keep herds of buffaloes, and flocks of sheep and goats. They claim certain beats of the forests as their 'warisi,' or ancestral property, subject to the payment of pasturage tolls. The forests of the lower hills are apportioned out among the Guddi or shepherds of the snowy range, who, in the winter season, bring down their flocks to graze. In the same manner, the Goojura with their buffaloes, will take up divisions on a hillside, and carefully respect their mutual boundaries.—*H. f. et T., p.* 203 ; *Cleghorn's Punjab Report, p.* 89.

SULTANPOOR, see Jellalabad, Kohistan.

SULTAN SAKADA is worshipped by the Kur. Sakal Deva, or Sakra Pen, the chain-god, is worshipped in Seone and elsewhere.

SULTAN SUKHI SARWAR, a man noted for his liberal and charitable disposition, and great generosity of character. On his death he was exalted to the position of a saint, and during February to May, a fair is held at the shrine, to which annually about 200,000 pilgrims, sikh, hindoo and mahomedan resort. It is at the mouth of the Sieree Pass, leading to Candahar, and is built on the skirt of the mountain. They are about 1,650 priests who issue to poor people parwane or orders in the name of Sukhi Sarwar.

SULU. The Sulu group of islands in the Archipelago embraces sixty inhabited islands, governed by a sultan, residing at Soug. Some parts of the interior of the island of Sulu, the largest island of this group, are occupied by Papuans who appear to be further advanced than any other mountain tribe of this race to be found in the Indian Archipelago; and the recent information that has been obtained respecting them, serves to show that they are useful and obedient subjects to the sultan of Sulu, whose family is said to be descended from a chief of that race. The Sulu government is divided into three estates: the sultan; nobility, or datos; and Orangkys, or the people. The religion of Sulu is mahomedan the sound of the Sulu language is not agreeable to the ear; it is said to have as great affinity to the Bissaya, as Spanish to Portuguese, and appears to be copious from the different appellations of quantity, &c. The Sulu have adopted some terms, not common to the Chinese, and corrupted others by pronunciation; in the following table, is represented the Sulu weights, and their relation to the Chinese terms:—

Sulu.	Chinese.		Sulu.
10 Muhuk....	10 Cash ——	1 Candarin. .	1 Ulandang or Chuchocks.
10 Ulandang or Chuchock..	10 Candarins..	1 Mace.... ...	1 Ammas.
10 Ammas....	10 Mace........	1 Tael	1 Tael.
16 Taels... ..	16 Taels...	1 Catty......	1 Catty.
5 Catties....	(5 Catties).....	....	1 Bubut.
10 Bubuts....	(50 Catties).....	... .	1 Lacksa.
2 Lacksas...	100 Catties......	1 Pikul.......	1 Pikul.

Sulu until recently continued to be the market where the Lanun and other pirates disposed of much of their plunder, and in former times itself was decidedly piratical. The mahomedan religion has made much progress in Mindanao and the Sulu islands, as has the Malay language, the usual channel through which it has at all times been propagated over the islands of the Indian Archipelago. The island of Basilan, is the largest of the Sulu Archipelago, on which the Spaniards have established a small settlement. From ten to twelve thousand Chinese annually visit the island of Basilan, the most northerly of the group, to cultivate its soil, and take away its products. The peculiar situation of these islands, and their contiguity to the Philippines, to Celebes, Borneo, Manilla, China and Singapore, make them well adapted for a European colony.—*Mr. Bartlett, Cor. Secretary of the American Ethnological Society in the Transactions of the Society*; *Keppel's Ind. Arch., Vol.* i, *p.* 71; *Jour. of the Ind. Arch., No.* vii, *July* 1849, *p.* 412; *No.* iv, *Sep.* 1849, *pp.* 546, 548-49, 561. See Ladrone islands, Sooloo.

SULUM PALLI, TAM. Garcinia mangostana.

SUM, HIND. Fraxinus floribunda, Ehretia serrata, Bombax heptaphyllum.

SUM, ARAB. Garlic.

SUM, DUK. Sarcostemma viminale.

SUMAC, FR. Sumach.

SUMACH. Sir A. Burnes tells us of the celebrated colossal idols and innumerable excavations called "Sumach," to be seen in all parts of the valley of Bamian for about 8 miles and still form the residence of the greater part of the population. A detached hill in the middle of the valley is quite honeycombed by them and is called the city of Gulgula. Caves are in greater number on the north side of the valley where the idols occur, on all sides of which excavations occur.

SUMACH or Shumac.

Tumtum,	AR.	Sumac,	FR.
Shih-Chu-Yu,	CHIN.	Schmack,	GER.
Divi Divi; Libi-Libi,		Sommaco,	IT.
		Sumak,	PERS.

The sumach tree of Europe is the Rhus coriaria, that of India is the Cæsalpinia coriaria, that of China is the Rhus venenata. The Cæsalpinia coriaria or Divi Divi of commerce, is a plant which was introduced about A.D. 1830 by Dr. Wallich, but which does not appear to have been distributed to the extent its importance merits. American sumach is a hardy plant of easy cultivation, it requires a little care, attention and watering during the first year or till the plant attains the height of 2 or 3 feet, it does not come into full bearing till about the third year, but in favourable localities it attains a height of 10 to 16 feet, and the produce of one full-grown tree is about 70 lbs. of pod valued at £8 to £12 per ton as a tanning substance.

It is a good hedge-plant and appears to be hardy and to bear pruning. The pods have been extensively used for tanning at Hoonsoor and it is approved of by the natives, but it is questionable if it will ever come into competition with the bark of the (Cassia auriculata) a wild shrub abundant on waste ground in the Peninsula. Should there be a dema for either of these plants at a remunerati price they could easily be procured now fr almost any district in Southern India.

The price of Divi Divi was quoted in public Ledger [illegible]n of 26th 1863 at 12sh. [illegible]er cwt., son of Divi Divi sh[illegible]e time ago for in London did not realize a sufficient sum to cover the freight.

American sumach is not quoted in the Ledger of the 29th August, but the following quotations are given :—

	1363.		1862.
Sumach, Sicily, per cwt.	12-0	14-0	11-0 14-0
Do. Palermo do.	12-9		
Do. 1 do. new crops	14-6		

Divi Divi has been used in considerable quantity at Hoonsoor ; it answered admirably for light skins such as sheep and goat for fancy leathers, but for strong hides it is not so suitable, it does not as the tanners call it fill the hide and instead of pliant thickish leather gives a thin hard material. It thrives well at Hoonsoor and the pods contain a large quantity of tanning stuff.—*Madras Agri-Horticultural Society* 1861, *Proceedings of the Board of Revenue, No.* 2441, 14*th May* 1861, *letter from Surgeon Major E. Balfour* ; *Major Loudon, Assistant Commissary General.*

SUMADHEE or Samadhi, SANS., from sung, prep and adhanu, a receptacle.

SUMAH, a tribe of Sind. They are Jut, though they are generally known by the former title. Such also are the Machi and numerous other subdivisions of the Jut tribes. See Jat, Sind.

SUMAICHA, one of the nyad, or proselytes to Islam, from the Soda race, are numerous both in the t'hul and the valley, where they have many pooras or hamlets. They resemble the Dhotes in their habits, but many of them associate with the Sehraes, and plunder their brethren. They never shave or touch the hair of their heads, and consequently look more like brutes than human beings. They allow no animal to die of disease, but kill it when they think there are no hopes of recovery. The Sumaicha women have the reputation of being great scolds, and never veil their faces.

SUMAJ BAREE. At Kulna is the Rajbaree of the rajah of Burdwan, several noble buildings and lofty temples, there is also the Sumaj-baree or the houses of sepulchre, where a bone of every deceased member of the rajah's family is deposited. The rajah belongs to the Khsetrya class, and observes the custom of preserving the ashes of the dead. He must have adopted this in imitation of the princes [illegible] Rajpootana, or otherwise he cannot find [illegible] authority in Menu to sanction the [illegible]eedings. They show here the bone [illegible]he last rajah, wrapt up in a rich cloth. [illegible] regarded as if the rajah was living him- t[illegible]d is placed o[illegible] musnud with T[illegible]s, and silver s[illegible]blers, hookas, of [illegible] water and utte[illegible] front of the hor[illegible] seat, just as the late rajah used to sit with all the paraphernalia of state about him.—*Tr. of Hind., Vol.* i, *p.* 23.

SUMAK, HIND., PERS. Rhus coriaria, Pistacia integerrima.

SUMALAYA, see Saisunaga, or Sesnag.

SUMALI, ARAB. A people, on the African coast, and found in Aden and along the west coast of Arabia. Those on the coasts are slaves, or their descendants brought from the interior of Africa by the traders. The dress of the men consists of merely a single piece of white cloth wound round their thin waist, one end of which, after being carried across the breast, is thrown negligently over the shoulder. In addition to a cloth of this kind, of smaller dimensions, the women wear a piece of tanned hide round their waist; to which is added a smaller apron of the same material, suspended by loops over the shoulder to conceal their breasts. The hair of the men is frizzled into large ringlets, several of which hang on either side of the face. The hair left in the middle is also frizzled and raised by the same means, the whole being anointed with large quantities of mutton fat. Through the upper part they thrust a straight piece of wood, resembling in form and size a skewer, which serves the double purpose of a comb, and also as an instrument for adjusting their curls.—*Wellsted's Travels, Vol.* ii, *p.* 370.

SUMALI HIND., of Chenab, Callicarpa incana.

SUMALYA, see Magadha, Nanda.

SUMANAKUTA, SINGH. Adam's Peak in Ceylon. See Serapad, Sripada.

SUMANAP. The industrious, peaceful and numerous people who speak the Madurese language with its dialect the Sumanap, occupy the island of Madura, divided from Java by a strait, and form in some districts the bulk of the population on the opposite shores of Java, to which, depopulated by long wars for the past two hundred years, they have been emigrating.

SUMASOKTEE, or Samasokti, SANS., from samasa, to compound, and ooktee, a word.

SUMATRA. A chain of mountains, as in Java, divides it longitudinally, running nearest to the western coast. It contains five active volcanoes. Three-fourths of the island, especially towards the south and east, are covered with impenetrable woods. Fifteen nations, speaking as many different languages, inhabit it, and six have made considerable progress in civilization. The Malays are here also, as in Java, the dominant race. The island, although three times the size, contains only one-fifteenth of the population of Java. There are plains and mountains of volcanic origin that rival in fertility the richest portions of Java; but many of the raised valleys of the country present a very different aspect. A recent Dutch writer has given a description of two of the great elevated plains or table-lands, which present a uniform scene of sterility. Nicolo de Conti, of Venice, returned from his oriental travels in 1449, and communicated to the secretary of Pope Eugenius V, a much more consistent and satisfactory account of what he had seen than any of his predecessors. After giving a description of the cinnamon and other productions, of Zeilam, he says, he sailed to a great island named Sumatra, called by the ancients Taprobana, where he was detained one year. His account of the pepper plant, of the durian fruit, and of the extraordinary customs, now well ascertained, of the Batech or Batta people, prove him to have been an intelligent observer. Sumatra was visited by Odoardus Barbosa, who wrote a journal of his voyage in 1516 in which he speaks of Sumatra with great precision. The productions of the island, he says, were chiefly exported to Catai or China. From Sumatra he proceeded to Banda and the Moluccas, from thence returned by Java and Malacca to the west of India, and arrived at Lisbon in 1508. Leaving out of view its modern alluvial accessions, Sumatra consists of a rectilinear belt of elevation, stretching from the parallel of Pinang to that of Bantam, and shutting in the Malay Peninsula and China Sea from the Indian Ocean. Its extreme northwest and southwest points differ 10° 30′ in longitude and 11" 40′ in latitude, the former being in 5° 45′ N. L., 95° 10′ E. long. and the latter in 5° 55′ S. L., 105° 40′ E. long. The belt thus makes an angle of about 36° with the meridian, its direction being a little west of N. W. by N., which gives it a length of about 925 geographical miles. Its average breadth appears to be rather more than 90 miles, as it nowhere expands to a much greater breadth for a considerable space save in the middle region, nor contracts to a less save at the northern and southern extremities. The area covered by it is about 85,000 square miles. The true limits and configuration of this mountain region on the east have not been ascertained, but it probably forms a vast number of systems of low hills as on the west coast, and as in the Malay Peninsula on the margins and in the depressions of the belt of mountain groups. The body of the Sumatran zone does not appear to consist of elevated chains of great length, but of numerous short ranges and isolated mountains varying extremely in all their dimensions. The circumstance of the belt being partly plutonic and partly volcanic forms its peculiar character. Its configuration is, in fact, a combination of that of the Malay Peninsula with that of Java, with this difference that its middle region is more elevated and expanded than any part of the peninsula, several of its masses being about thrice the height of the highest summits of that range. If a number of volcanic mountains rose here and there amongst the peninsular groups, and in greatest number in Pera, Tiangganu and Patani, where it is broadest, it would be identified in character with Sumatra. The greater elevation of the mountains of the latter is however accompanied by a greater expansion of the plains and valleys which lie amongst them. In crossing it anywhere, save towards its northern and southern extremities, three, and sometimes more, principal ranges are found with wide table-lands, plains or valleys between them, watered by numerous streams, and in some places containing lakes, as in the principal Korinchi plain, the great Malayan plain of Menangkabau and the Bata plain of Tobah. The most western ranges form the water-shed, and as the land to the west of it, chiefly hills, is not more than 25 miles broad, about one-fifth only of the waters of the island fall into the Indian ocean, the Straits of Malacca and the Java sea receiving the remainder, in nearly equal proportions as regards the drainage of the mountains, but with a large excess to the latter from the wide plain traversed by the rivers that disembogue into it.

The western margin of the belt, washed by the strong waves of the Indian Ocean, has retrograded to the eastward, the sediment of the rivers and the debris of the coast being carried away instead of being deposited. The northern part of the east coast, exposed to the assault of the Bay of Bengal, has retained its ancient dimensions, if it has not contracted, but as soon as the open sea is exchanged for the Straits of Malacca, the mountain belt begins to retire from the coast, and a great alluvial plain commences, which, to the south of the S. E. extremity of the Batta country opposite Parcelar hill, where the Peninsular and Sumatran belts approach nearest each other, expands to a breadth varying from 60 to 110 miles. The length is about 600 miles and the average breadth about 70 miles which gives a surface of about 42,000 square miles. This plain and the mode of its formation, described in a sketch of the Physical phy and Geology of the Malay Peninsula, the Journ. Ind. Arch. Vol. ii, p. 129-132 If to this we add 1,500 square miles for of the flat alluvial land to the nort great plain, we shall have 128,500 the area of the whole island, the region occupying about two-thirds. This result is nearly identical with the gross estimate of Lieut Melville van Carnbee, which is 8,035 leagues = 128,560 Eng. sq. geo. miles. The islands on the west coast give a further surface of 5,000 miles to be added to the elevated region, and this will make it almost exactly double the size of the alluvium. Its S. W. coast has a narrow tract of low land, beyond which the mountains suddenly rise.

The Sumatra coast, from Diamond Point to the Arroa Island, is low and woody, fronting the sea, having along it several rivers, towns and villages, which are only frequented by coasting prahus or other small vessels. Sumatra is known amongst the eastern people and the better informed of the natives themselves, by the two names of Indalas and Pulo Percha, (or, in the southern dialect, Pritcho.) The meaning or analogies of the former, which seems to have been applied to it chiefly by the neighbouring people of Java, is not known. Sumatra is rich in minerals. No country has been more famous in all ages for gold, and though the sources from whence it is drawn may be supposed in some measure exhausted, yet at this day the quantity procured is very considerable. There are also mines of copper, iron, and tin, sulphur is gathered in large quantities about the numerous volcanos. Saltpetre the natives procure, by a process of their own, from the earth which is found impregnated with it ; chiefly in extensive caves that have been, from the beginning of time, the haunt of a certain species of birds, of whose dung the soil is formed. Coal, mostly washed down by the floods, is collected of a greater quantity.

The island is divided into a number of petty states, the chief of which are Acheen, Delly, Langkat, and Siack. British political relations with Acheen date as far back as 1602. Various attempts, however, which were made to establish a factory at Acheen, failed. In 1815 a revolution broke out, and the reigning sovereign, Jowhar Shah, a dissolute prince, was deposed, and Syful Alum Shah, the son of a wealthy merchant, who was related to the Royal family, was raised to the throne. After protracted negotiations, however, the ex-rajah was restored, through the mediation of Sir Stamford Raffles, and a treaty was concluded with him. With Delly, Langkat, and Siack, treaties exist, but after the treaty with the Dutch, of 1824, the diplomatic connection of the British with Sumatra ceased.

The *Malay* race extends through the Malay peninsula south from Siam to Singapore; all Sumatra is Malay,—so is all Borneo and with a slight change of type, the Philippines are the same. In these situations they are found pursuing their livelihood as seamen or engaged in commerce with other countries. In the Malay peninsula they are in part mahomedan and in part pagan in the more impracticable parts of the Malay peninsula. The Malays of Sumatra generally wear the same weapons as those of the peninsula, with the addition of the rud and pemaudap, swords, and the suvar, dagger, used for assassination. Vanderworm in 1677 and Valentyn in 1727 gave correct though imperfect digests of the Sijara-Malayu and other Malay histories. Marsden in the 3rd edition of his history of Sumatra retracted his previous opinion that the Malaya of Sumatra had emigrated from the peninsula, cited the account in the Sirja correctly from Valentyn and Vanderworm, but added an ingenious conjecture of his own that the Maha Meru of the Malay historians was the mountains of Sungei Pagu in the Menangkabau country, and that the adventurers who established Singapura were from the Sunka Malays in that country 'one of the four great tribes.' Mr. Crawfurd adopts this conjecture and, misled by Marsden's loose transcript comprehension of Valentyn's notice of the Sukus, tells us that the parent race, that is, the Menangkabaus, consist of these four tribes, the fact being that they are the Sukus not of Menangkabau but of the country of the Sapulobua Bander to the south, which lies around Gunong Sungei Pagu. In Marsden's and Raffles's maps of Sumatra the inland part of this country is a perfect blank, the name being erroneously confined to its maritime division. The number of Sukus or clans is very great and their names are various. Thus the Malays of Pandang belong to eight distinct Sukus, one of which is also named Malayu. But Mr. Craufurd does not rest his opinion merely on Marsden's misinterpretation of the Dutch authorities. This great authority goes further and declares that we may believe the universal assertion of the Malays themselves that all the Malayu tribes, wherever situated, emigrated directly or indirectly from Menangkabau. Enquiries however satisfy us that neither the Malay histories, nor the belief of the Malays, support the opinion that Singapura was founded by a swarm thrown off by the inland people of Menangkabau itself. Singapura, was founded by Malays from Bentan, and the Malays of the peninsula at this day so far from considering the Orang Menangkabau, including those of the Sungi Pagu Malays, as Orang Malayu, regard them as a distinct though allied people. Although there can be no doubt that both originated from the same stock there are differences in manners, institutions and even to a certain extent in language, which even without reference to their traditions and opinions, would render it doubtful to any mind, that the Malays of the principal states of the peninsula are descended from the Orang Menangkabau. The existence of a Suku Malayu in Menangkabau, which is the foundation of Marsden's conjecture, proves nothing in itself as to the origin of the word, because if a considerable number of Malays from Sungai in Plembang resorted to Menangkabau, the rulers of the latter would have placed them in a separate Suku. The same policy is followed by the Menangkabaus of the peninsula and both there and in Sumatra, Sukus are generally named from the places where the clan had its first origin. The Menangkabau traditions derive their kings, and even the first inhabitants of Sumatra, from the country extending from the Plembang to the Indragiri, and Malay histories relate that Sangsapurba from Plembang, after visiting Java a Bentan, ascended the Indragiri or Kuantan and was chosen by the Menangkabaus for their king. Plembang did not even form part of the region over which Menangkabau extended its dominion in ancient times. Mr. Marsden's conjecture that by Maha Meru or Buit Saguntang-Guntang, the mountain of Sungei Pago is to be understood, requires no other comment than that it is a mere supposition, unsupported by evidence, and contradictory of the Malayan histories which were his only authority for a derivation of the Malays of the peninsula from Sumatra. As this eminently candid and sagacious author had only seen the Dutch abstracts of these histories, he could not have been aware of the extent to which his hypothesis departs from them. The Bukit Saguntang-guntang is in Plembang and is now known by the name of Bukit Se-buntang. It may probably be shown hereafter that the name Malayu having been carried by the clan to Singapore, and these to other maritime states subsequently formed, came to be applied by foreigners to all the people speaking the same or a similar language. At the time when Marco Polo visited the Archipelago the name appears to have been still confined to the first maritime state, which he calls Malaieur. The primitive Malay stock of Sumatra, from which all the civilised tribes were derived, appears to have been the rude tribe still scattered *over the interior, from the southern limit of the Batta country to the extremity of the* mountain ranges. From this stock, civilised tribes probably originated not only in Menangkabau but in other parts of the great region extending from the Rakan to the Straits of Sunda, and which from its possessing all the large rivers as well as the richest inland vallies of Sumatra, would be favourable to civilisation. The evidences of the language are almost decisive on this point. The people on the most southern of these rivers, the Talang Bawang, although so near to Java, preserve Malay as the bulk of their vocabulary. The same remark appears applicable to the people on the next river, the Plembang, with the exception of the greater number of the inhabitants of the capital who are of Javanese extraction. At the time when Sang Nila Utama left Plembang, the people were Malayan according to the Sijara, a fact which the history of the Javanese confirms, for they inform us that the Javanese colony which settled at Plembang left Java in the reign of the last king of Majapahit, or in the latter half of the 15th century. The people of the hilly country along the western coast from which the feeders of the Plembang are derived, also speak dialects essentially Malayan, and having a slight mixture of Sundanese. The people of the other rivers to the north, the Jambi, Indragiri, Kampar, Siak, and Rakan, are Malay. It is this whole region, and not merely the small country of Menangkabau in its N. W. corner, that may be regarded as the primitive land of the Malays. The people on all its rivers must have had some intercourse with the Peninsula and the Johore Archipelago from times long before the foundation of Singpura, but whether for centuries or thousands of years it is hardly possible that we shall ever know. In all points in which the Peninsular Malays differ from the inland and purely agricultural Malays of the region in question, they assimilate to its river and maritime Malays, and Malay history does not go back to a period when the maritime Malays were entirely confined to Sumatra. The Indragiri in particular appears to have been crowded with Hindu-Malay settlements, many of the numerous villages on its banks retaining purely hindoo names to this day. It was by this river probably that they reached the fertile plain of Menangkabau. We are inclined to think that the Malays on this river must have attained a certain civilisation, in advance of the wandering mountain tribes, even before the hindoos came. If any colonies of the latter settled in the country they must have been few in their numbers or unaccompanied by women, for the present inhabitants, unlike the eastern Javanese, preserve no physical traces of Indian descent. If hinduism was gradually introduced in the course of a commercial intercourse, the difficulties attending the hypothesis of hindoo colonisation would be got rid of. It is very conceivable that hindoo merchants remaining in the country for a time and unaccompanied by women, like the Klings at this day, would be led to marry the daughters of the native chiefs, assume political power, obtain priests and architects from India, and engraft on the old republican-oligarchical governments of the land semi-hindoo monarchical dynasties, the representatives of which, at each generation of descent, would depart further from Indian type, till all physical trace of foreign blood was lost. The Hindu-Javan influence was probably more modern and comparatively transient. The Menangkabau are a purely agricultural, mining, and inland trading people, and consequently when they began to emigrate to the peninsula their proceedings were precisely the reverse of those of the Singapore colonist and indeed of all other Malays. They passed through the maritime districts, and sought valleys amongst the mountains of the interior.

I. Wild Tribes. There are two races which, not being confined to particular localities, it is necessary to mention first. They are at the opposite extremes of the civilization of the island. The one is a half-wild people, the scattered remnants of the aboriginal inhabitants, now broken by oppression and solitary restriction for centuries in the jungly mountains, into a number of disconnected patches of communities, differing, it is probable, considerably in language and little in condition and ideas. In the north, where they are known under the name of Orang Lubu; the Battas describe them as having inhabited Pertibi before they occupied it. (Willer, Tigd. v. N. Ind. 8th y., 2d part, p. 402) They are found up the Mandan above Siak. (J. Anderson, Mission to Sumatra, p. 349.) In the south again they are mentioned under the name of Orang Kubu by Marsden and other writers who resided on the west coast, and we know from information received from Malays that they are found in the interior on ascending most of the large rivers whose embouchures are on the east coast. Major Sturler in his account of Palembang gives a particular description of the Orang Kubu, who in condition and habits entirely agree with the wilder tribes of the Malay peninsula. The same remark applies to the Orang Gunong of Banka. The southern extremity of the mountain belt is inhabited by the Orang Abung, a head hunting race. These are the mountain nomades, but there are also half-wild people, some living in boats in the salt water creeks, and others in the sago forests and low jungles of the east coast. In this lowest class of Sumatran tribes should be included those inhabiting some of the western islands, such as the Enganoans. Their physical resemblance to the Malays is everywhere remarked, and, as stated, in the Journ. Ind. Arch., Vol. ii, pp. 332, 517, there seems no room to doubt that they are the aborigines of the Malayan region of Sumatra, and the remnants of the stock from which the present Malays have descended. Their numbers may be provisionally assumed at 6,000. The Abung and Kabu in the south appear to near about 2,000.

II. Orang Malayu (*Malays.*) The Malay races are the principal inhabitants of the island, whether we consider their range, numbers, actual territory, influence or civilization. They entirely occupy the wildest and middle region of Sumatra extending from the Rakan nearly to the Palembang on the east coast, and from Ayer Bangis to Kataun on the west coast, a length of about 275 miles with an average breadth of about 190 miles, and a superficies of 52,250 square miles, or little short of one-half of Sumatra. The east coast is nearly straight, running throughout in a direction due N. W. by N. The breadth of the highlands is about 95 miles. The lowland that stretches from their base to the east coast has about the same average breadth, so that the region is divided in nearly equal proportions between them. The greater part of the lowlands appear to be nothing more than the waste matter of the mountains brought down by the streams. It is this accumulation of sediment over so wide a surface on the east side of the mountains that has given rise to the great rivers which intersect the plain, the Siak, Kampar, Indragiri, Iambi and Palembang. It was the possession of this central, largest and most highly favoured region, that enabled the Malays to grow in numbers and civilization till they obtained supremacy in Sumatra. The mountains contain numerous valleys, some of great extent, all well watered and many encircled by volcanic soil. The population varies extremely in density. The higher parts of the mountains, and the lowland between the rivers, are left to the jungle and wild animals, and possess hardly any human inhabitants. The rivers have considerable collections of houses scattered at greater or less intervals along their banks, and extending a short distance from them. The principal valleys in the mountains, on the other hand, are completely cultivated and filled with inhabitants. While the countries of Siak, Indragiri, Iambi and the northern part of Palembang, including a portion about 25 miles broad of the eastern flanks of the mountain land, contain about 200,000 souls or 5 to the square mile, the single province of Menangkabau has a population of about 385,000 or 128 to the square mile, and the whole mountain land taken together gives a mean of 40 to the square mile.

The population is distributed as follows :

1st.—Malays of the mountain region.

a. Menangkabau.

b. Malays of the region of Sapulo Bua Bandar and Gunong Sungei Pagu.

c. The Korinchi.

d The Rawa.

2d.—The Malays of the hilly territories to the west of the mountain region.

a. The sea-bord of Menangkabau (1,700 sq. miles.)

b. The sea-bord of Sapulo Bua Bandar having a surface of 1,300 sq. miles.

3rd.—The Malays of the low lands or eastern countries.

4th.—The Malays of the East Coast of the northern region.

Their entire number does not appear to be above 60,000. Anderson gives 350,000 as the population of this part of the east coast, but he includes a considerable portion of the Bata region lying behind the Malayan seabord, and it is clear that this number was a mere guess made without reference to the data of which he was in possession, for the numbers which he set down at the different places which he visited do not give an aggregate of much more than one half-of this estimate, distributed as follows :

Southern Races.

III. Orang Palembang.
IV. Orang Rejang.
V. Orang Serawi.
VI. Orang Lampong.

The Northern Races.

VII. Orang Batta.

1st. Battas on the West Coast formerly subject to Malay rulers.

2nd. Battas on the low land and hilly region on the east side of the mountains.

3rd. Battas of the mountain region.

VIII. Orang Ache.

Western Islands.

IX. Orang Engano.
X. Orang Mantawei.
XI. Orang Niha or Nias.
XII. Orang Maruwi.

It will be borne in mind that the above estimates are for the most part rough approximations. These races blend with each other at their boundaries, many districts and villages in the northern region for instance being peopled by Malays and Battas, Malays and Achinese, or Achinese and Battas, and most of the settlements near the coast possess in addition a very mixed population of foreigners from the rest of the Archipelago, China, India and Arabia, while Europeans are found in small numbers in the Netherlands possessions, chiefly at Palembang, Bankaulu and Padang, little more than two millions for ~~the entire~~ population. Mr Francis, estimates 4,500,000.

Malays..................	2,000,000
Rejangs and Pasumahs..	600,000
Lampongs.................	150,000
Battas......................	1,200,000
Achinese	600,000

but the following Table exhibits ascertained results :—

A Sumatran ever scrupulously abstains from pronouncing his own name ; not, from any motive of superstition, but merely as a punctilio in manners. It occasions him infinite embarrassment when a stranger, unacquainted with their customs, requires it of him. As soon as he recovers from his confusion, he solicits the interposition of his neighbour. He is never addressed, except in the case of a superior dictating to his dependant, in the second person, but always in the third ; using his name or title instead of the pronoun ; and when these are unknown, a general title of respect is substituted, and they say, for instance, 'apa orang kaya punia suka,' 'what is his honour's pleasure,' for 'what is your, or your honour's pleasure.' When criminals or other ignominious persons are spoken to, use is made of the pronoun personal kau (a contraction of angkau), particularly expressive of contempt. In Sumatra there were formerly three perfectly distinct kinds of marriage ; the 'Jugur,' in which the man purchased the woman ; the 'Ambel-anak,' in which the woman purchased the man ; and the 'Semando,' in which they joined on terms of equality. In the mode of marriage by Ambel-anak, says Marsden, 'the father of a virgin makes choice of some young man for her husband, generally from an inferior family, which renounces all further right to, or interest in, him, and he is taken into the house of his father-in-law, who kills a buffalo on the occasion, and receives twenty dollars from his son's relations. After this, the buruk baik'nia (the good and bad of him) is invested in the wife's family. If he murder or rob, they pay the bangun, or the fine. If he is murdered, they receive the bangun. They are liable to any debts he may contract in marriage, those prior to it remaining with his parents. He lives in the family, in a state between that of a son and a debtor. He partakes as a son of what the house affords, but has no property in himself. His rice plantation, the produce of his pepper garden, with everything that he can gain or earn, belongs to the family. He is liable to be divorced at their pleasure, and though he has children, must leave all and return naked as he came.

The *Batta*, a supposed aboriginal race inhabiting the island of Sumatra, are not unlike the Malay and Benua of the Malay peninsula in feature ; but are a finer race of men. They are said to eat their aged relatives, a custom mentioned by Herodotus as prevalent among the Massagetæ (Herod. Clio., i, c. 216), and speaking of the eastern countries of India (Thalia, iii, c. 99), producing gold, and tributary to the Persians under Darius, he particularizes the Padai, a pastoral people ; amongst whom when any person falls sick, or arrives at an advanced age, his friends despatch him, and eat his flesh with rejoicing. Rennel, in his chapter on the twenty Satrapies of Darius Hystaspes, is of opinion, that Herodotus, when he thus describes the east of India and customs of the Padai, must have meant a tribe who inhabit the banks of the Ganges, the proper and Sanscrit name of which, he says is Padda : Ganga being the appellative only : so that the Padæi may answer to the Gangaridæ of later Greek writers. Formerly it was usual for the people to eat their parents when too old for work. The old people selected the horizontal branch of a tree, and quietly suspended themselves by their hands, while their children and neighbours forming a circle, danced round them crying out 'when the fruit is ripe, then it will fall.' This practice took place during the season of limes, when salt and pepper were plenty, and as soon as the victims became fatigued, and could hold on no longer, they fell down, when all hands cut them up and made a hearty meal of them.

The *Batta* or Battah occupy wholly the valley of Mandeling in Sumatra and have an alphabet and language of their own. The women wear the sarong, only, from the waist to the knee.

The *Lubu* are a people apart from the Malays of Menangkabu. They now build houses like the Malays. One of their towns is Lubu Sipeking. The Lubu eat fruit, maize, dogs, monkeys and snakes, but never rice. They are slaves to the rajah of Achin. Lubu rajah peak rises 6,200 feet above the sea. It is the highest in the Batta land.

The Batta language is alphabetic and invented by themselves. It has several dialects. They believe in evil spirits and omens. They are an inland people, the Malays from Menangkabau having spread and occupied all the coasts. All the Batta beyond the territories of the Dutch are from time immemorial cannibals. On the Dutch acquiring the plain of the Mandeling valley, the Batta dwelling there were compelled to abandon their cannibalism. The writings of Marco Polo show that so early at least as 1290, they were addicted to this. The rajah of Sipirok assured the Dutch government at Pedang that he had eaten human flesh at least forty times and that nothing he had ever eaten was equal to it. Professor Bikmore travelling amongst them in 1865, confirms what Sir Stamford Raffles wrote in 1820 after visiting Tapanuli Bay, that for a person convicted of adultery, midnight robbery, prisoners of war, intermarrying into another tribe and for treacherously attacking a village, house or person, the punishment is to be cut up and eaten. Sir James Lancaster arrived at Achin in 1602, with four ships.

The character of the inhabitants of Komring, and especially those of Komring Ulu, is more substantial than that of the Ogan people; they have a peculiar language, their writing in letter and sound agrees much with that of the Battas. The so called menareh (dancing) and berswara (singing) also differ in Komring from what they are in the other districts. The young girls dress better, are more pleasing in the movements, and their voice is more harmonious than that of women of the country usually is in singing. Girls are able, in free, agreeable and melodious tones, to pour forth improvised couplets and verses in honor of persons and events. In former days the concubines of the sultan were chosen from the fair sex in Komring. The Sumatrans speak of tigers with a degree of awe, and hesitate to call them by their common name (rimau or maching), terming them respectfully satwa (the wild animals), or even nenek (ancestors); as really believing them such, or by way of soothing and coaxing them.

The Malayan peninsula and Borneo, extensive as they are, have never given rise to an indigenous civilization, sufficient to raise their inhabitants beyond the condition of small and miserable communities, and hence no indigenous alphabet can be traced to them. Their more civilized inhabitants are invariably stranger emigrants. This must be owing to the absence of a certain kind of fertility in the land, available to the rude and feeble efforts of a native industry, such as elsewhere gave rise to a concentrated population, to leisure and to letters. In Sumatra and the groups of islands on its western coast, in addition to the Malay, there are at least nine other languages, five of which, the Ache or Achin on the north-western end of this island, the Batak or Batta, the Korinchi east of the Batak, the Rajang or Rejang and the Lampung, are cultivated and written tongues. There are also several rude languages among the scattered tribes on the mainland. The Batak or Batta nation lie to the east of the Malays, and furnish perhaps the only recorded example of a people acquainted with letters, who practice a modified cannibalism. The Lampung nation, which occupies that portion of the south-western side of Sumatra which lies opposite to Java, divided from it only by the Straits of Sunda, has its own peculiar alphabet, which consists of 19 substantive letters with double or treble consonants making them up to 44. It has a great deal of that angular, linear, and meagre form which characterizes the other Sumatran alphabets. The Lampung people occupy the eastern end of Java, on the Straits of Sunda and fronting the western extremity of Java. In the groups of islands on the western coast of Sumatra, are several unwritten tongues, amongst which may be named that of the Pogy or Pagi islands, the language of the Nias and that of Maros. In Sumatra, beginning from the west, the first evidence of a native written character is among the Batak, and it is singular that a nation of cannibals should possess the knowledge of letters. There was assuredly nothing of the kind in Europe or continental Asia until long after men had ceased to eat each another. The form of the Batak letters is horizontal. The Bima alphabet formerly in use amongst the Bima people in the island of Sumbawa, east of Sumatra and Java, has now given way to the alphabets of the Celebes. The Achin and Malay of Sumatra are written in the Arabic character. The Rejang, at Taba Panaujong in Sumatra, are a distinct race from the Malays of Menangkabau, though they belong to the Malay race. They have a language and alphabet of their own.

There is a kind of indigo called in Sumatra tarum akar, the Marsdenia tinctoria.

The Sumatra forests contain an inexhaustible store and endless variety of timber trees, many sorts of which are highly valuable and capable of being applied to ship-building and other important purposes. On the western coast, the general want of navigable rivers has materially hindered both the export and the employment of its timber; but, those on the eastern side, particularly Siak are, more favourably situated.

Red bintangur.—For masts and yards the wood preferred is the red bintangur, a species of Uvaria or Calophyllum which in all the maritime posts of India, has obtained the name of poon or puhn, from the Malayan word signifying tree in general; as puhn upas, the poison tree, puhn kaya, a timber tree, &c., the source of the commercial term for the poon or peon spars.

Camphor wood, useful for carpenters' work.

Kayu pindis or *Kapini*, a species of Metrosideros, is named also Kayu besi, or iron-wood, on account of its extraordinary hardness, as it turns the edge of common tools.

Marbau, the Metrosideros amboinesis, *R.*, grows to a large size, and is used for beams both in ship and house-building, as well as for other purposes to which oak is applied in Europe.

Piňaga is valuable as crooked timber, and is used for frames and knees of ships, being also very durable. It frequently grows in the wash of the sea.

Juar, ebony, called in Batavia 'kayu

arang, or charcoal-wood, is found here in great plenty.

Kayu gadis, a wood possessing the flavour and qualities of the sassafras, and used for the same purposes in medicine, but in the growth of the tree it resembles rather the British elm than the laurus, to which latter tribe the American sassafras belongs. It is very common in the plains near Bencoolen.

Kayu arau, the Casuarina littorea, is often termed a bastard pine, and, as such, gave name to the Isle of Pines discovered by Captain Cook. By the Malays it is usually called Kayu chamara, from the resemblance of its branches to the ornamental cow-tails of Upper India. It has been already remarked of this tree, the wood of which is not particularly useful, that it delights in a low sandy soil, and is ever the first that springs up from land relinquished by the sea.

Rangas or *Rangi*, commonly supposed to be the manchineel of the West Indies, but perhaps only from the noxious quality of its juices, is the Arbor vernicis of Rumphius, and is particularly described in the Batav. Trans., Vol., v, under the name of Manga deleteria sylvestris, fructu parvo cordiformi. Sumatra produces by far the greatest quantity of pepper. In 1842, the annual produce of this island was reckoned at 30,000,000 lbs., being more than the amount furnished by all the other pepper districts in the world. A little pepper is grown in the Mauritius and the west India Islands, and its cultivation is making some progress on the Western Coast of Africa, as England imported from thence 2,909 bags and casks in 1846, and about 110,000 lbs. in 1847. Mr. J. Crawfurd, F.R.S., one of the best authorities on all that relates to the commerce and agriculture of the Eastern Archipelago, recently estimated the produce of pepper at lbs. 50,000,000 as follows :—

Sumatra (West Coast)... lbs.	20,000,000
Do. (East Coast).........	8,000,000
Islands in the Straits of Malacca	3,600,000
Malay Peninsula..............	3,733,333
Borneo.....................	2,666,667
Siam.......................	8,000,000
Malabar....................	4,060,000

If we add to this,

Western Coast of Africa and B. W. Indies.....................	53,000
Java..........................	4,000,000
Mauritius and Ceylon............	80,000

It gives 54,133,000 as the total produce of the world.

Helarctas Malayanus or *Sun bear*, lives in Sumatra. It is herbivorous.

There is a goat-like animal in Sumatra ; the two-horned and the long-horned rhinoceros, occur in Burmah, Sumatra and Java ; and the elephant of India is found in Malacca, Sumatra and Borneo. There are in this island ten species of monkeys, none of which are found in Java. And in Java there are four species, none of which occur in Sumatra. The orang utan occurs in Sumatra and Borneo, but is not known on the Malay peninsula.

Coal occurs at Ayar Sumpur, at Suban and at Kamuning in Sumatra.

Papilio memnon and P. coon also occur in Sumatra.

Kallima paralekta, of Sumatra, or leaf butterfly, when settled on a dead leaf, looks like a dead leaf, amongst which it rests.

Kallima machis, a very similar species, inhabits the Himalaya.

A Semnopithecus takes enormous leaps.

Siamang an ape of sumatra swings itself along in the trees hanging with its arms.

The elephant Elephas Sumatranus, and Rhinoceros sumatranus occur, also the Orang-utan.

Galeopithecus of Sumatra feeds on leaves. It has a broad membrane extending all round the body to the points of the toes.

Buceros bicornis occurs in Sumatra. The male plasters up the female with her egg.

After the rainy season, when the torrents are wasted, Tavernier says they find veins of gold in the stones, which the waters wash down from the mountains that lie toward the north-east. Upon the west-side of the island, when the Hollanders come to lade their pepper, the natives bring them great store of gold, but very coarse metal, if not worse than that of China.

One of the most terrible active group of volcanoes in the world, says Mrs. Somerville, begins with the Banda group of islands, and extends through the Sunda group of Timor, Sumbawa, Bali, Java, and Sumatra, separated only by narrow channels, and altogether forming a gently curved line 2,000 miles along ; but as the volcanic zone is continued through Barren Island and Narcandam in the Bay of Bengal, (lat. 12° 15,) and northward along the entire coast of Arracan, the entire length of the volcanic range is a great deal more. The band extends northward to Chittagong, lat. 22° or 600 miles beyond Barren Island. Lieutenant Colebrooke, visited Barren Island in 1787, when it was in a state of violent activity ; he does not seem to have landed on it, and he quotes entire the account of it given by Capt. Blair in his survey of the Andaman Islands. The cone which springs from near the level of the sea, rises at an average of 32° 17', to 1,800, feet nearly. [Later authorities make it 500 feet, and this is probably its true altitude, Captain Blair gives no separate representation of it on his chart ; he merely sets it down as a volcano.] Lyell quoting Von Buch as his authority, says Barren Island, in the Bay of Bengal, when seen from the ocean, presents on almost all sides a surface of bare rocks, which rise up with a moderate declivity towards the interior : but at one point there is a narrow cleft, by which we can penetrate into the centre and there discover that it is still burning. The volcanoes of Narcondam, Chedooba, Chittagong, in the Bay of Bengal are known. Barren Island was visited by Dr. John Adam in 1831. The water close in shore was then hot and steamy, while steam and smoke issued from the crater, but no lava or flame. He estimated the diameter of the base at about 800 or 1,000 yards, and the orifice of the crater, which occupies the entire summit of the cone, at about 30. A later description has been published of Barren Island by Captain Miller, who visited it in 1834.

The cone of the volcanic island of Narcondam, lat. 13° 22′, is about 800 feet high, no soundings are to be had within half a mile of the shore.

The volcanic belt of the Archipelago is marked by a chain of active and extinct volcanoes through the whole length of Sumatra and Java and thence by the Islands of Bali, Lombok, Sumbawa, Flores, the Serwatty islands, Banda, Amboyna, Batchian, Makian, Tidore, Ternate and Gilolo to Morty islands. Here the belt is broken and shifted 200 miles to the west, to north Celebes, from which it passes on to Siau and Sanguir, to the Philippine islands, along the eastern side of which it continues in a curving line to their northern extremity. From the extreme eastern bend of this belt at Banda, for 1,000 miles to the N. E. coast of New Guinea is a non-volcanic district. But on the N. E. coast of New Guinea another volcanic belt can be traced through New Britain, New Ireland and the Solomon islands to the farthest eastern limits of the Archipelago. The united length of these volcanic belts is 90 degrees, their width about 50 miles, but for about two hundred miles on either side of them evidences of subterranean action are to be seen in recently elevated coral rock, or in the barrier coral reefs which indicate recent submergence. In some part or other of all this line earthquakes are felt every few weeks or months, varying from a slight tremor to great movements shaking down villages and destroying life and property, and some of them devastating the adjacent lands. In Java in 1772, the volcano of Papaudayang was blown up by repeated explosions and a large lake left in its place. In Sumbawa in 1815, 12,000 people were destroyed by the great eruption of Tomboro. Makian, an island of the Moluccas, was rent open in 1646, by a violent eruption. On the 29th December 1862, it again suddenly burst forth, blowing up and altering its face and destroying the greater part of the inhabitants and sending forth such quantities of ashes as to darken the air at Ternate forty miles off and destroying almost the entire crops of that and neighbouring islands. Java has nearly 45 volcanoes, active or extinct, many of them with volcanic cones, and averaging 10,000 feet high. Sumatra, in reference to its extent has few volcanoes and a considerable portion has probably a non-volcanic origin. Sumatra, the uncultivated parts of Java and Celebes, Borneo, the Philippines and New Guinea are all forest countries, but on Timor and on all the islands around it there is absolutely no forest, and this character extends to Flores Sumbawa, Lombok and Bali.

Mr. George Windsor Earl, in a pamphlet on the Physical Geography of South-eastern Asia and Australia, (1855) pointed out that the islands of Sumatra, Java and Borneo are connected with the Asiatic Continent by a shallow sea, and that a similar shallow sea connects New Guinea and all the adjacent islands with Australia, these last being all characterized by the presence of marsupial animals, and, carrying out Mr. Earl's suggestion, Mr. Wallace maintains that some of the islands had long been connected with the Asiatic Continent, and others equally long with that of Australia, and that a line of separation can be drawn between these, and he designates the Asiatic portion Indo-Malayan, and the Australian division Austro-Malayan. The seas between Sumatra, Java and Borneo are so shallow that ships find anchorage in any part of it, as it rarely exceeds forty fathoms and the seas eastward to the Philippines, and Java rarely exceed one hundred fathoms. The elephant and tapir of Sumatra and Borneo, the rhinoceros of Sumatra and the allied species of Java, the wild cattle of Borneo and the kind long supposed to be peculiar to Java, are now all known to inhabit some part or other of Southern Asia, and of the birds and insects, every family and every genus of the groups found in any of the islands occurs also on the Asiatic Continent and in a great number of cases the species are also identical. The great islands of Java, Sumatra and Borneo, even yet resemble in their natural productions the adjacent parts of the continent almost as much as such widely-separated districts could be expected to do, even if they formed part of the Asiatic Continent. The Philippine islands agree in many respects with Asia and the western islands, but present some anomalies. The eastern portion on the other hand, from

Celebes and Lombok eastwards, exhibits as close a resemblance to Australia and New Guinea as the western islands do to Asia. Australia has no apes, monkeys, cats, tigers, wolves, bears, hyenas, no deer, or antelopes, sheep or oxen, no elephant, horse, squirrel or rabbit. In lieu it has Kangaroo, opposums, wombats and the duck-billed polypus. It has no woodpeckers or pheasants, but has in lieu, the mound-making brush turkeys, honeysuckers, cockatoos, the brush-tongued loris, which are found nowhere else in the globe : and all these peculiarities are found in the islands which form the Austro-Malayan division of the Archipelago. The islands eastward from Java and Borneo, form a part of a previous Australian or Pacific Continent, although some of them may never have actually been joined to it. The Aru islands, Mysol, Waigyiou and Jobie agree with New Guinea in their species of mammalia and birds and they are all united to New Guinea by a narrow sea. The 100 fathom line around New Guinea, marks the range of the paradise birds. This separation has no relation to their geological character. The Indo-Malayan and Austro-Malayan divisions, hold two distinct types of the human race, the Malay and the Papuan, who differ radically in their physical, mental and moral characters and, under one or other of these two forms as types, the whole of the peoples of the Eastern Archipelago and Polynesia can be classed, and the line separating these two types comes near but somewhat eastward of that part of the zoological regions. This easterly jutting of the Malay line, has been caused by the maritime enterprise and higher civilization of the Malay races who have overrun the nearer part of the Austro-Malayan region have supplanted the original inhabitants and spread much of their language, their domestic inhabitants and their customs far over the Pacific. To the Malay type and to the Papuan type respectively, all the people of the various islands can be grouped. The Asiatic races, include the Malay and all have a continental origin which the Pacific races including all to the east of the Malay (except perhaps some in the northern Pacific) are derived not from any existing continent but from lands that now exist or have recently existed in the Pacific Ocean.

The most extensive volcanic band in the world runs through the Archipelago, taking a part of Sumatra, all Java, and the chain of islands to the east of it, most of the Molucca or Clove islands, a small part of Celebes and much of the Philippines. In 1815, there was a great eruption from the Tombora mountain in Suubawa, the fifth island of the Sunda chain which is said to have destroyed 12,000 people. An active volcano lies N. E. of Kapaiyong in Sumatra. The island of Simo, one of the Batu group, on the west coast of Sumatra, had an earthquake and sea-wave on the 9th March 18 . Before the occurrence the island had 120 houses and a population of 1,045 ; on this day 96 houses were destroyed, and 675 of the inhabitants, besides 103 temporary residents, lost their lives. An earthquake was felt at the fall of the evening, shortly before the inundation. All the inhabitants then assembled, on the open space in the middle of the campong, but a moment afterwards they tried to make their escape from thence, as they dreaded the fall of the houses which were already tottering. They were driven back, however, by a rush of water which approached from the back of the campong. Running back from this they were overwhelmed by another terrific wave, which, out of 282 persons, swept off 206. Two waves met each other at this point and wrought a frightful destruction. Large masses of rock were carried from the sea for 100 to 200 paces inland. A colossal old jawijawi tree, which formerly stood on the bay, lay with its roots and branches, broken and twisted about two hundred paces from the shore. The water retired with so much force that much must have been swept into the sea. Soon after the earthquake very heavy reports were heard, like distant cannon shots, on which was observed approaching at a great distance from the sea a wave of the height of a full-grown cocoanut tree, and which dashed with furious force on the island ; some saved themselves by an immediate flight, the rest were overtaken by the water and swept away, except such as were caught by the jungle, or possessed presence of mind and strength enough to hold on to trees. Three such waves succeeded each other.

Volcanoes in Java are usually bare of foliage, alike on their summits as on their base, owing to the large quantities of sulphur that are washed down their sides. Mount Slamat peak is 11,330 feet above the sea, and is an active volcano, it is next to the highest in the island. Ungarung peak is about 5,000 feet. The north coast of Java is low. Further inland from Ungarung are Mount Prabu, Mount Sumbing and Mount Sindoro. At Boro-Boro hill in Java which is terraced, is a buddhist temple built A. D. 1344 and many buddhist images and remains, and at Brambanan are 296 hindoo temples erected A. D. 1266-1296. Telaga-bodas, or white lake, in Java, is in the old crater of the volcano of Papandayang. Java coast towards the south is high and bold, and its rocks consist of hard volcanic basalts and trachytes.

The *Volcano of Tael* is in the island of Luconia in Manilla. The island is formed by a mountain from three hundred and fifty to four hundred yards above the level of the Laguna de Bombon, is about three leagues in circumference and has a crater about two miles at its circumference on its summit. The lining walls of the interior are fifty to seventy-five yards in perpendicular height and five cones of eruption covered with sulphur rise from the centre of the crater, a lake of green water which boils in several places. The Laguna de Bombon, itself has a circumference of thirty leagues; its waters are brackish and bituminous, and of great depth, in some parts no soundings at 125 fathoms. The great eruptions occurred in the years 1716, 1746 and 1754.

North of Batchian is Makian, a volcano, of which in 1646 there was an eruption.

Makian island 50 miles from Ternate, consists of a single grand volcano. In 1646 there was a violent eruption, which blew up the whole top of the mountain, leaving a truncated jagged summit, and vast gloomy crater valley. It was said to have been as lofty as Tidore before the calamity. On the 29th December 1862, another eruption of this vast mountain took place in which all the villages and crops were destroyed and many of the inhabitants killed. The sand and ashes fell so far that crops 50 miles off, at Ternate, were destroyed, and it was so dark at Ternate that lamps had to be lighted at noon.

North of Makian is Motir, a trachytic cone.

The Tenger mountains of Java, mean the wide or spacious mountains. There is here an old volcano with its trachyte crater 7,500 feet above the sea, in diameter 3½ and 4½ miles. It is the largest crater in Java and one of the largest in the world. Its bottom is a level floor of sand, which in some places is drifted by the wind like the sea and is called by the Malays the Laut Pasar or Sandy Sea. Four cones of elevation rise from this sand floor, the smallest of which called Bromo in 1866 was active, throwing out ashes. It rises like Monte Somma in the crater of Vesuvius. But trachyte, obsidian and pumice have been thrown out in succession.

Papandayang volcano, on the south of Java, in Lon. 108° in 1772, in a single night threw out scoriæ and ashes which Dr. Junghuhn thinks made a layer 50 feet thick for seven miles around. In Dr. Horsfield's account of it, drawn up from the native testimony, it is stated that an extent of ground, of the mountains and its environs, 15 miles long and full 6 broad, was by this commotion swallowed up within the bowels of the earth, but this sinking, according to Mr. Bikmore, p. 75, does not seem to have occurred.

Mount Galung-gong, a few miles N. E. of Papandayang, is also a Java volcano. On the 8th July 1822, at noon, not a cloud was seen in the sky when suddenly at ½ past one a frightful thundering was heard in the earth, and from the top of this old volcano a dark dense mass was seen rising higher and higher into the air, and spreading itself out over the clear sky with such an appalling rapidity that in a few moments the whole landscape was shrouded in the darkness of night. Through this darkness flashes of lightning gleamed in a hundred lines, and many natives were struck down by falling stones. Then a deluge of hot water and flowing mud rose over the rim of the old crater and poured down the mountain sides, sweeping away trees and beasts and human beings. At the same moment, stones and ashes and sand were projected high into the air, and as they fell destroyed nearly everything within a radius of more than 20 miles. A few villages on the lower declivities of the mountains escaped from being built on eminences, as they were above the streams of hot water and mud, and the stones thrown out fell beyond them, destroying villages at a greater distance. By 4 P. M. the extreme violence of the eruption had passed, by sunset the sky was again clear, and the sun shining on a scene of desolation. A second eruption occurred five days afterwards, and by that time more than 20,000 persons had perished.

Tenger mountains are occupied by a peculiar people who speak a dialect of Javanese, and still follow the hindoo religion.

At about 5 o'clock in the evening of the 15th April 1872, the volcano Merapi, in Java, which had been quiet since 1863, began to show signs of vigorous life. Glowing streams of lava issued out of the mountain, and rushing furiously downwards, buried whole villages in their fiery masses, filled up ravines and checked the course of rivers. This outburst was one of the most frightful ever known, it came so unlooked for, that every one was surprised by it. A river in the neighbourhood of the mountain was filled with lava to a depth of 15 feet; all the trees on its banks (which are 80 feet high) were consumed or scorched by the fearful heat. A great many human beings have perished together with their villages. Showers of ashes, stones and sand followed the casting out of the lava, and caused dreadful devastation. At several places, the sand and ashes lay from two to four feet deep, whereby great damage was done to the coffee and other crops—coffee especially, because the berries were almost ripe. At Solo and other places the ash and sand showers lasted three days, and it became so dark that lamps had to be lighted in the daytime. The volcanic outburst was accompanied by slight shocks of earthquake. Thousands of Javanese had to take flight after having lost their all ; their villages had become uninhabitable owing to most of the houses having fallen down. 200 dead bodies were found on one side of the volcano. A woman who escaped brought news, that her fellow villagers, 160 in number, had perished.

Ternate is merely a high volcano, with its base beneath the ocean. Its circumference around its shore is six miles and its height is 5,400 miles. Severe and destructive eruptions took place in 1608, 1635, 1653, 1673 and next on the 26th February 1838, then on the 25th March 1839 and on the 2nd February 1840. In that of 1673, a considerable quantity of ashes was carried to Amboyna. In that of 2nd February 1840, for fifteen hours, the solid ground rolled like the sea, but the heaviest ground wave was at 10 A. M. of the 15th February, and the people then took to their boats. In this interval were great eruptions of ashes and hot stones which fell like hail, Lava poured from the crater into the sea. For ten days clouds of black smoke poured out. About midnight of the 14th, the shocks were more violent, and before half past three A. M. every house was levelled. Fissures formed in the earth out of which hot water rose for a moment and then the earth closed again to re-open at another place. Its population in 1865 was 9,000. The lower part of the mountain behind the town is covered with fruit trees and hundreds of men women and children go daily to the mountain to bring in the fruit, durian and mango, lansat, mangustin. When Drake visited Ternate in A. D. 1579, the Portuguese had been driven out of the island by the sultan. Ternate with Batchian constitutes the ancient Moluccas. In the great earthquake of 1840 nearly every house was destroyed. The people are of three well-marked races, the Ternate Malay, the Orang Sirani and the Dutch. The first are the descendants of the intruding Malay who drove out the indigenes (who were no doubt the same as those of the adjacent mainland of Gillolo) and established a monarchy, their language is quite unintelligible, the Sirani are the christian descendants of Portuguese. Ternate town is at the foot of the mountains. Ternate, Tidore, Motir and Makian are only cones standing on the same great fissure of the earth.

Goram, is a group of three islands in the Eastern Archipelago. S. E. of Goram is a high group, composed of raised coral reefs, 300 or 400 feet, with a volcano on the island of Teor which broke forth in 1659. In the Goram group, at Manowolko, east of Ceram, a slight infusion of Papuan on a mixture of Malay and Bugi, has produced a good-looking people. The Goram people are wholly traders, every year they visit the TenimberKe and Aru islands the whole N. W. coast of New Guinea, from Oetanata to Salwatty, and the islands of Waigiou and Mysol. They also extend their voyages to Tidore, Ternate, Banda and Amboyna. Their prahus are all built by the Ke islanders, who annually turn out hundreds of neat boats. The Gorgam people trade in tripang, medicinal Musso bark, wild nutmegs and tortoiseshell, which they sell to the Bugi traders at Ceram, Laut and Aru.—*Bikmore, pp.* 124, 306, 312, 408-9, 418-9, 425; *Times of India* ; *London Geog. Trans., Vols.* ix, xv ; *Bombay Times, January* 16, 1839 ; *Cor. Ind. Rev., Vol.* iii ; ***Bombay Med. Trans., p.*** 666 ; ***Bombay Times,*** 1840, 1843, *p.* 467 ; ***Bombay Geo. SUMATRAS also Sumatrans, a term given by navigators to squalls, from the south-west, often experienced in the south-west monsoon, in the Straits of Malacca. They are sudden and severe, blowing a moderate gale for 6 or 8 hours, and accompanied with loud thunder, lightning and rain. The tempestuous squalls are called Sumatras, because they rise in the direction of the island of Sumatra. They were formerly, and are still in some degree, the terror of those who navigate the Straits of Malacca. They are caused by the south-west monsoon being obstructed in its course by the mountains of Sumatra. The approach of the squall is betokened by a dense black cloud which rises from behind the opposite islands of Battam, and soon overspreads the sky, casting a dark shadow over the strait, within which the sea is lashed to foam by the strength of the tornado. Its effects are first felt by the ships in the roads, which heel to the breeze, and swing round to their anchors, the cables, which were previously hanging in bights under the bows, being now stretched out ahead to their full extent. The squalls seldom last more than half an hour, when, after a smart shower, the sun again breaks out, and the wind subsides to a pleasant sea-breeze, leaving an agreeable freshness in the atmosphere, which renders the remainder of the day comparatively cool and pleasant.—*Earl's Indian Archipelago, pp.* 354 *to* 356 ; *Horsfield* ; *Newbold's British Settlements, Vol.* i, *p.* 3.

SUMB, Hind. Fraxinus floribunda.

SUMBA or Sandalwood Island, of about 4,000 geographical square miles, is composed of a range of hills that rise immediately from the sea to a height of 2,000 feet, and almost of equal height. Mount Romba peak, however, is 7,000 feet. Vessels visit it in the S. W. monsoon from Surabaya, and return in the N. E. monsoon with the active little ponies of the island. They are, after the ponies of the Batta of Sumatra, the best of all the horses of the Archipelago. Bikmore thinks its people are Malays, though this is questioned and they are also said to have a different tongue. It yields sandalwood and copper. Sumba, is mountainous, three hundred miles in circumference, lying to the south of Flores, from the coast of which it is distinctly visible in clear weather. The inhabitants of Savu possess a settlement near the south-west extreme of the island, and the Bughis traders of Ende have two or three small stations on the north coast which are occasionally visited by small European vessels for the purpose for obtaining horses ; but the natives of Sumba all dwell in the uplands, where they cultivate maize, yams and other produce similar to that grown on Timor, and are said to use the plough, which is unknown in any other island to the eastward of Sumbawa.—*Mr. Earl, pp. from* 6 *to* 185 ; *Bikmore, p.* 112. See Archipelago, India, Papuan.

SUMBHA, Hind., a tool to make holes in hot iron, a tool used in metal embossing.

SUMBAJI, son of Sivaji, succeeded his father in 1680 and reigned for 9 years. He was a tyrannical voluptuous prince, but courageous. He refused to become a mahomedan. He was murdered by Aurungzeb. He was succeeded by Saho an infant son, a captive in Aurungzeb's camp.

SUMBAWA ISLAND, the third in a direct line east of Java is about three times the extent of Bali or Lombok, and divided by a deep bay into two peninsulas. It has three languages, the Sumbawa, the Bima, and the Tombora. The natives are little inferior in cultivation to the most improved nations of Celebes. The Sumbawa and Bima languages are written in the Bugis character, but there exists in this island a singular and curious obsolete alphabet. It is ascribed to the Bima nation, but the characters do not generally correspond with the simple sounds of the Bima language as exhibited in the specimen given of it.

One of the three peoples speaking distinct languages current in the island of Sumbawa, are the Bima. Their alphabet, once distinct, has been displaced by that of the Celebes. In Sumbawa, the mahomedans take a high place, and they are largely proselytising the mountaineers who, however, secretly trust in their idols. In Grobagan at the centre of the limestone district is a mud volcano, 16 feet in diameter. The black mud every two to five seconds bubbles up and subsides, it rises to a height of 20 to 30 feet, then explodes with a dull noise scattering a shower of warm black mud in every direction ; round about are warm brine springs from which salt is extracted Its eruptions are most frequent in the rainy season. It is called Kuwu, " the place of abode," and an old legend is that it is the residence of a monster snake whose writhings cause the eruptions. The Javanese give picturesque names to the various places in the Island, Prosperity ; Country of ghosts, Unlucky : Heroic difficulty : the Javanese are skilful workers in metals, gold, iron, brass, cutlery, and carpentry. Their kris has a hundred forms. Mount Tomboro is on a peninsula on the northern side of Sumbawa. On the 5th April 1815, commenced a series of frightful explosions which lasted five days. They were heard so distinctly at Jokyokarta, in Java, a distance of 480 miles, that troops were sent out, to repel, as was supposed, some attack that had been made. Similar movement of gun-boats was made at Surabaya, and to the north, the reports accompanying the eruption were heard as far as the island of Ternate, near Gillolo, a distance of 720 geographical miles. To the westward these reports were heard at Moko Moko, a port near Bencoolen which is in direct line 970 geographical miles. The ashes that were thrown out, fell to the eastward, against the prevailing wind, as far as the middle of Floris, about 210 geographical miles ; and westward on Java, in the mountains of Cheribon, about 270 miles from the volcano. So great a quantity of ashes were thrown out, it is estimated that on the island of Lombok, about 90 miles distant, 44,000 perished in the famine that followed and Dr. Junghuhn calculates that within a circle described by a radius of 210 miles, the average depth of the ashes was at least two feet. During the eruption, Timboro lost two-thirds of its previous height. A ship approaching the coast had to sail through a sea of pumice. About 7 p. m. of the 10th April, an eye-witness, the raja of Sangir, mentions that three distinct columns of flame burst forth, from near the top of Timboro, all of them, seemingly, within the verge of the crater, and on gaining some height in the air, the flames mingled in a confused manner. In a short time the whole mountain next Sangir, appeared like a body of liquid fire, extending itself in every direction. Towards 8 p. m. at Sangir, stones, some as large as a man's fist, generally of the size of walnuts, fell very thick, and obscured the view of the mountain. Between 9 and 10 p. m., ashes began to fall and soon after a violent whirlwind ensued which blew down nearly every house in the village of Sangir, carrying their tops and lighter parts along with it. In the Sangir district next to Timboro the whirlwind tore up trees and threw down men, cattle and houses. Sumbawa, is thinly inhabited, since the eruption of Mount Tambora, on April 11th, 1815.—*Bikmore, pp.* 108-110. See India, Pulo majo or Mayo, Teak.

SUMBEM, Jav. Blumea balsamifera.

SUMBOONATH is looked upon as one of the oldest temples in Nepaul, and was erected, according to Kirkpatrick, when Nepaul was ruled by a race of Tibetians ; its possession was at one time claimed by the Dalai Lama, or sovereign pontiff of H'Lassa, but he has since been obliged to abandon the claim. The Dagoba resembles the temple of Buddha, but is only about half its size ; the spire is covered with plates of copper, gilt. It is surrounded by pagodas, as well as numerous more modern shrines of a bastard hindoo class, to which Bhootyas and Bhamas, a tribe of Newars, resort in great numbers. Occasionally the Ghoorkas visit these shrines; the thunder-bolt of Indra, which is here exhibited, being the object of attraction to them, as they pride themselves on being orthodox hindoos.—*Oliphant's Journey, p.* 84.

SUMBU, Tam. Aniseed.

SUMBUL, or Suubul, a generic term in Arabic and Persian works on Materia Medica.

Sumbul-ul-taib, or fragrant Sumbul, the root stocks of Nardostachys jatamansi, the Nardos or spikenard of the ancients.

Sumbul Rumi, is said to be the Narden ukluti, and supposed to be Valeriana celtica.

Sumbul jibali, or mountain nard, is thought to be Valeriana tuberosa.

Sumbul-i-Farsi, or Persian sumbul, is supposed to refer to Adiantum capillus veneris : but it has the description of Hyacinthos applied to it, and Polyanthes tuberosa is substituted for it in India.

Sumbul-i-khotai, or Cathayan sumbul, is also mentioned.

SUMBUL, of Beng., is Spikenard, Nardostachys jatamansi, also Oriental hyacinth, Hyacinthus orientalis.

SUMBULFAR, Pers. White oxide of arsenic.

SUMBUL-KHAR, Hind. White oxide of arsenic.

SUMBUL ROOT, of modern commerce, reaches Europe by way of Russia. The Sumbul root which has recently been introduced into the French market, is the root of an umbelliferous plant, which is characterised by a strong odour of musk. The pilgrims, on their return from Mecca, generally import to Salonika, Constantinople, &c., among other articles of trade, various plants with a musk-like odour. The preparation of these vegetable substances is said to be effected by smearing them over with musk-balsam.—*Simmonds' Commercial Products, p.* 648.

SUMUNDAR PHAL, also Hijjul, Hind. Barringtonia acutangula.

SUMBULPUR, a district of the interior of Orissa. On the cession of Sumbulpore and Patna and their dependencies, the British annulled the dependency of the other zemindars on these two chiefs, and in 1821 separate sunnuds were granted to each zemindar, and separate engagements taken. 21 mahals form the S. W. Frontier of Bengal which may be classified in four groups, Sumbulpore, Patna, Sirgooja and Singhboom, viz. :

Sumbulpore group.

Sumbulpore proper,
Burgurh,
Raigurh,
Suktee,
Gungpore,
Sarungurh,
Bunmie,
Bamea,
Rehra Cole.
Sonepore.

Patna group.

Bora Samur,
Khuriar,
Bindra Nowagurh,
Patna proper,
Phooljhur.

The territories comprised in the Sumbulpore and Patna groups were ceded to the British Indian government by the treaty of 1803 with Ragojee Bhonsla but were, all but Raigarh, restored in 1806 and finally reverted to the British in 1826. The Sumbulpore and Patna groups are in the circle of the Cuttack Tributary Mahals. The following are names of pergunnahs of Sumbulpore which the British government transferred to the rajah of Nagpore by an engagement dated 24th August 1806, viz. :

Sumbulpore,
Sonepoor,
Saurungurh,
Burgurh,
Suktee,
Serakole,
Benvia,
Bonee,
Kautikpoor.

The only territory reserved was that of rajah Joojar Singh. Several timber trees are procurable in abundance in the forests of the Sumbulpore district, and the banks of the Mahanuddy, Brahminy, and Bytury rivers, and it is believed that their uses might be very much extended were a demand to spring up, and some experiments be made to test their properties and value.—*Aitchison's Treaties, Vol.* iii, *pp.* 168, 190; *Calcutta Engineer Journal, July* 1860. See Kol, Nagpore, Patna.

SUMBUT, see Vikramaditya.

SUMEISAT, see Iran, Mesopotamia.

SUMERU, see Manasarovara lake.

SUMI, Tel. Soymida febrifuga, *Ad. Juss.*

SUMITRA, B. C. 2100 Jones, 57 Tod. It is from this prince the Mewar chronicles commence their series of rajahs of Sahrashtra. It is the last name in the Bhagavat Purana, and he is said by Tod to have been contemporary with Vikramaditya. See Inscriptions, Saurashtra.

SUMLU, Hind. Berberis aristata, also Berberis lycium, *Royle.*

SUMMA, Hind. Glochidion, *sp.*? An insignificant tree, wood worthless except for fuel. Bark used by tanners.

SUMMA, a race in Sind, who now claim to be descendants of Sam, son of Noah. They have been long in Sind, of which they are supposed to be the original occupants. They were in power as rulers from A. H. 752 to A. H. 927, when they were overthrown by the Arghoni. Their subdivisions are very numerous, nearly two hundred. The chief seem to be the Summa, with the sections Sumaja, Dera-Sumani, Loond Summa, Joona-Summa, Oto-Summa, Saheb-Summa, Sahad-Summa, Shekhab-Summa and Sind-Summa. As they are regarded the original occupants of the country, the names of their tribes may suggest to ethnologists the regions whence they came.

Abra,
Abaraja,
Ageel,
Amra,
Babria,
Beeya,
Bodia,
Buda,
Budio,
Buttee,

SUMME, Hind. Bignonia suaveolens. Amru sun, Hind., is Pyrus malus.

SUMMER BARLEY Hordeum distichon, *Linn.*

SUMMER WHEAT. Triticum æstivum, *Linn.*

SUMMULZYE, or Ismailzye, see Affghan.

SUMMUNPOOR, see Burabur caves.

SUMOOM or Simoom. Ar., a pestilential wind, from Sum, Ar., poison. The Bad-i-Sumoom blows in Kutch Gundava during the summer months; and many people lose their lives by it.—*Pottinger's Travels in Beluchistan and Sind, p.* 322.

SUMPU, Tel. Aniseed.

SUMPAGHY, Can. Michelia champaca, *Linn.*

SUMPITAN, Malay. A blowpipe used as a weapon amongst the Binua, and other races in the Malay peninsula and Eastern Archipelago, the bow and arrow are also known but not used. The Malays have not supplied them with articles so costly and dangerous as fire arms. All the Bermun tribes use the sumpitan and poisoned darts. Their sumpitan is a light and neat instrument and differs from that of the Dyak which is a piece of wood bored. That of the Bermun tribes (timiang) consists of two bamboos seven feet in length one enclosed within the other. The external one, which is merely for strength and ornament, is about three-fourths of an inch in diameter, and neatly carved for about a foot at each end and in the middle. To prevent it splitting the fibrous bark of the triáp is bound round about 6 inches of the extremity and a coating of dammar placed over it. The internal tube, which is the proper sumpitan, is of the same length with the case but only three-fifths of an inch in diameter. It is composed of two pieces of bamboo, united by a piece 8 inches long, which embraces the ends tightly at the junction. The bamboo used (the bulu timiang) is very light and fine grained. The arrows (damák) are small darts made of the stem of the birtam leaf, 10 inches in length, and one-sixteenth of an inch in diameter at the base, from which they gradually taper to a very fine sharp point. The base is inserted into a cone of káyu tutu (which is very porous and light) about an inch in length and one-third of an inch in diameter at its base. The point of the dart is dipped for about five-sixths of an inch in ipoh. This is made by taking akar ipoh, batang ipoh (or kyas), limes and tuba, which are bruised, boiled and strained. To this arsenic is added. Other substances, such as pachet, jimardèa, màllye, and gadong, are also sometimes added.

The preparation, called ipoh, has the colour and consistency of chandu. An incision is made round the dart above the ipoh so as to ensure its breaking off and remaining in the wound. Each dart is kept ready for use in a case of bamboo about one-fourth of an inch in diameter. Fifty of these cases are laid side by side and united by strings. They are then rolled up and inserted into a case also made of bamboo, and which has a neat lid of jalutong. The same case contains a quantity of barok (a very light, spongy substance, also used as tinder) extracted from a tree called runout. After inserting the dart into the sumpitan a little barok is introduced. When the Binua blows into the tube, it is pressed against the base of the kaya tutucone, and prevents any of the air escaping between it and the sides. In shooting, the sumpitan is held firm by both hands being tightly clasped over its end, which is inserted into a handle.

SUMRA, Hind., of Hushyarpur, Sizygium jambolanum. The wild tree.

SUMRA, a dynasty of Agnikula Rajputs, who, in A. D. 750, succeeded to the Arabs in the government of Sind. The Sumra during the early part of their sway continued to be hindoos, indeed many of the tribe still continue so, and roam as shepherds through the thals of Jesulmir and the Upper Dhat country to the east of Sind. The Sumra of the desert, are one of the sub-divisions of the Pramara Rajputs and from their frequently combining with the Umar, the two gave name to the large tract of country which is still recognised as Umra Sumra and within which Alor is situated. Some of the mahomedans of Sind so early as A. D. 1032 adopted the Karmatian schism, and the Sumra, before they ostatized from their ancestral faith to ma- edanism intermediately adopted the tenets he Karmatian dynasty. The Sumra race seem to have been ruling as early as A. D. 1032, but their dominions do not seem ever to have been extensive—*Elliot.*

SUMROO, the name by which Walter Raymond was known to the natives of India. He had been a serjeant in the French army. In 1763, on the orders of nabob Mir Kassim, he slew all the British prisoners.

SUMSIHAR, or Samsihar, Hind. A tree of Chota Nagpore with hard timber, *Cal. Cat. Ex.*, 1862.

SUMSUM, Arab. Sesamum orientale. Gingelly seed.

SUMUL, also Sumbul-khar, Hind. Arsenic.

SUM-UL-FAR, Ar. White oxide of arsenic.

SUMUNDAR PHAL, also Hijjul, Hind. Barringtonia acutangula.

SUMUNDUR JUG, Sumundr-phen, Hind. Bone of the cuttle fish, considered refrigerant, used in eye ointments, also in mesalihs, *Gen. Med. Top.*, *p.* 150.

SUMUNDER-SOKH — ? Convolvulus argentaceus.

SUMUVARTTI, Sans., from sama, equal, and vrit, presence.

SUN, Duk. Briedelia spinosa, *Willd.*

SUN. It was worshipped separately (II. Kings xxiii, 5) in its physical character. Bel seems to have been a designation of the sun, amongst those who worshipped the heavenly host. The hindoos still worship the sun, and the Parsi race turn to the sun as an emblem of light. The Egyptian sun deity, was known there as Mu, Osiris and Ra. The ancient Arians, worshipped the sun as Mitra, which the modern Parsees still do as Mihr, and name their children after it, Mihr Bi, being in every household. In the city of Heliopolis, (Balbek) the Assyrians celebrated the worship of the sun with great ceremony. The image had been brought from Heliopolis in Egypt. The Phœnician Hadad, in Syria, Palestine and Mesopotamia, was the sun-god, representing the generative power of the sun, he was joined with the Phœnician Poseidon, (Demarus), the water-god, and Astarte, with her cow-horns, the producing and nourishing earth. Amun and Ham are said to mean the moon. Ham the chief god of Thebes was Amun-Ra, the sun, the king of the gods. Every king of Egypt was styled Zera, or son of the sun, and he was often sculptured as the third person of the trinity in the place of Chonso. With the spread of the Theban power, we note the acknowledgment of that power in the spread of the worship of Amun-Ra. In Nubia and at Elephantine to the south of Thebes, the chief god was Kneph, the Spirit, with a ram's head, who, in imitation of the worship in the capital became Kneph-Ra. So Sebek, the crocodile, called also Seb the father of the gods, became in due time Sebek-Ra-Chem, the god of generation, had his name from Chemi. He is in form a mummy, with his right arm raised, and a whip in his hand. He also was sometimes joined to the gods of Thebes and formed a trinity in unity under the name of Amun-Ra-Chem. At Heliopolis and the neighbourhood the name of the god of the sun was pronounced Athom, and he gave his name to the city of Thoum. At Mendes in the Delta, and at Hermanthis near Thebes, the sun was called Mando, and became Manda-Ra-Pasht, goddess of chastity, was worshipped chiefly at Bubastis, and has a cat's head. Athor was the goddess of love and beauty ; at Momemphis near Sais she was worshipped under the form of a cow. At

Sais was worshipped Neith, the queen of heaven, the mother of the gods. She wears sometimes the crown of Lower Egypt. Thoth, the god of letters, has the head of an ibis, and holds a pen in his hand. He was one of the gods of the moon and lord of Hermopolis. Hipimon, the god of the Nile, has water-plants on his hand, and carries fruits and harvests in his arms, the river's gifts to his worshippers. Pthah, the god of fire, was worshipped in Memphis and little known in Upper Egypt. He is bandaged like a mummy and was the chief god of the lower country as Amun-Ra of the upper. The only group of gods that was worshipped in every city alike was Isis, Osiris, and their family. They had once reigned on earth. They were feared less and loved more than the great gods, as being between them and the human race. Osiris had been put to death by his wicked brother Typhon.

Fire was held in the highest reverence, by many ancient sects, Chaldæans, Magians, hindoos, and Platonists. The noble principle of the Pur Zoegonion *πυζξοηγονιον* of the Stoicks, the universal agent of all nature, the *ψυχη κοσμη* of the Platonists, which, emanating from the sun, for that, like the other orbs of heaven, was thought to be composed of ætherial fire, was diffused through the boundless universe. The Greeks preserved a fire in the temple of Apollo, the Romans entrusted its charge to the Vestal Virgins. The Jews had their sacred fire, according to the Levitical laws. All nations have had their piers and altars; Les Brames lui addressent tous les matins des prieres. Aguini est le Dieu du feu, ils ne l'adorent, (they say) que parceque le feu est le figure de Chiven, "Seva," Dieu destructeur. In Apollonius's visit to Upper India, he describes the magnificent temple of the sun at Taxila. The sun was adored as the brightest symbol of the Deity. The Natchez of America worshipped the sun with singular honours, and preserved with the same reverence the sacred fires; and ministers were appointed to watch over and feed them. Sumpto exemplo ab igne altaris in templo. Dei Persæ etiam didicerunt in suis Pyræis ignem servare perennem, quem quamvis non cultu divino adoraveriut nimio tamen superstitiose habuerunt, et hodie habent. The great Gete of Central Asia deemed it right to offer the horse to the sun, as the swiftest of created to the swiftest of non-created being. Colonel Tod tells us that Bal-nath was the God Bal of the ancient times of India, and the bul-dan was the gift of the bull to the sun. In Central India, at the present day the worship of the sun as the Supreme Deity is the foundation of the religion of the Ho and Oraon as well as of the Moondah. By the former he is invoked as Dhurmi, the Holy One. He is the Creator and the Preserver, and with reference to his purity, white animals are offered to him by his votaries. The sun and moon are both regarded as deities by the Khond, though no ceremonial worship is addressed to them. In Northern Asia the Samoyedes are said to have worshipped the sun and moon. The earliest objects of adoration in Rajputanah were the sun and moon, whose names designate the two grand races, Surya and Chandra or Indu. Bud'ha, son of Indu, married Ella, a grand-child of Surya, from which union sprung the Indu race. They deified their ancestor Budha, who continued to be the chief object of adoration until Krishna, hence the worship of Bal-nath and Bud'ha were coeval. That the nomade tribes of Arabia, as well as those of Tartary and India, adored the same objects, we learn from the earliest writers; and Job, the probable contemporary of Hasti, the founder of the first capital of the Yadu on the Ganges, boasts in the midst of his griefs that he had always remained uncorrupted by the Sabeism which surrounded him: "If I beheld the sun when it shined, or the moon walking in brightness, and my mouth has kissed my hand, this also were an iniquity to be punished by the judge, for I should have denied the God that is above." That there were many hindoos who, professing a pure monotheism like Job, never kissed the hand either to Surya or his herald Bud'ha, we may easily credit from the sublimity of the notions of the 'One God,' expressed both by the ancients and moderns, by poets and by princes, of both races; but more especially by the sons of Bud'ha, who for ages bowed not before graven images, and deemed it impious to raise a temple to them. At Oodipoor thesun has universal precedence; his portal (Surya-pol) is at the chief entrance to the city; his name gives dignity to the chief apartment or hall (Surya-mahal) of the palace; and from the balcony of the sun (Surya-gokra) the descendant of Rama shows himself in the dark monsoon as the sun's representative. A huge painted sun of gypsum in high relief, with gilded rays, adorns the hall of audience, and in front of it is the throne. In addition to these, the sacred standard bears his image, as does that Scythic part of the regalia called the changi, a disc of black felt or ostrich feathers, with a plate of gold to represent the sun in its centre, borne upon a pole. The royal parasol is termed kirnia, in allusion to its shape, like a ray (carna) of the orb. The most revered text of the Vedas of the Hind-

[illegible]os, is imparted to a brahman youth on his initiation and is a invocation to the sun.—*Bunsen, Vols.* iii, *pp.* 525, 581 ; iv, *pp.* 269, 318, 325, 687 ; v, *p.* 127 ; *Sharpe's History of Egypt, Vol.* i, *pp.* 98 *to* 100 ; *Chatfield's Hindoostan, p.* 191 ; *Lubbock's Origin of Civilization, p.* 215 ; *Tod.* See Hindoo, Rama, Singhalese, Siva, Vidya.

SUNA or Sanna, Arab. Cassia lanceolata, *Royle*, Cassia forskalii.

SUNA or sona, Guz. Gold.

SUNAHSEPHA, a brahmin's son destined to be a victim to Varuna. See Hindoo, Sacrifice.

SUNAKA, a dynasty of Magadha kings of Bharatkanda reigned 128 years.

SUNA MAKHI, Guz., Hind. Cassia elongata, Senna. See Cassia plants.

SUNAR or sonar, Hind., a goldsmith.

SUNARI, see Kelat.

SUNBAL, Hind. Abutilon indicum.

SUN-BIRDS, Cynnyridæ. The purple honeysucker of Jerdon, the beautiful blue winged sun-bird (Arachnechthra asiatica, *Lath.*,) is common, and nothing can exceed the grace and elegance of its congener, the Ceylon sunbird (Leptocoma zeylanica). This exquisite little creature sports round the top of the prickly pear, sucking the nectar from its flowers like a humming bird. Neither species, however, subsists altogether on honey, for flies and minute insects are frequently found in their gizzards. The brilliant green spot on the wing of the male is wanting in the female. In the gardens the tiny sun-birds hover all day long, attracted to the plants, over which they hang poised on their glittering wings and inserting their curved beaks to extract the insects that nestle in the flowers.—*Adams*; *Tennent's Sket. of Nat. Hist., p.* 249.

SUNBUL-UL-TIEB, Arab. Spikenard.

SUNCAISHLA, Tel. Poinciana elata.

SUNCHUL, Guz. Bit-laban.

SUNDA, see Chalukya, India.

SUNDA, an island in the Eastern Archipelago, forming with Borneo and others a [illegible] of islands of which Borneo is the chief. [illegible]da people exhibit many features of a [illegible] race. They are shorter, stouter, [illegible], and more active men, than the inhabitants of the coast and eastern districts. In some respects they resemble the Madurese. Sunda Str[illegible] two channels which lead into it fr[illegible] westward, the small channel betw[illegible] west end of Java and Princes[illegible] great channel to the northw[illegible] betwixt it and the south coas[illegible] Su[illegible] which occupies upwards of a degree [illegible] longitude indented by two large bays, the shores of which are fronted by numerous islands and rocks.—*Raffles' Hist. of Java, Vol.* i, *p.* 59. See Johore, India.

SUNDA-KAIA, Tam. Solanum torvum.

SUNDAL, also Sukur, Duk., Guz., Hind. Sandal wood.

SUNDAL-KA-TEL, Hind. Sandal wood oil.

SUNDAN, see India.

SUNDAR, Hind. Blitum virgatum.

SUNDARA BADINIKA, Tel. Viscum orientale, *Willd.*, also V. verticillatum, *Roxb.*

SUNDARER, or Sundara murtti, a famous Saiva poet.

SUNDE-KIRE, Tam. Desmanthus natans.

SUNDEL, Duk. Santalum album, *Linn.*, Sandal wood.

SUNDEL AHMER, Arab. Pterocarpus santalinus.

SUNDEW, Eng. Drosera indica, Drosera peltata.

SUNDERBANS. The islands in the delta of the Ganges. The name may be derived from the Chandra bhanda tribe, employed on the salt manufacture there, and like the Molangis, only a step or two removed from slavery. Others derive the term from the abundance of the Sundra tree: and it is said also to be from two Bengali words, Sundar ban, great or beautiful forest. The Sunderbun forest occupies about 8,000 square miles, which may be represented by that portion of the English coast lying between Plymouth and Chichester, or one hundred and fifty-three miles east and west, and reaching as far north as Gloucester, or eighty miles from the sea and occupying the counties of Wiltshire, Dorset, the half of Hampshire, Somersetshire, the half of Devonshire, and the half of Gloucestershire. The northern, or cleared portion of the Delta, is highly cultivated and densely populated, supporting 420 souls upon each square mile, or nearly 5,000,000 inhabitants ; the southern portion on the contrary is occupied by extensive swamps and dense forests, and their few inhabitants live in boats, not daring to venture on shore by day on account of the numerous tigers, nor by night on account of the fatal miasm, exposure to which is almost certain death. Dr. J. D. Hooker in his interesting Himalayan Journal, Vol. ii, p. 340, remarks upon several very anomalous circumstances connected with the eastern portions of the Delta :—He says, the total breadth of the Delta is 260 miles, from Chittagong to the mouth of the Hooghly divided longitudinally by the Megna ; all to the west of that river presents a luxuriant vegetation, while to the east is a bare muddy expanse, with no trees or shrubs but what are planted. On the west coast the tides rise twelve or thirteen feet, on the east, to forty or eighty. On the west, the water is salt enough for mangroves to grow for fifty miles up the Hooghly ; on the east, the sea coast is too fresh for that plant for ten miles south of Chittagong. On the west, fifty inches is the Cuttack fall of rain ; on the east 90 to 120 at Noacolly and Chittagong, and 200 at Arracan. The east coast is annually visited by earthquakes, which are rare on the west ; and lastly, the majority of the great trees and shrubs carried down from the Cuttack and Orissa forests, and deposited on the west coast of the Delta, are not only different in species, but in natural order, from those that the Fenny and Chittagong rivers bring down from the jungle. Mariners, when approaching the Sandheads, having no land in sight, not even the height of a span to guide them, and are obliged to trust entirely to their lead to inform them of their position. The sand that is brought down by the rivers hardens under the surface of the sea into a concrete, nearly as hard as rock, to touch upon which is fatal to any craft ; but as the waters descending the rivers cut a subaqueous channel through the sand, the lead informs the pilot at once, whether he is on a bank or in a channel. Government pilots are always cruising a few miles from the land, and at night continually burn blue lights to inform ships of their position. The segregation of the sand from the mud is as follows : the freshes or heavy rains bring down from up-country vast quantities of sand and earth calculated at 40,000 million cubic feet, or nearly one-third of a cubic mile, rendering the waters of all the rivers opaque or of a dull yellow colour. This body of water rushing along with great impetuosity reaches the sea ; a contest immediately takes place between the rushing water and the advancing tides, the effect is to cause the heavier sand to subside, which is done on either side of the river channels, forming the Sandheads, the finer particles of mud are driven back or up the rivers, and deposited upon the ten thousand islands over which the tide sweeps ; but, as all the finer particles of sand and mud are not thus thrust back upon the Soonderbuns, some portion of the alluvium is carried out to sea for forty, fifty, and even for sixty miles, where silently and slowly it finds its way to the bottom of the ocean, forming the soft, impalpable purple mud so well known to pilots and others approaching the shores of India. At sixty miles from the Soonderbuns the ocean is free from any appearance of natant impurities, but nevertheless a certain amount of alluvial matter is subsiding to the bottom of the sea that number of miles from the land, which, probably, only commence to sink at forty miles from the Soonderbuns. Dr. Hooker alludes to the vast increase of the land on the eastern flank of the Delta by the deposition of soil driven up by the waves. He says the mainland of Noacolly is gradually extending seawards, and has advanced four miles within twenty-three years : this seems sufficiently accounted for by the recession of the Megna. The elevation of the surface of the land is caused by the overwhelming tides and south-west hurricanes in May and October : these extend thirty miles north and south of Chittagong, and carry the waters of the Megna and Fenny back over the land, in a series of tremendous waves, that cover islands of many hundred acres, and roll three miles on to the mainland. On these occasions the average earthly deposit of silt, separated by micaceous sand, is an eighth of an inch for every tide ; but in October 1848, these tides covered Sundeep island, deposited six inches on its level surface, and filled ditches several feet deep. These deposits become baked by a tropical sun, and resist to a considerable degree denudation by rain. Whether any further rise is caused by elevation from below is doubtful ; there is no direct evidence of it, though slight earthquakes annually occur ; and even when they have not been felt, the water of tanks has been seen to oscillate for three-quarters of an hour without intermission, from no discernible cause. The Sunderbuns have no defence whatever to seaward, not even an inch in height, every spring-tide and every cyclone wave dashes its waters over the land, deluging the country with waves, the impetuosity and volume of which are unknown and unheard of in Europe ; waves 30, 40 and even 60 feet in height have been known to rise in the Bay of Bengal, to dash over the highest trees and to deluge the whole country for miles inland. The Sunderbuns in their present state can never be inhabited ; they are too exposed to the fury of the tropical hurricanes that arise in the Bay of Bengal, and their unhealthiness is so great, from the stagnated air and corrupting vegetable deposits, that no human beings can ever hope to struggle against such fearful odds ; but should this tract ever share in the upheaval that is now going on near Arracan and on the Tenasserim Coast, rich would be the soil that would be brought under the plough, and great would be the population that would be found to occupy the sea-board tract. Until that time arrive, the Sunderbun tract can but remain waste, an inaccessible, and an impregnable defence to India towards the sea. The remains of temples, mosques and other buildings, both hindoo and mahomedan, prove that the country has not only been once populated, but had made great advancement in civilization. Maharajah Pratadyta, built a magnificent city in the 24-pergunnah portion of the Sunderbuns. He made tributary all the princes of

Bengal, Behar, Orissa and Assam, overthrew Akbar's army on the shores of the Mutlah and finally ended his days a captive in the Mogul capital. The storm wave of 1737, a wave forty feet above the water level, devastated the Sunderbuns and the ravages of Mugs and Portuguese buccaneers completed the desolation. Mr. Long has stated that, when in Paris in 1848, M. Jomard, of the Bibliotheque Royale, showed him a Portuguese map of India more than two centuries old, in which the Sunderbuns was marked off as cultivated land with five cities therein. This was confirmed by a map in DeBarros' "Da Asia," a standard Portuguese history of India. The libraries of Portugal would be worth searching for further information. He had, twenty years ago, examined Tarda, a town not far from Port Canning, which was the port of the Portuguese before Calcutta was founded; it was once an emporium of trade, and ships must have sailed up by the Mutlah, but no ruins now remain. He had seen, 40 miles south of Port Canning, a fine hindoo temple two centuries old. The cyclone of 1680, according to Mr. Long, carried away more than 60,000 people from the Sunderbuns.—*Calcutta Review No.* lxiii, *p.* 24, *March* 1859; *Hooker's Himalayan Journal.* See Migration of birds, Saugor islands, Sharks.

SUNDBYA, or Sandbya, SANS. In hindooism, is the recital of prayers accompanied by certain modra or gesticulations, and their performance by hindoos.

SUNDHUR, HIND. Pinus strobilus.

SUNDHUR or Soondoor, HIND. Red lead.

SUNDHYA, SANS., from sang, prep; and dhoi, to remember.

SUNDI, HIND. A kind of weevil.

SUNDLASA, HIND., a flat circular stone on which sandal wood is ground down.

SUNDOOQ, HIND., a chest, or trunk, a coffin. Sundooqcha, a box.

SUNDRA, TEL., BENG.? Acacia sundra.

SUNDRAS or Sundrus, resin of the Vateria indica, called by the various names of "East Indian copal," "Indian anime" and "Piney dammar;" in Hindi, according to the Makhzan-ul-adwiya, "Chanderus," and "Kahruba," among the common folk.—*Powell's Handbook, Vol.* i, *p.* 410.

SUNDRA TREE, Heritiera littsralis. See Sunderban.

SUNDRI, in musical instruments a 'fret.'

SUNDRI, BENG. Heritiera littoralis, *Ait.*, *DC.*, *Roxb.*

SUNDROOS, ARAB. Sandarach.

SUNDULE KA PAT, DUK. Elate sylvestris, leaf.

SUNDUL SAFED, PERS. Sandal wood.

SUNDUL, HIND. A ceremony, an embrocation of sandal wood. Sundul bath, a ceremony. Sundul ka khor, or sandal wood core.

SUNDUR, MAHR. Prosopis spicigera.

SUNDUR, a small principality, in L. 15° 5'; 76° 34', 24 miles W. of Bellary; level of the nalah is 1,900 feet, *Cull.*

SUNEHRI RANG, HIND. Gold color.

SUN FLOWER, Helianthus annuus. Sun Flower oil, Oils of Helianthus annuus and H. perennis.

SUNG, HIND. Eugenia acris, *W. & A.*

SUNG or sang, PERS. A stone, see Sang.

SUNGA-BADI, an atheistical sect amongs the hindoos.

SUNGA, a dynasty that reigned 110 years, the first of whom Pushpamitra, (B. C. 178) put his master, the last of the Maurya, to death. See Magadha.

SUNGAL, HIND. Abies smithiana, also Taxus baccata. The Himalayan yew.

SUNGAM KUPPI, TAM. Clerodendron inerme, *Gærtn.*

SUNGARI, a river of Manchuria. The Daurian dwelling on the Upper Sungari, in the neighbourhood of Tsitsikar, are well made, especially the women, and dress like the Manchu in China. The secretaries of the Mandarins who are sent to this part, are privileged by a letter from the Khan to select any women or young girls whom they may fancy. Some of the men whose wives had been taken in this manner, still persist in considering it a special favour to have such fine gentlemen as brothers-in-law. Others, though discontented, are compelled to conceal their chagrin from fear of punishment and disgrace.

SUNGARIANS, see Kirghis.

SUNG-BUSRI, DUK. Zinc, spelter.

SUNG-DIRAN, an impure and weak nitro-muriatic acid, made by attar or druggists by mixing equal parts of alum, nitre and salt with a little water in an earthen pot (gurra,) and distilling; an acid fluid comes over that is applied to cure herpetic eruptions.—*Genl. Med. Top., p.* 152.

SUNGEI PAGO, see Johore, Tin.

SUNGGL, HIND. Fraxinus xanthylloides.

SUNGHITA, SANS., from sung, prep. and hitu, to collect.

SUNGI-BULU, see Tin.

SUNG-I-BUSRA, is an officinal article at Lahore. It is a compound earthy mass of a greyish color, occasionally varying (from the different composition or manipulation) sometimes it is to be met with in small pieces, at other times in a tabular form, as thick as a finger. Whether its name "basree" be from Bassora, or from vision, as formerly the lapis divinus was used, is not known. It is certain that no zinc is in it. But in Ainslie's Mat. Indica, Vol. i, p. 573, Sung busrie is stated to be zinc. According to the analysis made by the Professor of Chemistry, Dr. Joseph Redtenbacher, in the Chemical Laboratory at the Thersianum in Vienna, the constituent parts of this compound are: clay, magnesia, silica, and oxyde of iron. It is probably prepared from Diorite, the analysis of which showed the same ingredients. Sung-e-Busree was tried in the cholera epidemy at Lahore, in 1835.—*Thirty-five years in the East, by Dr. Honig, p.* 351.

SUNGIE BULAK, also Sungie-liat, also Sungie tango. See Tin.

SUNG-I-MARMAR, Pers. Marble.

SUNG-I-MISRI, a red and white stone, imported viâ Pali, is used as an aphrodisiac: one tola for one anna.—*Genl. Med. Top, p.* 152.

SUNGKEERTANA, Sans., from sang, prep.; and keertana, to speak aloud.

SUNGKSHIPTA-SARU, Sans, from sangkshipta, abridged, and saru, essence.

SUNGLA, in the Kunawar Himalaya. The Barga Pass leads from it.

SUNGLA, see Barga Pass, Kunawer.

SUNG-NAI, or Sungraee, Hind.

Panolia acuticornis and P. eldii, *Gray.*
Cervus or Rusa frontalis, *McClelland.*
Cervus eldii, *Cal. Jour. Nat Hist.*
Rusa dimorpha, *Gray.*

Munipore and Malay peninsulas.

SUNGNUM, see Kunawer.

SUNGOO, Monetia tetracantha.

SUNGSKARA, also Sungskrita, Sans., from sang, prep.; and kree, to do.

SUNG SURMIYA, a concretion from the head of a fish comes from Delhi, used as an aphrodisiac. Sold at 8 annas a tola.—*Genl. Med. Top., p.* 152.

SUNGTRASH WANLU, Tel. The stonemason race.

SUNGTU, Hind. Xanthium strumarium.

SUNGU, Tam., the Chank shell.

SUNGUM, Sans., the fork or point of confluence of two or more rivers, always sacred to Mahadeva.—*Tod's Rajasthan, Vol.* i, *p.* 16.

SUNGURH PASS, see Khyber.

SUNG-YAN HILLS border on Fohkien in the district of Ping-yang, Wan-chan prefecture, and in close proximity to Peh-kwan harbour 27° 9′ 10″ N., 120° 32′ 6″ E. The locality has been visited by one foreigner only, to whom we are indebted for most of the following particulars. He started from Chih-kibight in Lamai harbour, to which Ningpo boats resort for trading purposes, to the northward of Peh-kwan. Three hours' hard walking over a succession of precipitous hills crossed by stone steps and pathways brought him to the mines. It is stated that no potash nor any other material is employed in the works. Granitic and porphyritic rocks abound in the vicinity, and some parts of the district produce iron and silver. According to the Wan-chan topography, the working of silver was discontinued in the reign of Wan-lih (1615) in consequence of imperial prohibition. This part of the coast has recently become the seat of extensive poppy cultivation.

SUNGYUMU, Sans., from sung, prep.; and yum, to cease.

SUNG ZEN, Burm. Citrus aurantium, *Linn.*

SUNG-YUN, the second Chinese pilgrim into India, belongs to the year A. D. 502, but his travels were confined to the Kabul valley and N. W. Panjab, they are of much less importance than those of Fa Hian, more especially as his journal is particularly meagre in geographical notices.—*Cunningham's Ancient Geography of India, p.* 8.

SUNHAWA, see Tin.

SUNISHUNNA, Sans. Achyranthes polygonoides.

SUNJIE UJONG, a state, in the interior of Malacca.—*Beul. As. Soc. Jour., No.* 4 *of* 1856, *p.* 366.

SUNJEEVANI, Sans., from sang, prep. and jiv, life.

SUNJIRU, Guz. Soapstone.

SUNJOGATA, daughter of Jye-chand, a Rahtor Rajput, the last hindoo king of Kanouj. Her father Jye-chand celebrated the last Rajshahi in India. He did this to soothe his vanity which had been mortified by his rival, Pirthi, a Chohan Rajput and the last raja of Delhi, assuming empire by performing the sacrifice of the Aswamedha. At the Rajshahi, Sunjogata was led forward to select her husband from the assembled princes; but she threw the Bar-mala, or marriage garland, over the neck of the gold effigy of the absent Pirthi-raj. Pirthi-raj hearing of this, he with the elite of his warriors, in A.D. 1175 carried her off from Kanouj, in open day. There was a desperate running fight for five days all the way to Delhi, losing the best of his warriors, but he kept his prize and gained immortal renown. For a year they lived happily together, but on the invasion of Mahomed Gori she urged him to battle. As he left she exclaimed, "I shall never more see him in Yoginipur (Delhi) but in the region of Swarga," and her prediction was verified, for he was taken captive and slain. She then mounted the funeral pyre, and this is the first authentic record of sutteeism.—*Cal. Rev.* See Chand Jye Keshu, Pirthivi.

SUNK, Duk., the Chank shell.

SUNKA and Banga, are rivers near Rungloo in Sumbulpoor also a nuddy near Bareilly, and near Kookroodie in Gangpoor.

SUNKAR, a river of Chittagong.

SUNKEERNA, Sans., from sang, prep.; and keerna, thrown about.

SUNKRANDANA, Sans., from sang, prep.; and krandana, to cry

SUNKESULU, Tel., or Sunkesur, Hind. Soonkasulu wood.

SUNKESWARAM, Tel. Poinciana elata, *Linn.*

SUNKH, Hind., the chank-shell, is frequently used by devotees; also as an accompaniment to the tumkee. Sometimes they play trios and quartettos on the shells alone.

SUNKISA. The ruins of Sunkisa (not called now Samkassa) can enter into no comparison with those of Canouj, even if we include the ancient k'hera of Suraee Uqut'h. It is stated as an extraordinary fact that the worship of the identical Naga mentioned by Fa Hain is still annually performed: but the truth is, that the mound where this worship takes place is nothing more than the common heap of bricks, or earth, which we see in every village, erected for worship during the Nag-Punchumee. Lieutenant Cunningham is probably correct in thinking that Sunkisa was detroyed in the wars between Prit'hi Raj and Jye-chund, but there seems reason to conclude that the town must have belonged to the latter when it was captured, for it is to the east of the Hallee-nuddee, and is familiarly known as one of the gates of Canouj. Sunkisa is generally recognized amongst the learned natives of these provinces, to be the site of the Sunkasya of the Ramayana.

SUNKJIRU, Hind., Guz. Soapstone.

SUNKO, see Tin.

SUNKUR, Gond. Acacia odoratissima.

SUNKUTUN, Hind. Symphytum officinale.

SUNMIANI, see Kelat; Sind.

SUNN, Beng., Hind.

Sunn,	Guz., Hind.		

The Sunn fibre has become an article of extensive export and of growing importance in the great agricultural districts to the east of the Godavery. In Malabar, Canara, Dharwar, Mysore, in all the great grain countries to the south, and in Khandeish, the quantity grown has more than doubled during the last ten years. In the Konkans, its culture has remained stationary if indeed it has not decreased. Brahmans and the higher classes of cultivators consider it beneath them to cultivate sunn, indeed there is a common belief, that a cow in calf, if tied with a rope of sunn will [illegible] carry. In Guzerat, it is often sown f[illegible] green manure being ploughed into the [illegible] just after the flower has appeared. Also in the collectorate of Broach, it is somewhat extensively cultivated on those broken lands and edges of ravines which decline from the level of the khannum or black soil to [illegible] Myhee river. In cleared patches of the diff[illegible]ent forests which skirt and lie at the foot of [illegible] ghauts, it is said to be regularly cultivated[illegible] a rotation crop. In Khandeish the Brin[illegible] grow it in spaces which they clear near their temporary camps in the rainy seasons and in the hilly parts of Mysore, large camps of the same wandering tribe may be seen with their small huts or lightly-stretched tents of cloth pitched near the slope of a great river, while their cattle are browsing among the neighbouring heights, and whole families are busied either in attending to the cultivation of sunn or in working up such material as they have collected from the crop into twine and cloth. For the former purpose the hemp has to be prepared by a tedious and laborious process of beating on a flat stone or wooden block, successive blows being dealt by the men, each of whom is armed with a heavy club. By this means the woody fibre is pretty effectually got rid of and the article is then handed over to the women, boys and girls of the company to be by them spun into twine on the rude spindle or pirn which they always carry with them. It is no uncommon thing to see one of their stout wiry and bronzed visages—for such they always appear in the line of march—stalking along with a child on her back, her eye fixed on the movements of the cattle and both her hands employed in mechanically twisting the fibre of the twine on this spindle. In districts below the ghauts the cultivation of sunn is limited to that grown by the wilder mountain tribes, and the mussulman and hindoo fishermen for their nets. The practice of sowing the sunn plant for the purpose of a green manure, proves that the natives appreciate the effect of manures decomposing in the soil: the use of liquid manure specially carted for the purpose of distribution was common in some parts of the country. Dr. Wight gave the following as the results of his experiments of the strength of fibres:—

Coir, ...	224 lbs.
Pooley Mungee, (*Hibiscus cannabinus*) .	290 ,,
Marool, (*Sanseviera zeylanica*) . .	316 ,,
Cotton, (*Gossypium herbaceum*) . .	346 ,,
Cutthalay nar, (*Agave americana*) . .	362 ,,
Janapa, (*Crotalaria juncea*), Sunn, hindee .	407 ,,
Yercum, (*Calotropis gigantea*) . . .	552 ,,

The prices of the fibre in the interior of Bengal are stated at from Rs. 1-8 to Rs. 2-8 per maund of 84 lbs. : in the interior of the Madras territories at 2*s.* a maund. In 1844, when Petersburgh hemp was selling in England at £ 38 per ton, Indian brown hemp brought £ 20 ; sunn from £ 16 to £ 18 and jute £ 10 to £ 12. In December 1854 Bombay hemp was quoted at £ 35, to £ 48, sunn £ 27 to £ 33, jute £ 21 to £ 25 when Petersburgh hemp was selling at £ 58 to £ 63. Crotalaria juncea furnishes the vast proportion of the so called hemps exported from India. It is cultivated near cities of Oude by hundreds of beegahs ; but in the vicinity of villages only in small quantities, principally for the purpose of making fishing nets. Its cultivation could be extended all over Oude, but principally where light soil exists. It is largely grown all over India for the manufacture of rope, string and ghunny bags, the exports from the Madras Presidency was:—

	Sunn, Hemp. Cwt.	Sunn, Twine. Cwt.	Ghunny Bags. No.
1850-51	2,095	1,372	58,950

It is, equal to Petersburgh Hemp, for many purposes, and when well prepared will bear comparison with flax. A small quantity of Madras hemp, 2 cwt., 3 qrs. and 3 lb, was cleaned by Mr. Dixon, at a cost of 6*s.* 1½*d.* This hemp was valued, as imported at £ 24 per ton, and produced

	Cwt.	qr.	lb.
Clean long fibre, valued at £ 45 per ton	1	1	7½
Clean tow. £ 30 per ton. ..	1	1	9
Waste, ...	0	0	14½
	2	3	3

This hemp when prepared by a Patent Liquid, became soft, white and so fine when heckled as to bear the closest comparision with flax at £ 80 per ton. It is better than any Russian hemp for fine spinning. The fibres of the C. juncea, probably form the chief part of the product known as Madras hemp, with which a small portion of the fibres of C. tenuifolia and C. retusa may be mixed. The Sunn plant, grows readily and yields on an average 700 lbs. per acre, varying from 3 cwt. to 10 cwt.

Wuckoo nar, or Wucknoo or Travancore flax, is a variety of the Sunn hemp, Crotalaria juncea, occasioned by climate and culture. It is exported to England in a state as if it had been combed or heckled, prepared for spinning. The fibres are brownish in colour, about three to four feet in length, clean and shining, and resembling some of the coarser kinds of flax. It is believed it would fetch £ 35 a ton as a substitute for flax. In the Northern Circars it is sown in October and November, about 120 lbs. of seed being allowed for the acre, which is covered in with the common hindoo harrow. In February and March, soon after the flowers drop and before the seed is ripe, it is plucked up by the roots half dried in the sun ; then tied up in bundles and committed to the water where it is steeped. Cows feed upon it, yield abundance of milk ; the plant only bears two or three cuttings. The common process of cleaning, in India, is similar to what was formerly employed in Britain in cleaning flax ; the stems which are about five feet long, are tied in bundles, and steeped in water, weighted with stones. A few days thereafter, they are beaten, which detaches the integument and coarse cellular tissue, after which, they are well washed in repeated waters, and the individual fibres picked out, free of the vegetable, mucous, and other impurities. It is then to be well beaten on water, to free it from impurities, wrung and hung over bamboo frames to dry.

Crotalaria juncea of Cuttack, under its local synonymes, Chuniput and Chumese, is grown in sufficient quantities to supply its wants, and probably more. It requires comparatively but little tillage, and not much after tending. The plants, when site and soil agree, attain to a height of 8 to 9 feet. The fibre is separated by threshing and beating, after the plant, which, at the time of cutting, is tied into convenient bundles for the purpose, has been kept immersed in water several days. The hemp is bought in the bazaar about 7 lbs. per shilling, and rope made of it at 5 lbs. weight for a shilling. The country paper is made from this article.

Crotalaria juncea of Lahore, is extensively cultivated for its fibre, especially near rivers. Sunn prepared for the native market can be obtained at Lahore for 14*l.* per ton.

The Sunn of Saharunpore is the Hibiscus cannabinus.—*Cat. Ex.*, 1862 ; *Mad. Ex. J. R.* See Ambaree, China grass, Hemp, Jute or Taag.

SUNNA, or Sunnat, AR. Traditions of Mahomed, usage, law of custom. The traditions consist of predictions and prophecies, which Sprenger considers were invented to oppose christians : also, of stories, genii, idols and soothsayers invented for the heathen Arabs ; and, for the Persians, announcements as to Chosroes and the East. The traditions began to be gathered about forty years after Mahomed's death, Abu Horeira (A. H. 58) himself a companion of Mahomed collected from the lips of eye-witnesses or of those who had heard, no fewer than 3,500 traditions regarding Mahomed. The fathers of tradition are called Sheikh.—*Burton's Pilgrimage to Mecca, Vol.* ii, *p.* 109.

SUNNA MUKKI, Cassia officinalis, *Gært.*, *Royle.*

SUNNAM, Lep. Alurus fulgens, *F. Cuv.*, *Bly.*, *Hard.*

SUNNAM, Tel. Quicklime.

SUNNA NEREDU, Tel. Eugenia jambolana.

SUNNI, Hind., a cap or butt on the pole of a cart, holding the yoke beam.

SUNNI, a sect of mahomedans who regard the Soonat, or account of the actions and traditions of Mahomed as of equal value to the Koran. The sunni mahomedan sectarians also follow his four successors, Umar, Abu Bakr, Usman and Ali. The mahomedan religionists are, however, of two great sects, the sunni and shiah, the former being in India, Turkestan, Turkey and Arabia while the shiah are most numerous in Persia. The sunni hold amongst other points, the succession to the khalifat to have followed in the line of Mahomed, Abu Bakr, Oomar, Usman and Ali; the shiah sect, on the other hand, maintaining Ali to have and by right succeeded his cousin and father-in-law Mahomed. There are other points on which their sectarian differences turn but small numbers of the shiah religionists, in several parts of Asia as in the west of India, believe in incarnations of Ali, and of these the Ismaili body may be instanced. The mahomedans of India, of these two great religious sects worship apart; but amongst both sects are to be found, mixed together, the people of the various national or ancestral tribes, Syed, Shaikh, Persian, Indian, Moghul, Pathan, into which the mahomedans are found arranged, and as in some christian countries the sons will be found as sunni and the daughters shiah. The sunni are occasionally styled Char-yari, as recognizing Abu Bakr, Oomar, Usman and Ali to have been the first four khalifs. The shiah are styled the Teen-yari, amongst the sunni in the south of India the Maharrum is a period of extravagant amusement, in which many non-Aryan and many hindoo races join. The sunni, by far the majority, at this period grossly outrage the grief of the shiah sect and scandalize the learned and devout.—*Wils. Gloss.* See Aimak, Brahui, Kajar, Kashmir, Kazzilbash.

SUNNOO, see Kush or Cush.

SUNNU, Hind. Amygdalus persica, Fraxinus floribunda.

SUNNUB, Tam. Crotalaria juncea, *Linn.*

SUN-PEL KURA, Tel. Portulaca quadrifida, *Linn.*

SUN-PUTTA, Cash. Tobacco.

SUNRI, a generic title, includes the Kalwar, which is also made to include Gurar, a Baniya and not a Sunri. It is curious that the Sunri, though necessarily impure from their occupation, frequently style themselves Sudras, especially those who have adopted agriculture as a pursuit.—*Cal. Rev.*, *No.* 110.

SUN ROSE, Helianthemum.

SUNSING, see Tin.

SUNTAN, Hind. Circumcision.

SUNTANG, see Kyans.

SUNTHI, Sans., Can. Ginger.

SUNUD, a grant, a title-deed, &c.

SUNURU, Tel. Ochna squarrosa.

SUNURISWARA, the capital of Langala, probably only the name of a temple.

SUNWAR, a Bhot ? tribe in the north-west of Nepal.

SUNYABAD, see Hindoo.

SUNYASEE, Sans., from sang, prep., and nyasa, to renounce, a hindoo devotee. Some of the sunyasee besmear their faces with ashes. The Jews, as an act of mourning, used to cover themselves with ashes; and the sunyasee do it as an act of mortification. Persons, who seek concealment, often assume, for a time, the appearance of sunyasees.

SUP, Hind. A winnow.

SUPALU, Hind. Delphinium brunonianum.

SUPAM, Sans. Pulse.

SUPARA SHAVAKA, Sans. Thespesia populnea, *Lam.*

SUPARI, Guz., Hind. Betel-nut. Nut of Areca catechu.

SUPARI-AM or Supri-am, or Safri-am, Hind. Psidium pyriferum.

SUPERSTITIONS. Amongst hindoos, the left side is the lucky side in a woman, the right in a man. The purport of the palpitations of the eyes, or throbbing of the eye balls, seems to have been similarly understood by the Greeks. The powder of white mustard is applied to the top of the head and forehead and other parts of a new born child as a protection against evil spirits. A mixture of the same with oil and rice is scattered about to every quarter upon the commencement of a sacrifice to keep off ghosts and fiends. The hindoos stain a new cloth with turmeric to keep off demons and disease. Amongst the avenging scourges sent direct from the gods, the Singhalese regard both the ravages of the leopard, and the visitation of the small-pox. The latter they call "maha ledda," the great sickness; and they look upon it as a special manifestation of devi. They say, the displeasure of the gods;" and the attraction of the cheetahs to the bed of the sufferer they attribute to the same indignant agency. A few years ago, the capua or demon priest of a "dewale,' at Oggalbodda, a village near Caltura, when suffering under small-pox was devoured by a cheetah, and his fate was regarded by those of an opposite faith as a special judgment from heaven. Such is the awe inspired by this belief in connection with the small-pox, that a person afflicted with it is always approached as one in immediate communication with the deity ; his attendants address him as "my lord," and "your lordship," and exhaust on him the whole series of honorific epithets in which their language abounds for approaching personages of the most exalted rank. At evening and morning, a lamp is lighted before him, and invoked with prayers to protect his family from the dire calamity which has befallen himself. And after his recovery, his former associates refrain from communication with him until a ceremony shall have been performed by the capua, called awasara-pandema, or "the offering of lights for permission," the object of which is to entreat permission of the deity to regard him as freed from the divine displeasure, with liberty to his friends to renew their intercourse as before.—*Hind. Theat., Vol.* ii, *pp.* 15, 113 ; *Tennent's Sketches of the Nat. Hist., p.* 28.

SUPEARI, Duk. Areca catechu.

SUPERB LILY, Gloriosa superba.

SUPEDA, Hind. Populus ciliata.

SUPHURA KUMRA, Beng. Cucurbita maxima, *Duch.*, *W. & A.* Cucurbita melopepo, Vegetable marrow.

SUPLAD, Hind. Baliospermum indicum.

SUPRA of Trans-Indus, Malva parvifolia, *Linn.*

SUPTA, or Sapta, Sans. Seven ; hence

SUPTARSHEE, Sans., from sapta, seven, and rishi, a sage.

SUPTA-SIND'HU, or Hapta Hindu, the Panjab, seven rivers.

SUPTASHWA, Sans., from sapta, seven, and ashwa, a horse.

SUPTASWARA, Sans., from sapta, seven, and swara, sound.

SUR, built on the ruins of Tyre, has a population of about 5,000.

SUR, Duk. Sus scrofa, *Linn.* Sus indicus, *Schinz.*, the hog.

SUR, a Sind grass, perhaps Arundo kurka : its flower stalks are beaten into firm fibres called Moonyah, from which string or twine is fabricated.

SUR, Rus. Cheese.

SUR, a 'tone' in music. A melody, a tune.

SURA, of Sutlej, Hyosciamus niger, *Linn.*

SURA, also Tadi, Sans. Toddy.

SURA, a tyrannical giant, slain by Subhramanya. See Asura, Kurma.

SURA, Hind. Hioscyamus niger.

SURA, chieftain of the Yadava, father of Vasudeva and Kunti.

SURA, Sans. Arrack.

SURA. Benign spirits governed by Indra, harboured about the North Pole, who with the Asuri churned the ocean, and extracted the Amrita or water of immortality, pending which a furious war broke out among them in which Vishnu took a part, as well as Surya and Chandra, who were the occasion that Rahu's head was severed from its trunk by the irresistible operation of Vishnu's chacra ; all which allegories figure an eclipse of the sun, which occurred near the moon's ascending node. See Devata and Asura.

SURA, Arab. A chapter of the Koran of Mahomed. The scattered Sura were collected by Zeid, and these Europeans call the Koran. Mahomedans call it the Word of God, Kalam Ullah also Koran-i-Sharif, the holy Koran.

SURABHI, a cow obtained as one of the fourteen products from churning the ocean. See Cow, Hindoo, Kurma, Lakshmi, Sacrifice.

SURABHI MANU, Tel. A tree growing in the Nagari Hills. Literally full of milk.

SUR AGHZAI, Hind. Gymnosporia spinosa, Red thorn, in Pashtu, Celastrus parviflora.

SURAHI, Hind. A long-necked water goglet.

SURAI, Hind., of Kumaon, Cupressus torulosa, twisted cypress.

SURAJ-UD-DOWLAH. Calcutta was attacked by the nawab Suraj-ud-Dowlah on the 18th June 1756, and captured on the 5th August.

In 1756, Suraj-ud-Dowlah became subadar of Bengal. He had previously manifested aversion to the English. The governor of Calcutta having refused to deliver up one of the principal officers of finance under the nabob's late uncle, the governor of Dacca, whom the nabob had resolved to plunder, Suraj-ud-Dowlah attacked Calcutta. One hundred and forty-six British fell into his hands and were thrust into a guard-room, since called 'the Black Hole,' where all save twenty-three perished in the night. On 22nd January 1752 Calcutta was re-taken by a force which had been despatched from Madras under Clive and Admiral Watson, and on the 4th of February the nabob's army was surprised and defeated by Clive. Overtures were then made by the nabob, and on the 9th February 1752 a treaty was concluded, by which the nabob agreed not to molest the Company in the enjoyment of their privileges, to permit all goods belonging to the Company to pass freely by land or water without paying any duties or fees, to restore the factories and plundered property, to permit the Company to fortify Calcutta and to establish a mint. Three days after a contract with the nabob, offensive and defensive was signed. War having broken out between France and England, Clive attacked the settlement of Chandernagore, but Suraj-ud-Dowlah furnished the French with arms and money, and was preparing to make common cause against the British. At this juncture a confederacy was formed among Suraj-ud-Dowlah's chief officers to depose him. The British joined this confederacy and concluded a treaty with Meer Jaffir Ali Khan, and at the battle of Plassey, which was fought on the 23rd June 1757, the power of Suraj-ud-Dowlah was completely broken and Jaffir Ali was installed by Clive as subadar of Bengal.

SURAJ MUKHI, Hind. Helianthus annuus.

SURAKHAORAH, Hind., Pushtu. Red ochre.

SURAKKA, Hind. Atriplex hortensis.

SURAL, Hind. Pueraria tuberosa.

SURA-LOCA, the abode of heroes, the Valhalla of the Rajput mythology, literally, the sun-place.

SURALATIGE, Tel. Ventilago maderaspatana, *Gært.*

SURA MIN SEPPUTTE, Tam. Shark's fins.

SURANA, Sans. Tacca pinnatifida.

SURAN, Hind. Amorphophallus campanulatus.

SURAN, see Jell.

SURANGRU, Hind. Acacia stipulata.

SURANJAN, also Suranjan-talk, Arab., Hind., Pers. Colchicum autumnale, *Linn.*

SURA PADI, Tel. Leea hirta, *Banks.*

SURA-PECH, Hind. Fishbone.

SURA PONNA, Tel. Barringtonia speciosa, *R. W.*, also Calysaccion longifolia, *R. W.*

SURAPURA, in Kashmir, the modern Sapur.

SURARI, Hind. Heteropogon contortus.

SURASARUNI, Hind. Melanthesa rhamnoides, *Retz.*

SURASENI: with Mathura, as a centre and a radius of eighty miles, describe a circle: all within it is Vrij, which was the seat of whatever was refined in hindooism, and whose language, the Vrij-basha, was the purest dialect of India. Vrij is tantamount to the land of the Suraseni, derived from Sursen, the ancestor of Krishna, whose capital, Surpuri, is about fifty miles south of Mathura on the Yamuna (Jumna). The remains of this day are called Surpuri. The province of the Suraseni, or Saraseni, is defined by Menu, and particuly mentioned by the historians of Alexander. In the civil war of his kinsmen, the Kuru and Pandu, when he sided with the latter, and shared their exile, he had thrown aside his Apollonic character of Murali, where, by the sounds of his pipe (murali) he captivated the shepherdesses as he attended the kine in the pastoral Surasen, and had assumed that of Chacradhari, or wielder of the discus, the most ancient weapon of this Indo-Getic race.

SURASHTRA, a province in West India, now Surath, or Gujerat, the same as Balabhi.

SURASWATI, the sakti or wife of Brahma, and the goddess of learning.

SURAT, L. 21° 6′, L. 72° 57′, in Kandeish, a large place on the left bank of the Tapti. Level of the railway 80 feet, *Ham.* The city of Surat is agreeably situated on the river Tapti, near its mouth a wide and pleasant stream, cooled by the fresh breezes of the Indian ocean. It was here where the East India Company formed their first mercantile establishment. Its population is upwards of a hundred thousand. It has a pinjra pol, or hospital for animals. A great fire occurred at this place, 24th April 1837. It was ceded on the 13th May 1800.—*Postan's Western India, Vol.* i, *p.* 297. See Kissa-i-sanjan, Korambar, Mahratta governments, Parvati, Saurashtra, Sevaji.

SURAT DOVE and Asiatic pigeon are the Turtur suratensis et humilis.

SURATI PETTE TIGE, or Surala tige, Tel. Ventilago maderaspatana, *Gært.*

SURB, Pers. Lead.

SURBA-JAYA, Beng. Canna indica, *Linn.* Indian-shot.

SURBURAH, Hind., stewards at an entertainment.

SURBUTEE and Surbund, Hind., see Cotton manufactures.

SURCH, Hind., of Sutlej, the fruit of Hippophae salicifolia, buckthorn.

SURCHI, Hind. Oxalis corniculata.

SURDE, or Surdy Islands, is in about lat. 5° 56′ N., on the north side of the Persian gulf.

SURDHARI, (music) = ghor.

SURE-BAY-TUN, taue-bay-sur. Hind. Mohurrum fuqeer.

SUREN of Java, the tuna tree of Bengal, of which the wood is very light, stronger and more durable than all other kinds of similar weight produced on the island: as the grain is not fine, it is not employed in making furniture, but it is useful for chests, trunks, carriages, &c.; its colour is red, and its odour somewhat resembling that of the cedar. Its weight is probably inferior to that of the larch.

SURGA, in the Himalaya, a light wooden bridge with long straight timber.

SURGANCH, Hind. Rubus lasiocarpus.

SURGEON'S AGARIC, Amadou.

SUR-GUROH, Hind., a leader of a troop of fuqeers.

SURGUTSCH, Rus. Sealing wax.

SURI, a town 109 miles from Calcutta in Birbhoom. See Khutri.

SURI, HIND. The husks or skins of pulse, mash, &c., which come off when it is split into dal.

SURIA-KHAR, GUZ., HIND.? Saltpetre.

SURIA-KHAR-KA-TEL, HIND. Nitric acid.

SURIALA, PANJ. Heteropogon contortus, *R. & S.*

SURIAM, LEP. Lutra leptonyx, *Horsf.*, *Bly.* Clawless otter.

SURIA MUKHI, Helianthus annuus, *Linn.*, *Roxb.* Sun-face.

SURIGAO ISLANDS, form a compact chain stretching from the north-east part of Mindanao, in a northerly direction.

SURI KANDA, TEL. Arum orixensis, *Roxb.* Typhonium orixense, *Schott.*

SURIN, HIND. Arum curvatum.

SURINGA, of Bombay? Calysaccion longifolia, *Roxb.*, *Wight.*

SURINJAN, HIND. Colchicum illyricum.

SURINJAN SHIRIN, PERS. See Hermodactyl.

SURINJAN TALKH, PERS. See Colchicum.

SURISHA, BENG. Bengal mustard, Sinapis dichotoma.

SURIT-KAYA, TEL. Mucuna capitata *W. & A.* 786. Carpopogon cap, *R.* iii, 284, Dolichos suruta, *Heyne*, 55. The same name is applied to M. nivea.

SURIYA, SINGH. Thespesia populnea.

SURJ, BENG., HIND. Shorea robusta.

SURJA VANSA RAJA, see Orissa.

SURJAN of MULTAN. A tool used in enamelling.

SUR JO KANI, SINDI. A reed, one of the Graminaceæ. See Sur.

SURJOO, a river near Sekrora in Oudh, near Gunglee Hath and Uetau in Almorah, also a river at Mhow.

SURJU, BENG. Shal tree, Shorea robusta.

SURKACHUP, HIND. Ribes grossularia.

SUR-KARNA, HIND., to tune an instrument.

SURKA VASUKA, HIND. Justicia picta.

SURKHA, HIND. A quality of charras or hemp plant resin.

SURKHI, HIND. Pounded brick or pottery, used when ground fine to mix with building mortar: pottery and bricks when broken, furnish a material for road-making, or ground into powder form the 'surkhi' used to mix with lime for building purposes.

SURKH KHAMBAR, see Kaffir.

SURKH RUD, see Jellalabad.

SUR KI CHARBI, HIND. Hog's lard.

SURKH RANG, HIND. Red or crimson colour.

SURLA TIGE, TEL. Ventilago maderaspatana.

SURLI, TEL. Dalbergia scandens. Syn. of Brachypterum scandens, *B. Benth.*

SURMA, HIND. Antimony ore, often confounded with lead ore.

SURMA. The valley of the Surma river is separated from that of Munipur by a meridional range of moderate elevation, which is continued to the southward, and separates Tippera, Chittagong and Arracan from the kingdom of Ava. Blue Mountain, which lies nearly due west of Chittagong, is said to attain the considerable elevation of 8,000 feet, and a peak on the same range forty miles to the south-west, in lat. 22, is elevated according to Wilcox's map, 3,100 feet. Sitakund, thirty miles north of Chittagong, has an elevation of 1,140 feet. The provinces of Tippera and Chittagong are throughout hilly. The rain-fall during the monsoon is about the same as in Bengal, at least on the sea-coast and in its immediate vicinity, averaging 86 inches annually at Chittagong; on the higher ranges in the interior it is probably much more considerable.

SURMADAN, HIND., a small toilet box, for holding antimony powder, used as a cosmetic.

SURMA-I-KANDAHARI. Galena from Kandahar,

Surma phari. lit. hill antimony.

Surma safed, is Iceland spar. Antimony occurs in various parts of the Panjab as a black ore of antimony. In composition it is a ter-sulphide, and called "surma." Mahomedans have a notion that the finest kind of surma comes from Arabia in the hills of Sinai, &c. The tradition is, that when Moses was in the mount, he asked that the glory of the Almighty might be shown him; he was answered that his mortal sight could not bear the glory, but through a chink of the rock a ray of the light was allowed to fall on him, and the rock on which the ray fell became melted into antimony.

SURMA-ISFAHANI, HIND. Glistening hæmatite, a kind of iron ore, erroneously called antimony of Ispahan by natives, ditto, used by men for staining the eyelids. Galena is sold for it in the bazaars, women use kohl.

SURMA-SAFED, Iceland spar, found in rocks in Kabul, is extracted and broken into crystalline fragments, more or less opaque, It is employed by the natives as an astringent in ophthalmia, gonorrhœa, and other fluxes, in doses, internally, of 70 grains, and also externally as a local application. It is called Surma safed, or white antimony, from being thought to be similar to black antimony, the common tersulphide of that metal. Price 3*d.* per lb.—*Local Committee, Cuttack.*

SURMAI, Rang, Hind. Deep blue-black, indigo.

SURME-KA-KALM, Hind. Blacklead pencils.

SURMI, Hind. Inferior antimony ore; also sulphide of zinc.

SURNA CHETTU, or Sarva chettu, Tel. Casuarina muricata.

SURNUREA is an abbreviation of Surjooparea, or people living in Sunar, *i. e.*, the other side of the Surjoo, or Gogra. The traditions of the peninsula relate that Parasurama stood on the promontory of Dili, compelled the ocean to retire and shot his arrow over the site of Kerala or Malabar and presented the new territory to the colonists whom he invited from the north and thus, to the present day the brahmins of Malabar and Canara are mostly of the five northern nations.—*Elliot.*

SURNA, Hind., a pipe or clarionet.

SURO, Jav. Betel leaf.

SUROD, Hind., a kind of guitar or seetar, having catgut or silk strings.

SUROTUN, a festival.

SURPA, Mahr. Memecylon ramiflorum, *Lam.*

SURPA-CHITRA, Sans. See Kalan.

SURPANKA, Beng. Tephrosia purpurea.

SURPAYCH, or Sur-pech. Hind. A head ornament.

SURPAGNA, Sans., from sarpa, a serpent, and han, to destroy.

SURPHUNKHA, Beng., Hind. Tephrosia purpurea, Calophyllum inophyllum.

SURPOSH, Hind., dish covers.

SURPUN-KA-PHUL, Hind. Flowers of Calophyllum inophyllum.

SURPUN KA TEL, Hind. Oil of Calophyllum inophyllum, *Linn.*

SURRENDHOOL, a wood of Nepaul. See Bechia cori.

SURS, or Suru, Hind. Euphorbia royleana.

SURU, see India.

SURSA, a river in the Hindoor rajah's territory, in the Umballa circle.

SURSAVA NUNA, Tel. Oil of Sinapis alba. Mustard oil. See Oil.

SURSI or Sarraska, Tel., Guz., Hind. Rape oil.

SURSI, or Surrus, Guz., Hind. Rape seed.

SURSINJLI, Hind. Cratægus oxyacantha.

SURSON, Hind., a variety of mustard seed.

SURSUTTEE, a river running in the Umballah district of the N. W. Provinces near Umballah and in Ajmir near Sidowrah in Umballah.

SURU. The Suru glacier terminates abruptly in a vaulted cavern, from which the Sind or Wurdwun river takes its rise.—*Adams.*

SURUJ, Hind. The Sun. See Kol. Surya. Sun.

SURUKH-KANEL, Hind. Nerium coccineum.

SURUL, Hind. Pinus longifolia.

SURUM—— ? Arum esculentum.

SURUS or sarras, Duk. Cupressus glauca, also Cupressus sempervirens, Evergreen Cypress.

SURV or Shajr-ul-Hyat, the Tree of Life, Hind., Pers. Cupressus sempervirens.

SURVEYS IN INDIA. Mr. Clement Markham produced a valuable memoir on a very interesting feature of Indian administration, namely, "Indian Surveys." In bringing together "a complete record" of the work done by officers of the old Indian Navy, of the Indian Engineers, Staff Corps, and Civil Service, the author has made good use of a vast body of precious materials, which attest the diligence and the scientific skill of those to whom the Indian government has been indebted for the large results presented in Mr. Markham's goodly volume. In this "Memoir" the progress of Indian surveying is carefully traced, from the first researches made by officers of the Bombay Marines in the beginning of the 17th century, down to the great trigonometrical surveys of Everest, Waugh, and Walker. Due space is accorded to the achievements of Colonel Thuillier, who pressed forward the revenue and topographical surveys of the last twenty years. The progress of geological research under Lambton and his able successors is full and clearly described; nor does the author fail to do justice to the labours of English archæologists in India, since the first formation of the Asiatic Society under Sir William Jones followed up by the patient researches of Colonel Mackenzie, James Prinsep, Sir Walter Elliot, General Cunningham, Major Kittoe, and Mr. James Fergusson. Due notice is also taken of those who, like the Messrs. Schlagintweit, have distinguished themselves in the field of Indian meteorology. There is an interesting chapter on Indian astronomers, and physical geography is handled at some length. In a period of 30 years with but very few parties at the commencement and only increasing very gradually 160,000 square miles of country, an area considerably larger than the whole of the British islands, was completed and map-ped by one branch of the department alone at a cost of not more than 32 shillings and 8 pence per mile ; whilst the revenue surveys likewise yielded excellent topograpical maps on a similar scale of 364,000 square miles of country between the years 1846 and 1866 or during Colonel Thuillier's incumbency and superintendence of the operations at a mean average cost of 50 shillings and 8 pence per square mile. The combined results from the large area of 524,000 square miles or upwards of four times that of Great Britain executed at a total cost of Rs. 1,25,00,000 (one hundred and twenty-five lakhs), yielding a mean average rate of 47 shillings and 3 pence.—*Ann. Ind. Adm, Vol.* xii, *p.* 81 ; *Home News.*

SURVA-BHOOTA-KSHAYA, SANS. From sarva, all, bhoota, souls, and kshee, a decay.

SURVVA-DAKSHINA, SANS. From survvu, all, and dakshina, a fee at dismission.

SURVVA-MANGULA, SANS. From sarva, all, and mangala, good.

SURWUL, also Surwulla, HIND. Andropogon aciculatus.

SURYA, the sun worshipped by the hindoos, in the Rig Veda, 1,115, 1 is Surya atma jagatas tashthusas' cha, the sun is the soul of all that moves and rests. Surya, or the Sun, called also Savitra, Mitra, Aryaman and other names, was a vedic god, who continues to be worshipped down to the present day, by hindoos and Zorastrians. The solar race of Kshetryas who appear in the Ramayana, derive their origin from the sun : but, in the higher spirit, the sun is regarded as divine, as pervading all things, as the soul of the world and supporter of the universe. In a verse of the Rig Veda (iii, 62 v. 10) this idea is supposed to be indicated. It is O'm ! Bhurbhuva suvaha, O'm ! Tatsa vit'hru varennyam. B'hargo devassya dhimahi dhiyo yona ha pracho dayath : O'm ! earth, air, heaven. O'm ! let us meditate on the supreme splendour of the divine sun. May he illuminate our minds. And, at the present day, the enlightened brahmins regard this verse as an invocation to the several deities who are implored by the worshipper to aid his intellect in the apprehension and adoration of God. In connection with the sun as a hindoo deity, are the 12 Aditya, sons of Aditi, the universe. In the later Vedic age, they were identified with 12 signs of the zodiac, or the sun in its twelve successive signs.

Soma, also Chandra, the moon, is chiefly celebrated in the Vedas in connection with the soma plant, but in the Mahabharata is the mythical progenitor of the great lunar race of Bharata. The Aswini, apparently a personification of light and moisture, as sons of the sun, also as the sun's rays, are noticed as the physicians of the gods. They are described as young and handsome and riding on horses. Vayu or the air, and the maruts or winds are personified and invoked. The maruts are depicted as roaring amongst the forests : compared to youthful warriors bearing lances on their shoulders ; delighting in the soma juice like Indra, and like him, the bestowers of benefits on their worshippers. Ushas or the dawn, the early morning, the first pale flush of light, is compared to a mother awakening her children, to a lovely maiden awakening a sleeping world : to a young married maiden, " like a youthful bride before her husband, thou uncoverest thy bosom with a smile." As a goddess, she is styled the (Rig Veda, i, 123, v. 2) mighty, the giver of light; from on high she beholds all things ; ever youthful, ever reviving, she comes forth to the invocation. Indra, according to Bunsen, (iii, 587, 8, iv. 459), is the prototype of Zeus, and was a personification of Ether, Soma was offered to him in sacrifice.

Ramesa, chief of the Surya, or sun-born race, was king of the city designated from his mother, Cushali, of which Ayodhia was the capital. His sons were Lava and Cush, who originated the two races. Was then Cushali the mother of Ramesa, a native of Ethiopia, or Cusha-dwipa, 'the land of Cush ?' Rama and Krishna are both painted blue (nila), holding the lotus, emblematic of the Nile. Their names are often identified. Ram-Krishna, the bird-headed divinity, is painted as the messenger of each, and the historians of both were contemporaries. That both were real princes there is no doubt, though Krishna assumed to be an incarnation of Vishnu, as Rama was of the sun. Of Rama's family was Trisankha, mother of the great apostle of Buddha, whose symbol was the serpent.

Sun-worship still prevails everywhere throughout Orissa,

The sun-temple at Kanarak, nineteen miles N. W. of Jaganat'h or Juggernat'h, looks down upon the sea. Sculptures in high relief, but of an indecent character, cover the exterior walls and bear witness to an age when hindoo artists worked from nature. The nymphs are beautifully shaped women in luscious attitudes. Each architrave has as usual the Nava-Graha, or nine brahminical planets very finely sculptured in alto-relievo. Five of them are well proportioned men with mild and pleasing countenances, crowned with high-pointed caps, and seated cross-legged on the lotus engaged in religious meditation. The form of the planet which presides over Thursday, (Vrihaspati or Jupiter) is distinguished from the other by a flowing majestic beard. Friday or Venus, is a youthful woman, with a plump well rounded figure. Ketu, the descending node, is a Triton, whose body ends in the tail of a fish or dragon; and Rahu or the ascending node, a monster, all head and shoulders, with a grinning grotesque countenance, frizzly hair, dressed like a full-blown wig, and one immense canine tooth projecting from the upper jaw. In one hand, he holds a hatchet, and in the other a fragment of the moon. At Jajpur, also in Orissa, is a figure on the wall of a temple, of the sun-god, with his seven horse chariot and a colony of sun-worshippers continues to keep alive the sacred fire in a neighbouring grove. Throughout India, the stricter vaishnava sectarians, refrain from animal food on the first day of the week, which bears the name of Sunday, Rabi-var or Ravi-var, as in Great Britain, South of Orissa, sun-worshippers, are a class of brahmins; the highlanders on the N. W. of Orissa will not break their fast till they catch a clear view of the sun, and sun-worship still continues amongst wild races of the central plateau of India.

Surya, the Sun, in hindoo mythology, is a god. This deity was the son of Kasyapa and, Aditi, and, from his mother, is called Aditya. He is pictured of a deep golden complexion, with his head encircled by golden rays of glory. He has sometimes four, and at others two, arms; holding a lotus in one of his hands, and sometimes the chakra or wheel in another; standing or sitting on a lotus pedestal, or seated in his splendid car with one wheel, drawn by a seven-headed horse of an emerald colour, or the seven coursers green of the sun. Surya is the personification of that luminary, the orb of light and heat. The mythology of the east confirms the opinion that the triple divinity of the hindoos was originally no more than a personification of the sun, whom they call Tritanu, or three-bodied, in his triple capacity of producing forms by his genial heat, preserving them by his light, or destroying them by the concentrated force of his igneous matter: this, with the wilder conceit of a female power united with the godhead, and ruling nature by his authority, will account for nearly the whole system of Egyptian, Indian and Grecian polytheism, distinguished from the sublime theology of the philosophers, whose understandings were too strong to admit the popular belief, but whose influence was too weak to reform it. Sir William Jones in a hymn has endeavoured to convey the hindoo views of the Sun's position amongst their other gods.

Lord of the lotus, father, friend and king,
Surya, thy powers I sing:

Thy substance, Indra, with his heavenly bands,
Nor sings, nor understands;
Nor e'en the Vedas thee to man explain
Thy mystic orb triform, tho' Brahma tun'd the strain.
"First o'er blue hills appear,
With many an agate hoof,
And pasterns fring'd, seven coursers green;
Nor boasts yon arched woof,
That girds the show'ry sphere,
Such heav'n-spun threads of colour'd light serene,
As tinge the reins which Arun guides—
Glowing with immortal grace,
Young Arun, loveliest of Vinatian race;
Though younger he, whom Madhava bestrides,
When high on eagle-plumes he rides.
But, Oh! what pencil of a living star
Could paint that gorgeous car,
In which, as in an ark, supremely bright
The lord of boundless light,
Ascending calm o'er the empyrean sails,
And with ten thousand beams his awful beauty veils!"

The mystic orb triform alludes to the omnipotent and incomprehensible power represented by the triple divinity of the hindoos. The flower of the lotus is said to expand its leaves on the rising of the sun and to close them when it sets. The Aswini kumara, the twins of the hindoo zodiac, are called the children of Surya, from Aswini, a form of Parvati in the shape of a mare, into whose nostrils Surya breathed, and thus impregnated her with sun-beams and gave birth to the Aswini. Surya is, by some writers, called the regent of the south-west. He presides over Aditwar, or Sunday from Adit, the first, and War, day. Surya has various names. In the Gaetri he is called Savitri, as the symbol of the splendour of the supreme ruler, or the creator of the universe. Prabha, or brightness, is the consort or sacti of Surya. She is also Chaya, or shade, which form she assumed in consequence of not being able to endure the intensity of the splendour of her lord. The Sauria sect of hindoos derive their name from the radiance of their deity, "soor, bright." He is, in his mortal form, the progenitor of the two great Khetri tribes, the Suryabansa and Chandrabansa, the descendants of which are termed the children of the sun and moon. In the centre of pictures, Surya is represented standing on a lotus pedestal, and holding in each hand a richly sculptured lotus sceptre. His mughut or cap, ear-rings, dress and ornaments are equally rich. Before him stands, also on a pedestal, a handsomely formed female, Prabha or brightness, his consort or sacti. At her feet, and in the front of the pedestal, is the legless Arun, holding "the heaven-spun reins" in one hand, and a whip in the other, guiding the seven coursers of the sun which are represented on the socle. On each side of Surya are two attendants, those nearest carrying chowries, another a sword, and the fourth a cup. At their feet are smaller figures with bows, from which they appear to have just discharged their arrows. In the back ground are the figures, animals and foliage, usually seen in hindoo sculptures, first idolators of the visible sun, and by the hindoos by their three principal deities, Brahma, Vishnu and Siva, personifications of his attributes, creation, preservation, and destruction. Surya is believed to have descended frequently from his car in a human shape, and have left a race on earth, who are equally renowned in the Indian stories with the Heliades of Greece. It is very singular that his two sons, called Aswina, or Aswini-kumara in the dual, should be considered as twin-brothers, and painted like Castor and Pollux, but they have each the character of Esculapius among the gods, and are believed to have been born of a nymph, who, in the form of a mare, was impregnated with sun-beams. Surya, or the sun, is exclusively worshipped by a sect, hence called Suras, or Sauras, who acknowledge no other deity; but this sect is not so numerous as those of the Saiva and the Vaishnava, of which latter, indeed, they may perhaps be, in strictness termed a branch. As well as a solar, the hindoos have a lunar, zodiac, divided into twenty-eight mansions, called Nakshatra, and believed to have been so divided or invented by Daksha, a mythological son of Brahma: hence their poetical astronomy feign these Nakshatra to be the offspring of daughters of Daksha, and, as diurnally receiving the moon in his ethereal journey, to be the wives of Chandra. Of these wives, Chandra is fabled to have the greatest affection for Rohini, the fourth daughter of Daksha, who, on the complaint of the majority of this pointed partiality, cursed Chandra with a consumption that continued fifteen days, but on his due repentance, his strength and power were eventually restored: the meaning of this story which is detailed in the Siva-Purana, is obvious, viz., an allusion to the waning moon. Chandra, like the western Lunus, is somewhat proverbial for inconstancy, and tales are related of his adulterous communication of his influences to the radiant spouses of others of the heavenly host. Amongst hindoos the sun is adored under a variety of names, as Surya, Mitra, Bhascar, Viava, Vishnu, Carna, or Kana, likewise an Egyptian epithet for the sun.—*Cole's Myth. Hind., p.* 129; *Moor, p.* 291; *Tod's Rajasthan, Vol.* i, *pp.* 602, 603. See Aditi, Burabur caves, Chandra Graha, Hindoo, Inscriptions, Rajputs, Kol, Rama, Saraswati, Savitri, Sun.

SURYA-GAS, SINGH. Thespesia populnea *Lam.*

SURYA KANTI CHETTU, TEL. Ionideum suffutricosum, *Ging.*

SURYA KHAND, a hot spring at Bhadrunath.

SURYA MANDALA, is the supreme heaven of the Rajput.

SURYA RATNALU, TEL. Quamoclit pennatum, *Ph.*?

SURYA SIDDHANTA. The first (though not the oldest) of the authentic and inspired Sastras, held in great veneration by all manner of hindoo astronomers, although they acknowledge that its elements, without the assistance and use of the tikas, or commentaries, no longer furnish means for representing the true positions of the planets. It is pretended that this book was revealed 1,000 years before the begining of the Tretayug (A. 302 7101, Ante-christum). European commentators, however, have all agreed to reduce considerably this enormous antiquity, though they still differ vastly in their opinion touching its true epoch; some supposing it to have been written 2,050 years before Christ (*i. e.*, 98 years after the flood), others in the 1268th year of the christian era. Mr. Bentley, however, seems to have proved, after a very profound research that let the antiquity of the Surya siddhanta be what it may, it only came into general use in A. D. 538.—*Kala Sankalita, pp.* 7, 69, 90, 129, 200, 239, 246, 325, *and tables* xvii, xlviii *and* xlix. See Varaha; Mihira.

SURYA SAVARNI, one of the 14 Patriarchs who preside successively over the 14 Manwantaras of the Calpa.

SURYA-VANSA, or Solar dynasty. This, as collated from the lists of Sir William Jones, Professor Wilson, Colonel Tod and Hamilton, commenced with Marichi.

Kasyapa Muni, married Aditi, Daksha's daughter.

Vavaswana, or Surya, the sun.

Sradadeva, or Vaivaswata (the sun) king of Ayodhya.

Ikshwaku in the Treta Yuga, B. C. 3500 Jones, 2200 Tod.

From Ikshwaku sprung the two Solar dynasties of Ayodhya (Oude) and Maithala (Tirhut.) In the Oude dynasty we find Harischandra, king of India, Bhagiratha, who brought down the Ganges. In that of Tirhut, Swadhaja, the father of Sita, who married Rama, the last of the line of Oude in the Dwapar Yuga or Brazen age.

The third Solar line of Vesala, was also descended from Sradha Deva, Vaivaswata (the sun) king of Ayodhya, and father of Ikshwaku, in this line occurred Trinavindhu, father of Brabira, who married Visvarawa Muni, and Besabiraja or Visala who founded Vaisali (Allahabad.)—*Thomas' Prinsep.*

SURYA-VANSA, SINGH. A Ceylon caste. The principal castes in Ceylon are four, viz., the Surya Vanse or royal race. This has two divisions, viz. : Goe Wanse, cultivators, the most numerous in the island, and to it belong the nobles, chiefs, priests, and nearly all the government servants. Nille Makareya, or shepherds, is the second division of the Surya.

SURYA VASISTHA, see Varaha.

SUS, the hog genus of mammals, of the family Suidæ.

Khanzir,	AR., PERS.	Dukar,	MAHR.
Baraha,	BENG., SANS.	Babi utan : Babi alas : Babi,	MALAY.
Indian wild boar,	ENG.	Ghrishvi,	SANS.
Hog,	,,	Varaha,	,,
Choiros,	GR.	Walura,	SINGH.
Hazir,	HEB.	Koka,	TEL.
Jangli Sur ; Sur,	HIND.		
Sus scrofa : Porcus,	LAT.		

The wild hog abounds in many parts of India and the males attain to a very large size: it is generally believed that there is no specific difference between the wild hog of Europe and India. The adult males dwell apart from the herd. The wild boar is constantly hunted by Europeans on horseback, with the spear ; Natives of India hunt the boar with dogs. All the wild hogs in the Archipelago are small animals, compared with the wild boar of Europe or even with that of continental India.

The Sus verrucosus, so called from the fleshy excrescence on the sides of the cheeks, has a grotesque and a formidable appearance, but is in reality a timid animal. The number of them in Java is immense, and in passing along the highway, in particular districts, scores of them are to be seen.

Mr. Blyth distinguished from the hog common in India, a specimen sent to him from Ceylon, the skull of which approaches in form, to that of a species from Borneo, the Sus barbatus of S. Muller.

The genus Babirussa, of F. Cuvier, takes its name from two Malay words, Babi, hog, and Rusa, a deer. It is the Sus babyrussa of Linnæus and the B. alfurus of Lesson, and occurs in the islands of Buru or Bourou one of the Moluccas, and in Celebes and Ternate.

The Porcula salvania, Hodgson, the Pigmy Hog of the Saul Forests of N. India, is the Sano banel and Chota sur of the natives of India. Confines itself to the deep recesses of primeval forest. The adult males abide constantly with the herd, and are its habitual and resolute defenders.

The boar is the male of the hog or swine. Of these in Asia are seven species, viz., Sus scrofa, Linn, var S. Indicus ; Bengalensis ; Audamensis, Malayensis ; Zeylanensis ; Babyrussa and Papuensis. When the wild boar of India, the Sus Indicus, has the run of cultivated lands, it eats daintily. But when stinted for food, it will revel on a dead camel, and in Cutch, when pressed by want, it prowls around the villages in search of refuse.

The wild boar of India is shot and hunted with dogs by natives, but the British sportsmen, in India, hunt it with the horse and spear; and, undoubtedly, of all the wild creatures in India, the wild boar exacts from its pursuers the greatest care. The Sus indica of Pallas, the Sus scrofa of other naturalists, the common wild boar, is supposed to be the parent of one of the two groups into which pigs are arranged. The Sus scrofa group or breed is known as the Chinese breed and extends into Europe, N. Africa and Hindustan, but in the latter country, the boar of the N. W. provinces is not higher than 36 inches, though that of Bengal attains 44 inches. The parents of the group is unknown.

Sus indica is not known in a wild state, but its domesticated forms come near to S. vittatus of Java. The Roman or Neapolitan pig, the domesticated breeds of China, Cochin-China, Siam, the Andalusian, Hungarian, the swine of S. E. Europe and Turkey, and the Swiss, are all of the Sus indica group, which, it is said by a Chinese author, can be traced back for 4,900 years. The Japan masked pig is the Sus pliciceps of Gray, and has a deeply plicated or furrowed skin. According to Dr. Kelaart, there are two species or varieties in Ceylon: the Newera Elia boar, and the low country S. zeylonensis. Of the Papuan hog, Macgillivray says two or three small pigs, of the same description as that hitherto seen (Sus Papuensis), were procured ; and he obtained two fine live opossums, of a rare and singular kind (Cuscus maculatus), for an axe a-piece. They appeared to be quiet gentle animals, until much irritated, when they bit hard. He fed them at first on ripe cocoanuts, of which they were very fond ; but latterly they became accustomed to pea-soup.—*Sykes' Cat. Deck. Mam., p.* 11 ; *Crawfurd, Dict., p.* 152 ; *Tennent's Sketches of the Natural History of Ceylon, p.* 59 ; *Catalogue of Mammalia in the India House Museum* ; *Forest Ranger* ; *Darwin* ; *Macgillivray's Voyage, Vol.* i, *p.* 285-6. See Babirussa, Boar, Mammalia, Sus.

SUS CRISTATUS, *Wagner.* Syn. of Sus scrofa, *Linn.* S. indicus, *Schinz.*

SUSA, the modern Shush, is some farsangs S. S. W. from the town of Dizful, on the banks of the river Dizful. It contains the tomb of the prophet Daniel, and beneath, the apartment containing the tomb is a vault into which (Daniel vi, 16,) Daniel was cast by order of Darius. Its western wall is close to the left bank of the river Shapur or Shoner, probably the Eulæus of profane writers and the Ulai (Dan. viii, 2,) of Scripture.

SUS, Heb. Horse.

SUSA, see Viswamitra.

SUSA, Beng. Common cucumber, Cucumis sativus.

SUSA, of Buffon, Platanista gangetica.

SUSAN, see Luristan.

SUSHA, Beng. Cucumis sativus, *Linn*

SUSHENAS, Sans. Carissa carandas, *Linn.*

SUSIA, a striped coloured fabric much used for making 'paijamas or loose trousers.

Sudi susi, do-kanni 'susi char,' 'panj' and 'sat-kanni' varieties of susi, according to the number of stripes.

Sufiyana, a kind of susi.

Chaukaunia, a cotton striped fabric, a broad susi. The term-kanni seems intended for khani, literally houses, or chequered.

SUSIANA. Khuzistan represents the Susiana of Strabo, as well as the Cissia of Herodotus. Towards the eastern frontiers are the ruins of Rhajoun and Kurdistan in the centre, those of Agines (probably represented by Ahwaz) towards the west. That the geography of the province was well known before the time of Herodotus may be inferred from a passage in his works, where it is said, that Cissia is watered by the river Choaspes on which is the city of Susa, and the palace of the great king. It is added that its waters alone were thought worthy of being drank by the monarch. Presuming that Alexander, after setting out from Sirs, made a detour, in order that he might have but one river to cross, four short marches might be required to bring the army, with its supplies, across the Karun; and then both the distance between the Kerkhah and Karun, and the description of the course of the latter, will afford ground to believe that this is the same as the Pasitigris of Quintus Curtius and Arrian as well as the Eulæus of Pliny and Ptolomy. The route from Bussorah to the ruins of Ahwaz, in Khuzistan, the ancient Susiana is easy.—*Mignon's Travels, p.* 334. See Arabistan or Khuzistan, Babel, Luristan.

SUSMANI. The gypsies in Persia are called Susmani, or Susmaniha (in the plural). Many gypsies are established near the castle of Wittgenstein in Sassmanhausen. Possibly it derived from them its name, meaning the abode of the Sussmani? See Gypsies, Zingarri.

SUSPENSION BRIDGES in Tibet, are of two kinds. Vigne saw one at Dodah, composed of a strong cable stretched across the river, and firmly fixed to the rocks at either end. On this, slides a wooden seat-like frame-work, to which are attached the ropes that pull it backwards and forwards. The other kind consists of a very thick cable of twisted birch? twigs, as a rough foot-rope, and four feet above it, on either side are two smaller hand ropes by which the passenger steadies himself as he walks on.—*Vigne, p.* 199. See Jhula.

SUSRAVAS, see Hindoo.

SUSS, Hind. Missiessya hypoleuca.

SUS SCROFA, Porcus, Lat. Hog.

SUSSHOLZ, Ger. Liquorice root.

SUSS-KLEE, or suss-kle, Guz. Hedysarum alhagi, *Linn.*

SUSSU, Hind. Viburnum cotinifolium.

SUSSU; Ayar susu, Malay. Milk.

SUSTI, a primitive household deity, a goddess of the hindoo households, largely worshipped by the households of Hindustan.

SUSUH, Jav. Edible bird-nests.

SUSU NAGA, according to the Mahawanso, a son of a chief of Assam. During the reign of his son and successor Kala Sangkha, about a century of Sakya Muni's death, the second convocation of buddhist priests was held.

SUSUP, the Malay name of a tree having a bright scarlet flower, found on the island of Pulo chiku koh.

SUS VERRUCOSUS, see Hog.

SUS VITTATUS, *Schl.* Syn. of Sus indicus, *Schinz.*, also Syn. of Sus scrofa, *Linn.* the common hog.

SUTA, a famous Rishi.

SUTA, Sans. A class of bards who used to recite the Mahabarata.

SUTA, Guz., Hind. Yarn.

SUTA MULLI, Sans. Asparagus racemosus, *Willde.*

SUTAR or carpenter, one of the five hindoo artizans; the others are,

Sonar or goldsmith.
Lohar or blacksmith,
Sungtrash or stone-mason.
Coppersmith. See Viswakarma.

SUTEEKA, Sans., from sa, substituted for saha, with, and teeka, a commentary.

SUTEI, Hind. Francœuria crispa.

SUTEI-GUL, Trans-Indus. Matricaria chamomila, *Linn.*

SUTHERLAND. Colonel, a Madras military officer distinguished as a political Resident at Gwalior; a man of great benevolence and the avowed friend of native states.

SUTHERLANDIA GRANDIFLORA. One of the Leguminosæ, a pretty shrub with scarlet flowers, native of the Cape, and is readily increased by seed in good garden soil.—*Riddell.*

SUTH-MULI, Beng. Asparagus racemosus, *Willd.*

SUTHOORA, (prop. Sut'hwara).

SUTHREH SHAHI, see Hindoo, Sikh.

SUTI, see Daksha, Parvati, Swastika, Vira badra.

SUTLAR, (well gear.)

SUTLEJ, a tributary to the Indus. Its remote sources are Lakes Manasarowara and Rahwan Hrad, lat. 30° 8', long. 81° 53', 15,200 feet above the sea. Runs N. W., 180 miles; S. W. through Bussahir; W. to junction with Beas; S. W. to Punjnud. Length 550 miles, to junction with Beas; 300 miles further to Punjnud; total, 850 miles, receives Spiti, 120; Buspa, 52; Beas, 290 miles. About 29,000 sq. miles, or, including Ghara and Beas, about 65,000 square miles drained. At Roopur, 30 feet deep, and more than 500 yards wide. Navigable as far as Filoor in all seasons, for vessels of 10 or 12 tons burthen, Bilaspur, a town on the banks of the Sutlej, swept away a flood. The Sutlej people are amiable and gentle, free of low cunning, having the appearance of a mixed race between the Tartar and the common hill men. They are fair, well made and strong, but are filthy and indigent. The women have a toga fastened round the waist. The Batti of Bhattiana, west of the Sutlej, is a tribe of fine handsome people, whose origin is obscure. The Bagri tribe inhabiting the district of Bagar, between the S. W. borders of Hariana and the Sutlej, are said to have been Rajputs but also supposed to be Jat. There is a robber race of this nation settled in Malwa. The Sutlej river is very furious and has a rocky bed: but on the whole the difficulties of floating timber are not insuperable: rafts cannot be constructed above Bilaspur. The river, at the commencement of the rains, is an impetuous torrent, foaming along its narrow, stony bed, confined within rocky banks, generally bare and precipitous. It preserves the same character from Kotgurh upwards, the valley in Bussahir being very narrow, the river is often not visible from the road, but the noise is always heard, as it rushes over the massy boulders. Occasional recesses occur at the bends of the river, where much timber is stranded, and in the course of 120 miles there are several broad tranquil reaches, where banks of white sand and mud may be seen. The average fall has been computed by various observers (Gerard, Thomson, and Madden) at 50 feet per mile from Wangtu to Bilaspur, and 60 feet per mile from Kanam to Wangtu. The Sutlej, or Sutluk, is the Hesudrus of antiquity, and the most eastern of the five rivers. To its Sanscrit names, Sitloda, Satadru, or Sutrudra, the other names can be retraced, the Hesudrus of Pliny, the Saranges of Arrian, the Shetooder and Seteluj of the Ayeen Akberi. In the plains, the Sutlej runs through a line of country six miles broad, and from twenty to one hundred feet lower than the general surrounding level. This tract is called Khadir, as the high adjoining lands are called Bangur.—*Campbell, p.* 97; *Wilson's Gloss*; *Powell's Hand-book, Vol.* i, *p.* 530; *Clegh. Punjab Rep., p.* 33; *History of the Punjab, Vol.* i, *p.* 29. See Arians, Hindu, India, Indus, Jun, Kandahar, Kohistan, Kunawer, Pir Panjal range, Rivers, Sikh, Yak.

SUT-KURMU, Sans., from sut, good, and kurmun, to work.

SUTNEE, a river near Nagoud in Oonchera.

SUTNI, loose woollen trousers, worn by Lahuli men.

SUT-PRUTIPUKSHU, or Sat'prati-paksha, Sans., from sut, right, and prutipukshu, an enemy.

SUTRAS, aphorisms. Sutra, means strong, and the works so named contain in the most concise style, doctrines in grammar, metre, law, or philosophy.

This body of religious &c., literature of India forms a connecting link between the Vedic and the later Sanscrit. They contain a concise elliptical and technical expression of all the knowledge of theology, philosophy and language which had been attained by the brahmins up to the buddhist period. It ranged from B. C. 600 to 200. The Grihya sutra, relate the ceremonies to be performed by the married householder for his family. The Samaya charika sutras, or Dharma sutras regulate the affairs of every-day-life. It is chiefly to them that we have to look for the originals of the later metrical books, such as Manu, Yajna valkya and the rest. Aphorisms or Sutras, were the usual mode of instruction followed in the hindoo liturgical books—the Vedas,—whose sacred character hindoos still acknowledge. They were adopted in the fourth period of the hindoo progress, about B. C., 1,000, and in the Sutras the ceremonial prescriptions were reduced to a more compact form and to a more precise and scientific system. The aphorisms of the Nyaya Philosophy, of the Mimansa and Yoga were reprinted in Sanscrit and English by professor James Ballantyne of the Benares College. The Jain faith is supposed to be amongst the most recent of all the religious systems in India. Hema Chandra, one of their greatest writers, flourished in the end of the 12th century, and the compiler of the Jain Puranas of the Dekhan, is said to have written at the end of the 9th century. The Kalpa Sutra was not composed earlier than the 12th or 13th century. The Jaina faith never extended itself into Bengal or Hindustan for two princes of Benares professed buddhism up to the eleventh century. In western Marwar and in all the territory subject to the

Chalukya princes of Guzerat, the Jain faith became that of the ruling dynasty, about 1174, and Jain relics and followers are still abundant in Marwar, Guzerat and the upper part of the Malabar Coast. The Jain faith was introduced on the Coromandel Coast, in the 8th or 9th century, in the reign of Amoghversha, king of Tonda Mundalum. This, the 8th or 9th century, seems to have been the earliest period of the existence of this religion, there, which was not but an offshoot of the buddhist faith. The Sutras, which constitute the earliest works in which the various systems were drawn out on a settled plan, are short treatises in the Sanscrit language, of very compact form. So complete are they, and so concisely expressed, that it seems evident that the subject they treat of must have been thoroughly examined and discussed previous to their time, and all their branches and divisions properly developed. These Sutras have been the great standards of instruction in later times, and have formed the basis both of commentaries in which their tenets are expounded, and of other treatises in which native scholars have arranged their doctrines, according to their own judgment, with new illustrations and perhaps greater breadth of plan. Their brief aphorisms and concise style were intended to assist the memory, although they necessarily render the meaning obscure.

The six categories or objects of knowledge are substance, quality, action, genus, difference, and intimate relation. The Bhasha Parichheda starts with a similar statement, adding, however, with many authorities, a seventh category, non-existence, or negation.

(*a*) Earth (prithivi) occupies the first place among the substances.

(*b*) Water (ap) has fourteen qualities: touch; number, quantity, individuality; conjunction, disjunction, &c.

(*c*.) Light (tejas) and heat are the same. Light has eleven qualities; the first eight ascribed to water, together with colour, fluidity, and viscidity.

(*d*.) Air (vayu) has the same qualities as light, excepting colour and fluidity.

(*e*.) Ether (akasa) has for its distinguishing quality, sound. Its organ is the ear. It has many titles.

(*f*.) Time (kala) has the qualities of number, quantity.

(*g*.) Space (dig) is one and eternal, ubiquitous and infinite.

(*h*, *i*.) The soul is ubiquitous and infinite; it has the qualities of number, quantity.

13. Quality (guna) forms the second category in Kanada's list.

(1.) Colour (rupa) is perceived by the eye; it manifests substances, qualities, and classes: it is the cause of the perceptions of the eye.

(2.) Savour (rasa) is apprehended by the tongue: it is of various kinds, as sweet, bitter, pungent, astringent, acid, and saline.

(3.) Odour (gandha) is perceived by the nose, and is of only two kinds, good and bad. It is the special quality of earth, and of earth alone.

(4.) Feel or tangibility (sparsa), by which is meant temperature, is apprehended by the skin. It exists in four substances, earth, water, light, and air.

A book of Sutras, said to have been compiled, is reckoned the most direct and important authority on the Vedanta system. It is called by the various names of Brahma Sutra, Saririk Sutra, and Uttara Mimansa. It is complete in itself, delivers the system in a clear, compact form, and, like the Sutras of other systems, is divided into sections, which may be readily committed to memory. Like them, also, it requires the elucidation of a commentary. The philosophical chapters and tracts are called Upanishads, and, though belonging to different parts of the Brahmanas, have been selected from them, so as to occupy a kind of independent position. More than a hundred of them are known, and the greater part are numbered among the treatises of the Atharbba Veda. The authors of the most ancient and authoritative are not known; they are all Sruti, *i. e.*, inspired, and are believed to be communications from the great Brahma himself. One special set of the Brahmanas are termed Aranyaka, because they were to be read in the forests by those ascetics and devotees who quietly withdrew from household life to meditate in retirement upon the supreme. These works were composed later than the Brahmana in general: they contain a great number of Upanishads, and, in after days, were declared by their brahmin commentators to be "the essence of the Veda." Eleven of these Upanishad are considered by the brahmin world to expound Vedantic doctrines, and their authority is appealed to as of the highest kind. The eleven Upanishads of the Vedantic school are the following: the Aitareya, Brihad Aranyaka, and Vajasaneyi: the Taittiriya, the Chhandogya, and Talavakar: the Mundaka, Katha, Prasna, and Mandukya; and lastly, the Swetaswatara. The Aitareya Upanishad is taken from the Brahmanas of the Rig Veda, and forms four chapters in book 2 of the Aitareya Aranyaka. It has been translated by Colebrooke in his Essay on the Vedas, and contains a curious description of the process of creation. The Brihad Aranyaka is a very voluminous Upanishad, the last book of the Satapatha Brahmana; the brahmana of the Vajasaneyi school, which, under the teaching of Yajnawalkya, formed the White Yajur Veda. The Upanishad contains an immense amount of interesting matter, including several dialogues between Yajnawalkya and his rivals and scholars. The Chhandogya is a very important and extensive Upanishad of the Sama Veda, full of theological disquisitions and dialogues. Several of the others named are exceedingly brief. They are all, however, so valuable that it will not be inappropriate to describe the character and contents of two or three of the most popular.

The Taittiriya Upanishad is found among the Brahmanas of the Black Yajur Veda, and stands high in the estimation of Vedantic scholars.

The Mundaka Upanishad professes to be a discourse, containing a series of instructions delivered by Angiras to Sounaka in answer to his inquiry: "Tell me, oh illustrious sage, what is that science, by the knowledge of which this universe is understood."

The Katha Upanishad is divided into six sections (valli). It describes a dialogue between Yama and Nachiketa, the son of Vajasravasa. Nachiketa had been devoted by his father to Yama, and arrived at the house of that deity during his absence.

The Swetaswatara Upanishad consists of a number of oracular sayings concerning the Supreme, the Universe, and Brahm, delivered by Swetaswatara to his disciples.

The works of authority which follow next in order, and which exhibit the system in its latest stages, are the various commentaries which have been written upon the inspired works.

The term Vedanta, says the Vedanta sar, applies to the arguments of the Upanishads, also to the Saririk Sutras, and other shastras auxiliary thereto. It is also defined as the system by which may be obtained the knowledge of Brahma. That knowledge is the chief end of man; the knowledge by which he will be delivered from all evils, especially the great evil of repeated birth. The sources of such knowledge are distinctly defined. The schools of hindoo philosophy generally recognize three ways of obtaining knowledge; the perceptions of the senses; the deductions of reason; and tradition or revelation. By the Vedantic authorities six methods are enumerated; and the logical system adopted is that of Jaymini. The principal authority however is the authority of the Veda; of truth derived originally from the deity himself and handed down from one generation of teachers to another. Hence it is named praman, agama, or sruti.

In the Upanishads we have many examples of teachers communicating divine knowledge to their numerous students. In the Chhandogya, Gautama teaches Satyakama, and he teaches Upakosal. Yajnawalkya taught the White Yajur and its two Upanishads. Angiras taught the Mundaka to the son of Sunaka.

The Upanishads being treatises which have for their end the teaching of the knowledge of Brahm, are of course crowded with passages descriptive of his existence, attributes and deeds.

The Bhagavat gita, in its tenth and eleventh lectures, contains some noble passages on the majesty and splendour of the Supreme.

The existence of Brahma is a point which the Vedantic authorities take not the slightest trouble to prove: even although the Sankhya had already made its heretical assertion that no evidence can be offered of such existence.

According to some views of the Hindoo-mythology, Brahma is not always invested with attributes. In the intervals between the Great Ages, or Kalpas, he is said to be altogether nirguna "without qualities," and to recline upon the leaves of the banyan-tree in a state of profound repose (batpatrasayi). The Sutras declare that the latter is the true description of him; not the former, nor the two together. It is only in relation to the creation that these "qualities" of various kinds are attributed to him. Really "he is unaffected by the modifications of the world: as the clear crystal, seemingly coloured by the red blossom of the hibiscus, is not the less really pellucid." He changes not: all change is expressly denied him by the texts in the Vedas.

The universe, on the Vedanta theory, is not a real universe, it is only an apparent one. Yet the relation of Brahma to that unreal world, is fully and frequently mentioned in the Vedantic authorities. He is declared to be its creator. "When there was neither day nor night, He was, who is without darkness and is pure goodness alone." But when the time arrived He made all. "One God produced the heavens and the earth." He is the Almighty Creator of the world and the all-wise author of the Shastras." "His will alone is a sufficient cause of the universe; and he has made it for sport." The Sutras say, that he first conceived the desire to create, and employed special words in the process. "From Vedic words, the universe beginning with the gods, has sprung." "Uttering the word "bhur" he created the earth." The Aitareya Upanishad (ii, 4.) enters fully into the subject of the creation, and describes the formation of the great objects of the universe with minute detail; especially the structure of man. The Brihad Aranyaka also describes the formation of the animated creation, and the mode in which the male and female of each kind were produced. Brahma is the sustainer also of the creation which he has produced. The Upanishads give numerous illustrations. "All things in the world proceeded from the Supreme, and in him they move. Through fear of him fire flames: through fear of him Indra, Vayu and Death keep in motion." Colebrooke's Essay on the Vedas gives it in full. There are three classes of passages contained in the various Vedantic authorities, which teach the perfect identity between Brahma and the universe; that is, the doctrine of Pantheism: numerous expressions and passages most strongly imply it: it is openly and forcibly asserted in distinct terms; and numerous illustrations are employed to explain it.

(1.) The Upanishads, the Sutras and Gita, frequently speak of Brahma as pervading the universe, and apply to him numerous epithets expressive of that idea. And in order to put the fact in a clearer light, the assertion is made, not only concerning the universe in general, but also its individuated parts. The term sarvabhutantaratma, "the internal spirit of all things," frequently occurs in the Mundaka and Katha Upanishads.

(2.) The doctrine is directly taught in passages like the following: "Brahma is the substance of the universe: for so the propositions (in the Vedas) and their illustrations require." (Sutras i, 4, 23.)

"Nothing exists but he." (iii, 2, 29.) "I am the sacrifice: I am the worship: I am the drug: I am the incantation: I am the fire: I am the incense." (Gita, ix.) "Fire is that original cause: the sun is that; so is air: so is the moon: such is that pure Brahma: and these waters; and Prajapati.... It is he who is in the womb: he who is born: and he who will be produced."

According to many authorities, the universe is divided into three worlds (Triloka)—viz., heaven, earth and hades. By others a division into only two is sanctioned, of which one includes the earth. In this division the worlds are classified as the upper and lower. In the upper worlds are included, first, Bhur-lok, the earth: then, Bhuvar-lok, the residence of the Munis, the region between the earth and sun: Swar-lok is the heaven of Indra: next comes Maha-lok, the abode of Bhrigu and other saints: Jana-lok, the residence of the sons of Brahma: Tapa-lok, the residence of the "Vairagis:" and lastly, Satya-lok or Brahma-lok, the dwelling-place of Brahma himself. Thence to the regents of the day: thence to the abode of the gods; thence, through the region of air, to the moon; thence to the realm of lightning. Above this is the realm of Varuna: and finally follows the region of Indra. In the Upanishads but few references are made to this subject, yet the same classification seems to have prevailed in their day. Allusions are made to the "seven retributive worlds of happiness:" and Brahma Loka is several times named: as also Pitri Loka. With a view to aid the priests in their severe toil of learning by heart all the formula necessary for their official duties, the directions conveyed in the brahmans of the Vedas were reduced to a system termed Kalpa Sutras; and so easy did the process become that many were induced to neglect the Brahmana and study the Sutras alone. The objects of philosophy were treated in the same way. Most probably the system now termed the Sankhya was the first that left the beaten track of the old Brahmanas; and by its novel theories; so contrary to the current brahmin notions, became the occasion of stimulating to new enquiries, and rendering the arguments respecting them more satisfactory and sound. While exceedingly free in its speculations, and on many important points differing from ordinary Vedic doctrine, it partly saved its position by not directly questioning the authority of the Vedas, or of the brahmin priesthood. As a matter of doctrine and argument, the Vedanta system seems to have been formed in direct reply to it. The other systems were likewise propounded; and at one time the Sankhya, Yoga and Vaiseshika were denounced as heretical. Brahminism, however, was very lenient where mere speculation was concerned.

Buddhism was the natural, popular reaction from the grinding tyranny of the brahmans. Its founder, Sakya Singh, a Kshatriya prince, had studied deeply brahminical lore: and at length prepared a system of his own, which, to much of Kopila's Sankhya doctrine, added a simpler theory of relief from the ills of transmigration than the Vedic system taught. On the courses of transmigration, past as well as future, he dwelt very fully: and laid it down that all classes, without those years of weary study, could carry on the works of virtue, which should infallibly end in final annihilation. Apparently pitying, with a large-hearted benevolence, the ignorance of the lower orders, he encouraged them to attend his teaching; preached his discourses in plain language, with repetitions and explanations that made his doctrine more clear and more impressive. After severe contests, the tide of opposition was rolled back: brahminism, once more triumphant, was considerably popularized, and the Puranic system was rapidly developed. The various schools of hindoo philosophy which were formed under the circumstances we have now described are distinguished from each other by names expressive of their origin or of the opinions which they advocate. As we have seen, the doctrines of some are taken from the Vedas, or are at least consistent with the tenor of brahmin-teaching, and the maintenance of brahminical authority. The speculations of others directly and indirectly tend to destroy that authority. The former are declared to be orthodox; the latter, heretical. The schools which are reckoned peculiarly orthodox are six in number, and are well known by the names of the Sankhya and Yoga; the Nyaya and Vaiseshika; the Purbba and Uttara mimansa. Those systems, termed Darsanas, always occupy a conspicuous place in any enumeration of the sacred shastras. Jaymini and Veda Vyasa, the authors of the two Mimansas, are reputed to have taken an important share in the compilation and arrangement of the Vedas. The six systems are not totally different from each other. Owing to the great similarity in doctrine and purpose existing between some of them, and the contrast which therein they present to others, the systems form themselves into three groups or pairs; and their followers into three great schools. The Vedanta and Purbba mimansa constitute one pair, as correlative to each other and working to the same end. The Purbba mimansa expounds the "earlier" portion of the Vedas, and describes the ritual, ceremonies and acts of devotion by which religious merit may be acquired. The Uttara mimansa or Vedanta, expounding the "later" books, the Upanishads, developes the higher mode of meditation on the nature and attributes of the Supreme Brahma, by which absorption into his essence can be more speedily and effectually attained. The Sankhya in its structure and tenets differs widely from the Vedant: but is closely followed by the Yoga of Patanjali. The Nyaya and Vaiseshika are also alike in doctrine; the former being occupied chiefly with the principles of investigation; the latter with the physical inquiries which form the main purpose of its treatises. The hindoo system termed Sankhya was apparently the earliest formed among those which introduced the really philosophic age. Its author is said to have been the great sage, Kopila. While largely using Vedic notions and materials, he quitted Vedic theories; and in important particulars reaches conclusions, the very opposite of what the Vedas teach. This term is derived from the Sanscrit word sankhya, which denotes "number," also "judgment," "discrimination." The doctrines of the system are pre-eminently sought and defended by "Reason," in opposition to mere authority, of which the brahmins at that period were very fond. "They exercise judgment," says the Bharat, "and are therefore termed" Sankhyas. The oldest authority of the system is the work entitled Sankhya Pravachan Sutras. It is attributed to Kopila, and is evidently a work of great value. The most valuable authority of all is the Sankhya-Karika, a collection of memorial verses by Iswar-Krishna, in which the system is embodied. This most admirable work is based upon the Sutras of Kopila; it takes up all their doctrines and arranges them in perfect order. The work is very brief, and contains only seventy-two slokas.

Of two translations the more valuable, from its completeness, is that of the Sankhya Karika, by Professor H. H. Wilson. Kopila's philosophy was entirely new. The Upanishads had been gradually developing in a clearer form the pantheist doctrine that the supreme Brahma was not only the author of the universe, but that he is the universe, including human souls. Kopila taught that in the universe there are two primary agencies, nature or matter (Prakriti) and souls; but there is no supreme. Souls have existed in multitudes from eternity; by their side stands this Prakriti. For eternal ages the two remained separate: at length they became united, and the universe in all its forms was developed from their union. The products of that union are twenty-three in number; so that twenty-five principles explain everything; of which soul and nature are the chief. He proceeds to explain how by the union first is produced the individual man in his germ and its full development; and then how the world and universe around are aggregated. The great evil of human existence is this union between soul and nature; it causes all the pains of life; and the endless transmigration which the soul makes from one gross body to another. The soul which knows the Sankhya system can secure the separation, and transmigration will at once cease. To all this the Yoga system adds, that besides the two primal agencies, there exists a Supreme Lord, and that intense devotion to him will secure the same desired end. A brief outline of the systems will show how these doctrines are laid down and defended. The Sankhya Karika embraces eight distinct topics.

The object of the Sankhya, as well as of the other branches of hindoo philosophy, is the removal of human pain by the final and complete liberation of the individual soul.

The Nyaya, properly so called, considers specially, though not exclusively, the true mode of enquiring after truth.

The Vaiseshika, on the other hand, takes up for its consideration, chiefly physical enquiries, and surveys, classifies and endeavours to account for, the various objects existing in the universe.

The Nyaya system is attributed to Gautama, and is described in a collection of Sutras written by him. They are divided into five books; the first of which sketches out the subject-matter of the whole. Gautama sets out, like the founders of the other systems, with the enquiry, What is the way to attain perfect beatitude (nisreyasa), and then asserts that deliverance is only to be secured by a knowledge of the truth.

Gautama next describes the instruments (praman) by which these right notions are to be acquired. He mentions four: perception (pratyaksha), inference (anumana): comparison (upamana); and testimony (sabda). Dr. Ballantyne translates them: (1) the deliverance of sense, the knowledge acquired by a contact of the sensorium with its object: (2) the recognition of a sign; this "inference" is of three kinds; a priori inference; a posteriori; and from analogy: (3) the recognition of likeness, that by which similarity is detected between different objects: (4) worthy precepts or authority. By means of these instrumentalities correct knowledge may be obtained of things as they really are.

Casuality occupies an important place, especially in the Sutras of Kanada.

With these instruments and on these principles, the various objects of knowledge (prameya) are to be examined.

Having cleared the way for enquiry, by defining the instruments of knowledge, and exhibiting in all its phases the mode of discussion both with friends and foes, as well as the different classes to whom it is applied, the Nyaya takes up in order the various objects of knowledge (prameya) which are to be proved and known. These are twelve in number: "soul, body, sense, sense-object, knowledge, the mind, activity, fault, transmigration, fruit, pain and beatitude," are the subjects fitted to supply "right notions," and thus secure the entire removal of all human pain.

(*a.*) Of these, soul (atman) is stated justly as first in importance.

(*b.*) The second object of proof is body (sarira). Body is an ultimate compound.

(*c.*) The third object are the organs of sensation (indriya). "The organs of sense originating from the elements are smell, taste, sight, touch and hearing."

(*d.*) The fourth object of knowledge in Gautum's list are the objects of sense (artha).

(*e.*) The fifth of Gautama's twelve objects is understanding (buddhi). Understanding, apprehension and knowledge have all the same meaning.

The remaining six of the twelve objects will not require more than a passing notice. The seventh, activity (pravitti). The eighth, fault (dosha), is that erroneous desire in men which produces the activity just mentioned. The ninth is transmigration. The tenth, retribution or fruit (phala). The eleventh is pain (dukha), which includes pleasure also as its opposite. The last is the beatitude (apavarga), promised to the followers of the system. It denotes deliverance from all the "pain," and the absolute prevention of all evil in the future.—*Mullen's Hindu Philosophy, pp.* 36-50, 74-8, 82-94, 107-11, 116-8, 122, 124-5, 127-30: *Max. Muller.* See Arians, Pali, Panini, Sanscrit.

SUTRANJI, properly Shatranji, Guz., Hind. Carpets.

SUTS, Hind., of Kanawar, Hippophae rhamnoides, also Hippophae salicifolia, buckthorn.

SUTSHER, a dark-coloured wood, close-grained, strong and heavy, grows from Sooree to Hasdiha in the Santhal jungles, but scarce. Furniture and posts are made from this wood. —*Cal. Engineers' Jour., July* 1860.

SUTTAN, loose trousers of 'susi,' worn by Jat women and others.

SUTTANI, or Sattani, Tel. Two Sudra sects of Telingana. One of them burn their dead. The other bury their dead in a sitting posture up to the head, then burst the head by throwing cocoanuts on it, and heap it over with earth.

SUTTEE, Sans., (from sati, a virtuous wife) from sut, pure, a widow allowing herself to be burnt with the corpse of her husband; a practice abolished in British India on the 4th December 1829. Suttee still continues to prevail in Bali to an extent that India never knew, and the slaves of a great man are also consumed on his funeral pile. The widows are often despatched by a kris. A suttee took place on the death of the maharana of Oodipore, but the authorities at the place urged upon the government the necessity that exists for inflicting punishment upon the transgressors, of such a nature as to deter for the future similar outrages on decency and humanity. It was suggested that government should mulct the native state in which suttee occurs to the extent of a year's revenue. No suttee can possibly take place without the concurrence of the rulers of the states, and as it is now in their power to prohibit any such disgraceful exhibitions they should be made to suffer as abettors of the offence. Sahamarana or the burning of the widows with the dead bodies of their husbands was not a Vedic usage. Dr. Wilson says "we have additional and incontestible proof that the Rig-Veda does not authorise the practice of the burning of the widows." The widow of the deceased had however to attend with married women the funeral of her husband. She was placed with his dead body on the funeral pile, and after the performance of certain ceremonies she was brought down and was thus addressed by the priest :—

"Rise up O woman, to the world of life,
Thou sleepest beside a corpse, come down;
Thou hast been long enough a faithful spouse,
To him who made thee mother to his sons."

The married females attending had then to anoint their eyes with collyrium, when they were thus addressed :—

"The women now draw nigh with oil and butter,
Not widows they, proud of noble husbands;
First to the altar, let the mother come,
In fair attire and with no grief or tears."

There is a passage in the Taitrya Arnukna of the Yajur Veda containing the following address to the widow by the younger brother, disciple or servant of the deceased :—"Rise up woman, thou liest by the side of the lifeless, come to the world of the living, away from thy husband, and become the wife of him who holds thy hand and is willing to marry thee." This is a clear proof of the widows marrying during the Vedic period. And that the widow was brought down and not allowed to be burnt is also confirmed by her collecting the bones of her late husband after a certain time. Manu recommends widows to emaciate their bodies, live on flowers, roots and fruits, not even pronounce the name of another man, avoid every sensual pleasure, and cheerfully observe those rules of virtue followed by women devoted to only one husband. The first mention of the burning of widows we find in Angira, one of the sage legislators who was a contemporary of Manu. He says :—"The woman who burns herself after the death of her husband, gains, like Arundhati, heavenly glory. She purifies the sins of the murderers of the brahmans, the ungrateful, and the slayers of friends. For sadhi women there is nothing so meritorious as cremation after the death of their husbands." The next mention is in the Katyana Sutra, and the age of Katyana is about the fifth century B. C. The Ramayana makes no mention of the practice. In the Mahabharat we find that one of the wives of Pandu burnt herself with his dead body, and that when Krishna died, several of his wives consigned themselves to the flame with his remains. But after the great war in Kurukshetra none of the numerous royal ladies burnt herself. The account of the funeral rite of Dranacharya leaves some doubt as to whether his wife was burnt or not. The passage is as follows :—"Behold the scholars of Dranacharya, after chanting the Sama Veda, performing his funeral rites, making his wife foremost and placing her on the right side of the pyre, are bending their steps towards the Dhagirathi." The practice of the cremation of the widow, though not in existence when Rama lived, nor in much use when Yudhishthira reigned, did not die away. In A. D. 66, Plutarch in his morals says,—"And among the Indians, such chaste wives as are true lovers of their husbands, strive and contend with one another for the fire, and all the rest sing forth for the happiness of her, who having the victory is burnt with her deceased husband." The brahmans, in support of the rite of Suttee, gave a quotation of a verse from a chapter of the Rig-Veda. This, Colebrooke translated as follows: "Om! let these women, not to be widowed, good wives, adorned with collyrium, holding clarified butter, consign themselves to the fire! Immortal, not childless, not husbandless, well adorned with gems, let them pass into the fire whose original element is water." Professor Wilson has pointed out, however, that they falsified the text by altering the words Yonim agre into Yonim agneh. The words of the verse in question are addressed not to the widow, but to the other women who, besides the widow are present at the funeral : and its correct translations is : "May those women who are not widows but have good husbands draw near with oil and butter. Those who are mothers, may go up first to the altar, without tears, without sorrow, but decked with fine jewels." A second marriage in a hindoo woman of most of the races in India who are following brahmanism, is considered an unlawful act. Manu, v. 160, 161, says a virtuous wife ascends to heaven, though she have no child, if after the decease of her lord she devotes herself to pious austerity; but a widow who, from a wish to bear children, slights her deceased husband by marrying again, brings disgrace on herself here below, and shall be excluded from the seat of her lord.

Sutti, however, seems a Scythic rite. Raja Dheau Singh acted a strange and unaccountable part on the occasion of Ranjit Singh's death. He declared he would be burned with his late master, and was with difficulty persuaded, after some hours' entreaty, to forego this resolve, the prince and sirdars throwing their turbands at his feet, and declaring that, without him, the affairs of the state would be deranged. He gave way to their importunity only on condition that he should be permitted to visit Benares. Although the practice of suttee forms no part of the institutions of the Sikhs, and is rare amongst them, upon this occasion, the four ranees of Runjeet, Koondun, daughter of rajah Sumsar Chund ; Hinderee, daughter of Meean Puddum Singh, of Noorpur ; Rajkoonwur, daughter of Sirdar Jey Singh, of Chynpur, and Baant Ali, determined, in spite of the entreaties and remonstrances of Khuruk Singh and his ministers, who guaranteed their rank and property, to burn. The corpse of the late maharajah having been washed with Ganges water, and placed on a bier of sandalwood, decorated with gold flowers, was carried, the day after his death, to the place of cremation, before the gates of the palace Hazaree Bagh, followed by the four ranees in their richest dresses, loaded with jewels of immense value, walking in a measured step, attended by brahmins and Sodees (Sikh priests,) singing the holy hymns of Nanuk, in the same form, and with the same ceremonies, which were beheld in these very parts (on the banks of the Ravi) by the army of Alexander the Great more than 2,000 years before, and which are described by the Greek and Roman writers with a minute fidelity, which would suit a modern suttee. The funeral pile was made of sandalwood, and when the procession reached it, an affecting scene took place. Rani Koondun, the principal widow, took the hand of Dheau Singh, and placing it on the breast of the corpse, made him swear never to betray or desert Khuruk Singh, or his son Nou Nehal Singh, or forget the interests of the Khalsa; and Khuruk Singh, in like manner, swore not to betray or desert Dheau Singh. Besides the fatal curse of a suttee, the torments incurred by the slaughter of a thousand cows were imprecated on the head of him who violated his oath. Rani Koondun then mounted the pyre, sat down beside the body of her late husband, which was in a sitting posture, and placed his head in her lap. The other ranees, two of them only sixteen years of age, and of extraordinary beauty, with five, some say seven, Cashmerian slave-girls (one of them the lovely Lotus, who had attracted the admiration of the mission in 1838), followed the example, seating themselves around the corpse, with every token of satisfaction in their countenance. At the hour fixed by the brahmins, in the presence of all the troops at the capital and an immense crowd of spectators, including several English officers, the pile was lighted, one account states by Khuruk Singh, another, by the rani Koondun, and without a shriek or groan being heard, the living and the dead were reduced to ashes. It is said the rajah Dheau Singh made four several attempts to jump upon the burning mass, but was withheld by the people about him. A witness of this appalling spectacle relates that a small cloud appeared in the sky over the pile, and that he saw (perhaps thought he saw) a few drops fall upon the smouldering embers, as if the very elements wept at the closing scene of this dismal tragedy. The ashes were conveyed in a palanquin of gold, in grand procession, accompanied by Khuruk Singh (in a plain white muslin dress), Dheau Singh, and Kooshal Singh, to the Ganges, and committed to that holy river.

The suttee seems to be the remnant of a scythic practice which is still followed by races of Tartar origin. The emperor Chun-Tche died at midnight, and at dawn of day, all the Bonzes and their adherents were chased from the palace. Towards noon the deceased was placed in his coffin, and was wept by an immense multitude who had witnessed the ceremony. As soon as the ceremony of taking the oath of allegiance to young Kiang-hi was concluded, that of the funeral of Chun-Tche was commenced in the style of magnificence surpassing anything of the kind that had hitherto been witnessed. To the solemn and sumptuous pomp of the Chinese rites, were added the extraordinary and barbarous customs of the Tartars. Tragic scenes took place, in which many of the attendants of the late emperor put themselves to death, that they might proceed to the other world, and continue their accustomed services to their master. It is stated in the annals of China, that the empress mother, perceiving a young prince who had been the intimate friend and favourite of Chun-Tche, expressed to him, with strong emotion, her grief and astonishment at finding him alive. "Is it possible," said she, "that you are still alive ? My son loved you, is doubtless now waiting for you ; hasten then to join him, and prove to him that your affection was sincere and generous ! Run and bid adieu to your parents, and then have the courage to die ! Your friend, my son, is stretching out his arms towards you. According to the historian, these words, uttered in a tone at once affectionate and severe, caused great distress to the young man. He loved Chun-Tche, but he loved life also, and could not think of death without a terrible shudder. He was surrounded by his afflicted family, who were urging him to escape by flight from so frightful a sacrifice, when the empress mother sent to him a present of a box ornamented with jewels, and containing a bowstring for him to strangle himself. The unfortunate young man still hesitated, for he was at the happiest time of life, and could not resolve to die of his own accord, as the barbarous prejudices of his nation required, but the two officers who had brought him the fatal present had orders from the empress mother to help him out of this perplexity, and give a little assistance to his courage should he be unable to put himself to death, and they helped him accordingly. The coffin of the deceased emperor was transported to the burial-place of the new dynasty, at twenty-four leagues north of Pekin, and never probably was there such a procession as that which accompanied the remains of Chun-Tche to Mantchuria. The immense multitude made the whole country resound with the voice of weeping and lamentation, for this prince, of whom in his latter days the people had seemed exceedingly tired, was now clamorously, and perhaps sincerely, regretted. "For my own part," wrote father Schall to his friends in Europe, "I owe an especial mourning to the memory of the emperor. For the seventeen years of his reign he never ceased to bestow on me many marks of kindness and regard ; at my request he did much for the welfare of his empire, and would doubtless have done much more if a premature death had not thus carried off, at the age of twenty-four, this certainly intelligent and highly-gifted young man."

The burning of the hindoo widows under the mahomedan emperors became latterly on the increase. When Man Singh died, in the reign of Jahangir, sixty of his 1,500 wives were reported to have burnt themselves. In 1818, 839 suttees were returned as having occurred in the Bengal provinces. Sikh women do not usually burn with the corpses of their husbands. The Adi Granth, a sacred book of the Sikhs, says, "They are not suttees who perish in the flames oh! Nanuk." An exception occurred in 1805, in the town of Booreeah. That affection and duty have not always place in this kind of felo de se, which would explain and extenuate such a deed, and convert the offspring of superstition into a noble act of self-devotion, is obvious from the fact that it is not only the favoured wife, but a whole host of females that sometimes are offered up to die on the pyre of their deceased lord. Frightful scenes occurred on the demise of the hill rajas of Kulu, Nahun, Juswoul, and other places. On the demise of the hill rajas of Belaspore and Nahun, in 1824 and 1827, there was no suttee, and the practice has since then disappeared in the hill states under the protection of British government. The Adi Granth says, "they are not suttees who perish in the flames, O ! Nanuk ! suttees are those who live of a broken heart." But, again, "the loving wife perishes with the body of her husband. But were her thoughts bent upon God, her sorrows would be alleviated." Mr. Elphinstone says, "The practice of suttee is by no means universal in India. It never occurs to the south of the river Kistna." But Marco Polo stated the practice of Southern India just as Odoric does, whilst in 1580, Gasparo Balbi, an accurate and unimaginative traveller, describes with seeming truth a suttee which he witnessed at Negapatam ; and speaks of the custom as common. In the middle of the seventeenth century, P. Vincenzo, the Procurator-General of the Carmelites, says it was especially common in Canara ; whilst he was told on the death of the naik of Madura 11,000 women had offered themselves to the flames ! These 11,000 suttees may have been as mythical as the 11,000 virgins of Cologne, but they prove the practice. And in the beginning of the last century it continued to be extremely prevalent in that region. P. Martin in a letter from Marawar (or Ramnad, opposite to Ceylon), dated in 1713, mentions three cases then recent, in which respectively forty-five, seventeen and twelve women had performed suttee on the death of the husbands, princes of that state. The widow of the raja of Trichinopoly, being left pregnant, burnt herself after delivery. Suttees still occur in spite of British prohibition, and not very unfrequently both in British territory and in the native states. Ramusio quotes Propertius on suttee. A few lines will show how familiar this still enduring Indian practice was to the Romans nineteen hundred years ago.

... ...Uxorum fusis stat pia turba comis ;
Et certamen habit lædi, quæ viva sequatur
Conjugium ; pudor est non licuisse mori.
Ardent victrices, et flammæ pectora præbent,
Imponuntque suis ora perusta viris.—Pa. 80.

Towards the close of the 18th century, Suttee was most frequent in the Bengal presidency, and most so in the Bengal province. It was comparatively rare in the Madras presidency and Orissa, Ganjam, Rajahmundry and Vizagapatam were the parts in which it most occurred. The custom was very prevalent under Mahratta rule, but under the British, became very rare in Bombay. About the beginning of the 19th century, it used to occur at Poona, in ordinary and quiet periods, annually, about twelve times, on an average of as many years. Major Moor was a whole year at Poona, and knew of its occurrence only six times ; but it was a tumultuous and revolutionary period, and people were of course put out of their usual and ordinary routine of thought and deed. It was generally performed at the junction of the Moota and Moola rivers, about a quarter of a mile from the skirt of the city, at which junction (thence called Sangam) the British residency was situated. By a Legislative Act of Lord William Bentinck's administration, in 1828, suttee was made a criminal offence in all who abetted it. It was common at Benares to set up, by the side of the river, stone monuments to the memory of widows who have been burnt with the bodies of deceased husbands. Persons coming from bathing bow to these stones, and sprinkle water on them, repeating the words Sutee, sutee, *i. e.*, chaste. A writer in the 'Madras Times,' writing in 1862 remarked that it will take some time for the British government effectually to suppress the frequent occurrence of suttee which are still of constant occurrence in the native States throughout India. It will not be forgotten that, on the occasion of the death of the maharani of Odeypore, a suttee took place in which the life of a slave girl was wantonly destroyed. Letters from Central India after that date, conveyed the intelligence that another case of a somewhat similar description had since taken place at the cremation of the remains of the thakooor of Rewa in Seralee. The persons implicated were placed in confinement, and were to be punished agreeably to the penalties ordered to be inflicted by the government for such offences. A writer, who dates his letter Hurdwar, 27th Feb. 1820, says I have this moment returned from witnessing the burning to death of a fellow-creature. The smoke and flames are still ascending to heaven. The first intimation I had of the melancholy circumstance was from noticing a number of people looking towards the island opposite the fire. On rising, I saw a volume of smoke, and for the moment imagined it was a fire, but on enquiring, was told with the most heart-sickening indifference, that it proceeded from a suttee. I hastened to the spot, and the hindoos there carried me all the way through the water to hasten my visit, and render my interference timely ; but the fire had been too long kindled ; the huge trunks of trees of which the pile was composed, became one live coal, and left no doubt of the utter extinction of life in the unfortunate victim. I stood there for a few minutes ; but the crowd, the noise of drums, &c., hindered my enquiring about the relatives and others who had set fire to the pile. I afterwards learned that the poor woman was not the lawful wife of the deceased. He had been thrice married, but the woman in question was not of his caste, but a hill woman, either of Budreenat'h or Kedarnat'h, and a well known concubine. All the brahmins of Hurdwar know this to have been the case, and neither they nor the relations of the deceased deny it. The man himself was well known at Hurdwar, being one of the 2,000 families of Pundas or officiating brahmins. He left a daughter by a wife, and considerable landed property as well as ready money : in all about 18,000 rupees. On the morning of his decease he distributed 200 rupees in cash among the brahmins ; and it was reported there, that his relatives apprehending the woman would inherit all his estates, promoted her death.

About the year 1860, the 'Delhi Gazette,' mentioned that an atrocious case of attempted suttee which ended in the unfortunate woman's being murdered on her refusal to consummate the sacrifice, occurred in Central India. The woman had been persuaded to consent to the sacrifice, and proceeded, after the usual ceremonies, to the pyre, accompanied by her friends and relatives. When she was on the top of the pile, and the flames began to ascend, her resolution gave way ; and screaming with terror, she lept to the ground, and tried to run away. The attendants, however, tried to cut her down ; and she was struck with sticks, and wounded in two places, with swords. She managed, however, to escape from these fiends in human shape, and ran down to the river's edge, where she concealed herself under some bushes. Here she was found, and thrown into the river (the Parwati) where she was drowned. Many of those concerned in this infamous outrage were apprehended, and tried at Goonah, in the neighbourhood of which station, the occurrence took place. Horrible as this is, and inclined, as every good hindoo must be, to execrate the ruffians who took part in this outrage, and to wish them speedy and terrible punishment, a nearly similar crime was perpetrated in 1858, in the Furruckabad district, without a single one of the criminals being convicted or punished.

A correspondent supplied 'All the Year Round' with the following narrative of a tragedy enacted before his own eyes in the neighbourhood of Foo-Chow-Foo :—"The first notification I had, says he, of what was about to take place was the parading of a handsome wedding chair about the suburb of the provincial capital in which our foreign settlement is situated. The chair was accompanied by all the pomps and gaieties of a wedding—music, gay streamers and so forth.

There was, however, one thing most unusual in this procession. The occupant of the chair was exposed to public gaze, instead of being, as in weddings is invariably the case, closely screened. On making enquiry among our Chinese servants as to what this extraordinary departure from established customs might portend, I was informed that the lady was no bride, but a disconsolate widow, recently bereaved, who, finding herself unprovided for and unprotected, and having, moreover, neither father nor mother, son nor daughter, father-in-law nor mother-in-law, was determined on following her husband to the unknown world, where she might serve and wait upon him as became his dutiful and loving wife. Having accordingly made known her intention to her friends, and having fixed the day for her departure, she was now taking leave of all she knew, and parading the streets as a pattern to her sex. The object of her death being to rejoin her husband, the ceremony was a sort of wedding. She was arrayed and adorned as a bride, and seated in a wedding chair. I ascertained the time and place appointed for the closing ceremony, and on the morning of the 16th January, proceeded, accompanied by two friends, to a spot some four miles distant from Nantae, the seat of the foreign settlement and southern suburb of Foo-Chow-Foo. Everybody we passed appeared as well acquainted with the object of our journey as we ourselves were. As we approached the scene of action we found ourselves in a stream of people, chiefly women and girls, the greater part of whom were small-footed, and were hobbling along, leaning one against another for support, or assisting their tottering footsteps by means of the shoulders of dutiful sons or brothers. We arrived only just in time to see the chair of the victim carried on the ground, and herself ascend the scaffold which had been prepared for her. The chair was the bridal chair in which she had been carried about the streets; and the scaffold consisted of two stages, one raised a few feet from the ground, and the other a few feet higher. The whole was covered with a dark cloth canopy, supported by a framework of bamboos, within which was set a gallows of one very thick cross-piece of bamboo, fastened at either end to a strong upright pole. From this bamboo, under the canopy, and exactly in the middle of the scaffold, hung the fatal rope, covered with a red silk napkin; beneath it was set a chair to enable the devotee to reach the noose. On the lower platform was a table of choice meats and vegetables, at which she was to take her last meal in the land of the living. The table was surrounded by the woman's friends, dressed in holiday costumes, and wearing the red cap of Chinese officials. In former times it was the custom for two district magistrates to be in attendance on all these occasions; but since the higher authorities were hoaxed some years ago by a lady whose courage failed her at the last moment, they have refused to be present at such exhibitions, and now despatch an inferior officer to superintend the arrangements. The scaffold was raised in the midst of a large expanse of fields, at the time lying fallow, and was surrounded by a crowd numbering some thousands. Benches from which a better view could be had were so much in demand that we were obliged to pay a dollar (4*s.* 9*d.*) before we could obtain one for myself and another for my companion; I use the singular number because we had lost the third member of our party in the crowd. The chief actress in this extraordinary scene appeared at first to be far less excited than any one in the vast concourse assembled. She was dressed in red bridal robes, richly embroidered with coloured silk, and her head was adorned with a handsome gilt coronet. Her decidedly plain face betrayed not the slightest emotion, and she sat down at the table with as much apparent good-will as if it had been her bridal rather than her funeral feast. While she was eating we made some inquiries among the crowd, and ascertained, in addition to the fact of her being childless, that she was 25 years of age, and that her only surviving relations were a brother in poor circumstances and his infant child, her nephew. We were further informed that she had resided in a village which was pointed out to us at a little distance from the spot. After the lapse of about half an hour, the poor woman having apparently satisfied her appetite, rose from her seat, and still standing on the lower platform, addressed the surrounding crowd in a set speech, thanking them for their attendance, and explaining why she acted as she did. When she had finished speaking, she took from a bowl on the table several handfuls of uncooked rice, which she scattered among the crowd, and eager was the scramble to get a few grains as her virtuous blessing. This done she fondled her baby nephew, and bade an affectionate farewell to her brother, who stood by her on the scaffold; then, stepping upon the upper stage of the platform, she bowed gracefully to the surrounding multitude, and addressed to them a few last words. It struck me at this moment that she might be under the influence of opium, for her laughing countenance and rapid gestures were too highly excited to be natural, except under the influence of some such stimulants. It is right to add that the gaiety was clearly not assumed. She was helped to mount the high chair placed under the rope; but the rope proving to be still beyond her reach, her brother stepped forward and held her up in his arms, while she with her own hands passed the fatal noose over her head and adjusted the cruel slip knot to the back of her neck. The red silk napkin was then placed over her face, and a handkerchief fastened to her right hand. At a signal given by herself her brother stepped back and left her suspended in mid air. She then, shaking her joined hands before her breast, "chin-chinned" the crowd; her own weight causing her to turn round and round, so that persons on all sides received her parting salutations. The spectators had, up to the fatal moment, been laughing and chattering as if assembled at a village fair; but now there was perfect stillness, as every ear was strained and every eye intent. In two or three minutes the action of the hands, at first decided and regular, grew weaker and weaker, and finally ceased altogether; then followed a convulsive shudder of the tiny feet (not above three inches in length) and all was over. The body was allowed to remain suspended for about a quarter of an hour, when it was cut down and placed in a common covered palanquin, which was in waiting, the bridal chair having been removed. The rope which had been the instrument of death was now cut into small pieces and distributed among the friends on the scaffold, all struggling violently to obtain a portion. The chair and the corpse were carried to a small temple about a hundred yards from the spot, followed by a terrific rush of people anxious to obtain another glimpse of the lifeless clay. My friend, who was somewhat sceptical of the reality of the transaction, forced his way into the temple, and witnessed the removal of the corpse from the chair. He returned, painfully satisfied that no deception had been practised, the poor girl's swollen and blackened face bearing unmistakeable testimony to the manner of her death.

Anugamana, in brahmanism is the performance of suttee by a woman alone, whose husband has died in a distant country: a sandal, or any article of his clothes may then represent him.

Arundhate, the wife of the Rishi Vaisistha, a resident of Swerga, is the spirit whom the devoted suttee woman invokes, before mounting the pile.—*History of the Punjab, Vols.* i, *pp.* 170-72, ii, *pp.* 169-70; *Huc's Christianity, Vol.* ii, *pp.* 401, 404-5; *Cunningham's History of the Sikhs, p.* 364; *Elphinstone's History of India, p.* 190; *M. Polo, Vol.* iii, *p.* 20; *Viaggio di Gasparo Balbi, p.* 83; *P. Vincenzo, p.* 322; *Lettres Edifiantes, ed. Lyon,* 1819, *Vol.* vii, *p.* 73-5; *in Yule Cathay, Vol.* i, *p.* 80. See Sati, Adee Grunt'h, Soohee, Ummer Das.

SUTTRA, lit. mark of defence.

SUTU, in Little Tibet, the flour or farina of roasted barley.

SUTUK, a hindoo ceremonial after childbirth and after death.

SUTUM, also Parada, SANS. Mercury.

SUTWASA, a rite observed amongst mahomedans when a woman has attained the seventh month of her pregnancy.—*Herk.*

SUT-WU-GOONA, SANS., from satwa, good, and goona, quality.

SUTYU-JIT, SANS., from satya, true, and jee, to conquer.

SUTYU-NARAYANA, SANS., from satya, true, and Narayana.

SUTYU-YOOGA, SANS., from satya, true, and yooga, a definite time.

SUVA, GUZ. Anethum sowa, *Roxb.*

SUVA KOLLI, URYA. Zizyphus jujuba.

SUVANA AMEL PODI, MAL. Ophioxylon serpentinum.

SUVANDE, SINGH. A wood used in Ceylon, for common house-building purposes. It grows in the western province of that island. A cubic foot weighs 56 lbs., and the wood is said to last 30 years.—*Mr. Mendis.*

SUVANDI KOTTE, also Karaug kotte, TAM. Ixora parviflora.

SUVARNAM, TEL. Mesua ferrea, *Linn., DC.*, also Cathartocarpus fistula, *Linn.*; also Mesua roxburghii, *W. Roxb.*; also Sida cordifolia, *Linn.*

SUVARUNKA also Suvernaka, SANS. fruit of Cassia fistula, Cathartocarpus fistula.

SUVEREK, see Mesopotamia.

SUVURNA, SANS., from su, one, and varna, kind.

SUVYABHICHARA, SANS., from saha, with, and vyabhichara, wrong practice.

SUWAHILI, see Aden, Beer-el-somal, Somal, Somali, Suahili.

SUWAL, HIND. Potamogeton tuberosum.

SUWARI —— ? Cassowary.

SUWARROW NUTS, or Saouari nuts. a species of butter nuts the produce of a large tree (Caryocar raciferum,) which grows in Guiana.

SUWAT, an affluent of the Kabul river. See India.

SVAMI, or swami god, lord, applied to any of the gods, and also to priests, and to the true God too.

SVANA BURBAARA, SANS. Syn. of Cleome viscosa.

SVARGA, the paradise of Indra, the Indian elysium, the world of the gods and also of mortals possessed of some merit.

SVASTI, see Inscriptions.

SVETA RAJAMASHA, Dolichos tranquebaricus.

SWADHA, see Sacta or Sakta.

SWADHAJA, see Surya-vansa.

SWADOO KUNTUKA, Sans. Flacourtia sapida, *Roxb.*, *W. & A.*

SWADU NARINGA, Sans. Citrus aurantium, Orange.

SWAHA, Sans. Presentment of oblations.

SWAHA, in hindoo mythology, is usually understood to be the goddess of fire, the consort or Sacti of Agni. See Agni, Inscriptions, Saraswati.

SWAINETZ, Rus. Lead.

SWAINSONIA GALEGÆFOLIA, a pretty shrub with purple, red and white flowers grown from seed in good garden soil. —*Eng. Cyc.*

SWAL, Hind. Potamogeton tuberosum.

SWALA, Japan, Jav. Biche de Mar, Holothuria.

SWALLOW, a bird of the family Hirundinidæ, sub-family Hirundininæ,

Hirundo rustica, *L.*, Europe, India.
„ domicola, *Jerdon*, Neilgherries, Bangalore.
„ filifera, *Stephens*, all India, Kashmir.
„ daurica, *Linn.*, „ „
„ fluvicola, *Jerdon*, Central India.
„ hyperythra, *Layard*, Ceylon.

The Daurian or red-rumped swallow, Hirundo daurica, is plentifully distributed over the lower regions in summer, but migrates to the plains of India during the cold months. The chimney swallow of Europe, the Hirundo rustica in allusion to its migratory habits, has been thus addressed:

Welcome, welcome, feather'd stranger,
How the sun bids nature smile;
Safe arrived, and free from danger,
Welcome to our blooming isle;
Still twitter on my lonely roof,
And hail me at the dawn of day,
Each morn the recollected proof
Of time that ever fleets away.

"Fond of sunshine, fond of shade,
Fond of skies serene and clear;
E'en transient storms thy joy invade,
In fairest seasons of the years.
What makes thee seek a milder clime?
What bids thee shun the wintry gale?
How know'st thou thy departing time?
Hail! wondrous bird! hail, swallow, hail!

Sure something more to thee is given,
Than myriads of the feather'd race,
Some gift divine, some spark from heaven,
That guides thy flight from place to place.
Still freely come, still freely go,
And blessings crown thy vigorous wing;
May thy rude flight meet no rude foe,
Delightful messenger of spring!"

The wire-tailed swallow the Hirundo filifera is plentiful in the Dekhan during the summer months. It is on wing soon after day-break and may be observed skimming over the ground all day long, hunting its winged prey. In the calm and delightful evenings peculiar to Poona they may be seen in hundreds, perched on stones and tufts of grass upon the plains and the river-banks, and just as night is closing in they rise and seek a roost on the tallest spires and mosques. It is seldom that the males have their delicate tail appendages perfect, and often they are entirely wanting. —*Adams.*

SWAMDHEKMA, loyalty, or fidelity to him whose salt the Rajputs eat, their immediate lord, even against their king.—*Tod's Rajasthan*, *Vol.* ii, *p.* 25. See Inscriptions, Junagurh.

SWAMI RAJA, also swami rudra dama, and swami rudra sah, see Inscriptions.

SWAMP DEER, Eng. Rucervus duvaucelli, *Jerdon.*

SWAN. A large golden figure of the sacred bird, is in front of the throne of the king of Burmah and is called in Burmese Henza. The word is of Sanscrit origin, Hanza, a goose. The Henza is regarded as the king of birds. It is perhaps a mythicised swan. 'Storks' and 'cranes,' differ in their appearance, habits, anatomy, modes of breeding, and everything, except that both happen to be long-legged birds. The Hurgila or 'Adjutant,' Leptoptilus argala, is called 'the gigantic crane.' The ordinary Indian cranes, Grus antigone, Gr. cinerea, Gr. virgo and Gr. leucogeranos, occur rarely in the North-West Provinces. The words Crane Geranos and Grus, and the Hindustani names of the three common Indian species, Saras, Karranch and Kakarra, all have reference to the loud trumpeting of these birds, which have a curious internal conformation resembling that of the trumpeter swans; whereas the storks are voiceless birds, having actually no vocal muscles, and can make no sound but by clattering their mandibles together, which they do pretty loudly. The ridge or keel of the breast-bone, common to all birds that fly, is in the cranes, belonging to the restricted genus grus, and in the trumpeter swans, expanded so as to form a cavity, which the wind-pipe is prolonged to enter and re-proceed from, after describing a vertical convolution therein. Mr. Yarrells' figure of this curious structure, as it exists in the Hooper swan, Cygnus musicus, is, in a general way, illustrative of it, as observed in the buccinator, the trachea even performs a second vertical convolution, while in the wild swan of North America (C. americana) and in the nearly affined Bewick's swan (C. bewickii) it is prolonged to form a horizontal loop in the body of the sternum, posterior to the vertical convolution within the keel, that is, in general, for several of Bewick's swans do not differ in this respect from the Hooper swan, although to all appearance of full age and development. In a newly hatched Hooper swan examined, not even an indication of the peculiar structure described could be detected: nor does it occur in the two species of crowned crane (Balearica) nor in the mute swans (Cygnus olor, C. immutabilis, C. atratus, C. nigricollis), nor probably in the C. coscoroba of South America; but the crowned cranes exhibit one curious anomaly in the organ of voice, which is that the long tendinous muscles, the office of which is to contract the windpipe, and which are known as the sterno-tracheales, from their ordinary mode of attachment, are not fixed, as usual, at their lower extremities to the sides of the breast-bone, but to the middle of the first pair of ribs! The sterno-tracheal muscles are wanting to the 'adjutant' and most other storks, are in a very few other birds, such as the condors (Sarcorhamphus) of the vulture family; indeed the vultures generally are among the most silent of the feathered creation, emitting no sound beyond a feeble cackling and snorting in their eagerness over their prey. In Australia the term 'crane' is applied to the egrets or white paddy-birds, as they are called in India; while in the Malay countries the so-called paddy bird, is a finch; and the real crane of Australia is known as the 'native companion.' Among the grallatores or waders, some cranes and storks, four-fifths of the ducks and the great majority of the scolopacidæ breed in the north and come to India in the cold season. There are four species of cranes in India, all of them principally or solely winter visitants. Of the species more or less diffused over India while in their winter quarters, two belong to the division termed Antigone, one to restricted grus, and one to Anthropoides of Blyth:

1. Antigone torquata; Grus antigone of Linnæus; Grus torquata, *Viellot*; the Saras, a noble bird, is the largest of the whole tribe. During the breeding season it has a pure white collar below the crimson papillose naked portion of the neck, whence the name torquatus. It is mostly seen in pairs; a few of which breed in India in extensive jhils, but the great majority cross the Himalaya for that purpose.

2. A. leucogeranos; Grus leucogeranos of Pallas, is the beautiful large white crane of Northern Asia, with black wing-primaries, and crimson naked face. A few stray pairs have been observed from time to time south of the Himalaya, in the upper provinces of Hindustan; and Burnes figured it from the vicinity of Cabul. Instances of its occurrence within the confines of India are worthy of special record. 'Mountaineer' once or twice indicated this fine bird in his narratives of Trans-Himalayan peregrinations. The other cranes have shorter and slate-coloured legs, and less (or in one instance not any) naked skin about the face.

3. Grus cinerea, *L.*; C. vulgaris, *Pallas*. The Kulung or Karrunch, or European crane: common to Asia and North Africa, visits India in great flocks, which wholly disappear in the breeding season.

4. Grus (or Anthropoides) virgo, *L.* The Kakarra, or 'Demoiselle,' common to Asia and North Africa; is only known in India during the cold weather; but it reaches further southward. It is the smallest of the cranes, and certainly one of the most elegant of this particularly graceful group; the only one with the head fully feathered, and it is adorned with beautiful white neck-tufts, and with lengthened and drooping tertiaries, and a bright crimson eye. Highly gregarious, the flocks are sometimes immense. All of the cranes are easily tamed and soon become reconciled to captivity; and they are very ornamental birds to keep. They have a curious and peculiar habit of skipping about at times, attitudinizing or dancing, and now and then emiting their loud cries. In the wild state they do much damage to the crops from their numbers; and repair during the heat of the day to sand-flats in rivers, or to other extensive waters, returning to feed morning and afternoon, at regular hours. They fly in V-like flocks, like wild geese. The young, commonly two in number, follow the mother soon after exclusion, unlike those of the stork and heron tribe, with which the cranes have little in common.—*Yule's Embassy, p.* 85. See Birds, Hanza, Henza.

SWANA, Hind. Daphne oleoides.

SWAN-PAN, a Chinese reckoning.

SWAN RIVER MAHOGANY, the Jarrah wood, or Eucalyptus marginata, is a tall and stately tree, the stem being frequently seventy feet in height before branching. It is the most enduring of woods, and if cut when the sap is down it defies decay. It is applicable for almost all purposes, being highly effective in ornamental wood work; for although somewhat inferior to Spanish mahogany in beauty of grain, still in more important matters it is most valuable for its natural properties. Time, weather, the white-ant, and that destructive sea worm, the teredo navalis, have no effect. For timbers of all kinds, for houses, warehouses, wharves, jetties, or bridges, it has no equal. At the Melbourne Exhibition in 1866, timbers of this wood were exhibited in perfect preservation, which had for thirty-five years been used as piles for a bridge over the river

Swan, near the sea, where the water is sometimes salt and sometimes fresh, and teeming at times with the above destructive worm.

SWARKA, see Jains.

SWARNA, SANS. Gold.

SWAROCHISHA, one of the 14 Patriarchs who preside over the 14 Manwantaras of the Calpa, noticed in the Calendar. See Brahmadicas, Menu.

SWARTZ, an eminent christian missionary and linguist. A monument has been erected for him in St. Mary's Church, Madras, Sacred to the memory of the Reverend Frederick Christian Swartz, whose life was one continued effort to imitate the example of his Blessed Master, employed as a Protestant Missionary from the government of Denmark, and in the same character by the Society in England for the propagation of christian knowledge. He, during a period of fifty years, "went about doing good," manifesting in respect to himself the most entire abstraction from temporal views, but embracing every opportunity of promoting both the temporal and eternal welfare of others, in him religion appeared not with a gloomy aspect, or forbidding adieu, but with a graceful form and placid dignity. Among the many fruits of his indefatigable labours was the erection of the church at Tanjore. The savings from a small salary were for many years devoted to the pious work, and the remainder of the expense supplied by individuals at his solicitations. The christian seminaries at Ramnadpuram and in the Tinnevelly province were established by him. Beloved and honoured by Europeans, he was, if possible, held in still deeper reverence by the natives of this country of every degree and in every section, and their unbounded confidence, in his integrity and in truth, upon many occasions rendered highly beneficial to the public service. The poor and the injured, looked up to him as an unfailing friend and advocate. The great and powerful, concurred in yielding him the highest homage ever paid in this part of the globe to Europeans. The late Hyder Ali Cawn, in the midst of a bloody and vindictive war with the Carnatic, wrote to his officers to prevent the Venerable Father Swartz to pass unmolested, to show him respect and kindness, for he is a holy man and means no wrong to any government. The late Tuljajee, rajah of Tanjore, when on his death-bed, desired to entrust to his protecting care, his adopted son Serfojee, the present rajah, with administration of all affairs of his country. On a spot of ground granted to him by the same prince, 2 miles east of Tanjore, he built an house for his residence and made it an orphan-asylum ; here the last 20 years of his life were spent in the education and religious instructions of children, particularly those of indigent parents, whom he gratuitously maintained and instructed, and here, on the 13th of February 1798, surrounded by his infant flock, and in the presence of several of his disconsolate brethren, entreating them to continue to make religion the first object of their effort, and imploring with his last breath for the divine blessing to attend them, he closed his truly christian career in his 72nd year.

SWASTIKA, a Tibetan sect, who received their name from their peculiar symbol the Swastika, or mystic cross, which was typical of their belief in Swasti. This term is a compound of Su, "well," and asti, "it is ;" meaning "it is well," or, as Wilson expresses it, "so be it ;" and implying complete resignation under all circumstances. According to the Chinese, they are the Tao-sse of the Chinese ; and the founder of the doctrine is said to have flourished between 604 and 523 B. C. The Swasti of Sanscrit is the Suti of Pali, and the mystic cross, or Swastika, is only a monogrammatic symbol formed by the combination of the two syllables sutti=suti. The Swastika sect were Rationalists, who held that contentment or peace of mind were the only objects worthy of attainment in this life. And as these have ever been the prevailing characteristics of mankind in the east, the atheistical principles of the Swastikas were received by the bulk of the people with very great favour. They assumed the name of Tirthakara, (see Fo-kwe-ki, 22, 23, and Cosma's Tibetan Grammar, pp. 181, 192. The old name of Tirthakar, is still preserved among the Mogal as Ter,) or "pure-doers ;" but by the buddhists of Tibet they are said to have been indecent in their dress, and grossly atheistical in their principles. Their Tibetan name Musteg, or "Finitimists," is significant of their doctrine of finite existence ; but they are more generally known as the Pon, or Pon-po. This sect, prevailed throughout Tibet until the seventh century, but is now confined to the furthest parts of the most eastern province of Tibet. The name of Pon is evidently only the Sanscrit punya, "pure,"—a synonyme of Tirthakara. Between the Swastikas, who promised nothing after this life, and the brahmans, who offered an almost endless series of mortal existences, people of strong minds and deep thoughts must have been sadly perplexed. The Greeks adopted the Indian symbol of Swastika, as the pottery from the Kamiras and the prototype of Crete show.

SWAT consists of a long valley, running

downwards generally in a southwesterly direction, but turning half round from east to west as it nears the British frontier, from which it is separated by a lofty range. It is difficult of access to a force moving from British territory. The Lundye or Swat river flows right through and fertilizes the valley, and then debouching through a gore in the hills, enters the Peshawur valley and joins the Cabul river near Charsudda. The Swat valley contains 300 villages and upwards; and its inhabitants may number 1,00,000 souls, of whom 20,000 might be fighting men. As soldiers, the Swati rank below several of the most martial tribes. Politically, the Swati consist of various clans, united under a loose federal government, at the head of which is an elective chief, styled padshah or king. In 1855, the king was a Syud, named Abkar, from the fanatic colony of Sitana. The high priest is called the "Akoond" (equivalent to the term doctor or reader) and is held in great veneration. Up to 1856 the king and the priest were sometimes said to be well-disposed persons, but they had never restrained their people from mischief. Swat is now under Pathan rule, with a subject race of Arian aborigines. North of Swat in the valleys of the Ghilghit river running into the Indus from the west, is an Arian people speaking a language of their own which is cognate to the tongue of the tribes east of the Indus in and about the country called Chilas. The Dard seem to be amongst those tribes, some of them are independent and scarcely known but most of the country and also Ghilghit, is now subject to the maharajah of Cashmir. The Ghilghit people are the farthest Arians of the country whence the Indus flows. Swat, or Subhavastu, is identified with Udyana, the Uchangna of the Chinese, and Udyana of Sanscrit. The Swat people are also sometimes called Deggaun and appear to be of Indian origin. They formerly possessed a kingdom extending from the western branch of the Hydaspes, to near Jellalabad. They were gradually confined to narrower limits by the Affghan tribes; and Swat and Boonair, their last seats, were reduced by the Eusofzye in the end of the fifteenth century. They are still very numerous in those countries. The course of the Swat river is imperfectly laid down in our latest maps, though so near our frontier, being almost a terra incognita; an intelligent native of Kandahar, who states that the lower ranges are destitute of trees but covered with grass. The higher hills on either side are clothed with forests, consisting chiefly of the edible pine and wild olive. The plane also flourishes in cultivated tracts. At the extreme head of the valley near Sardzaey, where is a pass leading into Kashkar, there are immense numbers of trees both along the river banks, and on the mountains on either side to their very summits.—*Cleghorn's Punjab Report, p.* 210; *The Bhilsa Topes, by Brevet Major Alexander Cunningham, p.* 19; *Calcutta Review, No.* 100, *p.* 44; *Campbell, pp.* 146-7; *Jour. As. Soc. of Beng.* 1862, *p.* 227, *by Capt. Raverty.*

SWAYAMVARA. One of the favourite incidents in the ancient heroic poems of the hindoos is the rite called Swayamvara or the choice of a husband by a princess from an assembly of suitors met from all parts to take their chance in the lottery. Success is not represented as depending on their own efforts, as in many of the fairy tales, where the knight wins the lady by his own prowess in a tournament; the heroes here submit themselves in silent rivalry to the princess' inspection as she walks along their line, and selects from the throng the favoured suitor by presenting him with a garland, or a cup of water or some such token of regard. This hardly corresponds with the practice as we find it described in hindoo literature, since Arrian represents the lady as acting a merely passive part, whereas, if we may judge by the poems and by the very name Swayamvara (from 'Swayam,' 'herself,' and vara, 'choosing'), she had a much more active share in the transaction. We find an allusion in a later part of the Institutes of Menu, which proves the prevalence of the custom, as it is said (ix, 90, 91), "three years let a damsel wait, though she be marriageable; but after that time, let her chose for herself (vindeta) a bridegroom of equal rank, if, not being given in marriage, she choose her bridegroom (adhigachhed yadi swayam,) neither she nor the youth chosen commit any offence." The scholiast explains it of the so-called Swayamvara, "adhikagunavaratable samanajatigunam varam swayam vrinita." It seems to have been common in the hindoo society of former times for princesses and women of rank to select a husband for themselves. The candidates for the hand of the lady were invited to her father's house, and after previous festivities for some days, were collected in a hall, round which the damsel passed and selected her future lord, by throwing a garland round his neck, the marriage rite was then celebrated as usual. The custom is the subject of much pleasing poetic description in the Mahabharat, the Naishadha, and other works. A translation of the Swayamvara of Draupadi from the former is published in the Calcutta Quarterly Magazine for September 1825. In the Hero and the Nymph by Kalidasa, (Hind. Th., Vol. i, p. 226). Pailava, describes a scene, in which Urvasi played Lakshmi ; Menaka, was Varuni. The latter says :

Lakhshmi, the mighty powers that rule the spheres
Are all assembled : at the head appears
The blooming Kesava. Confess, to whom
Inclines your heart ?

Damayanti was the tried and exemplary wife of Nala. She prayed for her union with him, having enquired after, and seen him in her apartments. Her becoming Swayambara again was simply to make Nala, from whom she had been separated, know where she was, that he might come there and be united to her. Of the Kshatriya women some married according to the Brahma mode, and some became Swayambara. Aja married Indhumati who was Swayambara. His son Dasaratha had the daughter of Kosala offered to him, and he married her ; but his second wife Kaikeyi whom he won, was a Swayambara. Janaka, king of Mithila, made his daughter Sita Swayambara. She prayed that she should be the wife of Rama who bent the huge bow and was the successful competitor. The high character of Sita as a model wife and a holy woman is well-known. When she met the venerable wife of Atri and was highly complimented, she said that, although she was devoted to Rama, and she tried her utmost to follow him, she doubted whether her soul mirrored the purity of his. When she solicited permission to accompany her husband into banishment, she said—

" A wife must share her husband's fate,
My duty is to follow thee
Wherever thou goest. Apart from thee,
I would not dwell in heaven itself.
Thou art my king, my guide,
My only refuge, my divinity."

After the death of Ravana, when she appeared before Rama, and when he cast reflections on her chastity, she dashed away her tears, brought on by the interview, and rising from the dust at his feet, addressed Lakshmana as follows :— " Son of Sumitra ! In thine eyes I see pity and trust of me. Build me a funeral pyre. Brother ; since am tainted in Rama's sight, 'tis time should die." When Draupadi became a Swayambara, it was proclaimed that whoever would bend an enormous bow and by it shoot five arrows simultaneously through a revolving ring into a target beyond, would win her. When she was brought to the Sabha, Dhristadumna informed her of the names of those who had been assembled. After the failure of several princes Karna rose, when Draupadi publicly said,—" I will not marry a carpenter's son." Arjuna rose, tried, succeeded, and won the bride. When she was taken to Kunti the latter inadvertently said to her sons,—" What you have acquired should be your common property." What emanated from a mother must be done. The propriety of the marriage of one woman to five men was discussed at the Drupada raja's palace where Kunti was present, and took a part in the discussion. Vyas supported Kunti, and sanctioned the proposed marriage. It appeared that during the Vedic times, the daughter of a rishi was married to Prachata and his nine brothers, and another woman of the Gautama line was the wife of a hundred rishis. But these were exceptions, they are not alluded to in the Rig-Veda, and were quoted to legalise the marriage of Draupadi with the five Pandava. Draupadi is described as an educated lady, and according to her own account she used to receive instruction from a brahmin teacher, while on the lap of her father. The Bana Purva records her two conversations ; one with Yudhishthira, on forgiveness and the Providence of God, in which she shows great powers of observation ; and the other with Satyabhama, wife of Krishna, who came to her while she was living in the forest with her husbands. The subject was, on the best way of making the husband attached to the wife. Draupadi said that she conducted herself humbly, serenely and devotedly to her husband ; she daily cleaned the house, utensils, cooked and offered meals at the appointed time. While at Indraprastha, she took care of Kunti, saw numerous brahmins and maid-servants fed and clothed ; she also looked after the servants, cowherds and shepherds. She took care of the treasury, and gave orders on all matters connected therewith. She performed all her duties with every regard to truth, but unmindful of her personal comfort. She added, the faithful wife cannot attain happiness unless she practises self-denial. Do what I have told you, and before strangers remain quiet, but true to your convictions, avoiding excitement and thoughtlessness, and make those your friends who are virtuous and devoted to their husbands. When Jayodrata seized and carried her away, he was pursued by the Pandava; she had then the generosity to advise him to lay dowh arms and implore forgiveness.

Kunti was brought up by Kunti Bhoja; while at her father's, she took a delight in entertaining guests. She became a Swayambara, and Pandu received her garland. When Draupadi was married to her sons she addressed her as follows :—"Daughter! be thou full of esteem and love to thy husbands, as Indrani was to Indra, Swaha to Bibhasara, Rohini to Chandra, Damayanti to Nala, Bhadra to Baiswanara, Arundhati to Vasishtha and Lakshmi to Narayan. Be thou the mother of heroes. Employ thyself with thy husband in religious service, and thy prosperity will be unlimited. Oh daughter, employ thy time in looking after the guests, visitors, the virtuous, children and the elders. By thee the rajah's of the principal cities of Kura Jangala, &c., will be installed." Kunti's next address to Draupadi was when she was about to proceed with her husbands, beggared by the game at dice, to pass twelve years in exile and one year in disguise.—*Hindoo Theatre*; *Calcutta Review, No.* 109, *pp.* 39, 40; *Calcutta Quarterly Magazine, Sept.* 1825.

SWURNAKARA, SANS., from swarna, gold, and kree, to make.

SWURYOGA, SANS., from swar, heaven, and yoga, a sacrifice.

Sweet Calamus, the aromatic which was of equal celebrity with Spikenard, mentioned by the same authors, and procured from the same country, is described by Dioscorides under the name of Κάλαμος ἀρωματικος. It is supposed by Sprengel and some authors that the Acorus calamus of botanists is intended, which is possessed of slight aromatic properties, is common in European ditches, and is likewise found in India in mountainous situations.

Sweet-cane, or Calamus, being described by Dioscorides immediately after Σχῖνος, which is generally acknowledged to be A. schænanthus, appears to Dr. Royle to belong to the same genus, and, indeed to be the above far-famed species, Calamus aromaticus is thought also to be the sweet-cane and the rich aromatic reed from 'a far country' of Scripture. He states that there is no plant which more closely coincides in description with everything that is required than the tall grass which yields the fragrant grass-oil of Central India, and which he named Andropogon calamus aromaticus.—*Illust. SWERGA, according to hindoo mythology, the paradise of Indra. The Apsara, in hindoo mythology, are nymphs of Swerga, the celestial court of Indra, celestial dancers, celebrated for their beauty. Amongst them is Rembha, the popular Venus of the hindoos and some others are described to be of inconceivable loveliness. They answer to the Pari of the ancient Persians, and the damsels called in the Koran, Hur-ul-ayun, the antelope-eyed Huri. These hindoo nymphs were produced at the churning of the ocean, as related in the Ramayana. Sir William Jones thus describes them in Swerga:

> "Now while each ardent Cinnara persuades
> The soft-ey'd Apsara to break the dance,
> And leads her loth, yet with love-beaming glance,
> To banks of marjoram and champac shades,
> Celestial genii tow'rd their king advance,
> So call'd by men, in heav'n Gandharvas named."

According to Kshatriya belief, warriors slain in battle are transported to Indra's heaven by these Apsarasa or nymphs of Swerga. Thus in Manu, vii, 89, it is said, 'Those rulers of the earth who, desirous of defending each other, exert their utmost strength in the battle, without ever averting their faces, ascend after death directly to heaven.' And in Book ii, 19, of the Nala, Indra says, 'Why are no warriors slain now-a-days, that I see none arriving in heaven to honour as my guests?'—*Coleman's Hindoo Myth.*; *Sir William Jones' Hymn to Indra, Vol.* xiii, *pp.* 270-73; *Tr. of Hind., Vol.* i, *p.* 302; *Williams' Story of Nala, p.* 140. Satin wood,	Eng.	Kodowah porsh,	Tam.
Dhoura,	Hind.	Billuga, Billu Karra,	Tel.
Burute, Buruch,	Singh.		
Gaha, Mal-burute,	,,		

This cabinet wood is well known for its glossy yellow shades. The tree grows in the peninsula at Gokak, on sand stone hills: and on the Alleh-Bella Hills, also in the southern, eastern and northern districts of Ceylon; and is recognised to be of two kinds, there, the ordinary satin wood which is used for oil presses, waggon wheels, bullock carts, bridges, cog wheels, buildings, and furnitures, and the flowered satin-lustered samples of the same wood, which is used for picture frames, furniture, backs of hair brushes, and cabinet work, and next to calamander, is the most valuable of the Ceylon woods. It is hard, weighs 55 lbs. or 57 lbs. to the cubic foot and is supposed to last about 80 years. It occurs in the northern circars. Very fine satin wood grew at Cotaputty in the Tengricottah taluq of Salem, but Dr. Cleghorn supposes that a good deal of the oldest and best was destroyed by the Railway contractors. It is used in the Madras presidency, for the naves of gun carriage wheels and is the best suited of all the Madras woods, for fuses. In beauty and lustre, the flowered samples rival the bird's eye maple of America. Tredgold mentions that in England, the best variety of the wood is the West Indian, imported from St. Domingo, in square logs and planks from 9 to 20 inches wide; the next in quality is the East Indian, shipped from Singapore and Bombay in round logs from 9 to 30 in diameter.; and the most inferior is from New Providence, in sticks from 3½ to 10 inches square; the wood is close, not so hard as box-wood, but somewhat like it in colour or rather more orange; some pieces are very beautifully mottled and curled. It was much in vogue a few years back for internal decoration and furniture, but is now principally used for brushes, and somewhat for turning, the finest kinds are cut into veneers, which are then expensive, the Nassau wood is generally used for brushes. Satin-wood of handsome figure was formerly imported in large quantities from the Island of Dominica. The wood has an agreeable scent, and is sometimes called yellow saunders. The price in the Madras presidency, is nearly the same as that of teak and black wood. A satin wood, a beautiful wood for ornamental furniture, was sent from Penang. —*Roxb. Flor. Ind., Vol.* ii, *p.* 400; *Tredgold*; *Dr. Cleghorn's Conservator's Report, p.* 15, *for* 1860; *M. E. J. R.*; *L. E. J. R.*

Fam. Podicipidæ, 1 gen. 2 sp. viz., 2 Podiceps cristatus, Philippensis.

SWIETENIA FEBRIFUGA, *Roxb.* Syn. of Soymeda febrifuga, *Jus.*

SWIETENIA MAHOGANY, Mahogany. The mahogany tree has been introduced into British India.

SWIFT, a genus of birds, one of them the Cypselus affinis is common, and builds in societies among ruined places and domes, its nest is made of clay, intermingled with feathers and grass. In haunts and habits it much resembles the European black swift, which, it would appear, has not hitherto been found in Hindoostan.

SWIMS, or Fishmaws.

SWINE, the hog family. The Jews and Egyptians were alike in refusing to eat the flesh of swine ; except that the Egyptians who reared those unclean animals to sacrifice to Isis and Osiris, indulged themselves in eating pork once a month, on the day of the full moon.

SWORD. A metal alloy known as "sakela," is used in the Panjab for the manufacture of swords, &c., consisting of cast-iron, asbat and kheri iron, and foulad or steel welded together. Occasionally, in Jammu, a small quantity of silver and sometimes tin, is beaten into and welded with the finest sword blades for the sake of texture and polish. The sword cutlers of Ispahan formerly enjoyed great celebrity, and numbers of swords are still manufactured there. The best blades are all made of Indian steel, imported in the form of small round cakes which cost about two tomans each. Old Persian swords will fetch very high prices, all over the east ; for they cannot now-a-days fabricate blades equal to those of former ages. When the blade has been hammered out of the koor or cake of Indian steel, it is put in the furnace, and kept there all night, subjected to the action of a low fire. In the morning it is taken out, smoothed and filed into shape, and then heated red hot, and immersed for a few moments in a trough filled with castor oil. It is next polished, sharpened, and the hilt and scabbard fitted to it ; and the last thing done, is to bring out the jowhar or damask pattern. For this purpose, the blade is perfectly cleansed from oil or grease ; and a yellow kind of stone is ground to powder, mixed with hot water in a cup, which must be of china or glass, not metal, and the solution laid on over the blade with a piece of cotton, two or three times. This brings out the black jowhar perfectly. The scabbards of Persian swords are all made of thin laminæ of wood joined together and covered with black leather with a sort of pattern stamped on the outside. The devotion of the Rajput is still paid to his arms, as to his horse. He swears by the steel, and prostrates himself before his defensive buckler, his lance, his sword, or his dagger. The worship of the sword (asi) may divide with that of the horse (aswa) the honour of giving a name to the continent of Asia. It prevailed amongst the scythic Geta, and is described exactly by Herodotus. To Dacia and Thrace it was carried by Getic colonies from the Jaxartes, and fostered by these lovers of liberty when their hordes over-ran Europe. The worship of the sword in the Acropolis of Athens by the Getic Atila, with all the accompaniments of pomp and place, forms an admirable episode in the history of the decline and fall of Rome ; and had Gibbon witnessed the worship of the double-edged sword (khanda) by the prince of Mewar and all his chivalry, he might even have embellished his animated account of the adoration of the scymitar, the symbol of Mars.

The Bikaner people work well in iron, and have shops at the capital and all the large towns for the manufacture of sword blades, matchlocks, daggers, iron lances, &c. The sword handles, which often are inlaid with variegated steel, or burnished, are in high request, and exported to various parts of India.

In Cutch, an inch bar of fine English or Swedish steel is forged into plates 7 inches long, 1 broad and $\frac{1}{6}$ thick : similar bars of fine spot iron are prepared in the same manner. These are smeared with a paste of borax dissolved in water, and laid in piles of twelve, nine of steel to three of iron, or three to one, alternately ; each pile is wrapped round with rag thickly plastered with mud made of a loamy earth ; then heated, welded, and drawn out to a bar one inch and one-eight broad and one-third of an inch thick, this is bent zigzag three or four times ; is again welded and drawn out to half an inch thick ; and during the heat, borax is frequently dropped on the metal while in the fire. Two of these bars are next welded into one and when about twelve or fourteen inches long it is bent into the form of a loop or staple. In the middle of this a piece of fine grained file is inserted of the same width and nearly as thick. All is then welded together and the blade is formed. To temper the blade, an earthen pot twelve inches wide and six deep is notched on the edges (the notches being opposite each other) with a file about a quarter of an inch deep and is then filled nearly up to the notches with water. Oil is then poured on the surface. The blade being heated equally to a light red is removed from the fire and the point entered into a notch on one edge is passed to the opposite one keeping the edge from a quarter to half an inch in the oil. It is drawn backwards and forwards rather slowly till the hissing ceases and the rest of the blade above the fluid has become black. A jug of water without oil is then poured along the blade from heel to point. In order to take out the warp produced by tempering, the blade when nearly cold is passed over the fire three or four times, then being brought to the anvil is set straight by striking it regularly but moderately with a hammer; by this means a damascus curved blade may be brought nearly straight. Swords, in Asia, are made with a hilt so small as to render it impossible for a European hand to use them in the manner of cutting which is common with Europeans. In cutting, an oriental does not straighten his arm at the elbow, the handle is purposely made small and confined, in order that the swordsman may not be forced to straighten his arm, but draw the cut as he delivers it. Mr. Vigne, when at Teheran, had seen a sheep laid in two at one stroke, and Suliman Mirza, one of the numerous sons of the late Futteh Ali Shah, king of Persia, had been known to cut a donkey in half at one sweep of his sword. The sword is an object of veneration or worship among the Govind Sikhs, as it was amongst the Getes, the Scythian ancestors of the Jats, from whom the Sikhs are descended. —*Tod's Rajasthan, Vol.* ii, *p.* 204; *Royle's Arts, &c., of India, p.* 460; *Rohde, MSS.*; *History of the Punjab, Vol.* i, *p.* 105. See Kharg, Sword.

SWURNU-JOOTHI, Beng. Yellow jasmine, Jasminum chrysanthemum.

SWUTI, Beng. Mountain panic grass, Panicum holcoides.

SYADREE, or the Western ghauts, called by the natives Syadree in its N. part; and Sukheit in its S. part, Malabar Coast. Length, about 800 miles; from about 21° 15′, 73° 45′, and 74° 40′, they terminate almost precipitously, forming the N. side of the gap of Palgatcheri. Average height, 4,000 feet. About 21°, 2,000 feet; Mahableshwur, 18°, 73° 40′, 4,700 feet; Poorundher, 4,472 feet; Singhur, 4,162 feet; Hurreechundurghur, 3,894 feet; about 15°, 1,000 feet, towards Coorg; Bonasson Hill, 7,000 feet; Tandianmole, 5,781 feet; Papagiri, 5,682 feet. Seaward face, though abrupt, is not precipitous, but consists of a series of terraces or steps. Chasms or breaks in the range give access to the highlands, and are denominated ghauts or passes, a name which has become generally applied to the range itself. The core is primary, inclosed by alternating strata of more recent origin. Scenery delightful and grand, displaying stupendous scarps, fearful chasms, numerous waterfalls, dense forests, and perennial verdure.

SYALITA—Dillenia speciosa.

SYAMA, see Dhermaraja or Yama.

SYAMA RAHASYA, see Tantras.

SYAMAK, (Panicum colonum) a kind of grain used generally among the poorer classes. The stalk forms good fodder for cattle.

SYAMALI, Tel. Helicteres isora, also Isora coryllifolia, *Linn.*

SYAN CHANE, see Yarkand.

SYANG, in lat. 0° 20′ N., long. 129° 54′ E., is a low flat island in the Gillolo passage. See Wu-tsau.

SYCAMORE TREE of Scripture, Morus nigra, *Linn.*

SYCAMORE FIG TREE.

Ficus sycamorus.

A large tree found in Egypt.

SYCEE-SILVER, silver in the form of ingots, of various weights. The purest quality has 97 to 99 pure silver.—*Simmond's Dict.*

SYCHET. Previously to the conquest of Assam, in 1824, the inhabitants of Jyntea were in the frequent habit of capturing British subjects in Syehet, to offer up as sacrifices at the shrine of Kalee. In 1832, two British subjects were passing along the high-road in Assam, when they were suddenly seized and carried up into the hills in the neighbourhood of Goba, in the Nowgong district. After having been decked out with new clothes and jewels, they were led away to be sacrificed, together with two other persons, also subjects of the British government. One of the individuals, however, succeeded in making his escape, and on his return to the plains, he gave information of what had occurred; and as no tidings were ever afterwards heard of the three other individuals, little doubt remained but that they were sacrificed. The chief had been frequently required to surrender the guilty individuals, but all to no purpose; and there being strong reason for believing that the chief had wilfully screened the perpetrators of this horrible crime, the Governor-General, Lord William Bentinck, in February 1835, confiscated all his territory situated in the plains. Dantipar consequently became annexed to the district of Nowgong; and these horrible atrocities were put a stop to.—*Butler's Travels of Assam, pp.* 246-47.

SYDIVA, see Pandu, Polyandry.

SYE, a river near Juanpoor passing Pertabghur in Oudh.

SYED, one of the four mahomedan tribes. The Syeds, the Saadat, or lords are descendants of Mahomed, through his daughter Fatimah and her husband Ali, and as a rule are quiet, humble-minded men not distinguished by other qualities from the Sheikhs; they are of Suni and also of Shiah persuasion, and are met with serving as soldiers, or in civil avocations or following some religious duties. Syeds range themselves as Hasani, Hoossaini and Alavi. A Syedani, is a Syed woman. Amongst the women of the Syeds of Madras most can read the Arabic Koran and the Hindustani books of Belief and Devotion, but they cannot write: in all Madras, there may be more than one thousand of this class of women, some of them also able to read Hindustani story books and can write a little, while a few even know the Persian Gulistan, Bostan, Anwar-i-Sohaili, Abul Fazl, and other usual books in Persian, and can even write the Persian grammatically, but there are not more than ten or fifteen such women, in all Madras. Also about four or five hundred of them are good needlewomen and embroiderers. The Syed race of Barh in northern India, furnished many persons of note to the courts of Delhi from the reign of Akbar to that of Ferokser. They are still numerous in Mozuffernugger.—*Wilson's Glossary.*

SYED ABDOOL QADIR JILLANEE, or Peer-i-Dustageer.

SYED AHMUD KUBEER, the founder of the Rufaee class of fuqeers.

SYED, ALIWI, the descendants of Ali, of his other wives, not by Fatima.

SYED, Hussunee and Hoseinee, the descendants of Ali by Fatima.

SYED JULLAL-OOD-DEEN, Bokharee.

SYED OOL TAAM, the prince of food.

SYED SHAH ZOOHOOR, distinguished by his wisdom, piety, and austerity of life. He built a small monastery of earth at Allahabad, which still remains. He was celebrated for his miracles, by his prayers the most frightful chronic complaints were immediately removed, of which an instance is given in respect to the case of the governor of Allahabad, nawab Oomdat ool Moolk Ameer Khan. Zoohoor boasted of having lived three hundred years.

SYED ZEIN OOL ABIDIN, a saint venerated.

SYHADRI a range of mountains continuing down from the S. W. end of the Aravalli to the western ghauts of India. See Syadree.

SYKES, Colonel William, Bombay Army, he was Statistical Reporter for the Deccan from 1821 to 1834 ; from 1840, one of the Directors of the East India Company ; a distinguished Zoologist, Meteorologist, Geologist, Antiquary and Statist. He has written so much on each of so many subjects, that his papers are classed below :

Meteorology.—Mean temperature of India at various elevations, Rep. Brit. Assn. 1834, Vol. iii, p. 567. On the measurement of heights by the thermometer, Ibid, 1835, Vol. iii, p. 25 ; Lond. Geo. Trans. ; Bom. Geo. Trans, 1839 ; Jackson's What to Observe, &c. On the remarkable difference betwixt the fall of rain at Mahabaleshwar, and that at Bombay and at Poona ; Ibid, 1839, Vol. vi, p. 16. On the meteorology of the province of Coorg, in the Western Ghauts ; Ibid, 1842, Vol. xi, p. 22. On the fall of rain on the coast of Travancore and Table-land of Uttree Mullee, Ibid, 1846. On the fall of rain on the Table-land of Uttree Mullee, Travancore, 1846, Ibid, 1848, p. 39. On a remarkable storm at Bombay, 6th April 1847, Ibid. On Indian hail storms, Ibid, 1850, 43. On the atmospheric tides in the Deccan. Phil. Trans. 1840. On the meteorological observations in India, Phil. Trans. 1850.

Zoology.—Geographical range of certain birds common to various parts of the world, chiefly to India, Rep. Brit. Ass. 1835, Vol. iii, 69. Fishes of the Deccan. Trans. Lond. Zoological Soc. 1838. Catalogue of the mammalia of the Deccan. Zool. Trans. 1831, republished, Bl. As. Trans. 1832, Vol. i. Birds of the Deccan. Zool. Trans. 1832 ; republished, Bl. As. Trans. 1834, Vol. iii. Quails and Hemipoda of India. Lond. Vol. i, 4to.

Statistics.—Wages of labourers in the Deccan. Rep. Brit. Ass. 1835, Vol. iii, 118. Special report on the statistics of the Deccan, its extent, and physical circumstances ; geology ; ghauts ; escarpments ; climate ; botany ; zoology ; antiquities ; population ; education ; irrigation ; mountains, &c., (See Deccan,) Rep. Brit. Ass. 1837, Vol. vi. On the mortality of Calcutta, Ibid, 1844, Vol. xiii, 88. On the Statistics of hospitals for the insane in Bengal. Ibid, 89. Statistics of civil justice in India for four years, from 1841 to1844, Ibid. 1846, 94. Of charitable dispensaries in, Ibid, 96. Statistics of the Agra Government, or N. W. Provinces. Ibid. 1847. Statistics of civil justice in Bengal, to which Government is a party. Ibid, 1848, 116. Contributions to the statistics of Sugar produced in India. Ibid, 1849, 108. Statistics of civil and criminal justice under the Bengal Government for the years 1844, 1847, 1849. Rep. Brit. As. 1836, vol. v. Statistics of the educational institutions of India. 1858. 8vo. On the fruits of the Deccan ; twenty-one kinds of ordinary wild fruits ; importance of communication for the introduction of plants of India. (Rudiments of Indian exhibition of 1858 ; Bombay economic museum, Sir A. Johnstone on, in Lond. As. Trans. Dr. Buist on, Bom. Geo. Trans. 1848). On the Dutch possessions of the East Indies, Rep. Brit. Ass. 1848, 112. Prices of cerealia and other edibles in England and India compared. Rep. Brit. Ass. 1847. Mortality in the Jails of the 24 pergunnas, Calcutta. Rep. Stat. Survey of India, 1841. Catalogue of Chinese Buddhist works. Lond. As. Trans. On the land tenures of the Deccan. Ibid, 1834, Vol. ii. 205—233 ; 1836, Vol. iii, 350—376. On the state of India before the Mahomedan invasion, founded on the travels of Fa Hian. Ibid, 1836, Vol. vi, 248. On the proprietary right of the soil vested in

the subject, not the sovereign, in India. Ibid, 1836, Vol. vi, 246. Same subject as land tenures of the Deccan. Mortality and chief diseases of troops under the Madras Government in 1851 compared with that in 1842, 1846 and 1849. Jl. of Lond. Stat. Soc. 1851. On expenditure of the Government of India on public works. Ibid, 1850.

Geology of a portion of the Deccan, Lond. Geol. Trans., Vol. iv, second series 4to. On a fossil fish from the table-land of the Deccan, Lond. Geol. Trans., 1851, Vol. vii. —*Buist's Cat.*

A large collection of plants of the Bombay presidency, chiefly from the neighbourhood of Poona, were presented by Colonel Sykes to the society. In 1832, a catalogue of birds, collected by Colonel Sykes in the Bombay presidency, was also published in the Proceedings of the Zoological Society of London. In this were enumerated 226 species, of which above 40 were described for the first time, many of them common and abundant birds. This catalogue was undoubtedly the most valuable enumeration of the birds of India published, and contains descriptions, with many highly interesting observations on the habits, food and structure of many of the species. Of those enumerated by Colonel Skyes there were about 9 or 10 which Dr. Jerdon, when writing in 1839, had not observed, most of which are probably peculiar to the more northern portion of the range of ghauts and neighbouring table-land.—*H. et T.*

SYKESIA KŒNIGII, *Arn.*, also S. thyrsiflora, *Arn.*, syn of Gærtnera kœnigii, *Wight Ic.*

SYKESIA WALKERI, *Arn.* Syn. of Gærtnera walkeri, *Wight's Illust.*

SYLABCHEE, or Chillumchee, HIND., PERS., a wash-hand basin.

SYLHET, possesses a few manufactures. The natives there excel in some kinds of ivory work. They manufacture a variety of articles, including ladies' bonnets. They also make shields of buffalo and rhinoceros' hides, which are celebrated throughout India for their durability and polish. The varnish is made of the juice of the Semecarpus anacardium or Indian marking-nut. One description of target called Afla-o-i, which is made here, is not varnished but is rendered by some peculiar process of preparing the leather, semi-transparent. The other skins of the district are an article of traffic, and would bear a comparison with similar furs in Europe. Considerable quantities of them are prepared annually both here and in Mymensing. They were formerly sent to Tibet, but they are now chiefly exported to China. The other manufactures for which Sylhet is famed, are sword handles, morahs, articles of brass-work (made at Toroff,) and fine 'seetalpatee' mats, such as are commonly used in Bengal, for covering the seats of chairs, beds and couches. This place has, also, long been celebrated for the preparation of certain perfumes, as the attars of uggur or lign aloe, and Nag-kesoor, (Mesua ferrea); also several compounds of essential oils, of which that of Cassia is one of the principal ingredients, the tree (Aquilaria agallocha, Roxb), which yields the lign aloe, grows in the Naga country between Sylhet and Assam, also in Cochin-China and Siam. Both the wood and the essence extracted from it at Sylhet, are purchased by Mogul merchants for exportation to Bussora, and other mahomedan countries, where they are held in high estimation and much used, the attar, as a perfume, and the wood, for fumigating apartments and cloths. Lign aloes is interesting from its antiquity as an export from India, being an article that was formerly much used as incense in Western Asia. It is mentioned under the name of agallochum in scripture. Amongst the articles of export, are a variety of parti-coloured cloths, generally known by the name of Sylhet cloths. Some of them are dyed of rich colours, and being of a strong durable texture, are well-adapted for table covers, to which purpose they are usually applied in the eastern part of Bengal.—*Dr. Taylor.* See Cossyah, Khassia, Khumia, Kuki, Polyandry, Sanatoria, Silhet, Tea.

SYLOCHELIDON CASPIA, also Sterna caspia: 'Caspian tern.' Warmer regions of the old world generally, Australia (S. strenuas, *Gould*): not rare in parts of India; but doubtful as occurring in Lower Bengal.

SYLVAN DEITY, Pan, see Vishnu.

SYLVIA ATRICAPILLA, (Curruca atricapilla: 'Blackcap warbler,') Europe, W. Asia, Arabia, (Schlegel), Japan, (Temminck), all Africa. One killed in Java; (Temminck.)

Sylvia cinerea, (Curruca cinerea: 'Common white-throat,' (Europe, Asia Minor, Arabia, (Schlegel), N. Africa: migratory.

Sylvia curruca, (Curruca sylviella: 'Lesser white-throat,') Europe, Asia, Africa: migratory. Common in India; and a nearly affined but larger species in S. India, S. affinis (Curruca cinerea, apud Jerdon.)

Sylvia orphea, (Curruca orphea: 'Orpheus warbler,') Europe, N. Africa, Arabia, (Schlegel) rare in Britain: migratory. The Indian race seems to differ only in having a somewhat longer bill: inhabiting both Upper Hindustan and S. India.

SYLVIA NIGRICAPILLA, see Ornithology.

SYLVIA PHILOMELA, see Bulbul.

SYLVIA SUTORIA, Tailor bird.

SYMPHOREMA. Of this genus of the verbenaceæ Wight, in Icones, gives involucratum, polyandrum.

SYMPHOREMA INVOLUCRATA. A species of St. Peter's wort, cultivated by seed or cuttings.—*Riddell.*

SYMPHYTUM OFFICINALE.

Συμφιτον	Diosc., iv, p. 6	Sunkootun,	Hind

Roots large, externally black, and branching, about a foot long, the thickness of the finger, fleshy, brittle, succulent, and pulpy. Inodorous taste, sweetish and mucilaginous. The plant is highly mucilaginous, and rather astringent, it also contains sugar and albumen. The recent root is in popular use in France in cases of rupture and bruises. Indeed the plant derives its name from its supposed virtue in consolidating wounds.—*O'Shaughnessy, p.* 496.

SYMPLECTES, see Ploceinæ.

SYMPLOCOS (from συμπλοκή, a knitting together), a genus of plants belonging to the natural order Styraceæ. Wight, in Icones, gives Symplocos foliosa, Gardneriana, microphylla, monantha, nervosa, obtusa, pendula, pulchra, racemosa. Thunberg gives as plants of Japan.

Japonica, *DC.*
Prunifolia, *S. & Z.*
Myrtacea, *S. & Z.*
Lancifolia, *S. & Z.*
Leptostachys, *S. & Z.*
Theophrastæfolia, *S. & Z.*

In Burmah there are three undetermined species, viz., one named Kunneen, Burm., another Keun-la, Burm., and a third Kain-tha-pho-gee, Burm., the last named is a tree of Tavoy, where its timber is used in boat-building. Symplocos racemosa, known as lodh and S. tinctoria, a native of Carolina, are used for dyeing.

SYMPLOCOS, *species.*

Kam-tha-pho-gee, Burm.

A timber of Tavoy, used in boat-building.

SYMPLOCOS, *species.* A few of the people of Lampteng in Sikhim find employment in drying the leaves of a shrub, one of the genus Symplocos, for the Tibet market, which are used as a yellow dye.—*Hooker's Him. Jour., Vol.* ii, *p.* 41.

SYMPLOCOS PANICULATA.

Symplocos,	Eng.	Lodh,	Punj.

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 to 9,000 feet. Used in dyeing madder.—*Cleghorn's Punjab Report, p.* 67.

SYMPLOCOS PULCHA, on the Neilgherries, has hairy leaves and snow-white flowers.

SYMPLOCOS RACEMOSA, *Roxb.'s Fl. Ind., Vol.* iii, *p.* 539.

Lodh,	Beng., Hind.	Lodduga,	Tel.
Hoora,	Mahr.	Erra lodduga,	,,
Savura, Lodhra,	Sans.		

This small tree, from ten to twelve feet high, and with a trunk about 20 inches in circumference, is a native of Nepaul and Kumaon and of Burdwan and Midnapore in Bengal. It grows also in the Kotah jungles, but, in the Bombay presidency, it is found only in the jungles of the highest ghauts. Wood small, white or yellowish, hard and durable, suitable for turnery. It is strong and compact, and might be used for cabinet as well as for other purposes. The bark of the root is sold at 4 seers the rupee, and is used in Rajputanah, for dyeing red. It is also used in medicine, being considered heating and promotive of the secretions. It is used also in the mesalihs for animals. The bark furnishes one of the red powders, known as 'abir,' scattered by hindoos in the festival of the hoolee.—*Thompson*; *Roxb.'s Fl. Ind., Vol.* iii, *p.* 239; *Voigt.*

SYNAGOGUE, is the name given to the religious buildings of the Jews. Speaking of Jewish customs, Jesus says they love to pray standing in the synagogues, and in the corners of the streets! Both hindoos and mahomedans offer their devotions in the most public places; as, at the landing-places of rivers, in the public streets, and on the roofs of boats, without the least effort at concealment.

SYNDESMIS TAVOYANA, *Wallich.*

Ka-tha khyæ,	Burm.	Mergui red wood,	Eng.
Tavoy red wood,	Eng.		

A very large tree of British Burmah. The wood makes handsome furniture, and is used for building, boxes, &c., and, in Tavoy, for similar purposes to what the gum kino wood is applied at Moulmein. It is, occasionally, a beautifully variegated wood, well adapted for furniture and ornamental purposes. It contains a dye, and is in great abundance in the islands on the coast and near Moulmein. When the wood is steeped in ferruginous mud, it turns jet-black and looks like ebony. The large cylindrical knobs, one or two inches in diameter, so often noticed in the ears of Karen women at Tavoy, are made of this wood after the colour has been changed. Mergui red-wood is a valuable dye wood for both black and red, but more especially for orange. From an article in the Journal of the Asiatic Society, it appears that a number of experiments, made at the request of Mr. G. Swinton, by Mr. Thomas Speir, upon the Mergui dye wood, prove that it affords, with the mordants commonly used by dyers, colours equally bright and of a more permanent nature than those of most other dye woods. The colours imparted to silk with different mordants were as follow :—

Muriate of tin. Three shades of orange, varying with the temperature of the bath, and the time of immersion.

Acetate of alumina. Two shades of flame colour.

Acetate of iron. Two shades of drab.

Ditto, with a weak decoction of galls. A fine black, two shades.

Mixed with manjit, a variety of red and pinks are obtained, but not perhaps equal in intensity to those of the manjit alone. The chief attraction of this wood as a dye, is the orange colour which it yields with the aid of muriate of tin and acetate of alumina, of a great variety of shade. These results show that the wood is deserving of further attention, and that it may become eventually an important article of commerce with our possessions on the Tenasserim Coast. It is not quite certain, however, what tree produces the Mergui red-wood. The flowers which accompanied the specimens of the wood sent to Calcutta, belonged to the Burman black varnish tree, yet Mr. Maingay who sent them, thought it a different tree. Mr. Mason imagines there was some mistake, and that the Mergui red-wood is identical with the Tavoy red-wood, viz., Syndesmis tavoyana.—*Mason.*

SYMPLOCOS CRATÆGOIDES, *Vern.* Leaves said to be astringent, *Powell's Handbook, Vol.* i, *p.* 359.

SYNGNATHIDÆ, a family of fishes, of the order Lophobranchii. This order may be thus shown—

ORDER V.—Lophobranchii.
Fam. 1. Solenostomidæ.
3 species of Solenostoma.
Fam. 2. Syngnathidæ.
FIRST GROUP.—Syngnathina.
2 Siphonostoma; 8 Ichthyocampus; 1 Urocampus; 1 Leptoichthys; 2 Stigmatophora; 1 Protocampus; 53 Syngnathus; 1 Nannocampus; 23 Doryichthys; 3 Cœlonotus; 9 Neroplus.
SECOND GROUP.—Hippocampina.
1 Gastrotokeus; 3 Phyllopteryx; 25 Hippocampus; 3 Solenognathus; 2 Acentronura.

SYNGNATHUS, of this genus are the species Acus, Æquorius, Anguineus, Brachyurus, *Bleeker.* A short-tailed sea-needle, Lumbriciformis, Ophidion Typhle. See Syngnathidæ.

SYONAK, HIND. Bignonia indica.

SYPHEOTIDES BENGALENSIS, *Gmel.*

Otis deliciosa,	*Gray.*	O. himalayana,	*Vig.*
Charras, or Charaj,	HIND.	Dabar,	of NEPAUL.
Charas,	,,	Bengal florikin,	ENG.

In the breeding season, the whole head, which is very fully crested, the neck, breast and lower parts and thigh coverts are of deep glossy-black, the plumes of the breast elongated, forming a full-breast tuft and the feathers of the neck in front also lengthened, back a rich olive buff, with zigzag markings, and a black dash in the centre of each feather. It is 24 to 27 inches long. It is found throughout Lower Bengal, north of the Ganges, north-easterly to the foot of the Himalaya, into Dacca, Assam, Tipperah, Sylhet, Assam, north-westerly into the valley of the Jumna, Rajputanah, the Cis-Sutlej states, and parts of the Panjab. It frequents large tracts of moderately high grass. The sexes live apart but near each other.—*Jerdon.*

SYPHEOTIDES AURITUS, *Latham.* The Lesser florikin.

Otis fulva, *Sykes.*

Khar-tilar of Bheels, near Mhow,		Chulla charz.	HIND.
Kan-noul.	CAN.	Likh, of Hindustan,	,,
Charaz, also Charas, of S. India.	HIND.	Tan mohr,	MAH.
		Warrogoo koli,	TAM.
		Niala nemiki,	TEL.

The Bheel name means 'grass partridge,' and it gets its Tamil name from being usually found in the Warroogoo (Paspalum frumentaceum) fields. The lesser florikin, also called the common florikin and black florikin, is 19 to 21 inches long. In winter dress, the male closely resembles the female, but has always some white on the shoulder of the wing, when in full feeding plumage, the male in its head, neck, ear tufts, medial wing coverts, and all its lower plumage is deep-black, the chin alone being white, the rest of the plumage fulvous. The different character of the plumage in the two seasons has led some to write on this bird under two names. It is found throughout India, from the extreme south to the foot of the Himalaya and frequents long grass in preference to any other shelter.—*Jerdon's Birds of India, Vol.* ii.

SYGHAN, a pretty place between the territories of Cabul and Kunduz, but situated in a dreary valley.

SYRASTRENE, see Bactria, Greeks of Asia.

SYRIA, is a Greek abbreviation of Assyria. Syria, or Aram, lying between the Mediterranean and the Euphrates, is separated into two plains by a double range of hills which divide the country from north to south. The smaller plain is next to the Mediterranean and is fertile, the larger consists of sand and rocks and stretches to the Euphrates. Libanus and Anti-Libanus its principal mountains, on the west, are well cultivated by means of terraced cultivation, but barren and rugged on the east. The Orontes and Eleutherus are the principal rivers.

The Aenezi, according to Burckhardt, are the most powerful Arab nation in the vicinity of Syria, and if we add to them their brethren in Nedjd, they may be reckoned one of the most considerable bodies of bedouins in the Arabian deserts. They are nomades, in the strictest acceptation of the word, for they continue during the whole year in almost constant motion. In spring, they approach the fountains of Syria and form a line of encampment extending from near Aleppo to eight days' journey to the south of Damascus.

Their principal residence, however, during that time is the Haouran, and its neighbourhood, when they encamp near and among the villages, while in the more northern country, towards Homs and Hamah, they mostly keep at a certain distance from the inhabited grounds. In these parts, they spend the whole summer seeking pasture and water, purchase in autumn, their winter provision of wheat and barley, and return after the first rains into the interior of the desert. They are the only true bedouin nation of Syria, the other tribes in the neighbourhood of this country having more or less degenerated in manners, and several being reduced to subjection; while the free-born Aeneze is still governed by the same laws that spread over the desert at the beginning of the mahomedan era. Mr. Robinson says there are three breeds of horses in Syria, the true Arab breed, the Turkoman, and the Kurdy, which is a mixture of the two former. The bedouins of Syria count five noble breeds of horses, descended as they say from the five favourite mares of Mahomed, Tanese, Maneck-eye, Kokeyl, Sablaye, and Djulfle. These five principal races diverge into ancient ramifications. Every mare, particularly swift and handsome, belonging to any one of the chief races, may give origin to a new breed, the descendants of which are called after her, so that the names of different Arab breeds in the desert are innumerable. The horses of the bedouin of Syria are mostly small, seldom exceeding fourteen hands. They ride almost exclusively, their mares, these having the advantage over the horses in speed and good temper. The latter they sell to the towns-people or to the fellahs. They object to them, not only because they are more vicious than the mares, but because they neigh, which in an expedition by night, might be the means of betraying them. They are first mounted after the second year, from which time the saddle is seldom taken off their backs. They are kept in the open air during the whole year, never entering the tent, even in the rainy season. In summer, they stand exposed to the mid-day sun. In winter, a sackcloth is thrown over the saddle. Like his master, with very little attention to his health, he is seldom ill. Burning is the most general remedy, and as this is done with a hot iron, it has given rise to the erroneous notion that the Arabs mark all their horses. Syrians, in the Hejaz are usually known as Abu Sham. The Syrian shugduf differs entirely from that of El Hejaz. It is composed of two solid wooden cots about four feet in length, slung along the camel's sides and covered over with cloth, in the shape of a tent.—*Robinson's Travels, Vol.* ii, *pp.* 167, 169, 183, 238, 356; *Burton's Pilgrimage to Mecca, Vol.* ii, *p.* 225. See Greeks of Asia, India, Ken Kurdistan, Khiraj, Mesopotamia, Rain, Semitic races.

SYRIAN CHRISTIANS. In Malayala, as in other parts of southern India inscriptions occur, in various ancient characters as well as in modern letters. The copper plate grant to the Syrian christians, is still in their possession.

SYRIAN DOGBANE, Asclepias syriaca. One of the plants of the Asclepiadeæ family, useful both for its down and for its fibrous stem, although a native of the burning plains of Syria, it is cultivated as far north as Upper Silesia. It is easily propagated either by seed, or by parting the roots. The plants thrive luxuriantly in light soil, but will flourish on any poor land. The silk-like down which surmounts the seed of this plant, is not more than an inch or two in length; but it has, nevertheless, been usefully applied for articles of dress manufactured of it both in France and in Russia. The fibres of the stem, prepared in the same manner as those of hemp and flax, furnish a very long fine thread of a glossy whiteness.—*Royle's Fib. Pl., pp.* 302, 333, 709. See Caoutchouc.

SYRINGA, a genus of plants of the order Oleaceæ. Syringa chinensis, *Willde.*, the Chinese lilac, is a native of China cultivated in Europe. Syringa villosa, has villous leaves and is found in China on mountains about Pekin.—*Eng. Cyc.*; *Voigt, p.* 549.

SYRINGA EMODI, *Wall.*

Chunu,	BEAS.	Rang-chul,	KUNAWAR.
Ban-phunt,	CHENAB.	Karmar,	RAVI.
,, -dakhur,	,,	Ban-chir,	,,
Gnari,	,,	Shatri; Dudla,	SUTLEJ.
Shafar,	KUNAWAR.	Lolti; Rang chul,	,,

Elliptical-oblong leaves, glaucous beneath, attenuated at the base, and acuminated at the apex, with purple flowers. A native of Kumaon near the Himalaya, at many places in the Punjab-Himalaya at 7,000 to 11,000 feet up to the Indus, and collected by Bellew at 9,000 feet near the Sufed Koh. The wood is white and close-grained, and carves well. The leaves are eaten by goats.—*Eng. Cyc.*; *Dr J. L. Stewart.*

SYRINGA PERSICA, *L.*

var β. laciniata, *Vahl.*

Hiasmin,	KANGRA.	Persian lilac.

Leaves small, lanceolate, flowers purple. A native of Persia, and cultivated in some of the gardens on the Kashmir lake seems to be a variety of S. laciniata, a small shrub, from four to six feet high. It is one of the most ornamental of low deciduous shrubs, and on that account is very commonly cultivated. When planted in pots and forced, it may be made to flower at Christmas; but by this process the fragrance of the flowers is lost. Of this species also three varieties are found in English nurseries, the White, the Cut-leaved, and the Sage-leaved Persian lilacs. —*Dr. J. L. Stewart*; *Punjab Plants*; *Eng. Cyc.*; *Voigt, p.* 549.

SYRNIUM ALUCO, (S. stridulum: 'Tawny owl,') of Europe, N. Africa, Asia Minor, N. Asia to Japan, (Temminck.) S. nivicolum, common in the W. Himalaya, rarer eastward, is barely separable.

SYRNIUM INDRANEE, Devil bird, *Sykes.* Mr. Blyth had some doubts about this bird. There would appear to be three or four distinguishable races, the Ceylon bird approximating most nearly to that of the Malayan peninsula. The horror of the owls nocturnal scream was as prevalent in the west as in the east. Ovid introduces it in his Fasti, L. vi, I, 139; and Tibullus in his Elegies, L. i, E. 5. Statius says—but Pliny, I, xi, c. 93, doubts as to what bird produced the sound; and the details of Ovid's description do not apply to an owl. —*Tennent's Sketches of the Natural History of Ceylon, pp.* 246-47. See Owl.

SYRO-ARABIAN languages appear to have. been spoken from the very earliest times by the various nations who inhabited that part of Asia lying to the eastward of the Tigris. See India.

SYRO-CHALDAEN, see Mesopotamia.

SYROPS, see Crocodilidæ.

SYRUP, Ger. Molasses.

SYRUP OF CAPILLAIRE, see Capillaire.

SYRUP OF SARSAPARILLA, see Sarsaparilla.

SYUD, or Syed, a mahomedan who claims to be a descendant of Mahomed, through his daughter Fatimah and her husband Ali, or through the other wives of Ali. There are 13 tribal designations of Syeds in Kurrachi, and 11 in the Hyderabad district. In the Hyderabad collectorate, the Syuds are land-owners and extensive cultivators and say they came from Arabia, and Persia, about 700 years ago. Kaghan is a long narrow glen, stretching upwards till it nearly reaches Chelas, the latter outpost of maharajah Golab Sing's kingdom, is a barren dependency of Hazara. It is inhabited by pastoral and aboriginal races, and was given by former rulers in fiefdom to a family of Syuds who were confirmed by the British. These Syuds exercised internal jurisdiction and sent certain members of the family in attendance on the Deputy Commissioner of Hazara, virtually as hostages for good behaviour. The Syuds were summoned to answer numerous complaints preferred by the people of Kaghan; they came, but afterwards fled, and assumed an attitude of resistance and intrigued with the Sitana fanatics and with the Hussunzye, then hostile to the British. See Syed.

SYZYGIUM, a sub-genus of plants of the natural order Myrtaceæ, of which the following species grow in the East Indies;

S. acuminata, *Roxb.*, Moluccas.
S. balsamea, *Wall.*, Assam.
S. brachiata, *Roxb.*, Moluccas.
S. caryophyllifolia, *Roxb.*, Bengal.
S. fruticosa, *Roxb.*, Chittagong.
S. grandis, *Wight*, Sylhet.
S. inophylla, *Roxb.*, Sumatra.
S. jambolana, *Lam.*, Pen. of India, Hindustan, Moluccas.
S. leuchophylla, —? Sylhet.
S. macrocarpa, *Roxb.*, Chittagong.
S. myrtifolia, *Roxb.*, Singapore, Sumatra.
S. oleina, *Wight.*, —?
S. operculata, *Roxb.*, Mollucas.
S. rubens, *Roxb.*, Chittagong.
S. tetragona, *Wight*, Sylhet.
S. venusta, *Roxb.*, Tipperah.

It is a large tropical genus, some species of which are now referred to other genera, particularly Eugenia, and notices of E. acris; E. alternifolia; E. amœna; E. bracteata; E. caryophyllifolia; E. caryophyllata; E. cerasoides; E. jambolana; E. jambos, E. laurina; E. malaccensis; and E. obtusifolia, will be found under these names, but, particular attention is directed to the remarks against Eugenia jambolana. And, as Dr. Wight, in Icones, gives Syzygium carophyllaceum; densiflorum; jambolanum; lanceolatum; nervosum; oblatum; rubicundum; rugosum; salicifolium and Zeylanicum, it will be understood that different botanists mix up the genera. Mr. Thwaites notices Zyzygium assimile, Z. gardneri, Z. micranthum; Z. rotundifolia; Z. sclerophyllum; Z. spathulatum and S. umbrosum, all growing in the central province of Ceylon, at elevations of from 2,000 to 8,000 feet. S. oliganthum, *Thw*,, a small tree of the Ambagamowa district, at an elevation of 3,000 to 5,000 feet. Z. jambolanum, will be found noticed under its synonym E. jambolana (Mr. Thwaites gives as its synonyms, Syzygium caryophyllifolium, *DC.* E. S. caryophyllifolia [E. S. jambolana? var. microcarpa,] Wight, t. 553. E. caryophyllifolia, Lam., Roxb.; Fl. Ind., ii, p. 486. Calyptranthes cumini, Moon's Cat., p. 39—c. p. 1584.) It is the Madang-gass, Singh., and is common in Ceylon, up to an elevation of 3,000 feet. Mr. Thwaites gives, Syzygium polyanthum, Eug. S. polyantha, Wight's Ill., ii, p. 17; Ic. t. 543. And S. balsameum, Wall. Wight, III. ii. p. 16. Calypt. caryophyllifolia, Moon's Cat., p. 39—c. p. 2081, the Batta domba-gass of the Singhalese, as a large tree common in Ceylon up to an elevation of 3,000 feet. And, Syzygium sylvestre, (Eug. S. sylvestris, W. Ic. t. 532. Calyptranthes jambolana, Moon's Cat., p, 39—c. p. 2862,) the Aloobo-gass of the Singhalese, as a large tree, common in Ceylon, up to an elevation of 3,000 feet. The woods of several of these trees are employed for economic purposes.—*Wight's Icon.*; *Voigt*; *Thw. En. Pl. Zeyl.*, *p.* 116.

SYZYGIUM ASSIMILE, *Thw.* A small tree of the Central Province of Ceylon, up to an elevation of 5,000 feet, in open places. *Thw. En. Pl. Zeyl.*, *p.* 116.

SYZYGIUM CARYOPHYLLIFOLIA, *R.*

Ch'hoto-jam, BENG.

Its fruit is eaten, but is unpleasantly acid and astringent, *Roxb.*, *Voigt.*

SYZYGIUM CARYOPHYLLIFOLIUM, *DC.*

Eug. (S.) caryophyllifolia E. (S.) jambolana? *Var.*, microcarpa, Wight, t. *Wight*, 533,

A fine tree of most parts of British India. and the Moluccas, grows to 70 and 80 feet high, and 8 or 9 in girth in low flat localities. Its reddish-coloured timber is heavy, hard and durable, made into planks and used for sugar mills, but though strong and much used for ordinary purposes, it is not esteemed. The fruit is small, somewhat astringent, and is sold in the bazaars. Length of trunk to first branch being 10 feet, and the circumference 6 feet. It attains full size in 40 years; heart-wood tough, of a dark red-colour, liable to warp a little; not subject to worms; used by zemindars for agricultural implements, and produces good timber.—*Mr. Thompson*; *Captain Macdonald*; *Dr. Cleghorn, in M. E. J. R.*; *quoting Balfour, p.* 113; *Roorkee Proceeding papers on Gwalior Timber, p.* 32.

SYZYGIUM MICRANTHUM, *Thw.* A moderate sized tree of the Central Province of Ceylon at an elevation of 3,000 to 5,000 feet.—*Thw. En. Pl. Zeyl.*, ii, 116.

SYZYGIUM OLIGANTHUM, *Thw.* A small tree of Ambagamowa district, at an elevation of 3,000 to 5,000 feet.

SYZYGIUM SCLEROPHYLLUM, *Thw.* A moderate sized tree of the central province, of Ceylon, at an elevation of 6,000 to 8,000 feet.—*Thw. En. Pl. Zeyl.*, *Vol.* ii, *p.* 116.

SYZYGIUM SYLVESTRE.

Eug. (S.) sylvestris, Wight, Icon. t., 532.

Calyptranthes jambolana, Moon's Cat., p. 39—c. p. 2862.

The Aloobo-gass of the Singhalese, is a large tree in Ceylon, common up to an elevation of 3,000 feet. The woods of several of these trees are employed for economic purposes.—*Wight's Icones*; *Voigt*; *Thw. Enum. Pl, Zeyl.*, *p.* 116.

SYZYGIUM SPATHULATUM, *Thw.* A small tree of the central province of Ceylon, at an elevation of 3,000 to 5,000 feet.—*Thw. En. Pl. Zeyl.*, ii, 116.

SYZYGIUM UMBROSUM, *Thw.* A moderate sized tree of the open, grassy places in the Central province of Ceylon, at an elevation of 5,000 to 6,000 feet.—*Thw. En. Pl. Zeyl.*, ii, 116.

SZAKHR, or Beni Szakhr, are a tribe of free Arabs. According to Burckhardt, they rove in the plain from the fourth to the fifth station of the Haj, and thence westward towards the mountains of Belkaa. They were employed by the pasha of Damascus for the defence of the caravan against the other tribes. They live by breeding camels, for the use of the pilgrim caravan, of which they have a very considerable number. Though smaller than the Anadolian, Turkman, or Kurd camels, they are better able to bear heat and thirst than the latter, are chiefly of a light or reddish grey colour, with very little wool about their necks.—*Burckhardt's Travels.*

SZE-CHUEN, a district of Western China, bordering on Tibet. Gold is collected in the sands of the rivers in Yunnan and Szechuen, especially from the upper branch of the Yangtszekiang called Kinsha-kiang or Golden-sanded River. The largest amount is said by Sir John Davis to come from Li-kiang-fu near that river and from Yung-chang-fu on the borders of Burmah. It is wrought into personal ornaments and knobs for official caps, and beaten into leaf for gilding, but is not used as a coin, nor is much found in the market as bullion. Silver also is brought from Yunnan, near the borders of Cochin-China and the mines in that region must be both extensive and easily worked to afford such large quantities as have been exported during the last five years. Tavernier tells us there comes gold from China, which the Chinese exchange for the silver which is brought them. For, price for price, they love silver better than gold, because they have no silver mines. Yet it is the coarsest metal of all the Asiatic gold.—*William's Middle Kingdom, p.* 144; *Tavernier's Travels, p.* 156.

SZE, CHIN. A dollar.

SZE-TSEW-KWO. CHIN. The kingdom of lions, also known by the name of Paouchoo, the island of gems.

SZEZECINY, POL. Bristles.

SZU, or Azes Scythians, see Kabul.

SZU TARTARS, Ili is a valley and town in Central Asia, from which Lassen supposes the Szu Tartars were expelled by the Yue-tchi or White Huns B. C. 150. The Szu Tartars he supposes to be the Sacæ and the Yue-tchi to be the Tochari. After occupying Tahia or Sogdiana for a time, they are stated by the Chinese to have been driven thence, also, by the Yengar, some years afterwards, and to have established themselves in Kipen, in which name Lassen recognises the Kophen valley in the Kohistan. The great Kirghis horde is adjacent to Ili and Tarbagatai. It is under the dominion of China and exchanges large quantities of cattle on the frontier for silk goods. See Affghan, Kabul, Kirghis.

SZU TCHOUAN, see Kalkas.

T. The Arabic, Persian, Urdu, Sanscrit, Hindi, Mahratta, Guzerati, Bengali, Uriya, Telugu, Karnata, Tamil, and Malayalam, all contain letters with the sound of the English letter T, as in tar, tanning, terse, tortion, and turning, and the Arabic, Persian and Urdu have two letters each with the power of the English letter T. This letter of the English alphabet has, in English, but one sound: as in tan, ten, tin, tone, tun, tyne; but in combination with the English letter h, it assumes two compound sounds, a softer one as in than, thus, thyme, then; and a harder sound, as in thicken, thief, thong, thrall, thumb, and thwart. Th, with the sound of the English letter as in thief, and of the Greek letter theta, occur in Telugu, Uriya and Karnatica, but this sound is not frequent in other of the Eastern tongues, though a "t," with the aspirated "h" occurs in most of them, in which "h' has the sound of an aspirate, pronounced after the "t,' and should be written t'h, and pronounced hat-t'hear.

TAALEB. Ar. Fox.

TAALIM KHANA, the gymnasium of India, are in almost every town. The Sindi are very fond of wrestling, but the Malla or wrestlers of Sind are, generally speaking, African blacks. In Sind wrestling, it is not necessary, as in India, to throw the adversary on his back. —*Burton's Sindh, page* 289.

TAAM. Ar. Food.

TAARLINGEN. Dut. Dice.'

TAB. The Tab river is only partly in Khuzistan, near Beibahem, there of considerable size, it preserves a western course as far as Indian, a town of about 4,000 inhabitants; up to which, when ascended by Lieut. Whitelock, of the Indian navy, in 1836, it was found to be navigable for boats of twenty tons. From hence, the river inclines more southward, and has a tortuous course through an alluvial soil to the Persian Gulf; an extensive population have their dwelling on its banks. A little way northward of the city of Shuster, at the bifurcation of the river, Karun is the famous reservoir called Shadarwan, with the bridge of Shapur, and several deep and fine kanat. See Fars, Kabi, Khuzistan.

A siliceous concretion found in the joints of the female bamboo. It is partly soluble in water, bluish white, concrete, adhesive to the tongue, at a red heat fuses into a transparent glass. It is composed of silica 70, potash 30, per 100. The Persians deem it tonic and aphrodisiac; the Arabs suppose it to be astringent, but from its composition we are warranted in supposing it to be entirely inert. In Tenasserim tabasheer has a place among native medicinal substances. It resists acids, is indestructible by fire, and forms, on being fused with alkalies, a sort of glass. It is much esteemed by the Hindoos, Persians, and Arabs as a powerful tonic, and is said by them to have great efficacy in internal bruises. It is imported into Bombay chiefly from Singapore; small quantities are also brought from the Malabar coast. Dr. Irvine has often removed it from old bamboos at Hoshungabad. It is brought to Ajmeer from Hurdwar, and is used as an aphrodisiac and in general debility. One massa is the dose, and it is sold at two tolahs for one rupee.—*Faulkner. O'Shaughnessy, page* 694. *Mason. Gen. Med Top. p.* 128. *Thompson's Records of General Science* viii. *pp.* 132-35.

TABERISTAN. See Koh.

TABERNÆMONTANA, a genus of plants belonging to the natural order Apocynaceæ, found in the West Indies, South America, Australia, India, and tropical Asia. Seeds in a follicle, immersed in pulp. The flowers of many species are very sweet scented, and the double-flowered variety of T. coronaria is very ornamental and is one of the most common species in Indian gardens. The deep red pulp surrounding the seeds of this species appears capable of yielding a beautiful colour. The cream-like sap of T. utilis, the milk-tree, or Hya of De . . ara, is said to be very nourishing. Other species are employed medicinally. The sap of T. persicariæfolia is considered a poison in Mauritius. The wood is employed in turnery. Dr. Wight in Icones, gives T. coronaria, T. crispa, T. dichotoma, T. parviflora, and T. recurva.—*Voigt. W. Ic.*

TABERNÆMONTANA ALTERNIFOLIA. LINN. syn. of Tabernæmontana crispa, *Roxb.*

TABERNÆMONTANA CITRIFOLIA. GIBS. Nagin koora. CAN. is a small tree common on the hills near and below the ghats of Canara and Sunda. Wood white, but tough and strong.—*Dr. Gibson.*

Nandier vatam TAM	

This ornamental shrub is cultivated in flower gardens, the flowers are fragrant during the night. In the Dekhan it is common in gardens with dark shining leaves, flowers generally double, colour pure white, resembling wax, having a faint pleasant smell. The foliage beautifully contrasts with its large blue-white double flowers, which are often called "wax flowers." The wax flower of Bengal is a trailing creeper, Hoya carnosa, which has been recently introduced into European gardens. Fark-i-taggar is the single variety, and barra-tagar the double flowered. It is propagated by cuttings.—*Genl. Med. Top. p.* 186. *Riddell, Mason, Voigt, p.* 527.

TABERNÆMONTANA CRISPA. ROXB.

T. alternifolia, *Linn.*	Kurutupala, MALEAL.

This shrub grows on the coasts of peninsular India, and is employed in medicine. *Voigt.*

TABERNÆMONTANA DICHOTOMA. ROXB. *A. DC.*

Cerbera manghas. *Linn.*	Manghas lactescens, *Burm Thes. Zeyl.*
Forbidden Fruit. ENG.	Diwi-kaduru-gass. SINGH.

This is a native of Ceylon, very common in the warmer parts of the island. Its native name is *Diwi Kaduru*, but nine species of the genus are enumerated. "Kaduru," which signifies "forbidden," and *Diwi* "tiger's" It thrives in a low situation, with a light mixed soil.—*The Book of Trees, p.* 157. *Thw. En. Pl. Zeyl. p.* 192.

TABERNÆMONTANA DIVARICATA, R. BR. syn. of Tabernæmontana coriara, *R. Br.*

TABERNÆMONTANA PARVIFLORA. ROXB. syn. of T. micrantha, *Voigt.*

TABERNÆMONTANA PERSICARIÆFOLIA.

Polygonum leaved Tabernæmontana, ENG.	Tugur, HIND.

A straight middling sized tree; the tree is sacred, and the scented wood is used in incense.

TABERNÆMONTANA RECURVA is a low shrub, indigenous about Moulmain, remarkable for its recurved peduncles and fragrant flowers.—*Genl. Med. Top. p.* 186. *Mason.*

TABI. MALAY. Pepper, Long pepper.

TABIA. BALI. Cayenne pepper.

TABKI HURTAL. HIND. Hurtal.

TABLE-CLOTHS are manufactured at the towns of Cuddalore, Chingleput, and in the outskirts of Madras, equal in quality to those of Britain. They are of different sizes, the largest 9 cubits in breadth and 15 in length, and 12 cubits long by 6 broad, the smallest 9 by 4. They are sold at different rates. The table cloths and napkins of Pondicherry are good in quality, varying in size from that of the ordinary table cloth, to those of dimensions suited to public entertainments. The damask pattern design is imitated in various parts of the Madras Presidency.—*M. E. J. R.*

TABLE BAY. L. 33° 54′ S., L. 18° 25′ E.; leading to Cape Town at the Cape of Good Hope, is overlooked by Table Mountain.

TABLUNG, a rude pagan tribe in the hills of Assam, on the eastern frontier of the Mikir and Cachar.

TA-BOOT. A tree of Akyab. It grows

to a moderate size, but is not very plentiful. Its wood is used for making banghies and other fine work.—*Cal. Cat. Ex.* 1862.

TABOOT OR TAZEEAH. ARAB. A bier in the shape of a mausoleum, intended to represent the one at Karbulla, erected over the remains of Hoossain. It consists of a bamboo frame work, the interstices being filled up with a nicely clipped network of paper, often pasted on mica. But every variety of materials is employed, from the purest silver, to ivory, ebony, sandal-wood, cedar, down to bamboo, also wax and bangles. Within it are placed allums, or tombs to represent those of Hussun and Hoossain.—*Herklots.*

TABOR. At the foot of Mount-Tabor is a green valley. In ascending the hill, on the right hand, looking into the plain of Esdraelon, stands a little village, called Deborah by the natives, in which, say the legends, Jael slew Sisera. The view from Mount Tabor is magnificent, and comprises places of the greatest interest ; the hills of Gilboa and Samaria, Mts. Hermon and Carmel, the plains of Galilee and Esdraelon, the Jordan and the Kishon, the Sea of Galilee and the Mediterranean, are all discernible. On the anniversary of the transfiguration, mass is performed at, and a great procession led to, the altars set up where the three tabernacles were made. They are in a vault under ground.—*Skinner's Overland Journey, Vol. I, p.* 130-131.

TABRIZ OR TAURIS, the ancient Antropatia, the capital of Azerjiban, is situated in an open country crossed by ranges of low hills. It presents a large monotonous assemblage of flat roofed, mud-built and mud colored houses, in streets intersected by numerous streams. It was the residence of Abbas mirza, son of the king of Persia. According to the observations of Major Menteith, it is in lat. 38° 4' ; and according to the unfortunate traveller, Mr. Browne, it is in long. 46° 25'.—*Porter's Travels, Vol. I, p.* 220. *Mignan's Travels, p.* 333. See Kharvar, Kizzel Ozan, Kuzzilbash.

TABU, in Oceanica, sacred monuments.

TABUT, also Tazia, in India the representation of a tomb in the moharam festival. See Ashoora ; Taboot.

TACAMAHACA, a resin obtained from America and the E. Indies. That of Bourbon is obtained from Calophyllum calaba ; portions of this gum are obtained from Elaphrium tomentosum and Canarium commune, also from Fagara octandra ; and likewise it is supposed from Populus balsamifera. It is imported from America in large oblong masses wrapt in flag leaves. It is of a light brown colour, very brittle, and easily melted. When pure it has an aromatic smell, between that of lavender and musk ; and dissolves completely in alcohol, water having no action on it. Calophyllum calaba is a native of Travancore, and produces true East India tacamahaca resin. This variety is rarely met with : it is yellow, translucent, adhesive, of acrid taste, and pleasant, aromatic smell.—*Thomson's Chemistry. Faulkner. O'Shaughnessy, page* 238. See Balsamodendron, Clusiaceæ, Calophyllum.

TACCACEÆ, a natural order of perennial herbs, with large tuberous roots, seven species of which grow in the East Indies and the Archipelago, viz., T. cristata, integrifolia, lævis, montana and rafflesiana.

TACCA PINNATIFIDA. LINN. FORSK.

T. pinnatifolia, *Gærtn.*

Toja of	BANDA.	Surana	SANS.
Touk-ta	BURM.	Kara-chuné	TAG.
Kunda	DUK.	Kara Karnay kalungu	TAM
Salep Tacca.	ENG.	Cunda gudda	TEL.
Chanay Kalangu	MALEAL.	Kunda	,,
Tacca Liker	MALAY.	Chunda	,,

In Otaheite and other Society isles, they make, of the meal of the root, a nourishing gelatinous cake, like that made of salep. It possesses a considerable degree of acrimony, and requires frequent washing in cold water previously to its being dressed. In Travancore, where this root grows to a very large size, it is much eaten by the natives, who mix a sufficient portion of some agreeable acid with it, to subdue its natural pungency.—*Voigt.* 600. *Ainslie, p.* 248. See Arrow Root, Food, Maranta.

TACCA PINNATIFOLIA, GÆRTN. syn. of Tacca pinnatifida, *Forsk.*

TACHASH. HEB. Badger.

TACHYRES ZARINDA, of Celebes, a rare butterfly with cinnabar red wings.

TACHYPETES AQUILA, or Frigate bird, also called the Sea Hawk, also Man of War bird, and the Boatswain, has short feet, and cannot swim or dive. It is intermediate between the predaceous sea and land birds, and makes other fishing birds abandon their prey. It is of great endurance, takes great flights, rising to great heights in the air. It ranges through all tropical seas and hovers over the tropical waters. It has been seen 400 leagues from land, and yet is said to return to land every night. Its expanded pinions measure 14 feet from end to end.—*Bennett.*

TACSHAC. See Krishna, p. 545. Tak.

TACSONIA PINNATISTIPULA. A climbing plant, nearly allied to the Passion Flowers, and requiring the same treatment. Colors rose or pink.—*Riddell.*

TACHXUDOGBO, COCHIN-CHIN. Acorus calamus. Sweet flag.

TACHYDROMUS SEXLINEATUS. See Zonurideæ.

TADA CHETTU. Tel. Grewia tiliæfolia, *Vahl.*

TADAGUNNI. Can. Dolichos catiany.

TADALA. Singh. Colocasia antiquorum, *Schott.*

TADDI MARAM. Tam. Pterospermum tuberiflorum.

TADDIKA CHUVVA. Tel. Grewia Rothii, *D. C.*

TADI CHETTU. Tel. Terminalia bellerica, *Roxb.*

TADJOURRA. See Tajurra.

TADMOR. Arab. Palmyra. See Balbec.

TADORNA VULPANSER, the common shieldrake of Europe, Asia, N. Africa, is common in the Punjab, not rare in Lower Bengal.

TADRELU. Hind. Coriaria Nepalensis, *Wall,* also Barleria cristata. See Balel, Kashmir.

TADRU. Hind. Rhamnus purpureus, also R. virgatus.

TAEFA. Ar. Amongst the Afghans, this term means a nation, a tribe. In India, amongst mahomedans, a band of singing women.

TAEL, a Chinese coin, value about forty pence.

TAEL VOLCANO. See Volcano.

TÆMBILE. Singh. Cocos nucifera, *L.*

TÆNIS BLECHNOIDES. The tapeworm fern, so called from the resemblance of the line of sori to a tapeworm, It is not infrequent in Tenasserim.—*Mason.*

TÆN-YO, Burm. Pines of several varieties are abundant in the dry and hilly districts of Burmah, reaching a good size, often fifty feet without limb. One or two species are found in the Tenasserim provinces, but not frequently. It is neglected as timber because of its softness and liability to be attacked by ants. Some turpentine is manufactured from it. Pieces of it are every year washed down the Irrawady. —*Malcolm.*

TAE-PING, native Chinese, as distinguished from the Tartar ruling race.

TAER. Arab. A bird.

TAFL. When Arabs wish to cool the skin after a journey, they wash with a kind of clay called "Tafl," or with a thin paste of henna, and then anoint the body with oil or butter.—*Burton's Pilgrimage to Mecca, Vol. I., p.* 255.

TAFSIR. Arab. Ilm-ul-Tafsir, or the exposition of the Koran. Several Tafsir are known all over the modern world. The smaller one is called Jelalani, or the two Jelal, i.e., the joint work of Jelal us Siyuti and Jelal-ul Mahalli, and fills two stout volumes octavo. The larger is the exposition of ul Baizawi, which is supposed to contain the whole subject. Some few divines read Ul Khazin.—*Burton's Pilgrimage to Mecca, Vol. I., p.* 156.

TAFTA, a kind of silk cloth.

TAGABALOY. A tribe in Mindanao.

TAGADA. Tel. Bignonia chelonoides, *Linn.*

TAGADA TUNGA. Tel. Cyperus dubius, *Rottl.*

TAGAL. Dry rice cultivation, equivalent to the Malay "muah."

TAGALA. A language of Lucon island, in the Archipelago. See India, Philippine Islands.

TAGARA. Maleal. Tam. Cassia tora, *Linn.*

TAGARAM. Tam. Tel. Tin.

TAGARISE KURA. Tel. Cassia, *species.*

TAGARU. Tel. Morinda tinctoria.

TAGASHE. Tam. Cassia tora, *Linn.*

TAGETES ERECTA ; Genda, Hind. A great variety in gardens. Its handsome yellow flower is used by the hindus in making garlands to decorate their idols, and it may be seen on the gates of churches and houses of Europeans at Christmas and New Year's day.—*Gen. Med. Top. p.* 206.

TAGETES LUCIDA. The African marigold, is common in all Indian gardens, and readily grown from seed.—*Riddell.*

TAGETES PATULA. Linn.; *Roxb.*

Genda	Beng.	Gul jafare	Hind. Pers.
French Marygold	Eng.	Banti chettu	Tel.

This marigold is grown in most of the gardens of India, and the flower is worn by hindoo women in their hair.—*Gen. Med. Top. p.* 206. *Graham in Thomson's Records of Gen. Science, Vol.* IX., *p.* 303.

TAGGAR. Hind. Varleriana Hardwickii, and V. Wallichii.

TAGHAN. See Kaffir.

TAGHANI KI LAKRI. Duk. Hind. See Polkee.

TAGHAR. Hind. Calotropis procera.

TAGHAR. Turk. Pers. A large sack of which horsemen carry a pair, slung over the horse, to contain provender. According to Timkowsky, it contains about four poods, or one hundred and forty pounds, of flour. Until lately, revenues continued to be estimated in China in sacks of rice ; perhaps are so still. In Burmah they are always estimated in baskets of rice.—*Meninski. Yule Cathay I, p.* 153.

TAGIRISE KURA, Cassia, *sp.* Chakramardaka, Sanc. is C. tora, *W.* C. occidentalis, *Heyne.*

TAGHO. Hind. Pistacia atlantica, also Celtis caucasica and C. nepalensis.

TAGHUN, or Takpun, Pushtu. Celtis caucasica. Nettle tree.

TAGOLANDA ISLAND, on the north coast of Celebes, is in lat. 2° 23′ N., and long. 125° 36′ E., 12 miles from Bejaren Island. It has a high conical peak, and is of considerable extent.—*Horsf.* See Siao.

TAGOW, a valley in the Kohistan of Kabul, now held by the Safi, an Affghan tribe. It contains many ancient remains and numerous coins have been found in them. See Kohistan.

TA-GOUNG, the ancient capital of the Burmese empire.

TAG-PA. Bhot. Birch. Betula bhojputra, *Wall, Royle.*

TAGUE. A high island, off the coast of Cochin China, in lat. 11° 49' N., and bounds on the south Camraigue Bay, in Cochin China. —*Horsf.*

TAGU-MUDA. Tel. Tam.? Gmelina arborea, *Roxb.*

TAGUSHE. Tam. Cassia tora, *Linn.*

TA-HAVIN? Chin. Rhubarb.

TAHBUND, a Loonggee; an article of dress.

TAHFAT-UL-MAJAHIDIN, written by Shekh Zain-ul Abidin, gives an account of the proceedings of the Portuguese against the mahomedans from A. D. 1498 to 1583.

TAHIA, a name of Sogdiana. See Afghan, Kabul, p. 434.

TAHLEEL, a shrill noise made by the women of Arabia. It is a combined motion of the tongue, throat, and hand, vibrated rapidly over the mouth. When an Arab or a Kurd hears the tahleel he almost loses his senses through excitement, and is ready to commit any desperate act. This shrill cry is like a very quick repetition of the word *el* (or *lel lel lel lel*). Between Kazerun and Bushehr, the women, chiefly of Arab descent, use it to welcome a stranger as an expression of joy; they use it also during the mournful ceremony of a funeral—*Ouseley's Travels*, Vol. I., p. 310. *Layard, Nineveh. Vol.* I. 120.

TAH-NOUNG, a most beautiful, though rather small, tree of Burmah. Leaves very small, composite, lively green, rising from the base of a double thorn.—*Malcom, Vol. I. p.* 188.

TA-HOAN, Coch-Chin. Rhubarb.

TAHSIL, a revenue subdivision of a district presided over by a tahsildar, whose primary duty is to collect revenue, &c., but who, in the Punjab, is vested with civil and magisterial powers: also the office or building in which the business of a tahsildar is transacted.

TAHSILDAR. A sub-collector or officer in charge of a tahsil.

TAHTAH. Hind. Pers. The Tartar race.

TAI. The Shan race. See Ahom, India, p. 338.

TAI. Burm. Ebony.

TAI. Hind.? Oryza sativa.

TAIA-BOUK-BHA—? A tree of Akyab. It is a small wood, is plentiful, and is used for firewood.—*Cal. Cat. Ex.* 1862.

TAIBEMBAGA. Malay. Acetate of copper.

TAIF. Arab. Aloe litoralis, *Kœnig.*

TAIFAH. Ar. Pers. A nation, a tribe, a company of singing women. See Taefah.

TAIFI of Kabul, &c., unripe apricots dried; called in the Punjab kishta.

TAIGAB, near Kelat, is 360 feet above the sea.

TAI KHANA, a cellar or underground room.

TAIL, a river near Ambulwara in Nagpoor.

TAILA. Sans. Sesamum orientale. Gingelly seed.

TAIL CHARHANA, a mahomedan domestic ceremony.

TAIL GHURRAY. Oil pots, a mahomedan domestic ceremony.

TAILLESS DEER, or tailless Roe of Pennant and Shaw, syn. of Cervulus pygargus. See Cervus; Deer; Mammalia.

TAIM. A cubit-measure in Rangoon of 18 inches.—*Simmond's Dict.*

TAIMOR, or **TAIMUR-LANG.** See Timur.

TAINDU, also Bakul, also Mulsari, Duk. Minnusops elengi.

TAING. A Burmese itinerary measure, containing 7,000 cubits, nearly 2 miles 1 furlong.—*Simmond's Dict.*

TAINT, the fruit of the Capparis dela.

TAIR. Arab. Bird.

TAIT, Colonel C. B., aide-de-camp to the Queen, commanded for many years the 3rd Bengal Irregular Cavalry, which, as "Tait's Horse," did good service in General Pollock's expedition to Cabul, and in the Sutlej and Punjab campaigns. Colonel Tait commanded his Irregulars at the battles of Tiseen and Mammoo Kale, under Pollock; at Ferozepore, under Littler, when besieged by the whole Sikh army; and under Hardinge and Gough at Ferozeshah, Ramnugger, Chillianwallah, and Goojerat. He entered the service as an infantry cadet in 1825.

TAITAN. Tam. Strychnos potatorum.

TAITSUNG, emperor of China, is said to have dismissed three thousand women from the imperial establishment.—*Ch. Anc. p.* 286. in *Yule Cathay I, p.* 1.

TAIWAN, the island of Formosa.

TAIWU, emperor of China (B. C. 1634). In his reign ambassadors, accompanied by interpreters, and belonging to 76 distinct kingdoms, are reported to have arrived from remote regions at the court of China.

TAJ, a crown; a circular head-dress, and in central Asia, as Tajik, applied by the Uzbek and Armenian to the Iranian population in Khiva, Bokhara, Khorasan and Badakhshan.

TAJ. Hind. aromatic bark or cinnamon: Cinnamomum albiflorum, Cassia lignea.

TAJ-BADSHAHI. Astragalus hamatus.

TAJEND. See Aimak.

TAJIK. In Bokhara, this name is given to Persians to distinguish them from the Uzbek. Taj, in Persian, means a crown, or circular head-dress, and in Central Asia, Tajik is applied by the Uzbek, and Armenians to the Iranian population in Khiva, Bokhara, Khorasan and Badakhshan. In Persia proper, the Tajik is so termed in contradistinction to the Iliyat. On the Oxus, a Tajik is used as opposed to an Uzbek; in Afghanistan, as opposed to an Afghan or Hazarah. Throughout Persia, this term is applied to a cultivator, to distinguish him from an inhabitant of towns. The Tajiks are of the shiah sect. According to Dr. Latham, the term for this race in Bokhara is Sart; in Afghanistan, Dehgan; in Beluchistan, Dehwar. On the Kabul river, they are called Kabuli. In Seistan, the mass of the population is Tajik, and many of them dwell in reed huts on the great lake, and live by fishing and fowling.

The Tajik race of Badakhshan speak Persian and possessed the country before the inroads of the Uzbek and Turk. They are purer Iranian than other Tajik. They are a wild race, living in the little mountain glens, in villages surrounded by gardens. The Tajik of Badakhshan are not so handsome as the men of Chitrar, their dress is like that of the Uzbek.

Bokhara has often changed its rulers and modified its inhabitants. At each successive influx new tribes have been added to the bulk of the population. This intermixture was more particularly felt whenever the Uzbek race re-entered the Khanat. Of the Tajik aboriginal inhabitants there is but a remnant left, which forms the chief population of the city of Bokhara; in other towns there are none, or very few indeed. Owing to their peaceful disposition, not to use the word cowardliness, they abstain from taking any part in warlike achievements. The most salient traits of their character are avarice, falsehood, and faithlessness. They are usually tall, have a white skin with black eyes and hair. Although in their dress they strictly adhere to the rules of the Koran, there is still much greater affectation than is observable among the Uzbek. The Tajik of Balkh are corrupt, dissolute, vicious men. Their politeness in conversation often becomes disgusting, especially if they require the assistance of the person to whom they address their words. The Tajik is supposed by Colonel Tod to be the Scythic Tachari of Strabo, Tak-i-uk of the Chinese. The Tajik of Kabul are the aborigines of the country, and are not Afghans. Alexander probably found them there as fire-worshippers speaking Sanscrit or Pelhevi.

At Mongal, M. Ferrier met with 220 tents of Hazarah surrounded by a considerable extent of cultivation. This tribe had intermarried with the Tajik population, descended from the ancient inhabitants of the country. These Tajik, he says, are subdivided into two very distinct classes:—the Parsivan or Parsi-zaban, who speak the Persian language, and inhabit towns and villages, and the wandering Eimak, who live under canvas. The Hazarah are Eimak, though they pretend to be of Afghan race; the Afghans deny this, because they speak corrupt Persian, whereas the Afghan always speaks his mother tongue the Pushtoo. By their general appearance it is easy to see that they are of Tartar origin. A Hazarah's face is square, flat, and angular, the eyes are small, and obliquely placed; complexion pale and sallow, and beard scanty; they are rather undersized, but their proportions indicate great personal strength; their bravery amounts to rashness, and the Afghans dread them; there are no better horsemen in all Asia. Their duplicity is not so great as that of their neighbours; on the contrary, a certain simplicity may be observed amongst them, which contrasts strangely with their ferocious manners. The women are proud of being able, when necessity requires, to mount a horse and use a firelock or sword with an intrepidity equal to that of their warlike brothers and husbands. In time of peace, women do all the house work, cultivate the fields, and, with their children, weave the barek which are the source of so much wealth to their tribe. They cannot be called pretty, but they are well made; and enjoy perfect liberty, a rare thing indeed amongst Asiatics; their husbands are not jealous, though their Afghan enemies pretend that they profit largely by their indifference.—*Ferrier. Journ. p.* 194. See Afghanistan, Arian, Kabul, Kafir, Kelat, Khurm.—*Latham.*

TAJ KALMI. HIND. Cinnamomum albiflorum.

TAJ-I-KHOROS. HIND. Celosia cristata.

TAJ MAHAL, a monument erected by the emperor Jehangir to the memory of his wife Nur Jehan Begum. It is built upon the banks of the Jumna, in a quadrangular space one hundred and ninety yards square surrounded by a wall. This wall is sixty feet high and adorned at each angle with a tall minaret. The minarets, as well as the wall, are of red sand-stone, but the Taj Mahal itself is of white polished marble, and stands out in shadowless splendour beneath the burning sky of India. It is erected upon a basement nine hundred feet long, and forty feet high. The great dome which rises in the centre, and which is seventy-two feet in diameter, is surmounted by a spire of gilded copper, thirty feet in height. It is said that the original spire was of pure gold. The interior of the Taj Mahal forms an octagon, in the centre of which, in an octagonal enclosure, is the sarcophagus. On each side of the octagon is a window, closed with a kind of marble net work, in the interstices of which are inserted small panes of glass. Eight chambers surround this hall, the angles of which correspond exactly with those of the main wall. In the four chambers, answering to the sides of the building, are inserted in the walls plates of white marble, six feet high, upon which flowers, in their natural colours, are wrought in a mosaic of precious stones, the stems being worked in with negro-antico. So elaborate is the workmanship, that to form one flower nearly a hundred different gems have sometimes been used; and so exquisite is the finish, that the eye might almost be deceived. The tomb is rather more than a mile to the eastward of the Fort of Agra. It is approached by a handsome road, cut through the mound left by the ruins of ancient palaces. Like the tomb of Akbar, it stands in a large garden. The term Taj Mahal is said to be a corruption of Mumtaz Mahal, another title of the lady.—*Taylor's Visit*, p. 133. *Schonberg's Travels, India and Kashmir*, Vol. I. p. 183, 4, 5.

TAJURRAH, a harbour on the west coast of the Red Sea, quite unsafe and exposed to the north-east monsoon, as well as the southerly winds, and it is probable that ships could not lie there, nor a landing be effected very often.

TAK. A district which adjoins the province of Dera Ismael Khan, and is partly in the plains. The only enemies of which the Sikhs here stood in awe were the Wuzeeree, a barbarous tribe of Afghans who inhabit the mountains to the westward, and sometimes descended and plundered in the low country.—*Papers East India, Cabul and Affghanistan*, 1859, *p.* 22.

TAK. Colonel Tod supposes the Tak race to be the same as the Takshak, Nagabansa or Serpent, race who act a conspicuous part in the legendary annals of ancient India. It is certain that the Tak were progenitors of the mahomedan kings of Guzerat, before that province was absorbed into the empire of Akbar. The Tak of Guzerat are said to have adopted mahomedanism when Wajih-ul-Mulk was converted, and became the founder of the mahomedan dynasty of Guzerat. From this time the name almost disappeared, but there are Tak amongst the Bhangi, who though of spurious descent, have evidently preserved the name. There are also Tank Rajputs in the central Doab and lower Rohilkhund, whose privileges of intermarriage show them to be of high lineage, and there is a tribe of nearly similar name existing near Jamu not far from their ancient capital Taksha-sila, or Taxila, of which the position is most probably to be sought between Mani kyala and the Suan River. Tonk Thoda and its lands on the Bunas, from remote times had been occupied, perhaps founded, by the Tak race, and hence bore the name of Taksillanuggur, familiarly Takitpur and Thoda.

From the ruins of the Thoda temples, remnants of Takshac architecture, the amateur might speedily fill a portfolio. This tract abounds with romantic scenery at Rajmahal on the Bunas, Gokurn, and many others. Herbert calls Cheetore the abode of Taxiles, the ally of Alexander. The Tak were all of the race of Poorú, so that Porus is a generic, not a proper name. This Taksilla-nugger has been a large city. The emperor Baber has given the position of the city of Taxiles, where Alexander left it, west of the Indus.—*Elliott Hist. of India*, p. 504. *Tod's Rajasthan, Vol. I. p.* 673. See India, Khelat, Khyber, p. 514.

TAK. HIND. Salvadora oleoides.

TAKAVI. ARAB. HIND. PERS. Advances to farmers in bad seasons.

TA-KEEP-NEE. In Tavoy, a very strong, close grained, heavy, light coloured, wood.—*Mr. Blundell.*

TAKER. HIND. Capparis spinosa.

TAKHE, a Siamese guitar.

TAKH-I-BAHI, in the country of the Yuzufzai, an early seat of the Arians. It is called Bahai by the natives, is an isolated barren hill of no great height, about eight miles west of fort Hoti-Mardan in Yusufzai. It forms irregularly three sides of a square, with the open side towards the north-west. The inner slopes of this hill are covered with the still standing shells of lofty buildings, constructed of hewn stones, most of them have at least been of two stories, the openings for the beams of the upper floor and the windows remaining to attest the fact.

TAKHTA, GUZ. HIND., a plank.

TAKHTA SIYA. Black brick-tea.

TAK-UL BOSTAN, is one parasang and a half from the town of Kermanshah. There are here magnificent bas reliefs, splendid works of art, well worthy of a visit; their history has been commented upon by many authors, and amongst them by Sir John Malcolm. These bas-reliefs were executed by command of Bahram IV., the Varanes IV. of Roman history, who lived at the commencement of the fifth century, and who, as it is said, was the founder of Kerman-shah.—*Ferrier Journ. p.* 27. See Kerman-shah.

TAKHT-I-JAMSHID. See Naksh-i-Rustoom, Vathek.

TAKHT-I-RAWAN. Pers. A light frame, fixed on two strong poles like those of a sedan chair; the frame is covered, generally, with cloth, and has a door, sometimes of lattice work, at each side; it is carried by two mules, one between the poles before, the other behind. The Kajawah is a kind of cradle, swung one on each side of a mule.—*Ouseley's Travels, Vol. I. p.* 251. *Rich's Residence, Koordistan, Vol. I. p.* 6.

TAKHT-I SULAIMAN. A mountain in L. 34° 4′ 8″ N., and L. 74° 49′ 7″ in Kashmir above Kosa. Srinugger, the capital of Kashmir, is 6,266 ft. above the sea.

TAKIAH. Arab. Pers. Amongst shiah mahomedans, the outward observance of a faith with which the observer differs.

TAK-I-KESRA, or Arch of Chosroes, the modern Tak-i-Kesra, marks the site of the ancient Ctesiphon. See Chosroes, C'tesiphon, Kasr, Kesra, Tigris.

TAKHT MALANGA. Hind. Nepeta elliptica.

TAKHUM. Panj. Celtis caucasia, *Willde.*

TAKHUR. See Thakoor; Tripati.

TAKIN, the Budorcas taxicolor of Blyth, is a large, massive and remarkable animal, denominated Takin by the Mishmi, and Kin by the Khamti. It is one of the group of Bovine antelopes. Its nearest affinity is probably to the gnoo; but it has various points of stronger connexion with musk oxen, and in a natural system its place would probably be assigned between those two types. The Takin tenants the easternmost part of the Himalaya, adjacent to Yunan, Sechuen and Kham, more especially in the upper or alpine region, but found also in the central region, though never in the lower region, and it probably extends its range from the Himalaya proper, to the proximate mountains of China and Tibet. The Takin derives its high interest for the naturalist, not merely from its compound structure, made up, as it were, of the ox, the antelope, the sheep, and goat, but also from its habitat, so remote and dissimilar from those of its allies. It is described as of high courage and great ferocity, so that it cannot be taken alive, and is killed by the natives with much trouble and some risk. It is said to be very gregarious, though old males are sometimes found solitary; but, for the most part, the species herd together in considerable numbers. Strength and ferocity are inscribed in very legible characters on the form and aspect of the Takin, which is a much larger as well as bulkier animal than the lusty Caprine antelope (Thar) of the Himalaya. The Takin, however, reminds one in several respects of the Thar, (Schinz in his "Genera Mammalium" has ranged this animal with the gnoo; this is a mistake, but one indicative of remote affinity. The Thar is a typical Nemorhedus,) which it much resembles in colour as well as by its short Caprine tail, harsh adpressed hair, and vigorous make, suited to climbing these stupendous mountains. But the Thar is in structure as much more Antelopine as the Takin is more Bovine. The Takin is not much, if it all, inferior in size or bulk to the female yak; and, as seen from the front especially, with its lunate horns displayed and its short tail concealed, it would be at once pronounced to belong to the ox kind, close examination alone being likely to suggest any doubts on that head. Its massive form and peculiar proportions are quite Bovine. It is in length, from snout to vent, six and a half feet; and in height 3½ feet at the shoulder. Its head is 20 inches, its ears 5 inches, its tail 3 inches, or 8 with the hair. The head is large and heavy, the neck short and thick, the body somewhat elongated but deep in the barrel, and yet more so in the shoulder, which is said to be raised in the Bisontine manner. The limbs are short, stout and Bovine, and so are the broad hoofs. In Takin there is no approach to the Cervine limbs, or equine body and tail of the gnoo: and the horns of the Takin, which to a superficial view are round, smooth and lunate, would complete the impression of a Bovine animal, were not progressive attention almost necessarily now turned to the short narrow pointed ears, very short depressed tail, and hairy attenuated muzzle of this animal; particulars in which, with others, the Takin deviates from the Bovine to approach the Ovine or Caprine type, and is sundered from the gnoo in the same degree, that it is approximated to the musk oxen or Ovibos. The head of the Takin is large, heavy and inelegant, exhibiting a mixed character, compounded of the Bovine and Ovine types. Its vertical dimensions (or height) are great, owing to the lofty curve of the nose and forehead, the chaffron being more romanised than even that of the Barwal (Ovis barual). But the length also of the head of the Takin is considerable, and surpasses that of any Caprine or Ovine head, though inferior to the full normal length of head characterising the ox tribe. The head, though large and upon the whole perhaps Bovine, yet lacks the characteristic squareness of the ox's head, both jaws being attenuated towards their aureal extremities much more than in the ox, though somewhat less than in the sheep and goat. There is in the muzzle of the Takin neither the nudity nor the breadth of that of the ox and gnoo, but on the contrary the lips are both tapered and clad with hair almost as much as in the goats and sheep, and the animal is consequently a browser, not a grazer. Nevertheless the mere nostrils, which are wide and terminal, have a decidedly Bovine character both as to form and position ; and, as it were, to remind us of the true Bovine muzzle, there is a clear broad margin round the nostril which is quite nude and moist.—*Beng. As. Soc. Jour. No.* 1 *of* 1850. *J. A. S. No.* 185, *for December* 1847, *No.* 206, *for August* 1849. *No.* 205. *No.* 181. *July* 1847. *Phys. Geog. of Himalaya.*

TALA. Sans. Borassus flabelliformis.

TALA, also Kufl, also Kulf, Guz. Hind. Duk. A lock.

TA-LAIN-NO. Burm, is a vine which attains a diameter of eight or twelve inches. Fruit yellow, pear-shaped, acid, with six or eight stones, size of an egg.—*Malcom, Vol. I, p.* 180.

TALANOPPI CHETTU. Tel. Xanthium orientale, *L.* X. Indicum, *R.* The prickly involucre is tied to the earring to cure headache. Hence the name which means headache tree.

TAKKU MARAM. Tam. Tectona grandis.

TA-KOUK-THA, also Yay-mi-ne. Burm. A tree of Amherst, Tavoy and Mergui, abundant all over the provinces, of maximum girth ½ cubit, and maximum length 7 feet. When seasoned it floats in water. It has a durable wood, likely to make good helves or to be useful in turning, too small in size, however, to be recommended.—*Captain Dance.*

TAKRI or TAKNI. See Chandragupta.

TAKSHA, Hind. Oxytropis macrophylla, *Lad.*

TAKSHAC, or Snake Race, are the Toorshka, one of the most extensive and earliest of the races of higher Asia, and celebrated in all its extent. The Takshak were Scythians of the buddhist persuasion. From the time of the great war of the Mahabarata, when we find them already in the northwest, to about 500 B. C., they extended their conquest in India ; and as they had a serpent for their national emblem, they were known as the *Takshac*, or serpent race. There can be no question, also, that the early legends of Persia are to be interpreted with this key, and that the voracious snakes of *Zohac* were hordes of barbarous Scythians from the north.

The period of their chief, though perhaps not their first, invasion of India, under their leader *Suhesnag*, occurred about 600 B. C. Many memorials of the bloody wars in which the hindoos were engaged with these invaders, exist in the records of Indian history. They extended their usurpations to the Magadha empire of Behar, the throne of which was held by the Nag, or Serpent dynasty for ten generations, and a branch of them, the Nagbunsee chieftains of Ramgurh, Sirgooza, have (*Trans. R. A. Society, Vol. II. p.* 563) the lunettes of their serpent ancestor engraved on their signets in proof of their lineage,—while the capital and district of Nagpoor are called after their name. The Vayu and Matsya Purana books call the Saisunaga, Kshatra-Bandhee, which may designate, says Wilson (Vishnu Pur. p. 467), an inferior order of the Kshatriya. The use of the title serves to show that they had already begun to be included in the military class, and is confirmatory of the view that they are included in the *Agnicula.* The invasion abovementioned was, according to Colonel Tod's supposition, nearly contemporaneous with the appearance of the 23rd Buddha, *Parisnath,* whose symbol is that of the race he accompanied, and hence he is called *Suhus Phun*, "the thousand-hooded." It is supposed that the brahmins made converts of some powerful branches of these new sectaries, and that it is to them the term *Agnicula* (fire-race) is applied, as signifying their spiritual regeneration by the element of fire. If so, the *Takshac* must be the progenitors of the most distinguished tribes of Rajpoots, and yet it is strange that no vestiges are now to be found of the original name

Tak, or *Takshac*, though it is recorded amongst the 36 royal races. Elphinstone opposes the doctrine of a Scythian admixture with the Rajpoots, but there is much in Indian history which could not well be explained without it, at least, without the admission of an incorporation of some northern family; and even he is disposed to concede the point with regard to the Jat. *Tak* is one of the sub-divisions of the Bhungee, but they are not likely to be in any way connected with the Rajpoot Tak. There is also a community of Tank Rajpoots in Gihror of Mynpooree, and in the south of Rohilcund. They trace their origin from Tank Tora in Kuraolee, and receive the daughters of Bumun Gour, Chumur Gour, Gehlote and Dhakura in marriage, which would argue them to be of respectable lineage. Takshac is still one of the Grama Deota, or village gods, of the Bhagulpoor district. It was a converted Tak Rajpoot who established the independent dynasty of Guzerat. The "Mirat-i-Secunderee" says the tribe was called Tak, because it became Teeagee, or separated from its brethren, ascribing therefore the same origin to the name as is given to the Tuga. For instance, when it is mentioned that an Apsara from Naglok was married to Chuttergoopt, and that more than half the Kayeth race of the country are the offspring of this union, and when it is mentioned that the seventeen daughters of Basook, the king of the Naga, were married to the seventeen sons of raja Ugersein, we are to understand that a nuptial alliance united a Scythian family with that of Chuttergoopt and raja Ugursein.

This race seem to have, on one occasion, entered Hindustan, led by a conqueror named Sehesnag, from Sehesnag desa who ascended the Pandu throne. The dynasty lasted 360 years, and terminated with Bykjat. Another Takshak dynasty of ten princes commenced with Chandragupta Mori, but lasted only about 137 years. Chandragoopta, the supposed opponent of Alexander, was a Mori, and in the sacred genealogies is declared of the race of Takshac. The ancient inscriptions of the Pramara, of which the Mori is a principal branch, declare it of the race of Tusta and Takshac, as does that now given from the seat of their power, Cheetore. The terms Nag, Tak, or Takshac are regarded by Colonel Tod as synonymous. Sehesnag-desa he considers to be synonymous with the abode of the ancient Scythic Tachari of Strabo, the Tak-i-uk of the Chinese, the Tajuk of the present day of Turkistan. This race appears to be the same with that of the Toorshka of the Poorana, who ruled on the Arverma (the Arakes), in Saca-Dwipa, or Scythia. The names of animals in early times, planets, and things inanimate, all furnished symbolic appellations for the various races. In Scripture we have the fly, the bee, the ram, to describe the princes of Egypt, Assyria, and Macedonia. Amongst the ancient as well as the present races in India, we have the snake, the horse, the monkey, the fox, the tortoise, the boar, the nag or snake-race being the Takshac. The Jat divided with the Takshac the claim of being the parent name of the various tribes called Scythic, invaders of India; and Colonel Tod possessed an inscription of the fifth century, applying both epithets to the same prince, who is invested moreover with the Scythic quality of worshipping the sun. It states, likewise, that the mother of this prince was of the Yadu race: strengthening their claims to a niche amongst the thirty-six Rajcula, as well as their Yadu descent. The fifth century of the christian era, to which this inscription belongs, is a period of interest in Jit history. De Guignes, from original authorities, states the Yuchi, or Jit, to have established themselves in the Punjab in the fifth and sixth centuries, and the inscription alluded to applies to a prince whose capital is styled Salindrapoora in these regions, and doubtless the Salivahanpoor, where the Yadu Bhatti established themselves on the expulsion of the Tak. How much earlier than this the Jit penetrated into Rajasthan must be left to more ancient inscriptions to determine: but in A. D. 440 we find him in power.—*Elphinstone's History of India. Tod's Rajasthan, Vol.* I. *p.* 35. *J. A. S. B., Vol. VI.*, p. 677.

TALAING OR MON, is the native name of the natives of Pegu. The Burmese call them Talieng. The Siamese appellation is Ming-mon. Part of this population dwell in the delta of the Irrawadi, Mon being the name used by themselves for the native populations of Pegu, Martaban, Moulmein, and Amherst; but their neighbours call them Talieng, and the same names Mon or Talieng are given to the vernacular language of Pegu. The alphabet, like that of the T'hay and Burmese, is of Indian origin, being essentially that of the Pali form of speech, and like all alphabets of this kind, it embodies a buddhist literature. The Mon language is quite unintelligible to a Burmese or Siamese.—*Latham's Eth.* See Mon.

TALAPIRIGES. See Oryza sativa.

TALAPOIN. This order of budd'hist ascetics or monks are known under different names in Ceylon, Siam, and Thibet, conveying nearly the same meaning, and expressing either the nature or the object of their profession.

The members of the order are known also as "Bonz." The former word is derived from the Pali "Talāpat" meaning the leaf of a palm tree, but applied by the Siamese to designate the large fan made of palm leaves, set in a slender wooden frame which the Talapoin carry with them when they go abroad. The votaries of buddhism in Ceylon, Burmah, Siam, Thibet, &c. show the greatest respect to the Talapoin. They are called by the Burmese Phonghi, which term means great glory, or Raban, which means perfect.

According to the tenets of this religious order, there exists an eternal law, which, when obliterated from the memory of men, can be known again, and, as it were, recovered and only thoroughly understood by the incomparable genius and matchless wisdom of certain extraordinary personages called Buddhs, who appear successively and at long intervals during the various series or successions of worlds. These Budd'hs or Budd'has announce that law to all the then existing rational beings. The great object of that doctrine is to point out to mankind the means of freeing themselves from the influence of passions, of becoming abstracted from all that exists; that being thereby delivered from the action of evil influence, which causes mortals to turn incessantly in the whirlpool of never ending existence, they may obtain the state of Neiban or rest, that is to say, a situation wherein the soul, disentangled from all that exists, alone with herself, indifferent to pains as well as to pleasures, folded, as it were, upon herself, remains for ever in an incomprehensible state of complete abstraction and absolute rest. A Budd'ha is a being who, during myriads of existences, slowly and gradually gravitates towards this centre of an imaginary perfection, by the practise of the highest virtues. Having attained thereto, he becomes, on a sudden, gifted with a boundless genius, wherewith he at once discovers the wretched state of all beings, and the means of delivering them from it. He thoroughly understands the eternal law which alone can lead mortals in the right way, and enable them to come out of this circle of existences, wherein they have been unceasingly turning and moving in a state of perpetual agitation opposite to that of fixity or rest. He preaches that law whereby man is taught the practice of those virtues which destroy gradually in him every evil influence, every affection for all that exists, and brings him at last to the end of existence, possession of Neiban. His task fulfilled, Budd'h dies, or rather to use the language of budd'hists, he enters into the state of Neiban. In that situation which is truly inexplicable, he knows nothing of, and enters nowise into the affairs of this world. He is as if he was not, or had never been. Buddhists venerate three precious things, Buddha, his law and the assembly of the just or perfect, in the same sense as we venerate and admire what is morally good and beautiful, such as virtue considered abstractedly and the acts originating from it. The statues of the last Buddh, Gaudama, are honored by his followers, not with the idea that any powers or virtues are inherent in them, but solely because they are the visible representations of Buddh, who desired that the same honor should be paid to them as would be offered to his person, were he yet living among them. This faint outline of the buddhistic creed is sufficient to bear out the above assertion that it is in no wise based on the belief in a supreme being, but is strictly atheistical, and therefore that no real priesthood can ever be found existing under such a system. It may prove too of some assistance for better understanding what is to be said regarding the subjects of this notice.

A buddhist, on becoming a member of this holy society, proposes to keep the law of Buddh in a more perfect manner than his other co-religionists. He intends to observe not only its general ordinances obligatory on every individual, but also its prescriptions of a higher excellency, leading to an uncommon sanctity and perfection, which can be the lot of but a comparatively small number of fervent and resolute persons. He aims at weakening within himself all the evil propensities that give origin and strength to the principle of demerits. By the practice and observance of the highest and sublimest precepts and counsels of the laws, he establishes, confirms and consolidates in his own soul, the principle of merits, which is to work upon him during the various existences he has as yet to go through, and gradually lead him to that perfection which will qualify him for, and entitle him to the state of Neiban, the object of the ardent desire and earnest pursuit of every true and genuine disciple of Budd'ha. The life of the last Budd'ha, Gaudama, his doctrines as well as his example, he purposes to copy with scrupulous fidelity, and to follow with unremitting ardour. Such is the great model that he proposes to himself for imitation. Gaudama withdrew from the world, renounced its seducing pleasures and dazzling vanities, curbed his passions under the yoke of restraint, and strove to practise the highest virtues, particularly self-denial, in order to arrive at a state of complete indifference for all that is within or without self, which is, as it were, the threshold of Neiban.

Like the monk, the Talapoin bids a farewell to the world, wears a particular dress, leads a life of community, abstracts himself from all that gives strength to his passions, by embracing a state of voluntary poverty, and absolute renunciation of all sensual gratifications. He aims at obtaining by a strict observance of the law's most sublime precepts, an uncommon degree of sanctity and perfection. All his time is regulated by the rules of his profession and devoted to repeating certain formulas of prayers, reading the sacred scriptures, begging alms for his support, &c. These features of exterior resemblance common to institutions of creeds so opposite to each other, have induced several writers little favourable to Christianity, to pronounce without further enquiry that Catholicism has borrowed from Buddhism many ceremonies, institutions and disciplinary regulations. Some of them have gone so far as to pretend to find in it the very origin of Christianity. They have however been ably confuted by Abbe Remusat in his Memoir intituled Chronological Researches into the Lamaic Hierarchy of Thibet.

It is somewhat surprising to find in the middle of half civilized nations, such as the Burmese, Siamese, Singalese, and Thibetans, a religious order with a distinct and well marked hierarchy, constitution and regulations, providing for the admission of members, their occupations, duties, obligations, and their mode of life, forming as it were a compact, solid and perfect body, that has subsisted almost without change during several centuries, and survived the destructions of kingdoms, the fall of royal dynasties, and all the confusion and agitation produced by political commotions and revolutions. It is in Thibet that the order is found existing in the greatest perfection, under the fostering care of the Great Llama, or high priest, who combines in his own person the regal as well as the sacerdotal dignity and power. In the city of Lhassa, a pontifical court, an elective sacerdotal chief, and a college of superior Llamas, impart to the order dignity, decency, respectability, and stability, which insure its continued existence, and more or less extend its influence over its members living in distant countries, ruled by a foreign sovereign. The period of the introduction of buddhism from India into Thibet is very uncertain if not quite unknown; but it appears certain that the establishment of a pontifical chief or sovereign, with royal prerogatives, was set up by one of the grandsons of the great Tartar warrior Gengis, in or about the middle of the thirteenth century. In other countries, where the order has no connection whatever with the civil power, we expect to see it surrounded with an equal splendour, or subsisting in the same state of perfection, regularity and fervour. Extraordinary indeed would be its vital energies, were the remotest parts of this great and far spread body to receive the same impulse and exhibit the same symptoms of vitality as those nearest to the heart or principle of life. The following is an account of all that relates to the constituent parts of the order, such as they have been found existing in Burmah, and developed in their sacred writings.

The whole fraternity is composed, 1st, of young men who have put on the Talapoinic dress, without being considered professed members thereof, or having hitherto passed through a certain ordeal somewhat resembling an ordination; they are called Shung. 2nd, of those who having lived for a while in the community in a probationary state, are admitted professed members with the ceremonies usually observed on such occasions, whereby the title and character of Talapoin are solemnly conferred—they are denominated Pazin. 3rd, of the heads of each house or community, who have the power to control all inmates of the house. 4th, of a Provincial, whose jurisdiction extends over all the communities spread over the towns and villages of one province or district. 5th, of a superior general, residing in the capital or its suburbs, called Haia Daw or great master, having the general management and direction of all the affairs of the order throughout the empire. In the kingdom of Ava, the key-stone of the Talapoinic fabric is the superlatively great master residing in the capital or its suburbs. His jurisdiction extends over all the fraternity within the realm of his Burmese Majesty.—*Jour. of Ind. Arch. Vol. IV. No. V. and VI. May and June* 1850, *page* 223.

TALARA. Hind. Kalanchoe varians.

TALASHRUBE. Tam. Aristolochia indica, *Linn.*

TALATHI MARAM. Tam. Grewia tiliæfolia, *Vahl.*

TALAUMA HODGSONI, a Magnolia growing on Tonglo, in Sikkim, at an elevation of several thousand feet. It is a large tree, with very dense foliage, and deep shining leaves, a foot to eighteen inches long, most of its flowers drop unexpanded from the tree, and diffuse a very aromatic fragrance : they are nearly as large as the fist, the outer leaves purple, the inner pure white.—*Hooker Him. Journ. Vol.* I. *page* 163.

TALAWA. SINGH. Open park like meadows, in the lowland forests of Ceylon, varying in extent from one to one thousand acres.

TALAXAN, a solid measure for firewood in Manilla, equal to 72 cubic feet.—*Simmonds.*

TALAZ—? A tree of Akyab. It is plentiful and is used for oars and banghies, and in house building.—*Cal. Cat. Ex.* 1862.

This mineral is a hydrous silicate of magnesia; it occurs crystallized and massive. Massive talc reduced to powder is the boot powder of shoe makers. It occurs also indurated.

TALCOSE SLATE, is a rock resembling mica slate. Talcose rocks are the gold rocks of the world, and contain the topaz of Brazil, euclase, and other minerals.

TALCHIR, a town in Cuttack where coal was discovered about the year 1850 by Mr. Turnbull, an Overseer in the commissariat department. The series of rocks there have been designated the Cuttack and Talchir group. Messrs. Blanford and Theobald examined the Cuttack or Talchir coal-field, and the following section is in descending order.

Alluvium, laterite, &c.

1.—Upper grit series,—unfossiliferous—quartzose grits and coarse sandstones, with occasional red shales ; pebbly throughout, and near base conglomeric—above 2,000 feet.

2.—Carbonaceous shale series, fossiliferous, consisting of

(*a*)—Blue and lilac shales, micaceous ; white speckled sandstones, ironstones, about 1,500 feet thick.

(*b*)—Carbonaceous shells containing thin seams of coal (3 inches) irregularly dispersed through them, about 200 feet.

(*c*)—Shales and coarse white sandstones, the latter predominate in lower portion, 100 to 200 feet.

3.—Lower shale and sandstone series, annelide tracks, consisting of

(*a*)—Blue nodular shales, generally arenaceous.

(*b*)—Fine sandstones, much jointed and "tesselated."

(*c*)—"Boulder bed," containing numerous boulders of gneiss and granite frequently 5 to 6 feet across—in a fine argillaceous or arenaceous rock, often rippled, sometimes replaced by a coarse sandstone.

Each of these series rests unconformably on that beneath it.

The Talchir field extends for about 70 miles from east to west, with an average breadth of 15 to 20 miles, and is bounded both on the north and south by great parallel faults, the former of which has an aggregate throw of upwards of 2,000 feet ; these faults are not truly east and west, but to the south of east and north of west. The section in ascending order of the basin shows at the base sandstone and blue shale, but slightly fossiliferous, in thickness from 500 to 600 feet ; over these is a series of shales and standstones often micaceous, occasional beds of ironstone, and thin layers of coal and coally shale, giving a total thickness about 1,800 feet ; and over these again is a distinct series of quartzose grits, conglomerates, and sandstones, in thickness from 1,600 to 2,000 feet. These three groups are unconformable each to the other ; the uncomformity between the two lower being, however, much less marked than that between the two upper.

To the lower group, as having been first recognized and described in this district, the name of "Talcheer" series has been given.

The second group, which, from its imbedded vegetable remains, was proved to be identical with the rocks of the extensive Damoodah coal-field, when these were first described, has been denoted the "Damoodah" series.

While the upper group, supposed to represent the great series of rocks, so magnificently seen in the Mahadeva hills of Central India, has been called the "Mahadeva" series. Thus three series can be recognised in each of the extensive fields referred to, although with varying developments and thickness. At the base of the Talcheer series there is a remarkable bed consisting of very large and only slightly rounded masses of granite and gneiss imbedded in a fine silt, and occurring under such conditions as induce the opinion that the action of ground ice has been the cause of its formation. In the Rajmahal dictrict there is a very limited development of the lower beds, above which unconformably comes the Damoodah series, here exhibiting a greater extension upward than in Cuttack ; but unfortunately, the sequence of the rocks is interrupted by the intercalation of several successive floes of basaltic trap, the intervals between which have been marked by the continued and tranquil deposition of the mechanical rocks going on. These floes have been repeated six or seven times, and the pheuomena of contact are in all cases marked ; the upper layers of the mechanical deposits in contact with the trap being in all cases greatly altered, while the lower layers are in no cases changed, but rest unaltered on the degraded surface of the underlying trap. But while the actual physical sequence of the deposits cannot be here traced, the fact of their all belonging to the same great series is attested by the occurrence of some identical fossils throughout. A few species pass upwards through the series, but there is a very marked change in the general facies of the flora in the upper as compared with the lower portions of the group, the latter characterized by the abundance of vertebrata pecopteris, trizygia, &c., the former by the abundance of zamia-like plants. The series, therefore, has been divided into Upper and Lower Damoodah rocks.

TALDENIA, a town in Ceylon, on the road to Badulla.

TALE, or Tael, a Chinese money and weight of 10 mace. See Tael.—*Simmond's Dict.*

TALEE. Beng. Corypha umbraculifera.

TALEE-TARAS, a fibre of Singapore, made into sewing twine.

TALE ELLE, Tam. Leaves of Pandanus odoratissimus.

TALENA, also Talbana, Talhang, Hind. Viburnum fœtens.

TALESFUR. Hind. The highly fragrant, stimulating leaves of Rhododendron aromaticum, used as a medicinal snuff in India.—*Simmonds.* See Talisa.

TALG. Ger. Tallow.

TALGACH. Beng. Hind.? Borassus flabelliformis, *Linn.*

TAL-GHAT in L. 19° 40′ N., L. 73° 33′ E. in the Dekhan, a principal pass on the road from Bombay to Nassik and Agra. Top of the ghat is 1,912 ft. above the sea, and the top of the hill near the ghat is 3,241 feet.

TALI, a name in the Eastern Archipelago for the treble fanam formerly coined at Madras, the 24th part of the Spanish dollar.

TALI, in peninsular India a piece of gold tied by the bridegroom round the bride's neck, at the time of marriage. It remains till she become a widow and is then removed by the husband's relations. The Tali are not all of the same form. In some castes it is a small round plate of gold, without stamp or figure on it: in others, it is a tiger's tooth: others are hammered by the goldsmith without any precise form; many castes have them flat and oval, of two small pieces which separate, and with hieroglyphics, representing the god Pulcar, or the Lingam. A woman is obliged to wear the tali during her husband's life. —*Sonnerat's Voyage*, p. 92.

TALI. Beng. Corypha umbraculifera, *Linn.* of Ceylon. C. taliera, *Roxb.* of the Peninsula.

TALI. Hind. Dalbergia sissoo.

TALIB, an inquirer or wisher, a pupil, a seeker, from talb.

TALIB-UL-ILM, a learner.

TALIENNOE. Burm. Chaulmoogra odorata, syn. of Gynocardia odorata.

TALIERA, Beng. Corypha taliera, *Roxb.*

TALIERA BENGALENSIS. Spreng. syn. of Corypha taliera, *Roxb.*

TALIERA ELATA. Wall. Corypha elata, *Roxb.*

TALIERA SYLVESTRIS. Bl. syn. of Corypha utan, *Lam.*

TALIF-I-SHARIF, a Persian work on medicine translated by Dr. Playfair.

TALIKAN. A city of Tukharistan between Balkh and Merv, three days' journey from the latter. There is another town of the same name east of Kunduz. The Talikan of Tukharistan is the one most frequently mentioned, and it is generally coupled with Fariyab, a city of Guzjan west of the Oxus, three days' journey from Talikan, three from Shaburkan, and six from Balkh. Yule, however, says there were, in fact, three places so called, that in Badakhshan, that in Khorasan, and a third in Dailam, the hill-country adjoining Kazbin.—*Yule Cathay* i. p. ccliii. *Elphinstone's Cabul* II., 221, 210.

TALIPAT. Singh. Corypha taliera, *Roxb.*

TALIPAT TREE, also, Talipat Palm tree, Anglo-Singh. Corypha umbraculifera, *Linn.* one of five species of a genus of palms, all inhabitants of Asia. The Talipot tree grows in stony parts of the mountains of Ceylon. Its leaves are of gigantic size, the petiole being seven feet long, the blade six feet long and thirteen broad. The outspread leaf affords shelter for seven or eight persons. They are extensively used by the Singalese as umbrellas and some of their records are written with a style on pieces of the blade of this palm.—C. taliera is the Talipat of the peninsula.—*Seeman.*

TALI-KALAT, Malay. Cordage.

TALI RAMI. Malay. China grass.

TALISA, also Talisfar, Talisri, Hind. Rhododendron anthopogon, R. campanulatum.

TALISAPATRI. Vern. Flacourtia cataphracta, *Roxb.*

TALI-SAWAH. Malay. Cable.

TALISH. A province on the western shores of the Caspian.

TALISHA. Sans. Flacourtia cataphracta.

TALOPOTA. Hind. Sansc. Cassia auriculata.

TALAR. Hind. Vitis Indica.

TALPIDÆ, a family of animals belonging to the order Insectivora, and including the Moles, the genus Talpa. The species of restricted Talpa amount to five in number, viz., T. europœa, *L.*, of Europe generally ; T. cœca, *Savi*, of Italy and Greece ; T. moogura, *Temminck*, of Japan ; and T. microura, *Hodgson*, of Nepal, Sikim, Butan, and the mountains of Assam : the fifth is T. leucura, of Cherra Punji, N. of Sylhet. It differs little from T. microura, except that the tail is considerably more developed, though much less so than in T. europaca ; and the tail is clad and tufted with white hairs, whence the name T. leucura. This animal also would seem hardly to attain the size of T. microura. An adult female in spirit measures 4¼ inches long, with a tail ⅜ inch additional : the latter is of a club shape, much constricted for the basal half. The general colour of the fur, too, is less fulvescent than is usual with T. microura. In both of these Asiatic species, as in T. cœca, there is no perforation of the integument over the eye, as in T. europæa, the skin being there merely attenuated and imperfectly transparent.

The specimens of T. microura from Assam, like those of Nepal, have generally a very minute tail, which can be distinctly enough felt under the fur ; but those from the vicinity of Darjiling have no external trace of a tail. There is, however, no perceptible difference in the skulls and dentition, nor in any other character whatever, that should warrant us in considering the tailless Darjiling mole as a distinct species, separable from T. microura. It is not improbable that T. leucura may extend its range eastward into China ; and in that direction we may look for additional species of Talpa, if not also in western Asia. In Africa the genus is unknown, but is represented in the south by Chrysochlore ; in N. America by Scalops and Condylura ; while in S. America the Insectivora, *Cuv.*, do not occur, their functions being performed by numerous diminutive species of Didelphys, as also may be said in Australia by the Perameles tribe ; and it is far from unlikely that Australia may yet be found to produce a fossorial marsupial form, resembling the moles, as other Marsupialia present an analogical but superficial likeness to certain other Insectivora.—*Blyth.*

TALPA MACRURA. Hodgson. The long tailed mole of Sikkim, is four inches long and tail $1\frac{1}{4}$ inches. Its fur is a deep slaty blue, with canescent gloss.

TALPA MICRURA. Hodgson.

T. cryptura	*Blyth.*	Pariam	Lepch.
Short tailed mole	Eng.	Biyu kantyem	Bhot.

The mole of Nepaul and Darjeling, is $4\frac{3}{4}$ to 5 inches long, with a tail 3-16ths or less. *Journ. Ben. As. Soc. p.* 215, *No. III. of* 1850. *Jerdon Mammals.*

TALPUR, a dynastic title of the late amirs of Sind, descendants from Mir Bahram Khan, chief of the Baluch tribe of Talpur, who succeeded Abdul Nabi of the Kalora dynasty in 1788. Their greatness arose of Futteh Ali Khan. The Talpur dynasty of Sind were replaced by the British in 1845. The Talpur were an inferior hill clan of Baluch. Even when they became rulers of Sindh, Mahomed Khan, the ruler of Kelat, was ready to go to war with amir Gholam Ali, Talpur, because the latter had the audacity to propose to a female of his family.

TALSAR. Hind. Rhododendron lepidotum.

TALUDALA. Tam. Clerodendron phlomoides, *Linn.*

TALU-DAMA. Boerhavia diffusa.

TAMARIA. See India, p. 329.

TAMARICACEÆ, the Tamarisk tribe of plants. Six species occur in the E. Indies, viz. 3 of Tamarix, 1 of Trichaurus, 2 of Myricaria. Four of these inhabit the plains of the peninsula and Hindustan, and two are found in Kunawar and in Kashmir. Dr. Roxburgh describes the Tamarix indica,—identical with T. gallica—and T. dioica (jhuo). T. furas occurs in the drier parts of the Doab, and in the neighbourhood of Delhi, where it is called Asul or Atul as in Arabia. The other species are also found in the peninsula.

The Tamarices are bitter and astringent. In Denmark they are used instead of hops for making beer, and in some parts of Europe as a tonic remedy. Galls are formed on the T. furas and are called Sumrut-al-asul or Chotee mue. Those on the Jhou are named Sumrut-ul-toorfa, or Burree mue.

The T. gallica of Mount Sinai is at certain seasons covered with a kind of sugary exudation, said by Ehrenberg to be produced by the puncture of the Coccus maniparus. It is called Arabian manna, or Guzunjabeen ; it is unknown in the bazars of Bengal, and is not produced in India.—*Voigt. Roxb. Royle, p.* 213, 214. *O'Shaughnessy, page* 332.

Tamarind is the fruit of the Tamarindus Indicus, which grows in the East and West Indies the Eastern Islands, Arabia, and Egypt. It attains the height of 30 or 40 feet. Tamarind pods are from 3 to 6 inches long, and more or less curved, when ripe they consist of a dry, brittle, brown external shell, within which is the useful part, an acidulous, sweet, reddish-brown pulp penetrated by strong fibres. Within this is a thin membranous coat enclosing the oval brown seeds. The pulp, as analysed by Vauquelin, contains citric acid 9·40, tartaric acid 1·55, malic acid 0·45, bitartrate of potash 3·25, sugar 12·5, gum 4·7, pectin 6·25, parenchyma 34·35, and water 27·55. The fruit is used by the natives of India and Persia in making a sherbet or cooling drink ; and also as a necessary ingredient in curries, to which it communicates a tartish flavour. The pulp allays thirst, is nutritive and refrigerant, and in full dose laxative. An infusion forms a very pleasant, cooling drink, as does also tamarind whey. Infusion of senna with tamarinds is a useful laxative. Tamarinds form a large export from India, being packed in tin with or without syrup. Several varieties are distinguished, such as the red tamarind, the sweet tamarind, obtained from Persia : the dark tamarind, produced in Madura, one of the Eastern Islands ; and the common or green tamarind, which is extensively produced throughout India. The red coloured tamarinds are found in Guzerat, at Kheir on the Godavery, at Punderpoor on the Kistna, and there are four trees in Madras. It is the best of the three Indian varieties. In preserving it for export, when the fruit is ripe, the shell or epicarp is removed and the fruit placed in layers in a cask, boiling water being then poured over it. Another plan is to put alternate layers of tamarinds and powdered sugar in a stone jar. Tamarinds are exported both raw and preserved. The mootchee men prepare a useful paste of the tamarind stones, which is called Pasay, Tam. —— ? Tel., by first taking off the brown skin and then boiling them down till they become glutinous.—*Madras Exhibition Juries Reports. Ainslie's Mater. Medica, p.* 231. *Royle Materia Medica. This is a very handsome tree, of slow growth, but attains a great size ; indeed, is one of the largest in India, and with a very extensive shady head. It is not common in forests, but is met with in gardens, near old temples, where it has been planted. It is a graceful avenue tree, and grows throughout Hindustan, in the Peninsulas, in Burmah and the Archipelago, but is rare in the Punjab.

In Burmah it is not found upon tidal waters, but is very abundant throughout the upper provinces. It rises to ninety or one hundred feet high, and twelve or fifteen in circumference, and, like the mango, is planted not less for shade than fruit. The branches extend widely, with a dense foliage of bright green composite leaves, very much like those of the sensitive-plant. The flowers are in clusters of a beautiful yellow, veined with red. The pods hang like beans, are longer, darker, and richer than the tamarind of the West Indies, and are preserved without the addition of syrup.

Its timber is remarkably heavy and hard, much like Lignum vitæ, and is used generally for shivers in blocks, and such purposes. It is hard, dark coloured and durable, is often finely veined, and the heart wood of old trees is dark coloured, resembling ebony. The tree is apt to be hollow in the centre, which prevents large slabs being obtained. It is used in the manufacture of sugar and oil mills, naves, mallets, rice pounders, and for furniture and building purposes, but carpenters are very unwilling to work it up on account of the great damage it causes to the best tempered tools. It is valuable for brick and tile burning. The trees grow to about seven or eight feet in diameter at the but, while that of the body of the tree is about five feet. This part is seldom more than ten feet long when it branches out into curves of various dimensions. Mr. Edye, in saying that there are two sorts of tamarind, the light and the dark,—must allude to the West Indian red and East Indian white varieties ; several large trees of the former, with red fruit, grow in the south of India, and the editor largely distributed the seeds through the Madras Board of Revenue. The tree is valuable from the quantity of fruit it produces, which is used medicinally in cookery. In India, the shadow of the tamarind tree is deemed particularly injurious to vegetation, and for people to reside beneath this tree, is supposed, in India, to be unhealthy; but in the northern part of the island of Ceylon, people build their houses beneath the tamarind tree as the coolest site.—*Edge, Forests of Malabar and Canara, Drs. Wight, Ainslie, Royle, Riddell, Mason, Cleghorn, Stewart and Gibson, Mr. Mendis. Mr. Rohde. McCulloch's Com. Dic. p.* 1111. *Malcom's Travels in S. E. Asia. M. E. J. Rep.*

The Indian tamarisk is a glabrous greenish plant with stiff twiggy branches, of considerable size in the Ajmeer district, but the wood is there very inferior. In the Dekhan it grows abundantly as a small tree or shrub in the beds of many rivers, and affords shelter for all sorts of game. It is subject to the attacks of a cynips, which produces galls that possess astringent properties, and they are on this account used in medicine by the native doctors of India. The same property also renders them valuable in dyeing; baskets are made of the twigs which are also used medicinally as an astringent. This and other Indian species of the tamarisk produce galls. The galls are largely gathered in the Jhang, Gugaira and Muzaffargurh districts, as also in Dera Ghazi Khan district, where as much as 500 maunds are annually collected. The manna of Mount Sinai is produced from a variety of this plant, and consists of a pure sugar. It grows up to 10,600 feet on the Shayokk in Ladak, reaches 3 feet in girth and 30 high, and furnishes much of the steamer fuel in the southern Punjab and in Sind; the wood is coarse grained and often very red and is used for Persian wheels, in turning, &c. In Ladak, where wood is scarce, this is used for the handles of the sticks for polo or hockey on horseback.—*Dr. J. L. Stewart. Royle. Ill. Him. Bot.*

The flowers.

Bur, HIND.

This tree is sometimes mistaken by Europeans for a fir. It grows commonly in the Punjab plains, chiefly from Delhi westward, along the more arid tracts up as far as Peshawur, flowering after the rains. A proportion of the trees grow with their branches rather upright and close to the trunk, somewhat like Acacia arabica var. cupressiva. It grows very rapidly and to a large size, 10 or 12 feet girth, and 60 or 70 high; but it affords little shelter; it speedily decays at the heart, and most of the larger specimens are hollow. It mostly grows where the soil is saline, but not too light; it is raised very readily from cuttings which are frequently merely buried length-wise in the ground. The timber is coarse-grained, and weighs 92 lbs. per cubic foot green, and 60 lbs. dry. In the southern Punjab it is used for ploughs, Persian wheels, and small rafters, being often cut as coppice for the last purpose. In Sind the wood is employed in turnery. When the green wood is used for fuel, it is said to give out a most offensive odour, rendering it intolerable in a room, whence the European soldiers at Peshawur give it a ludicrous nickname. But when dry it burns without smell, and makes a tolerable fuel for ordinary purposes, although by the railway people only the Salvadora is reckoned worse for the locomotive. The galls appear mostly or altogether to be derived from this species, and the two names seem to Dr. Stewart to indicate merely difference of size, not of origin. They are employed as a mordant in dyeing, and in medicine are reckoned astringent, being used in gargles, &c. Trans-Indus the bark is stated to be used for tanning. The manna of the tamarisk is said to be very accurately described by Diodorus Siculus. This plant sometimes secretes saccharine matter allied to manna caused by a species of coccus which attacks the tree. A shower of this kind of manna fell at Agra in February 1855. Near Sinai it is stated to be produced by the borings of an insect. Aitchison notes that he never saw it on the tree in the Punjab, nor has Dr. Stewart observed anything nearer it than a white caterpillar-looking larva, with which he has repeatedly seen trees infested. It is, however, said to be produced largely in parts of the Punjab, as near Jhang. Masson states that in Brahuistan it is produced on the white flowered kind only (in the Punjab some few trees have whitish, instead of reddish flowers), and in alternate years with the galls, but this seems hardly probable. The twigs have often or always a saline taste from a very minute efflorescence of salt, and Edgeworth mentions that poor people near Multan dip them in water in order to season bread. In parts of the Punjab the flowers are said to be used in dyeing.—*Dr. J. L. Stewart.*

TAMIL. The name of a language and of a country where that idiom is in general use. The Tamil land is the same with Dravira, and comprehends all the districts in which that language is spoken, enclosing a portion of the eastern parts of the peninsula. When Dravira was confined to the Chola, Pandya and Chera principalities, its northern boundary was the Palar river. When the Chola princes colonized Tondamandala, it was extended westward to Tripeti, in a line with Pulicat, where the land of Dravira was met by that of Telingana. Tamil is spoken in the country called Dravira, which occupies the extreme south of the peninsula, and is bounded on the north by a line drawn from Pulicat (near Madras) to the ghats, between Madras and Bangalore, and so along the curve of those mountains westward to the boundary line between Malabar and Canara, which it follows to the sea, so as to include Malabar. Dravidian is a term recently applied to the vernacular tongues of the great majority of the inhabitants of Southern India. With the exception of Orissa, and of those districts of Western India and the Dekhan where Gujarathi and the Marathi are spoken, the whole of the peninsular portion of India, from the Vindhya mountains and the river Nerbudda to Cape Comorin, from the earliest period, appears to have been peopled by different branches of one and the same race, speaking different dialects of one and the same language; and scattered off-shoots from the same stem may be traced still further north and west, as far as the Rajmahal hills, and the mountain fastnesses of Beluchistan. Dr. Caldwell, excluding theRajmahal,the Uraon and the Brahui, designates as Dravidian nine idioms current in Southern India, viz. Tamil, Telugu, Canarese, Malayalam, Tulu, Toda, Kota, Gond or Goand, Khond or Kund or Ku, and it has been remarked that in the cultivated languages of the Dravidian tongue, Sanscrit words are not at all, or but very rarely employed. The *Tamil* was formerly called by Europeans the Malabar language, and this term is even still used amongst the illiterate of the English speaking community, but even the educated classes write it erroneously as Tamul. It was the earliest developed of all the Dravidian idioms, is the most copious, and contains the largest portion of indubitably ancient forms. It includes two dialects, the classical and coloquial, the ancient and the modern, called respectively the Shen Tamil and the Kodun-Tamil, which so widely differ that they may almost be regarded as different languages. The Tamil language is spoken throughout the vast plain of the Carnatic or country below the ghauts, the country termed the Carnatic Paen Ghat by the late mahomedan sovereigns and by the British who have succeeded them, from Cape Comorin to Pulicat, and from the Bay of Bengal to the eastern ghauts, or central mountain range of Southern India. It is also spoken in the southern part of the Travancore country, on the western side of the ghats, from Cape Comorin to the neighbourhood of Trevandrum; and in the northern and north-western parts of Ceylon, where Tamilians formed settlements prior to the Christian era, and from whence they have gradually thrust out the Singhalese. The Tamil race is the least scrupulous or superstitious, and the most enterprising and persevering race of hindus, and swarm wherever money is to be made, or wherever a more apathetic or a more aristocratic people is waiting to be pushed aside. The majority of the hindus found in Pegu, Penang, Singapore, and other places in the east, where they are known as Klings, are Tamilians. All throughout Ceylon, the coolies in the coffee plantations are Tamilians; the majority of the money-making classes, even in Colombo, are Tamilians, and ere long the Tamilians will have excluded the Singhalese from almost every office of profit and trust in their own island. The majority of the domestic servants, and of the camp followers in the Madras presidency, and along with its army, are Tamilians. The half of its army are Tamilians, and the coolies who emigrate so largely to the Mauritius and the West India Islands, are mostly of the Tamil people. Including the Tamil people who are residing in the military cantonments and distant colonies, and those in South Travancore, Northern Ceylon, and excluding all Mahomedan, Teling.and Brahmin residents of the Tamil country, who amount to at least ten per cent. of the whole population, the people who speak the Tamil language are estimated by Dr. Caldwell at about ten millions. The Tamil people are, generally speaking, a dark colored and short statured race, energetic, fiery and quarrelsome, but not vindictive. Most of them have embraced brahminism, but the outcasts and fragmentary tribes have a spirit and a devil worship, and they worship the local deities called Ammun. Amongst the poorer of the Tamil people, we find remnants of a belief in spirits, a veneration of black stones, a shammanite diabolatry, indications of their earliest mythology. Tamil and Malayalam writing characters were originally modifications of the ancient Thibetan. The Tamilian languages are written in alphabets derived from some prototype of Devanagari, scarcely from the actual Devanagiri. Tamil is written from left to right. Tamil labourers arrived in Ceylon in 1858, to the number of 96,000, and the number who took their departure was 50,000. Amongst the Tamil people, the Adima or Adimai are predial slaves attached hereditarily to the land, and only transferable with it. The Vellala are a Sudra race of hindus who speak Tamil. They assume the honorific designation of Mudali or (*pl.*) Mudliar, meaning first man, and are chiefly farmers, but many of them are soldiers. Another branch of the Tamil race is the I'dyan, who take the honorific appellation of Pillai, meaning sons. These are of the herdsman race, and are less advanced in education than the Vellala. Amongst the fragmentary tribes in the Tamil country, the more prominent are the Pariah, and the Chakkili, the Yenady, the Kadir, the Malai Arisar, and others. The Chakkili is a currier, a tanner, shoemaker, the village shoemaker; known to Europeans as a chuckler. The chakkili is one of the outcast races of India, and correspond to the Mhang or Mang of the Mahratta country. They are held in great disesteem, and are the public executioners. The condition of the tanners is similar in Japan, where they are restricted to a particular locality, and are similarly employed.—*Elphinstone's History of India, vol. I., p.* 410. *Tennent. Wilson.* See Aborigines. Beluchistan. India. Kelat. Malayali.

TAMIL FASLI. The Fasli or Harvest era of the Tamil people.

TAMIL KORAN. A translation of the Arabic Koran, in use by the Labbi mahomedans.

TAMILLA JILLEDDU. TEL. Calotropis, *sp.*

TAMIRAMA. MALEAL. Boerhavia procumbens.

TAMISRA. SANS. The hell of darkness, from Tamisra, darkness.

TAMIYA. HIND. Alhagi maurorum.

TAMLUM, the tael of Siam; a money of account of four silver ticals, or two Spanish dollars.—*Simmonds' Dict.*

TAMMA. TEL., also Chamma, Canavalia gladiata, *D. C.*

TAMMA KAIA, TEL. Dolichos cultratus.

TAMOOK ISLAND, in lat. 6° 28′ N., long. 121° 56′ E., a rathre low island off the Philippines.

TA-MOOLEE. BENG. Curculigo orchioides.

TAMPANG. MALAY. A weight in use in Malacca for tin, about 1⅓ lb.—*Simmonds' Dict.*

TAMPING. MALAY. A package; "sago tamping" is baled sago, wrapped in the leaves of the pandanus.

TAM-PING. CHINESE, a kind of oil-cake extensively imported into Shanghae, China, made from a large white pea.—*Simmonds' Dict.*

TAMPINNIS, a fruit tree of Penang, of a light red colour, used for ornamental furniture. billiard cues, &c.—*Colonel Frith.*

TAM-POI-NE. MALAY. Artocarpus echinata, ***Roxb.***

TAMRA, also Tamraka, SANS. Copper.

TAMRA VALLI. TEL. Manjistha-tige TEL. Rubia cordifolia, ***Linn.***

TAMTOO ISLAND, on the south coast of China.

TAMULI. BENG. Curculigo orchioides, *Gœr.*

TAMUS.——? See Dioscoreaceæ.

TAN, the body. See Dhan, Rudra sampradayi.

TANA. TAM. A tree with hard and heavy wood, used in house-work, and for implements of agriculture. It is very scarce.—*Edye. M. and C.*

TANAB. TURK, a land measure of 60 yards square.

TANACETUM TENUIFOLIUM. JACQ. The tansy, grows at 10,000 feet on the Sutlej, and is useful for flavoring puddings.—*Dr. J. L. Stewart.*

TANA-JINIYA. BENG Poa punctata.

TANAKEKE OR Tunikik island, in lat. 5° 34′ S., long. 119° 24′ E., in the Java sea, is discernible from the sea 18 or 21 miles.

TANA-HAL. SINGH. Millet.

TANAKU MARAM. TAM. Cochlospermum gossypium, *D. C.*

TANARIUS MAJOR. RUMPH.

Lacca Tree,	ENG.
Malayan Red-wood	„
Laka, or Kayu laka	MALAY.

A tree with a red coloured wood, a native of Sumatra, used in dyeing and pharmacy. It is an article of considerable native trade, and is chiefly exported to China. This Malayan red wood is heavy and compact, somewhat resembling red sanders wood, but when powdered the colour is browner and not so brilliant.—*Crawfurd. p.* 204.

TANAUR. HIND. Vitis Indica.

TANBARARI. A Beluch race. See Kelat, p. 492.

TAND, in Kohat, a kind of soil.

TANDA. HIND. A binjara encampment. A caravan for transportation of goods on bullocks, bulls, and cows.

TANDAI. HIND. Albizzia odoratissima.

TANDALA. HIND. Digera arvensis; also Ephedra alata.

TANDALE COTTI. MALEAL. Crotalaria retusa, *L.*

TANDEI. HIND. Viburnum fœtens.

TANDESVARA, the most famous and most honored of the sixty-three special devotees of Isvara.

TANDOI. in Bunnoo, land watered by canals.

TANDOK. MALAY. Horn.

TANDOO. JAV. AR, palanquin, a sedan chair, a palanquin carried by two bearers.

TANDRA MARAM. TAM. Terminalia rubrica.

TANDUL. MAR. Rice.

TANDUR. HIND. An oven.

TANEN THA. BURM. also Ree Kyeing Calamus, *sp.*

TANG. HIND. Pyrus communis. P. variolosa. Mail Tang. HIND. Pyrus Kumaonensis.

TANGA, TANJA, a money of Goa, worth about 7½*d.*—*Simmonds' Dict.*

TANGEDA WOOD. ANGLO-TEL. Tangeda karra, TEL. Cassia auriculata.

TANGAL. Mal. A priest of the Moplah mahomedans.

TANGA MARA. A pirate race who, in ancient times, occupied the seacoast from Karachi to Lahori Bandar; one of their heroes, Rana Abaid, lived A. D. 1591.

TANGAN, a river near Kurmi in Dinajepoor.

TANGAN-TANGAN. Philippine. Ricinus communis. Palma christi. Castor-oil.

TANGAR. A hill in the Tanna collectorate of Bombay, about 2350 feet above the sea. Its rainfall is about 80 to 83 inches. The top is about two miles long and one mile broad.

TANGASIR, or Tangestan, a district near Bushehr, a country of narrow and difficult passes. The people possess very considerable bodily strength.—*Ouseley's Travels,* Vol. I., p. 226.

TANGAYREE. Can. Cassia auriculata, *Linn., Roxb.*

TANGEDU, Tel. Cassia auriculata, *Linn.*

TANGEDU MANU. Tel. Inga xylocarpa, *D. C.*

TANGEER BARK, of Macassar, is used in making a dye for washing the hair, which it is said to cleanse and strengthen.

TANGGILIN. Malay. Ant Eater, the Manis or pangolin.

TANGGULUN, a hard wood of Java, of a close grain, and employed by turners for various small works.

TANGHA. Malay. Cocoa-nut palm.

TANGHAI, or Tangul, or Tangala. Malay. Ægle marmelos, *Corr.*

TANGHAN, a small horse of Tibet wonderfully strong and enduring; they are never shod, and the hoof often cracks, and they become pigeon-toed : they are frequently blind of one eye, when they are called "Zemik" (blind ones), but this is thought no great defect. They average *5l.* to *10l.* for a good animal in Tibet; and the best fetch *40l.* to *50l.* in the plains of India, where they become acclimated and thrive well. Giantchi (Jhansijeung of Turner) is the best mart for them in the eastern part of Tibet, where some breeds fetch very high prices. The Tibetans give the foals of value messes of pig's blood and raw liver, which they devour greedily, and it is said to strengthen them wonderfully; the custom, Dr. Hooker believes, is general in Central Asia. Humboldt (*Per. Nar. IV. p.* 320) described the horses of Caraccas as occasionally eating salt meat. The Tangun, Retangun, or Tanyan, of Nepaul, so much esteemed in India for their hardiness, come entirely from Upper Tibet; and, notwithstanding their make, are so surefooted, that the people of Nepaul ride them without fear over very steep mountains and along the brink of the steepest precipice. The species which is indigenous to Bhootan, has its title from the region in which they are bred, being called Tangun, vulgarly Tannian, from Tangastan, the general appellation of that assemblage of mountains which constitutes the territory of Bhootan.—*Turner's Embassy, p.* 22. *Hooker Him. Jour. Smith's Nepal.*

TANGHANI. Uria. Cassia, *species.*

TANGHEDU. Tel. Cassia auriculata.

TANGHINIA ODALLAM. Don. Cerbera odallam, *Gært.*

TANGHINIA VENENIFERA. See Cerbera tanghin.

TANGHIN POISON. See Cerbera.

TANGI. Hind. Pyrus variolosa.

TANGLA. Hind. Tagetes erecta.

TANGLING. See Kunawer.

TANG-NET-NA. Burm. A Tavoy wood.

TANGNO. See Kunawer.

TANG-PO-CHA. See Kambogia.

TANGROR, Hind. of Lahaul and Kulu, the ibex.

TANGUL, also Tanghula, Malay. Ægle marmelos.

TANGUS. See India, p. 311.

TANHARI. Hind. Pistacia integerrima.

TANI. Maleal. Tam. Terminalia bellerica, *Roxb.*

TANI. Hind. Oryza sativa.

TANI. Tam. Water. Tani-kacha, a water-woman.

TANI-KAI. Tam. Myrobalan.

TANI KAIA MARAM. Tam. Terminalia bellerica.

TANI-KAI ENNAI. Tam. Oil of Terminalia bellerica. See Oil.

TANIKI, Tel. Adelia neriifolia, *Roxb.*

TANI MARAM. Tam. Jellam, Malayala, means water-wood. This tree grows to about two feet in diameter, and forty feet high. It is remarkably soft and porous, and contains a great quantity of water. It is one of the inferior kinds of jungle wood.—*Edye, Forests of Malabar and Canara.*

TANISHA. See Kuru-Khet.

TANJAT, p. 309. See India.

TANJONG. Malay, a headland ; Tanjong Batu Besayab, Tanjong Krassak, Tanjong Merrum, Tanjong Sumbuang, are headlands in the Banca Islands.

TANJONG AWAT, or Cape Caran, called also Mud Point, nine miles N. W. of Salangore.

TANJONG BASSO, or Baccoun Island in lat. 0° 20' S., long. 103° 48' E., distant 19 miles N. W. by W. from the Calantigas.—*Horsf.*

TANJONG BATO, or Point Pedro, 12 miles E. N. E. of Acheen Road, terminates in a gentle slope and is covered with large trees.—*Horsf.*

TANJONG SAMPAN MANGAIO, the north extreme of Borneo.

TANJORE, a town in the district of Tanjore in the south of the peninsula of India. It has a temple of Siva, considered the finest specimen of the pyramidal temples in India. The town is built on a branch of the river Cauvery. It was the capital of a province of that name ruled by a Mahratta prince till his death in 1855, and then annexed. He was descended from a brother of Sevaji. Tanjore was conquered by Shah-ji, father of Sevaji, about 1650. On the 16th September 1773, the capital was taken by storm by the nabob of the Carnatic and the British, but was restored to Tuljaji in 1775. The Tanjore collectorate has a population of 1,676,000. It has the river Cavery, and has been provided with the means of irrigation and good roads, and the revenue has risen in consequence from £300,000 to £500,000 sterling. See India, Mahratta, Narapati, Polygamy, Sevaji.

TANK, an artificial water reservoir.

TANK. Hind. A small, brown, wild grain of Kangra.

TANK, a dry-measure averaging 240 grains in weight. In Bombay a weight for pearls of 72 grains.—*Simmonds' Dict.*

TANK. To the south of Bunnoo lies the Tank valley, connected with Murwut by the Kyzoo Pass, and with Bunnoo by that of Mulizye. In richness, beauty and political position, the Tank valley resembles Bunnoo. Above it rise the Wazeeree and Buttanee mountains, and as several passes afford a ready approach, the inhabitants are exposed to assault and encroachment from one of the most oppressive among the hill tribes. The Ghubber mountain is a large mountain mass between Tank and Bunnoo, protruding into the plains. It is infested by a predatory tribe named Mithani, who are perpetually at feud with the Waziri.—*Rec. of India, No.* 11. See Khyber, p. 508, 512.

TANKA. See Jakun.

TANKHUL, a rude tribe near the source of the Irawaddi.

TANK-NI. Guz. Hind. A pin : Pins.

TANKOEBAU PRAHOE, a volcano in Java, with a crater from which the eruptions of 1829 and 27th May 1846 issued. Dr. Horsfield paid a visit to it in 1804.

TAN-LABET—? In Amherst, a heavy white timber, employed for house posts and other common purposes. It is not liable to injury from insects.—*Cat. Ex.* 1851.

TAN, MAN, DHAN. Sans. Body, mind and wealth. The hindu delivering himself up to his guru, his body, his mind and his property. See Rudra Sampradayi.

TAN-MOHR. Mahr. Sypheotides auritus, *Latham.*

TAN-MUH. Chin. Sandalwood.

TANNA. Ben. Burm. Artocarpus, *species.*

TANNA. Tam. A tree of Malabar and Canara with a hard and heavy wood, used in house work and for implements of agriculture ; it is very scarce.—*Edye, Forests of Malabar and Canara.*

TANNAH. Malay. White clay.

TANNAH MALAYU. Malay. Malay-land. See India, p. 354.

TANNAH SHAH, the last of the Kutub-Shahi dynasty in Hyderabad in the Dekhan.

TANNEER-VITTANG. Asparagus sarmentosus.

CHAKKILI. Tam. Mal. A currier, a tanner, a shoemaker, the village shoemaker ; known to Europeans as a chukler. The chakkili is one of the outcast races of India, and corresponds to the Mhang or Mang of the Mahratta country. They are held in great disesteem, and are the public executioners. The condition of the tanners is similar in Japan, whereas in India, they are restricted to a particular locality, and are similarly employed.—*Wilson.*

TANNERS CASSIA. Eng. Cassia auriculata, *Linn.*

TANNIC ACID. See Galls.

TANNIN. See Galls.

TANNING of leather is one of the manufactures where, with an unbounded quantity of raw material, the results are most unsatisfactory : with an unlimited supply of hides and first-rate barks, gums and extracts, the goods turned out by natives of India are of the worst possible description. The manufacture of leather in India generally, is by no means so thriving an art as it might be, considering the great abundance of tanning materials at command. Inferiority of Indian leather may be ascribed to want of skill on the part of the currier, and the use of quicklime. This is probably owing to the very low rank of the artisans *(chuckler)*, for the art of leather production is well understood and successfully practised by the European tanners at Pondicherry, Hoonsoor, Guntoor, Bangalore and Madras, the leathers made there being scarcely inferior to that made in Europe. In the usual native process, the raw hides on first being removed, are steeped in stone vats for four and five weeks in a strong pickle of salt and water—from ten to fifteen hides are placed in each vat. While steeping, a pint or quart of the milk bush, *Euphorbia tirucalli,* is thrown into each vat. This contains a considerable quantity of elastic gum, and is used for water-proofing leather, and rendering cords elastic.

Goat skins, sheep skins, buffalo and bullock hides are much used and are generally procurable. Currying the leather is the province of the wife, while manufacturing it for the market belongs to the husband.

The basis of the skins of animals is composed of a substance to which the name of gelatine is given. One of the properties of this substance is, that when combined with tannin, it forms the compound of tannate of gelatine, or leather material. From time immemorial, the substance employed in Britain, to furnish the tannin to the hides of animals, in order to convert them into leather has been oak bark.

More than 672,000 cwts. of raw hides were imported into Britain in 1851, besides the hides of the cattle, &c. consumed in the United Kingdom, and the imports into England of bark for the use of tanners and dyers amounted yearly to the very large quantity of 380,674 cwt., besides what England obtains at home. Tannin obtained from various sources, differs materially in some of its characters. The tannin of gall-nuts, which is that generally employed for chemical purposes, is sometimes called gallo-tannic acid, to distinguish it from other species. The tanning materials best known in Europe are the oak bark, Peruvian bark, and the barks of some of the Acacias. Oak bark is powerfully astringent, and contains usually a large proportion of tannin, 8½ lbs of it being equal to 2¼ lbs of galls ; to 3 lbs of sumach ; to 7½ lbs of the Leicester willow ; to 11 lbs of the bark of the Spanish chesnut ; to 18 lbs of elm bark ; and to 21 lbs of common willow bark. The importance of oak bark has however been greatly diminished since the introduction of the sumachs as Rhus cotinus, the Venus sumach, and R. coriaria, the hide or elm leaved sumach ; also of the Divi-divi, or Cæsalpinia coriaria ; of Valonia, the acorn cups of Quercus Ægilops ; of Catechu and Gambir, from the Acacia catechu and Uncaria Gambir ; of the Indian Myrobalans, the Mimosa or wattle bark of Australia ; the cork tree bark of Spain, and willow bark. Catechu has long been employed in India for tanning skins ; and its tanning properties are so great, that skins are tanned by it in five days. The Cæsalpinia coriaria, or Divi-divi, was introduced into India by Dr. Wallich in 1842. The produce of the kino tree (Pterocarpus marsupium) the catechu of the betel palm, are also employed. Dr. Heyne states that the Morocco manufactured at Hurryhur was treated with salt and a mixture of water, and the milk of wild cotton, *(Calotropis gigantea)*. The skins are put into vats till the epidermis is decomposed, and the hair comes freely away. The skin, being cleared of this, is next immersed in a decoction of mangrove, babool, or other tanning bark : after remaining some time in this they are taken out and sewed up, so as to form a sack, and are then suspended from the roof of the building, or from a crosspole and filled with fresh tanning solution. When the process is completed they are taken down, the stitches cut, and the skins dried. The leather is soft and flexible, and looks tolerably well—but it resists the rain indifferently, is easily penetrated by wet, and during the S. W. Monsoon becomes as moist and flexible as paper dipped in water. When set aside it becomes mouldy, and very easily rots. Buchanan gives the following as the method of tanning practised at Bangalore. For each hide of ox or buffalo take two seers of quicklime and six seers of water : in this keep the skins a week, when the hair may be rubbed off. Keep the hides four days in a solution of unpeeled sticks of Tangadu (Cassia auriculata,) in ten seers of water, for an equal length of time : add the same solutions as before—then stretch and dry the hides. The leather is very bad.

In many parts of India the hides are so removed as to form a bag, into which the tan is placed, and the filled bag kept suspended for several weeks. Divi-divi, Catechu, Tanghedu bark, &c., produce their effect rapidly, and the leather is durable. At the Madras Exhibition of 1855, a valuable series of tanning materials accompanied the leather prepared by Mr. Bowden at Guntoor, and some interesting samples were shown from the Government Tannery, Hoonsoor, with hides tanned by the different barks, to illustrate the practical application of these various substances. The extract procured from the bark of the Butea ; the bark of the Buchanania latifolia ; the Syzygium jambolana, &c., are of much consequence to tanners. Several species of Acacia, Conocarpus, the gum of the Butea or dhak are also used. The extract procured from the barkof the Butea, that of the Buchanania latifolia, the Syzygium (Calyptranthes), jambolana, &c., are likely to be of consequence to the tanners, and could be produced in India in large quantities. Specimens of these and of the barks of the Saul tree, of Nyctanthes arbortristis, Terminalia angustifolia, and of the "*gaub*" fruit (Diospyros glutinosa), were shown as tanning substances by the East India Company at the Exhibition of 1851.

The following are the principal of the tanning materials of Southern and Eastern Asia.

Acacia arabica.	Babool bark.
Acacia catechu.	Catechu, cutch.

Acacia vera. Its fruit.
Alnus, species.
Bauhinia variegata, Bark.
Bruguiera Rheedii. ,,
,, eriopetala. ,,
,, parviflora. ,,
Buchanania latifolia. ,,
Butea frondosa. Pulas kino.
Cæsalpinia coriaria. Divi divi.
Calotropis gigantea, Sap.
,, procera ,,
Cathartocarpus fistula, Bark.
Carallia lucida ,,
Careya arborea ,,
Cassia auriculata, Tarwur ,,
Conocarpus latifolia.
Diospyros glutinosa. Gab tree.
Eucalyptus species.
Hibiscus Rosa sinensis. Petals.
Garuga pinnata.
Glochidon, species.
Hymenodictyon excelsum.
Juglans regia.
Kandelia Rheedii. Bark.
Nyctanthes.
Nyctanthes arbortristis.
Pinus longifolia.
Pterocarpus marsupium. Kino.
Punica granatum. Pomegranate rind.
Quercus incana.
Quercus infectoria. Gall nuts.
Rhizophora conjugata Mangrove bark.
,, gymnorhiza. ,, ,,
,, mangle. ,, ,,
Rhus cotinus.
Rottlera tinctoria.
Shorea robusta.
Sysygium jambolanum.
Tamarix indica. Tamarisk galls, sumrut-ool-asl.
Terminalia, *several species.* Myrobalans.
Uncaria gambier. Gambier.
Zizyphus jujuba.

The bark of Bauhinia variegata is made use of as a tanning substance in Sind and other parts of Asia. The bitter astringent bark and the galls of several of the Tamarisk tribe are also well suited for the purpose.

The Tenasserim provinces are rich in materials for tanning. The bark of the Careya, and of half a dozen different species of mangrove, the fruit of the sea-cocoanut, and the peel of a species of ebony, all abound in tannic acid.

All attempts to hurry the leather-making process beyond a certain point by the use of concentrated solutions of tan, &c., are for the most part failures, as the manufacture of good leather, to a great extent, depends on the process being conducted in a slow and gradual, but—at the same time—thorough and complete manner.

The substance from which pure tannin is most frequently obtained for chemical purposes is nutgalls, for tannin constitutes above 40 per cent. of their weight. It is also procurable from several other sources, such as oak, horse chestnut, sumach, and cinchona barks, catechu, kino, &c.—*Tracts, Historical and Statistical on India, &c., vol. I., page* 46, *London,* 1814. *Tracts, Vol. I., p.* 228. *Simmond's Comml. Products, p.* 493 *and* 494. *Prof. Solly in Jury Reports of Great Exhibition,* 1851. *Madras Exh. Jur. Reports. Dr. J. L. Stewart.*

TANNIR VATTANG. TAM. Asparagus sarmentosus, *Willd.*

TANNSA, a river of the W. Ghauts, lat. 19° 41′ long. 73° 29′ S. W., W., W. S. W., W., empties into Indian Ocean; length 58 miles.

TANPING. There is imported into Shanghae from the north of China, a great quantity of a dry paste, known under the name of Tanping, the residuum or husk of a leguminous plant called "Teuss," from which the Chinese extract oil, and which is used after being pressed as manure for the ground.—*Simmonds.*

TANSA. See Hot Springs.

TANSALA, a smoky quartz stone, like the smoky topaz or "cairngorm" stone.

TANSEIN. A mountain in Nepaul 6,000 feet above the sea.

TANSEN, a celebrated musician, who went to Gwalior in the beginning of the 16th century and is buried there. He was a native of Patna, who had a great natural fondness for music, and had been attracted to Brindabun by the fame of Huree Doss. The emperor's persuasions and promises prevailed upon Tansen, and he followed in the train of Akbar to flourish in life, and acquire the celebrity of an incomparable musician in the annals of his nation. From a hindoo he became a convert to the mahomedan faith, and his remains lie buried at Gwalior, where the tomb is overshadowed by a tree, concerning which a superstitious notion prevails, that the chewing of its leaves will give an extraordinary melody to the voice. Dr. Hunter, writing in 1790 mentioned this, and thirty years later Lloyd found that it was still "religiously believed by all the dancing-girls." So strong was this belief, that the original tree died from the continual stripping of its leaves, and the present tree is only a degenerate seedling of the melody-bestowing tamarind.—*General Cunningham,* quoted in *Tr. of Hind.* Vol. II., p. 69.

TANSY. Tanacetum vulgaris, *var.* crispum. The young leaves cut small, are used in coloring and flavouring puddings, omelets, cakes, &c. The curled var. T. cripsum used in garnishing, succeeds on the plains of India, and grows freely in any good soil.—*Jaffrey.*

TAN TAE HOEY, a political union amongst the Chinese of Singapore. A description given of the initiation into this combination is as follows:—About 7 o'clock they had all arrived and commenced to eat and drink spirits, which they did with a noise like battle. In about an hour this finished, when they commenced to play on drums, &c., the music of which was exceedingly loud. On this they all arranged themselves in order, sitting opposite the Datu (idol), but I observed that their faces were as red as the Bunga Rayah from drunkenness. Among them all there was one chief, who sat on a lofty chair, with two men standing at his right, and two at his left. After them came eight men, with drawn swords, who arranged themselves at the right and left; then came one man who burned paper in front of the idol (sacrifice), after him came eight men, with drawn swords, who guarded a man with dishevelled hair, and without any upper garment, in fact he had only a pair of trowsers. This man came in front of the chief, and bowed down till his head touched the ground, the armed men on the right and left now advanced, shouting, and laid their swords on his neck, they remained silently in this position, for a short time, when a man advanced to the candidate's side. The chief then spoke as follows in the Chinese language:—"Who are you, and from whence came you? Who are your father and mother? Are they still alive or are they dead?" These questions were explained to the candidate by the man who stood at his side, and were answered as follows:—"I am such a one, of such a country, and my father and mother are both dead;" even if his father and mother were alive he would be obliged to say they were dead, because no one whose father and mother are alive can be admitted into the society, as the existence of all those is as if they were dead to the world and its ties. The chief then said, "Will you swear that your father and mother are dead?" he answered, "I will," and performed the oath by burning paper in front of the idol, saying at the same time, "my father and mother are dead." The chief then said "what have you come here for?" answer, "I wish to join the Tan-Tae-Hoey." These words mean the sky, the earth, and man. The chief then said, "you are deceiving, your thoughts are not as your speech;" answer, "I will swear that I am in good faith" —"then swear." The candidate then taking paper, burned it while he repeated his assertion. The chief then said, "are you acquainted with the rules of the society?" answer, "yes, I understand that I am required to take an oath by drinking blood." The chief then said something to which the following answer was made:—"I promise not to divulge the secrets of the society to any one under penalty of death." The chief said, "truly?"—answer "truly." A vessel was then brought containing arrack and a little blood from each of the members of the society, and, with a knife, was placed in front of the idol. The candidate then taking up the knife made a slight cut in his finger, from which he allowed some blood to fall into the cup. The chief then said "drink in presence of Datu Peking." The candidate then drank a small cupfull, of which the chief, and all the confederates, drank a little each in his turn. The chief then said to-morrow go to our secretary, and ask him for a book, in that book you will find all our rules and secret signs; you will pay one dollar for it." The chief then rose, and himself raised the candidate from his prostrate position, and now being initiated, he can take his place among those who, before, would have considered him an enemy.—*Statement of Abdoollah bin Abool Kadir Moonshee.*

TANTALINÆ, a sub-family of birds of the order Cultirostres, *Fam.* Ardeadæ: *Sub-fam.* Tantalinæ, 6 gen. 7 sp., viz. 1 Falcinellus; 1 Geronticus; 1 Threskiornis; 2 Tantalus; 1 Platalea; 1 Anastomus.

TANTARIK. HIND. Pistacia lentiscus; P. terebinthus, also Rhus parviflora.

TANTEPU CHETTU, TEL. Cassia tora, *Linn.* Senna tora, *Roxb.*

TAN-THE-AH. BURM. Hopea floribunda of Wallich. Very large, somewhat abundant, and a useful timber.—*Malcom, p.* 188.

TANTI, or weavers, are a prosperous class of cultivators, and own a good deal of land.—*Campbell, p.* 107.

TANTIA, a river near Kalapahar in Jeypore.

TANTRA. HIND. A set of works of the hindus in use as religious books in calculating mystical and impure rites in honour of different forms of the god Siva and goddess Durga. The principal of the Tantra books are the Syama Rahasya, Rudra Yamala, Mantra Mahodadhi, Sareda Tileka and Kalika Tantra. These are numerous, and of great extent, and are in the form of a dialogue between Siva and his bride, in one of her many forms, but principally in those of Uma and Parvati, in which the goddess questions the god as to the mode of performing various ceremonies, and the prayers and incantations to be used in them. The observances they prescribe have, in Bengal, almost superseded the original ritual of the Vedas. The followers of the Tantras profess to consider them as a fifth veda, and attribute to them equal antiquity and superior authority. Some of the Tantras are superior to some of the Puranas. It may be inferred that the system originated at some period in the early centuries of Christianity, being founded on the previous worship of the female principle, and the practices of the Yoga with the Mantra, or mystical formulæ of the Vedas. Tradition is silent as to the authors of the tantra; they are mythologically ascribed to Siva, and are generally in the form of a colloquy between him and his wife Parvati. They are very numerous, and some are of considerable volume ; but they are not included in any of the ordinary enumerations of hindu literature, and were, no doubt, composed after that literature was complete in all its parts. They are specified in some of the puranas, to which they must be anterior. They have been but little examined by European scholars, but sufficient has been ascertained to warrant the accusation that they are authorities for all that is most abominable in the present state of the hindu religion.

The great feature of the religion taught by the Tantras is the worship of Sakti,—Divine power personified as a woman, and individualised, not only in the goddesses of mythology, but in every woman ; to whom, therefore, in her own person, religious worship may be and occasionally is addressed. The chief objects of adoration, however, are the manifold forms of the bride of Siva, Parvati,, Uma, Durga Kali, Syama, Vindhyavasini, Jaganmata, and others. Besides the usual practices of offerings, oblations, hymns, invocations, the ritual comprises many mystical ceremonies and accompaniments, gesticulations and diagrams, and the use in the commencement and close of the prayers of various monosyllabic ejaculations of imagined mysterious import. Even in its least exceptionable division it comprehends the performance of magical ceremonies and rites, intended to obtain superhuman powers, and a command over the spirits of heaven, earth, and hell. The popular division is, however, called by the hindus themselves the left-hand Sakta-faith. It is to this that the bloody sacrifices offered to Kali must be imputed ; and that all the barbarities and indecencies perpetrated at the Durga Puja, the annual worship of Durga, and the Charak Puja, the swinging festival, are to be ascribed. There are other atrocities which do not meet the public eye. This is not an unfounded accusation, not a controversial calumny. Some of the books are in print, veiled necessarily in the obscurity of the original language, but incontrovertible witnesses of the veracity of the charge. Of course no respectable hindu will admit that he is vamachari, a follower of the left-hand ritual, or that he is a member of a society in which meat is eaten, wine is drunk, and abominations not named are practised. The imputation will be indignantly denied. If the tantra be believed, "many a man who calls himself a Saiva, or a Vaishnava, is secretly a Sakta, and a brother of the left-hand fraternity." No hindu of reason and right feeling can say anything vindicative of a system which has suffered such enormities to be grafted upon it. No explanation could afford any plea, any suggestion, any opening for abuses of which he admits, when he dares not avow them in his own case, he shame and the sin.—*Wilson's Religious Practices and Opinions of the Hindus, p.* 33.

TANTRA PALA. See Inscriptions, p. 375.

TANTRI. HIND. Rhus coriaria.

TANTYN, a nuddy in Jeypore.

TANUKU. or Tanuku Manu, TEL. Gyrocarpus Jacquini. G. Asiaticus, *Willd.*, also Cavallium urens, *Sch.* and *End.*

TANWERK. GER. Cordage.

TANYAN. The Tangun horse.

TANYU or ISLANDS. Low woody islands in the Java Sea, the southernmost of which is about lat. 5° 33′ S., long. 118° 36′ E.

TANZIMAT. The reformed system introduced into most provinces of Turkey.

TAOOS PACHI. TAM. Bat.

TAO-SSE. See Swastika.

TAPAN, a river on the N.East of Mandalay, on the bank of which the town of Bamo or Bhamo is built.

TAPAS, a Dutch settlement on the N. W. coast of Sumatra.

TAPAS, in hinduism, penance.

TAPAS and Dhyan, in buddhism, is abstinence and abstraction. The Tapas of the buddhists was not penance or self-inflicted bodily pain like that of the brahmins, but a perfect rejection of all outward things, (*pravrittika.*)—*Cunningham's Bhilsa Topes.* See Tapsi.

TAPASI GEDDA. TEL. Agati grandiflora, *Vahl.*

TAPEANTANA ISLAND, on the west of the Philippines, is in lat. 6° 14½′ N., long. 122° 8′ E.

TAPER-LEAVED DENDROBIUM. Dendrobium teretifolium.

TAPETE, *Sp.* Carpets.

TAPEWORM FERN. Tænis blechnoides.

TAPHOZOUS, a genus of mammals of the sub-family Taphozoinæ, family Notilionidæ. These bats inhabit the warmer regions of the Old World and Australia. T. Bicolor is said to be from the East Indies.

TAPHOZOUS LONGIMANUS. HARDW.

T. brevimanus.	T. fulvidus. *Blyth.*
T. Cantori.	Long-armed Bat.

Found throughout India, and common in large towns, frequenting dark out-houses.

TAPHOZOUS MELANOPOGON, TEMM. The black-bearded bat occurs in Canara, and is common in Malayana. It is about 3¼ inches long, and in colour is brownish, mouse gray above, light beneath.

TAPHOZOUS SACCOLAIMUS. TEMM.

T. crassus,	*Blyth.*	White bellied Bat.
T, pulcher,	*Elliot.*	

Inhabits Madras, Burmah, and Malay peninsula.

TAPIA. HIND. Cratæva nurvala, *Ham.* C. *Roxburghii.*

TAPIOCA is the farina deposited from the expressed juice of the Jatropha manihot. Tapioca is extensively cultivated in gardens. Great care is requisite in the preparation of the farina, as they contain a poisonous principle, which is only got rid of by the application of strong heat. The poorer classes use the tapioca flour, but none is exported. The plant will thrive in any soil, although a sandy loam is the best. It requires no cultivation whatever, and is occasionally met with in Aracan, growing wild in the jungle. At the Madras Exhibition of 1855, tapioca was exhibited by Mr. Rundall, of Razole, near Rajahmundry, which in respect of feel and taste was excellent. It was manufactured by him at the rate of Rs. 780 per maund. Various other samples of miscellaneous "Hill Tapioca" were exhibited—obtained from the roots of different species of Arum, Dioscorea, or Terrestrial Orchids : none of them appear important. Tapioca is prepared in S. America from two species of Janipha, or the bitter and sweet cassava or manioc roots. From the facility with which the bitter cassava can be rasped into flour, it is cultivated almost to the exclusion of the sweet variety, which contains in its centre a tough fibrous ligneous cord, which is absent in the bitter variety. The latter, however, contains a highly acid, and poisonous juice, which is got rid of by heat or by fermentation, so that the cassava bread is quite free from it. When the juice has been carefully expressed, the fecula or flour is washed and dried in the air without heat, and forms the Brazilian arrowroot of commerce; but when dried on hot plates it becomes granular and forms tapioca. An artificial tapioca is made with gum and potato starch. The granules of this are larger, whiter, and more brittle and more soluble in cold water than genuine tapioca.—*Tomlinson. On the Culture and Manufacture of Tapioca, Jatropha Manihot, J. P. Langlois. Journ. Agri. Hort. Socy. Vol. XII. p.* 175. See Janipha manihot. Food.

TAPIRUS MALAYANUS. RAFFLES.

Tapirus Indicus, *F. Cuv.*

TAPPANULI. Dryobalanops species.

TAPPETA. TEL. Asystasia Coromandeliana, *Nees.*

TAPPETI. IT. Carpets.

TAPROBANE, an ancient name of Ceylon, —that used by Milton,

> "From India and the golden Chersonese,
> And utmost Indian isle Traprobane,
> Dusk faces with white silken turbans wreathed."

See Megasthenes.

TAPSI. SANS. TAM. People who have renounced the world. If brahmans, they are burned with clothing. If sudras, sometimes seated on chairs and with limes in their mouths. See Tapas.

TAPSI MACH'HI. HIND. Mango fish.

TAPTA-KUND. The town and temple of Bhadri-Nath are situate on the west bank of the Alaknunda river, in the centre of a valley of about four miles long, and one mile in its greatest breadth. The east bank rises considerably higher than the west bank, and is on a level with the top of the temple. About the middle of the bank is a large cistern about twenty or thirty feet square, covered with a sloping roof of deal planks supported on wooden posts. This is called Tapta-kund, and is a warm bath, supplied by a spring of hot water issuing from the mountain by a subterraneous passage, and conducted to the cistern through a small spout representing a dragon's or a griffin's head. A little to the left of it is Surya-kund, another hot spring, running in a very small stream through a fissure in the bank. There is no basin or reservoir to receive the water. The principal idol, Bhadri-nath, is placed opposite the door at the farther extremity: above his head is a small looking-glass, which reflects the objects from the outside; in front of him are two or three lamps (which give all the light the apartment receives, excepting from the door), diffusing such feeble glimmering rays, that nothing is clearly distinguished. The idol is dressed in a suit of gold and silver brocade. Below him is a table, or board, covered with the same kind of cloth, which, glittering through the gloom, might impress the beholder with the idea of splendor and magnificence.—*Fraser's Himalay Mountains, p.* 373—375. See Badri-nath.

TAPTA MUKTI, or ordeal by hot clarified butter. In 1807, this was tried before 7,000 spectators on a young woman accused by her husband of adultery.—*Tr. of Hind., vol.* 1, *p.* 46.

TAPTEE river rises in the Sautpoora mountains near Mooltye, in lat. 21° 46′, long. 78° 21′, runs generally west to the Gulf of Cambay; length, 441 miles. It receives the Poorna, 160; Girna, 160; Boree, 90; Panjar, 92 miles. About 25,000 square miles are drained. It can scarcely be deemed a navigable stream, as at Surat, 17 miles from its mouth, it is fordable when the tide is out. It is said to be navigable in the dry season for boats of light draught, through Candeish. The mouth is obstructed by numerous sands and a bar. The Ajunta caves,—the most complete series of buddhist caves in India without any mixture of brahmanism,—contain types of all the rest; they are in a ravine or narrow valley in the ghat south of the Taptee. At Baug, in a ravine or small valley in the ghat on the north side of the valley of the Taptee, are three ancient buddhist caves.

TAPUNG; Pular lumat. MALAY. Flour of wheat.

TAPURI. See Koh.

TAPURIA. HIND. Physalis peruviana.

TAPYTEN. DUT.

TEN. DUT. Carpets.

TAR TALGACH. BENG. and HIND. Borassus flabelliformis.

Tar is obtained by burning pine and fir trees in a close smothering heap, with a channel through which the tar exudes. Applied to wood, rope, iron, it is extensively used for resisting moisture, and is consequently in great request as a marine store. It is largely made in Russia, the United States, and Sweden. Tar water was long a celebrated remedy in the treatment of some chronic diseases of the lungs.—*Faulkner. O'Shaughnessy, page* 618. *McCulloch's Com. Dic. p.* 1112.

TARA. BENG. Corypha *taliera, Roxb.*

TARA. SANS. Alpinia alhugas, *Roscoe.*

TARA. HIND. Brassica eruca.

TARA, in buddhism, the volumes of the sacred law. The two tables of Moses is, in Hebrew, Torah.

TARA BAI, daughter of Rao Soortan, a Solanki rajput chief of Bednore in Rajputana. Rao Soortan was the lineal descendant of the Balhara kings of Anhilwara. Stimulated by the reverses of her family and its ancient glory, Tara Bai learned military exercises, and joined in an unsuccessful attempt to wrest Thoda from the Affghans. Jai Mul, the third son of Rana Rai Mul, a Sesodia Rajput, proposed for her in person, and Tara Bai promised to be his if he redeemed Thoda, but, before accomplishing this, he rudely attempted access to her, and was slain by her indignant father. His brother Prithiraj accepted the gage, and relying on his honour she accepted him in anticipation. She accompanied her husband in an attack on the mahomedans, when celebrating the Moharram; the lance of Prithi and arrow of Tara Bai, slew the mahomedan chief, and their followers, rushing on, regained Thoda. Prithiraj had been engaged in the war from the age of 14 to 23, when he was poisoned in revenge of an insult by his brother-in-law. He died at Komulver; and Tara, too late to see him in life, burned herself with his remains. Their ashes are in a lonely gorge opposite the temple of Mama Devi, where the road leads to Marwar.

TARA DEVI, a mountain near Simla, composed of corralline magnesian limestone of fantastic shape, overhanging the road, and full of fissures and caverns.

TARAI, outer arid tracts, or else miasmatic swamps at the skirts of the lowest Sub-Himalayan hills.

TARAI. See Samangarha.

TARAKAI. See Kurilian.

TARAMBA SHIRIN. Kashmir buck wheat.

TARAMIRA. HIND. Raphanus raphanistrum, also Brassica eruca, and Sinapis eruca.

TARAMONI. BENG. Serissa fœtida.

TARANG-GILING. MALAY. Ant-Eater, the Pangolin.

TARANTARRA, in the Manja territory, the chief city of the Akali Sikhs, armed fanatics. See Akali.

TARANTULA MUSTARD. Sinapis sinensis.

TARAR. Dioscorea deltoides, a wild yam.

TARAR PATTR. HIND. Dioscorea deltoidea.

TAR-ASUN a kind of beer of China, made

from barley or wheat, a prepared hop being added to the wort in brewing.—*Simmonds.*

TARA-TEZAK. Lepidium sativum.

TARAXACUM OFFICINALE, Dandelion. Leontodon taraxacum. This plant is a native of Europe and the Himalayas. The inspissated juice of the plant, the infusion, decoction, and extract of the root, are strongly bitter, and prove tonic and diuretic, in large doses aperient. It is a favourite and useful remedy in the old hepatic diseases of persons who have long resided in India, and returned to a cold climate. The dose of the extract is 3 to 10 grains, thrice daily.—*O'Shaughnessy, p.* 407.

TARBAGATAI. See Kirghis.

TAR-BAN. HIND. a palmyra grove. Sandarban, HIND. a forest of the Sandar or Acacia sundra.

TARBUSH, a red cap worn by the Turk. It is a corruption from the Persian Sar-posh, head covering, head dress. The Anglo-Saxon further debases it to Tarbrush. Fez, the other name for the Tarbush, denotes the place where the best were made. Some Egyptians distinguish between the two, calling the large high crimson cap Fez, the small one Tarbush. —*Burton's Pilgrimage to Meccah, Vol. II. p.* 275.

TARBUZ. HIND. PERS. Cucurbita citrullus, the water melon.

TARCICE. POL. Deals.

TARDAVEL. Spermacoce hispida.

TARDI, HIND. Dioscorea deltoidea.

TAREAQ FARUQ, or Theriaca Veneta, the modern representative of the mithridatum of the ancients, is sold in little canisters in the bazars of India, on the paper wrapper are printed in Persian, "the Therïa of Andromachus, an invention of Theron the Presbyter." It is prepared, measured and made public by me, John Baptest Sylvester, in the Rialto, by authority of the excellent Government Physicians of ancient Righteousness and of the Council of Apothecaries and learned physicians."

TAREE, the juice or toddy of the palmyra tree, Borassus flabelliformis.

TAREE MARA. CAN. Yehela, MAHR. Terminalia bellerica.

TAREMOOK, known as Bail Kambar in Canarese, Ghassari in the Dekani, Lohar in the Mahratti, is a wandering blacksmith of the peninsula of India.

TARFA. See Kurdistan.

TARI. HIND. Palm wine from the palmyra tree.

TARIAT. BENG. Corypha taliera, *Roxb.*

TARIKAT. ARAB. path. In the Mahomedan religion, tarikat means the path or way which leads, or is supposed to lead, to heaven.—*Burton's Pilgrimage to Meccah, Vol. I. p.* 22.

TARIKH. AR. A date, a history. Gibraltar is Jabl-tarikh, the mountain of the date.

TARIKH-I-BADAUNI, or Muntakhab-ut-Tawarikh, written by Mulla Abdul-Kadir Maluk-Shah of Badaun, and finished in 1595. It is a general history of India from the time of the Ghaznevides to the 40th year of Akbar. It contains a copious notice of the reign and character of Akbar, under whom the author lived.—*Thomas Elliot's Hist. of India. Muller's Lectures, p.* 143.

TARIKH-I-HIND, a History of India written by Abu Rihan a translation from an old Arabic history, made about A.D. 1216 (A.H. 613) by Mahomed, then residing at Uch in Sind. The ancient Arabic seems to have been written before A.D. 753. It is largely drawn upon by Nizam-ud-din, Ferishta, Mir Masum and others. Chach-nama is a Persian work descriptive of the Arab conquest of Sind. The Arab occupation of Sind was only temporary. On their retreat, the territory reverted to the rule of native princes, and was practically independent until its absorption into the empire during the reign of Akbar, in A. D. 1592, for the successes of Mahmud of Ghazni made no permanent impression on them. Up to the time of Mahomed, the races in Arabia had been quarrelling with and robbing their neighbours. But immediately on his demise, his followers and disciples, whom his teachings had made brothers, moved with a spirit of unanimity.—*Elliot's Hist. of India, p.* 9.

TARIKH-I-WASAF, composed, as appears by different dates, at the end of the thirteenth and beginning of the fourteenth century, by Abdullah, Shirazi. The style of this work is much admired by the Persians, although in many places so obscure and difficult, that to most copies of it marginal explanations have been added. It contains the history of Hula'ku Khan and Chengiz Khan.—*Ouseley's Travels, Vol.* I., *p.* 170.

TARINGI. CAN. Calysaccion longifolia, *Roxb. Wight.*

TARINGAL of Spiti, &c., the ibex.

TARINE. A hard, fine, close-grained, rather heavy Ceylon wood, much resembling English birch.

TARISA PALLI. See Jews.

TARWAI. PUSHT. Ipomea turpethum.

TARIYAT, TARA, TALIER. BENG. Corypha taliera.

TARIZHA. HIND. Microrhynchus nudicaulis.

TARJI. See Kelat, p. 491.

TAR-KA-GUR. DUK. Sugar from Borassus flabelliformis.

TAR-KA-JHAR. HIND. Borassus flabelliformis, Palmyra tree.

TARKARI. HIND. Vegetables generally.

TAR-KA-PATTA. HIND. Olay or palm leaves, on which the Asiatic peoples write with a style of steel.

TARKHA. HIND. Artemisea Indica.

TAR-KHAN, a title bestowed by Chengiz Khan on two youths, Bata and Kashlak, who overheard Aung or Prester John making arrangements to destroy Chengiz Khan. From these are said to have descended the Tar Khan dynasties of Khorasan and Turkistan.

The Tar Khan dynasty of Sind are said to have been so denominated by Timur having sprung from Eku Timur; when Tuktamish Khan was advancing against Timur, he was gallantly opposed by the great grandson of Arghun Khan, Eku Timur, who fell in the unequal conflict. Timur, who witnessed the conflict, bestowed the title of Tar Khan on his surviving relatives. The origin of this titular term seems however doubtful, but it is an ancient one, as Tar Khan of Farghana, hospitably entertained the last monarch of Persia in A. D. 703. Tar Khans are mentioned as officers under the Khakan of the Khazar, to the west of the Caspian Sea. Their rule extended to A.D. 1591-2, and with them expired the independence of Sind as a kingdom; its history from that date merging into that of the empire of Timur. Scions of the Tar Khan family still reside at Nasrpur and Thatta.—*Elliot Hist. of India, p.* 500.

TARMUJ, also Tarbuz. BENG. Cucurbita citrullus, *Linn.*

TARNI. HIND. Edwardsia mollis.

TARO. Colocasia macrorrhiza. Taro of South seas, Colocasia antiquorum, *Schott*; C. esculenta, *Sch.*

TAROMI. See Inscriptions, p. 391.

TAROOSEE. MAL. Green copperas, or green vitriol.

TARRU. HIND. Hippophae rhamnoides.

TARSHISH. HEB. Beryl.

TARSHISH. of sacred history, is supposed by Sir J. E. Tennent to be Galle. But Tarshish seems to have been a name given to several places, one of them in India, as the Dante, Kapi and Togai of the Hebrew Bible are Indian names for ivory, apes, and peacocks, dant, Hindi, a tooth; kapi, Tamil, a monkey; Togai, a peacock.

TARSIUS SPECTRUM. GEOFF.

Tarsius bancanus,	*Horsf.*	Lemur tarsier,	*Raffles.*
Lemur spectrum,	*Pallas.*	Tarsier,	*Buffen.*
Didelphis macrotarsus	*Schr*		

The Tarsier inhabits Sumatra, Banca, Borneo, Macassar, Salayer: its habits are nocturnal. It is mild, gentle, and easily domesticated. It lives on the tops of trees in the large damp forests; it eats fruits and small animals. The inhabitants have a superstitious dread of it.

TARSUS, on the river Cydnus, was situated at the foot of the wooded slopes of Mount Taurus, and it guarded the great pass in that range between the Phrygian tribes and the Phenician tribes. It was a city half Greek and half Asiatic, and had from the earliest days been famed for ship-building and commerce.—*Sharpe's History of Egypt, Vol.* 2, p. 55.

A salt formed by deposit in wine casks.

TARTAR, Tatar, or Tahtah, a term variously applied. The Manchu of China are called a Tartar dynasty. The Bhot of the Himalayan frontier of Tibet are called Tartars, as also are the Turks of Khoten and Yarkand or Little Bokhara. The Tartars of China are Manchurian Tangus. The peoples who inhabit the vast regions of high Asia, bounded on the south by India, China and Persia; on the east by the Sea of Japan; on the west by the rivers which disembogue into the Caspian Sea and Black Sea, and on the north by the Frozen Ocean, are all known in Europe by the collective name of Tartar; whatever may be the origin of this name, it is applied to numerous half civilized nations, who greatly differ from each other, to—

The Tartars of the Oxus, the king's guard,
First, with black sheep skin caps and with long spears;
Large men, large steeds; who from Bokhara come,
And Khiva, and ferment the milk of mares.
Next, the more temperate Toorkmuns of the south
The Tukas and the lances of Salcre
And those from Attruck and the Caspian sands;
Light men, and on light steeds, who only drink
The acrid milk of camels and their wells.
And then a swarm of wandering horse who came
From far, and a more doubtful service own'd;
The Tartars of Ferghana from the banks
Of the Jaxartes, men with scanty beards,
And close-cut scull caps; and those wilder hordes
Who roam over Kipchak and the northern waste,
Kalmuks and unkempt Kuzzaks, tribes who stray
Nearest the Pole, and wandering Kirghizzes
Who came on shaggy ponies from Pamere.

It was from Tatary those people came, who, under the successive names of Cymbrians, Kelts, and Gauls, possessed all the northern part of Europe. The Goths, Huns, Alans, Swedes, Vandals, and Franks, were but swarms of the same hive? The name of Tatar, the terror of Asia and Europe, was applied promiscuously to all the nomadic warriors whom Asia in bygone years poured forth over Europe. Originally Tatar was a name of the Mongolic races, but, through their political ascendency in Asia, after Chengis Khan, it became usual to call all the tribes which were under Mongolian sway by the name of Tatar. In linguistic works, Tataric is now used in two several senses. Following the example of writers of the middle ages, Tataric, like Scythian in Greek, has been fixed upon as the general term comprising all languages spoken by the nomadic tribes of Asia. Hence it is used sometimes in the same sense in which we use Turanian. Secondly, Tataric has become the name of that class of Turanian languages of which the Turkish is the most prominent member. While the Mongolic class—that which in fact has the greatest claims to the name of Tataric—is never so called, it has become an almost universal custom to apply this name to the third or Turkic branch of the Ural-Altaic division, and the races belonging to the branch have in many instances themselves adopted the name. These Turkish, or as they are more commonly called, Tataric races, were settled on the northern side of the Caspian Sea, and on the Black Sea, and were known as Komanes, Pecheneg, and Bulgar, when conquered by the Mongolic army of the son of Chengis-khan, who founded the Kapchakian empire, extending from the Dniester to the Yemba and the Kirgisian steppes. Russia, for two centuries, was under the sway of these Khans, known as the Khans of the Golden Horde. This empire was dissolved towards the end of the fifteenth century, and several smaller kingdoms rose out of its ruins, among which Krim, Kasan, and Astrachan were the most important. The princes of these kingdoms still gloried in their descent from Chengis-khan, and had hence a right to the name of Mongol or Tatar. But their armies and subjects also, who were of Turkish blood, received the name of their princes; and their languages continued to be called Tataric, even after the tribes by whom they were spoken had been brought under the Russian sceptre, and were no longer governed by khans of Mongolic or Tataric origin.

It would perhaps be desirable to use Turkic instead of Tataric, when speaking of the third branch of the northern division of the Turanian family, did not a change of terminology generally produce as much confusion as it remedies. The recollection of their non-Tataric, i. e., non-Mongolic origin, remains, it appears, among the so called Tatars of Kasan and Astrachan. If asked whether they are Tatars, they reply no; and they call their language Turki or Turuk, but not Tatari. Nay, they consider Tatar as a term of abuse, synonymous with robber, evidently from a recollection that their ancestors had once been conquered and enslaved by Mongolic, that is, Tataric tribes. All this rests on the authority of Klaproth, who during his stay in Russia had great opportunities of studying the languages spoken on the frontiers of this half Asiatic empire.—*Muller's Lectures, p.* 284-85. Though the word is very vaguely used, the populations to whom it is applied belong to one of three great groups, stocks, or families, the Turk, the Mongol, or the Tungus. It is necessary to insist upon this; because, whatever may be the laxity with which the term Tartar is used, it is, in Russian ethnology at least, a misnomer when applied to a Mongol. It is still worse to call a Turk a Kalmuk. This is because the populations under consideration are the fragments of four Turkish kingdoms or khanats, the khanats themselves being the fragments of the great Mongol empire of the Kipchak. But this great empire itself was, more or less, the consolidation of at least two older kingdoms compressed into one. There were the Mongols of Temudzhin or Chengiz Khan. There were the Chagatai Turk of Timur and his successors, whose origin was in the parts beyond the Oxus, Bokhara and Ferghana. There were the three denominations of the Khazar, the Petsheneg, and the Cumanian, the Chagatai being the Turk of the dynasty to which Timur belonged.

According to Mountstuart Elphinstone, the Tartar are divisible into Turk, Mongol, and Manchus. The greater part of Timur's army was Turk; and the Uzbek, who now possess Transoxiana; the Turkoman, who reside both on the Oxus and in Asia Minor; the wandering tribes of the north of Persia, and the Othmanli or Turk of Constantinople, are all Turk. The ruling tribe, and the greater part of the army of Chengiz Khan, was Mongol. The Tartar dynasty, which now reigns in China and the adjoining part of Tartary, is Manchu.

In India, the term Tartar is applied to designate the tribes north of the Himalaya, and Mr. Hodgson regards the Tamil as the more ancient Tartar immigrants, in contradistinction to the Tibetan and Himalayan stock, who are more recent Tartars.

Tartars occupy Ladak, except in the Dras valley. In all Tartar families there, the second son is made a lama, and the third a tola, both being forbidden to marry; in a manner obliged to renounce the world, having no interest in their father's property at his death. Tartars, met with by Mountaineer, looked on fish as unfit for food. They ate the flesh of the wild horse.

Of the black Tartars, who had come from Tartary with Timur, he had settled part in Turkey, and part in Khorassan. After his death they had dispersed. Nadir Shah had desired to reassemble them, and seven or eight thousand families had been brought together under Najuff Ali Khan, the chief in whose service Isaak Khan and his father were employed.

The Tzeremish resemble the Tartars in their external appearance, and they also wear their hair short; but their language is totally distinct, and they spring from a different origin. They are the original inhabitants of the province of Cazan and O-se-ta-our-han. After the Russians had made themselves masters of all these places, this people still continued to occupy the country to the left of Cazan, and they have now been in subjection to the Russians for many years.—*Latham Nationalities of Europe, Vol. I. p.* 249. *Recherches sur les Langues Tartares, p.* 1, 3. *Kennedy on the Origin of Languages, p.* 57. *Malcolm's History of Persia, Vol. II., p.* 226.

TARTARIAN LAMB. Eng. Aspidium barometz, so enthusiastically described by Darwin in his Botanic Garden, has long been celebrated in China. The ingenuity of Chinese gardeners, taking advantage of the natural habits of the plant, form it into a shape resembling a sheep or other object.—*William's Middle Kingdom, p.* 275.

TARTARIAN FURZE. Caragana Gerardiana.

TARTARIAN WHEAT. Hordeum ægiceras.

TARTARIN. See Simiadæ.

TARTARO. Port. Sp. Tartaro volgare. It. Tartar.

TARTRE-CRU, BLANC ET ROUGE. Fr. Tartar.

TARUK, also Taru. Beng. Alpinia allughas. also Corypha taliera.

TARTARY is a term applied in Europe to an innumerable multitude of nations, by whom the rest of Asia and all Europe has in different ages been overrun, and their countries are denominated, as various images have presented themselves to various fancies, the great hive of the northern swarms, the nursery of irresistible legions, and, by a stronger metaphor, the foundery of the human race. Sir William Jones defines their boundaries by a line drawn from the mouth of the Oby to that of the Dnieper, and bringing it back eastward across the Euxine, so as to include the peninsula of Krim, extend it along the foot of Caucasus, by the rivers Cur and Aras, to the Caspian lake, from the opposite shore of which follow the course of the Jaihun and the chain of Caucasian hills as far as those of Imaus: whence continue the line beyond the Chinese wall to the White Mountain and the country of Retso, skirting the borders of Persia, India, China, Corea, but including part of Russia, with all the districts which lie between the Glacial Sea, and that of Japan. The Grand Tartary of the ancients may thus be said to have extended from the Volga to the ocean, and from the Gihon to Siberia. Ptolemy divided this vast region into Scythia beyond, and this side the Imaus. North of the sources of the Ganges, a range of mountains extends to Kashgar, where it turns to the north-east towards the river Ili; this chain was called by Ptolemy the Imaus. That part of Scythia on this side the Imaus, which lies between the Oxus and Jaxartes was known to Roman geographers as Transoxiana, and to the Arabs as Mawur-ul-Nahar.

The tract formerly styled Chinese Tartary lies east of Affghanistan and north of the British dependency of Cashmere; from the former it is separated by the Pamere steppe, and from Cashmere by the almost impassable barrier of the Kuen Lin mountains. It is a vast level valley, irrigated by rivers and canals, and rich in various minerals, including gold and coal. It contains four provinces, Kashgar, Yarkand, Aksoo and Khoten. The general population is a mixed breed, half Persian and half Kirghis, but there are likewise the Kalmuk, Chinese, and a race called Tunghani, who, though by extraction Chinese, are by religion mahomedan. These all, as a rule, occupy fixed habitations and follow agricultural pursuits. In 1863, the Tunghani rose on their Chinese masters whom they overcame and compelled to adopt mahomedanism. Kashgar, in 1865, fell to a party of Kipchak refugees from Kokand, driven out by the king of Bokhara; Khoten became independent.

The great Turanian or Tartar family of languages, is spoken by all the tribes from the Himalaya to Okotsk and to Lapland, and includes the Hungarian, Krimean, and Turkish In India, there are three or four distinct branches of this family of languages, and consequently of the Turanian race:—in the North are the Himalayan dialects and tribes, from Upper and Lower Kanawar on the Sutlej to the Butani of the extreme east; then we have the Lohitic class, comprising, with the Burmese and others of the eastern peninsula, the dialects of the Naga and Mikir tribes in Assam, and of the Bodo, Kachari, Kuki and Garo in Eastern Bengal. Nearly related to this class is the Kol or Munda family, including the Kol, Sonthal and Bhumij of Singhbhum and Western Bengal, and the Mundala of Chota Nagpur. The fourth class is the Tamulic or Dravidian, to which belong the Brahui of Baluchistan, the Gondi, the Tuluva of Kanada, the Karnata of the S. Mahratta country, the Toda of the Nilgiris, the Malayalam of Travankur, the Tamil and Telugu. The Kur or Muasi, and the Korku in Hushangabad, and westward in the forests on the Tapti and Narmada, until they come in contact with the Bhil of the Vindhya hills, and the Nahal of Khandesh belong to this Kol family; indeed Mr. Hislop held that the word Kur is identical with Kol.—*M. De Guignes, Sir W. Jones's Works, Vol.* 3, *p.* 72.

TARUKA. HIND. SANS. Alpinia allhugas.

TARUKESHWARA. SANS., from tarăkă, a saviour, and ēēshwără, a god.

TARAKA-JIT. SANS., from tarăkă, and jee, victory.

TARUM. MALAY. Indigofera tinctoria. Indigo.

TARUM. BENG. HIND. Aloe perfoliata.

TARUM of Pliny, LAT. Eagle wood.

TARUSI. MAL. Sulphas ferri. Green copperas. Green vitriol; Sulphate of iron.

TARW. DUT. Wheat.

TARWAAD, on the Malabar coast, a family community living according to the Marumakatayam rule of inheritance, or descensus a matrice with a karnaven or head, See Polyandry, p. 108.

TARWAR. Cassia auriculata, *Linn.*

TARU OR KHO-THU. See Karen, p. 466.

TASMAH BAZEE. A term applied in Hindustan to a class of Thugs, professional murderers, who destroyed their victims by means of a tasmah or belt.

TA-SOUNG-LET-WAH. BURM. Juglans tricocca.

TASSADUQ. AR. an offering, a sacrifice.

TASAR. HIND. Sambucus ebulus.

TASBIH. AR. HIND. PERS. a rosary. A m[illegible]dan rosary consists of 99 beads, sometimes more, to stand for certain prayers. All mahomedans usually carry a chaplet of this description. Amulets are also worn on the person as a protection from evil; these are portions of the Koran, or the whole book, written exceedingly small, enclosed in cases and bound on the arm. Cornelians, and bits of coloured glass having the names of God, and his family, and verses of the Koran engraved on them.

TASH. Cloth interwoven with gold or silver thread.

TASHHIR. HIND. A public disgraceful punishment in the time of the emperors of India; the culprit had his face blackened, and was made to ride, with his face to the tail, on a donkey through the streets of the city.

TASHKEND, in Central Asia, has been a Russian advanced post.

TA-SOUNG. BURM, a pavilion.

TAT. BENG. Corchorus olitorius. Gunny Coarse matting made of "san" and other materials.

TAT. HIND. Saccharum semidecumbens.

TATA. SANS. Borassus flabelliformis, the palmyra tree.

TAT AKU. TEL. Olay. Leaf of palmyra used for writing on with a style.

TATA KURA. TEL., also Perugu Tata Kuru, TEL. Amarantus oleraceus.

TÀTA NELA VEMU, TEL. Radhidospora glabra, *Nees.* Justicia glabra, *Roxb.*

TATAUR. HIND. Impatiens, *sp.* also Artemisia Indica.

TATA-YOUBA. Caryocar.

TATCHAWARI—? A stable or coach factory.

TATI-AKU. TEL Cadjan. ANGLO-MALAY.

TATI BELLAM. TEL. Sugar from Borassus flabelliformis, palmyra sugar.

TATI CHETTU. TEL. Borassus flabelliformis, *Linn.*

TATI GEDDA. TEL. Root of Borassus flabelliformis.

TATI KALLU. TEL. Palm wine from Borassus flabelliformis.

TATI KELANGU. TEL. root of Borassus flabelliformis.

TATI NAR. TEL. Fibre of Borassus flabelliformis.

TATI PANDU. TEL. Fruit of Borassus flabelliformis.

TAT MORANG, also Tat-palanga, HIND. Bignonia Indica, *Linn.*

TATOO. See Semang.

TATOW. See Kyans, p. 5678.

TATRI. HIND. Rhus buckiamela, R. succedanea.

TA-TSIAN-LOO, the border town and customs station of Western China. Beyond this point, a handful of tea, a few needles, or a few yards of white or blue thread, are of more value than gold, silver, or copper coin; indeed the latter are useless, while sycee silver and rupees are only exchanged at a considerable loss. Leaving behind the magnificent gorge of Ta-tsian-loo, with its perpendicular walls of mountains, travellers follow up the stream, which, flowing through it, joins the Tatowho at the foot of the gorge; by noon they can reach the summit of the Jeddo range of mountains, which may be said to form the great natural wall of Western China. From this point two days journey brings them to the little town of Hokow, situated on the left bank of the river Yarlong, a tributary of the Kin-char or Yang-tsze River—*Geog. Soc. Pro.* 1870.

TATTA, a city of Hyderabad in Sind, at the head of the delta of the Indus. The population in 1828 was 40,000. Maurice states that Tatta is the Daibul of the Persian tables of Sir William Jones. The statement is made by Ferishta, who was probably followed by Maurice, but Elphinstone shows (Book V. Chap. 1) that Tatta cannot be Dival or Dewal, celebrated for the siege by the Arabs under Mahomed Qasim in A.D. 711. The point has been discussed also by Rennell, Burton, and many other writers, but with no satisfactory result.—*Cal. Rev. Jan.* 1871. *Burnes' Sindh.*

TATTAN. Tulu. See Kummaler. Polyandry, p. 109.

TATTA PYER, Tam. Lablab vulgaris.

TATTARAN and LANAWAN, two small islands of the Philippine group, of middling height.

TATTI, Hind. a matted screen, kept wet to cool the wind entering a house.

TATTI CHETTU, Tel. Palmyra tree, Borassus flabelliformis.

TATTOO ? Hind. a pony.

TATOOING the body with various figures of animals or plants, or with scrolls, has been in use from the most ancient times. It was forbidden by Moses in the Levitical law, it was not known among the Copts, but must always have been in use among the Lower-Egyptians. It was used by the Arab prisoners of Rameses, and is practised by the Egyptian Arabs of the present day. On the return of Philpator to Egypt, he showed his hatred of the Jewish nation by his treatment of the Jews in Alexandria. He made a law, that they should lose the rank of Macedonians, and be enrolled among the class of Egyptians. He ordered them to have their bodies marked with pricks, in the form of an ivy-leaf, in honour of Bacchus ; and those who refused to have this done were outlawed, or forbidden to enter the courts of justice. The king himself had an ivy-leaf marked with pricks upon his forehead, from which he received the nickname of Gallus. The Fellahin or country women of Palestine generally tatoo stars and dots, with gunpowder, on their foreheads, lips, chins, breasts, arms, hands and feet. The tatooing of women is a practice very prevalent amongst several of the races in Persia. The mahomedans of India do not tattoo or mark their skins in any way, neither men nor women, but most of the women of the Dravidian races mark their fore arms, from the wrist to the elbow with scrolls. The Kheriah, Juanga, Mundah, and Oraon girls have lines tattooed on the forehead and temple, and dots in the chin and nose. The Singhbum girls have a tattooed arrow. Oraon boys have severely tattooed arms. Every male Burman is tattooed in his boyhood from the waist to the knees : in fact he has a pair of breeches tattooed on him : the pattern is a fanciful medley of animals and arabesques, but it is scarcely distinguishable save as a general tint, excepting on a rather fair skin, tracing on various parts, the figures of animals or plants, in a manner so pleasing that British officers have often been attracted to submit to the painful and barbarous process. Tattooing of the Burmans is not unfrequently followed by sloughing and death. In Fiji this practice is confined to the women, the operation being performed by members of their own sex, and applied solely to the corners of the mouth, and those parts of the body covered by the scanty clothing worn by them. The skin is punctured by an instrument made of bone, or by the spines of the shaddock-tree, whilst the dye injected into the punctures is obtained chiefly from the candle-nut. They believe that the custom was commanded by Degei, their supreme deity. Neglect of this divine commandment is believed to be punished after death. In Polynesia the practice seems to have attained its culminating point in the Society Islands and the Marquesas, where both men and women submitted to it ; in Samoa and Tonga, it is restricted to the men, in Fiji to the women, and altogether ceasing in the new Hebrides. Tradition however asserts that the custom was known in Fiji before its being adopted in Samoa or Tonga. Two goddesses, Taema and Tilafainga, swam from Fiji to Samoa, and on reaching the latter group, commenced singing, " Tatoo the men but not the women." Hence, the two were worshipped as the presiding deities by those who followed tatooing as a trade.—*Galton's Vacation Tourists, V.* 259, 260. *Sharp's History of Egypt. Vol. I. p.* 344. *C. A. DeBode's Travels in Luristan and Arabistan, p.* 85.

TATTU AMMAVARU. See Hindu.

TATTUR. Hind. Datura stramonium.

TATUA. Hind. Prinsepia utilis.

TATUA. Hind. Calligonum polygonoides.

TATUN. Ar. Tobacco.

TATURA. Turk. Thorn apple.

TATWAM. See Hindu.

TATWEN. Hind. Artemisia sacrorum.

TAU. Hind. Grislea tomentosa.

TAU of the Egyptians, a cross, anciently a symbol of the generative power, was transformed into the Bacchic mysteries. Such a cross was found on the wall of a house in Pompeii in juxta position with the Phallus with symbols embodying the same idea.

TAU BOKE. Burm. Diospyros *sp.*

TAUHID. See Kalamah.

TAU-KYET-THWON. Burm. Allium porrum, *W.*

TAU-MA-GYEE. Burm. a species of Elæocarpus, tree generally very large. Grain clear and straight; timber highly prized.—*Malcom.* vol. I. p. 188.

TAN MUNGHSEE. Burm. Cassia *sp.*

TAUNPOONI. Malay. Artocarpus echinata, *Roxb.*

TAUP-SHA, An Amherst wood, employed for house posts, and would answer for common carpentry, but it is liable to split; the bark is supposed to be medicinal.—*Cat. Ex.* 1851.

TAUR. Hind. Bauhinia racemosa, B. vahlii.

TAURA. Hind. Machilus odoratissimus, Pennisetum cenchroides.

TAURIS, the modern Tabriz was the capital of more than one dynasty, and throughout the middle ages was a chief point of contact and trade between the Latin and Oriental worlds. It has been identified not only with Shushan of Esther, and the Achmetha of the Apocrypha, but with the northern Ecbatana and half a dozen other ancient cities of fame. Rawlinson, however, considers it not to be older than the third century.—*Chardin, Amsterd.,* 1735, *I.* 258; *Journ. Asiat., S. II. IV.* 117; *J. R. G. S., X.* 109, *in Yule Cathay I. p.* 48. *Mignan's Travels, p.* 334.

TAURUS. See Koh, Kurdistan, Mesopotamia.

TAUTANG. The name of a tribe whom the Heuma populations describe as living beyond their boundary. See Mowtu.

TAUT'H, Sans. father, supposed to be the Teuthes and Tot'h, the mercury of Egypt. —*Tod.*

TAUWERK. Ger. Cordage.

TAU-YEW. Burm. Inga bigemina.

TAVADU, a dry measure in Mysore, of 1 lb. 2 solas of 8 oz.—*Simmonds' Dict.*

TAVAKANCHANAM Tel. Bauhinia, species. Perhaps a clerical error for Deva-kanchanam.

TAVAKU, Tam. Cochlospermum gossypium, *DC.*

TAVALAM, a term which, substituting bullocks for camels, is equivalent to a caravan. The class of persons engaged in the traffic in Ceylon, of carrying light loads on pack oxen, who resemble in their occupations the Banjari of Hindustan.—*Tennent Ceylon, p.* 53.

TAVATIKI. Tel. Schmiedelia serrata, *DC.*

TAVERNIER, a traveller in India, and the history written by him merits mention, for the fidelity of his description of countries little known. He was by birth a Swiss, and the son of a very able geographer: he himself was the greatest traveller of his age. Besides his European travels in the early part of his life, he spent forty years in six journeys into Turkey, Persia, and India, and entered deeply into commerce, chiefly in that of jewels. He determined on a seventh voyage, but died on the road, at Moscow, in 1689, aged 84.—*Pennant's Hindoostan, Vol. II. p.* 5, 6.

TAVITI-CHETTU. Tel. Caralluma adscendens, *R. Br.*

TAVIZ, Pers. A charm. The practice of binding sentences of the Koran on the arm would seem to be alluded to in Deut. xi. 18. Therefore shall ye lay up these my words in your heart and in your soul, and bind them for a sign upon your hand that they may be as frontlets between your eyes. The extract is usually a slip of paper with a quotation from Holy Writ, some curious spell to avert the evil eye, or a song to some dead saint. These are the "characts" of ancient days, commonly used in different parts of Europe.—*Burton's Scinde, Vol. I. p.* 280.

TAVOLE. It. also Piane, It. Deals.

TAVON. Burm. Baskets.

TAVOY TOWN, in lat. 14° 5′ N. and long. 98° 13′ E., is built on the east bank of a river of the name. The river is rendered intricate, by numerous shoals and low islands, the rise and fall on springs is 18 feet, and velocity of tide is 3½ knots per hour.

Tavoy town is on the left bank of the Tavoy river in the Tenasserim provinces, and was taken by the British on the 15th September 1824. In the neighbourhood of Tavoy are two sacred lakes, two small currentless basins in the Pagaya river at the foot of pagoda crowned precipices, one to two hundred feet high. A fish, a species of barbel, (Barbus mortonius) is held sacred to the pagodas by the buddhists, and come in shoals for rice thrown to them by passers bye, as fearless of man as the barking deer that drinks their waters. Tavoy province is 1,200 square miles and has 50,000 people.

TAVOY ISLAND, extends from lat. 13° 13′ to 12° 55′ N. long. 98° 14′. It is of middling height, about two miles in breadth and six leagues in length. It is the most northern of the group called the Mergui Archipelago. It has Port Owen, a good harbour, on its east side.

TAVOY POTATO. Dioscorea fasciculata.

TAWA, Hind. See Tuwa.

TAWAF, or circumambulation of the Kaaba at Meccah, must never be performed at the tomb of Mahomed. See Tayf.

TAWAI of Trans-Indus. Fragaria vesca, *Linn.*

TAWALLY, a large island fronting the S. W. part of Gillolo.

TAWAR, or Tor, Hind. the elephant creeper, Bauhinia racemosa.

TAWAS, Mal. Jav. Alum.

TAWEE-TAWEE ISLANDS, forming the south-west part of the Sooloo Archipelago, extend nearly to the peninsula of Usang, the extremity of which forms the north-east point of Borneo. They consist of an extensive chain of islands very imperfectly known. See Leegetan islands.

TAWI. Hind. Grislea tomentosa. *Roxb.*

TAWIZ. Ar. Hind. Pers. Charms.

TAWMARA, properly Tamarai. Tam. Nelumbium speciosum.

TAWMARA DARUM, properly Tamara Darum. Tel. Nelumbium speciosum.

TAWMARAI KALANGU, Tam. Root of Nelumbium speciosum.

TAWMARAI NULU. Tam. Nelumbium speciosum.

TAWNI, in Tamil, **TANIKI MARUM** in Malayala. This tree grows to about three and a half feet in diameter, and from thirty to forty-five long ; wood is of a whitish colour, and is used by the natives for catamarans, canoes, &c. It produces a fruit which the native medical men of India use as a purgative in cases of fever, &c. ; the timber is not durable or of much use.—*Edye. M. and C.*

TAW-SHOUK. Burm. Limonia carnosa.

TAW-THE-DIN-BIN. Burm. Ricinus diococa.

TAWURI, T'hori, or Tori, a race dwelling in the desert of Rajputnah. These engross the distinctive epithet of Bhoot, or 'evil spirits,' and the yet more emphatic title of 'sons of the devil.' Their origin is doubtful, but they rank with the Bawuri, Khengar, and other professional thieves scattered over Rajpootana, who will bring you either your enemy's head or the turban from it. They are found in the thuls of Daodpotra, Beejnote, Noke, Noakote, and Oodur. They are proprietors of camels, which they hire out, and also find employment as convoys to caravans.

TAXIDIA LEUCURUS, the Tibetan Badger, Thumphà of the Tibetans, inhabits the plains of Tibet ; total length 37 inches, whereof the tail, with the hair, is 10 inches, and without it 7. The head is $5\frac{1}{2}$ inches, the palm and nails $3\frac{1}{8}$, the planta or rest of the hind foot, from heel to end of the nails, 4, the longest claw or nail $1\frac{1}{4}$, the ear $1\frac{1}{4}$, the longest hair of the body $4\frac{1}{4}$. The aspect is entirely that of a long-tailed Badger, with somewhat smaller head and longer finer fur than usual. The small head is conico depressed with remote ears and eyes, and sharp elongated face. The muzzle or nude extremity of the nose is clearly defined, rounded, prolonged beyond the teeth, and has an abrupt oblique termination in front. The oval nostrils are opened entirely to the front, their lateral prolongation being merely linear and very much curved. The lips are thin and almost void of moustaches, and there is a still fainter indication of the tufts proper to the cheeks, chin, and eyebrows. The small pig-like eyes are situated midway between the ears and tip of the snout. The ears are oval, well developed and tending to a point.—*Mr. Hodgson in Jour. Ben. As. Soc.*

TAXILA, the country between the Indus and Hydaspes, frequently mentioned in the history of Alexander. See Bactria, p. 284. Chandragupta. Greeks of Asia. Iran.

TAXUS BACCATA. The Himalayan Yew.

Birmi	Jhelam.	Rakbai	Sutlej.
Tung	Kashm.	Nyamdal	,,

Kautu	,,	Thoono	Hind.
Burmi	Ravi.	Thuneer	,,
Dhnui Kunt'h	Ravi.	Zurnub	Hind.
Chogu	,,	Tuna	Panjab.
Rakhal	Beas.		

This tree occurs in many parts of the Punjab Himalaya, up to the Indus, at from 5,000 to 10,000 feet, but sparingly in almost all except in parts of Hazara, where it is pretty common. It is a hard, heavy, strong wood, is tolerably elastic, and is used for making native bedsteads, and in some parts for jampan poles, buggy shafts, and on the Sutlej for bows. The wood of an old tree is of a fine red colour and polishes well, and seems adapted for upholstery purposes, it is well fitted for turning, and Vigne states that in Kashmir it is used for making clogs. The leaves of this tree are sold in the bazaars of the N. W. Provinces of India, under the name of " Burmee" or Zurnub. Taxus baccata or " Tingschi," is the yew whose timber is red. It is comparatively scarce in Sikkim. It is found, however, in the Sutlej valley between Rampur and Sungnam, at an elevation of 9,000 to 10,500. Its appearance and form of growth vary much, when it grows in the higher latitudes, and when growing in deep forests. It is a large tree with naked trunk. It is often of great thickness, but seldom attains any great height ; the thick trunk generally dwindles away or divides into branches at a few feet above the ground. On the skirts of the forests, it is almost a prostrate bush, while on open slopes it becomes a stout, dense, and tabular branched tree. *Hooker, Vol. 1, p. 45. Lt. Col. Lake. Com. Jhullundur. Cleghorn Punjab Report, p. 63.*

TAXUS CUSPIDATA. S. and Z. and Taxus adpussa, *Knight*, are trees of Japan.

TAY. Burm. Ebony. Diospyros ebenum.

TA-YA. Burm. A constellation. See Astronomy.

TAYA ISLANDS, separated from the island of Hainan, consists of two groups of six, or seven high barren islands.

TAYANI. See Resins.

TAYA. Tam. Father. Tya-pan, father and other.

TA-YAN. Burm. Grewia floribunda, *Wall.* also Excœcaria agallocha, *Linn.*

TAYET KHYEE. Burm. This timber tree, of maximum girth, 2 cubits, and maximum length, 15 feet, is abundant all over the Tenasserim provinces. When seasoned it floats in water. It yields a pretty wood in grain, but one which rots readily when it dies. It is of no durability.—*Captain Dance.*

TAYF is the participle of the Arabic verb Tafa, which signifies to go round ; it is especially applied to the religious ceremony of mahomedan pilgrims of going round the Ca'aba at Mecca. It is the encircling of holy places so often alluded to in the Old Testament, and still practised by the budd'hists, the hindus christians and mahomedans. Psalm xxvi. 6 says, I will wash mine hands in innocency, so will I compass thine altar O Lord. Hindu women often compass their husbands as in Jeremiah xxxi. 22. Hindus and buddhists circle from right to left. Romish priests and mahomedans from left to right. The Persian couplet says : Tuaf-i-Kaaba-i-dil kun, gar dili dari, circle the holy place of your heart if you have a heart.— *Hamilton's Sinai Hedjaz, Soudan, p.* 152, 153. See Tawaf.

TAYF. At a short distance, near one of the gates, the Bab-ul-Yemen, outside the town of Tayf to the west, a five sided block of granite, rising in a slant from the ground, is pointed out as the idol "lat." In its greatest length, it measures about twelve feet, and four feet and a half to its highest edge. Another of the idols of the old Arabs, El Izzah, is within the town; like the lat it is an unhewn stone, with a depression or hollow on the north side, resembling a water-worn boulder. Whether any well authenticated tradition, or merely popular love for assigning sites to well known names, be the origin of these appellations, Burton could not learn. They are mentioned in the chapter of the Koran, called the Star, liii. 19,23. "What think you of El Lat and Izzah and Marrat, the third ? They are but names you and your fathers have given them." El Lat was adored at Tayf, but there is not only, he believes, no ancient authority for placing the worship of El Izzah here, but it does not even seem to have been a stone, but rather the trunk of a tree or a wooden image which was burned by Mahomed's order. The dimensions of the stones pointed out as El Lat correspond to the description given by Herodotus and his commentator of the idol Alilat Αλιλατ, or Αλὶατ, whom he compares to Urania. Lat may not improbably have been such a stone as that pointed out to Hamilton. That it was this identical one, Burton cannot help doubting, notwithstanding the tradition of the place. Herodotus mentions another deity, Urotalt, Ουροταλτ, whom he identifies with the great Bacchus, but this can hardly be other than a slight corruption of the title of the Supreme God (Allah taalah) the *r* and *l* being easily convertible sounds.—*Hamilton's Sinai Hedjaz, Soudan, p.* 150, 51. *Burton's Pilgrimage.*

TAYING. See Mishmi. Muttak. Singhpo-

TAYLI-MARAM. Tam. One of the sand-binding plants.

TAYLOR, Dr. James. Author of Topography of Dacca, Calcutta, 1840.

TAYLOR, Captain Meadows, rose in the Nizam's service. He wrote Memoirs of a Thug, 3 vols. 1840 ; also on Celtic remains near Ferozabad, Deccan, in Bom. As. Trans. 1851, 52. also Tara.

TAYLOR, Revd. W., of Madras. Author of an account of the seven pagodas, in Mad. Lit. Trans. 1844, I. 50. On supposed early Celtic and Scythian vestiges in various parts of the Carnatic.—*Ibid*, 1847-48.

TAYL-KODOKHOO. Tiaridium Indicum.

TAY-LAK-YOUK. Burm. Sulphuret of Antimony.

TAYMUNUS. See Jews. Kalmuck.

TAYN. Tam. Honey.

TAYNAM. See Tin.

TAYNDAUNG. Burm. The basket measure, by which rice is sold in Rangoon, equal to 56 lbs. nominally, but in reality often but 53¼ lbs.—*Simmond's Dict.*

TAYNGAY. Tam. Cocoa-nut palm.

TAYNGAY YENNAI. Tam. Cocoa-nut oil, &c.

TAYAR TAYZEE, a mahomedan domestic ceremony.

TAYSAAN. Chinese. Raw silk of Nanking the Tat-san of the Chinese, inferior in quality to Tsat-lie, but superior to Canton silk.—*Simmond's Dict.*

TAY-THA. Burm. A timber tree of Amherst, Tavoy and Mergui, maximum girth 3 cubits, and maximum length 15 feet. Scarce in Amherst, but abundant towards Tavoy, and found inland also along the sea coast all over the provinces. When seasoned it floats in water. It is subject to the dry rot when seasoned; is a useless wood, and not recommended.—*Captain Dance.*

TAY THEE. Burm. Diospyros kaki.

TAYUM. Tangala. Indigofera tinctoria.

TAYUMAN, of Java, a wood resembling Kamuning, and very much esteemed.

TAYUNG. BISAYA. Indigofera tinctoria.

TAY YO THA. BURM. A timber tree of Amherst, Tavoy and Mergui, of maximum girth 2 cubits, and maximum length 18 feet. It is very abundant on the sea coast and adjacent islands of these provinces. When seasoned it floats in water. It is used for oars and masts of boats. When this wood is cut, a very acrid caustic juice or sap flies from it, which will destroy sight if it touch the eye; or, if it fall on the face, it raises blisters. A wood dangerous to work, and not durable.—*Captain Dance.*

TAYZEE, a date of the moon, so called only in the month Suffer.

TAZAO, an affluent of the Kabul river.

TAZAK TSUN. HIND. Rhododendron anthropogon.

TAZEEA or Taboot, the representation of the tomb of Hussan and Hoossein.

TAZEEA KHANA, the house of mourning or Ashoor khana

TA ZEEN BAN. BURM. Bolbophyllum sunipia, *Lind.*

TAZIAH, Tazia Khanah. See Ashura. Tazeeah; Tabut.

TA-ZOUNG. BURM. An ornamented shed, or roof, over an image of Gautama.

TCHA. See Kangue.

TCHAI. RUS. TURK. Tea.

TCHERKESS. See Kabarda.

TCHERMALA. See Karadagh.

TCHING-TOU-FOU, the capital of the province of Ssetchouen, is one of the finest towns in China. It is situated in the middle of an admirably fertile plain, watered by beautiful streams, and bounded towards the horizon by hills of graceful and varied forms. The principal streets are of a good width, paved entirely with large flagstones, and so clean that you can scarcely, as you pass through them, believe yourself to be in a Chinese town.—*Huc. Chinese Empire, Vol.* I., *p.* 79.

TCHITREA MELANOGASTER. SWAINSON. An Abyssinian bird in plumage like some specimens of Tch. affinis, Blyth, but the bill and feet much smaller.

TCHOKPO——? Juniperus recurva.

TCHOU-MA. CHIN. China grass, Rheea.

Tea is the leaf of a species of the genus Thea, a native of China, Japan and Assam, and cultivated in Brazil, and other places. The Honorable Mr. Morrison says that the total exportation of tea from China, was put down at 350,000 peculs or forty millions of pounds, but it was probably nearer 427,500 peculs, or fifty-seven millions of pounds; viz. to England, 40,000,000 lbs.; to the United States 14,000,000 lbs.; and to all other countries, 3,000,000 lbs. which at 25 taels per pecul, amounts to 10,687,500 taels or 14,500,000 dollars. The present duty of 25t. exclusive of all shipping and other charges, which were before included in the total sum of 5 tael paid the hong-merchants as duty. The immense traffic in the produce of this simple shrub, affords one of the most remarkable illustrations of the enterprise and energy of modern commerce. The trade in tea now gives employment to upwards of 50,000 tons of British shipping, and about ten millions sterling of British capital, producing a revenue to Great Britain of nearly six millions sterling.

Articles of such vast consumption as tea and coffee (amounting together to more than 343,500 tons annually), forming the chief liquid food of whole nations, must exercise a great influence upon the health of the people. There is scarcely any country in the world in which a dietetic drink or beverage resembling tea is not prepared, and in general use from some exotic or indigenous shrub. The two chief plants laid under contribution are, however, the Chinese tea-plant, and a species of holly peculiar to South America producing the Paraguay tea. *Astoria theiformis* is used at Santa Fe as tea. The leaves of *Canothus Americanus*, an astringent herb, have been used as a substitute, under the name of New Jersey tea. Tea by many is looked on more as a luxury than of use to the human system, but Liebig without entering minutely into the medical action of caffeine, theine, &c., says it will surely appear a most striking fact, even if we were to deny its influence on the process of secretion, that the substance, with the addition of oxygen and the elements of water, can yield taurine, the nitrogenised compound peculiar to bile:—

	Carbon.	Nitrogen.	Hydrogen.	Oxygen.
1 atom caffeine or theine =	8	2	5	2
9 atoms water =	...	..	9	9
9 atoms oxygen =	..	..	..	9
	—	—	—	—
= 2 atoms taurine..	8	2	14	20
=	2	4	9	10

The first tea imported into England was a package of two pounds, by the East India Company, in 1664, as a present to the king; in 1667, another small importation took place, from the Company's factory at Bantam. The directors ordered their servants to "send home by their ships 100 pounds weight of best tea they could get." In 1678 were imported 4,718 lbs.; but in the six following years the entire imports amounted to no more than 410 lbs. According to Milburn's "Oriental Commerce," the consumption in 1711 was 141,995 lbs.; 120,595 lbs. in 1715; and 237,904 lbs. in 1720. In 1745 the amount was 730,729 lbs. For above a century and a half, the sole object of the East India Company's trade with China was to provide tea for consumption of the United Kingdom. The Company had the exclusive trade, and were bound to send orders for tea, and to provide ships to import the same, and always to have a year's consumption in their warehouses. The teas were disposed of in London, where only they could be imported, at quarterly sales. The Act of 1834, however, threw open the trade to China. From a parliamentary return, showing the quantity of tea retained for home consumption in the United Kingdom, in each year, from 1740 to the termination of the East India Company's sales, and thence to the present time, it appears that in 1740, 1,493,695 lbs. of tea were retained for home consumption. Two years afterwards the quantity fell to 473,868 lbs., and in 1767 only 215,019 lbs. were retained. Next year the amount increased to 3,155,417 lbs.; in 1769 it was 9,114,854 lbs.; in 1790, 21,342,845 lbs.; in 1836, 49,842,236 lbs. The return in question also specifies the quantity of the various kinds of tea, with the average sale prices. According to the annual tea reports of Messrs. W. J. Thompson and Son, and Messrs. W. E. Franks and Son, the total imports into Britain of tea during the fifteen years 1838-1852 were as follows, reckoned in millions of lbs.:—

Years.	Black.	Green.	Total	Home Consumption.
1838	26,786	8,215	35,001	36,415
1839	30,644	7,680	38,324	36,351
1840	21,063	7,161	28,224	31,716
1841	24,915	6,303	31,218	36,811
1842	31,915	9,729	41,644	37,554
1843	39,513	7,340	46,853	39,902
1844	39,644	8,749	48,393	41,176
1845	39,518	11,790	51,338	44,127
1846	41,017	12,486	56,503	47,534
1847	46,887	8,368	55,255	46,247
1848	37,512	7,611	45,123	48,431
1849	43,234	9,156	52,400	50,100
1850	39,873	8,427	48,300	51,000
1851	62,369	9,131	71,500	54,000
1852	55,525	9,175	64,700	54,724

In Great Britain, duty on tea was gradually raised from 9*d.* per lb. in 1787, to 3*s.* a lb. in 1806. It was 2*s.* 2*d.* per lb. until May 1852, when 4*d.* per lb. was taken off, and further annual reductions were to be made. Down to the year 1834 the duty was an *ad valorem* one of 96 per cent. on all teas sold under 2*s.* a lb., and of 100 per cent. on all that were sold at or above 2*s.*, charged on the prices which they brought at the East India Company's sales. The *ad valorem* duties ceased on the 22nd of April 1834, and under the Act 3 and 4 William IV. c. 100, all tea imported into the United Kingdom for home consumption was charged with a customs duty as follows:—

	per lb.
Bohea	1*s.* 6*d.*
Congou, twankay, hyson skin, orange pekoe and campoi	2 2
Souchong, flowery pekoe, hyson, young hyson, gunpowder, imperial, and other teas not enumerated	3 0

In 1836, the uniform duty of 2*s.* 1*d.* per lb. on all descriptions of tea was imposed, which, with the additional 5 per cent. imposed in 1840, made the total duty levied per lb. 2*s.* 2*d.* and a fraction.

The average cost of tea in China at the ship's side is 10*d.* per pound, but it is confidently asserted that it could be produced in many parts of America at 5*d.* the pound. The great cost in China is owing to the expensive transportation, the cultivation of the fuel used, the absence of all economy of machinery, &c. It is only by adulteration that tea is sold in China as cheap as 10*d.* In America the heating and rolling of the leaves (one half of the labor) could be done by the simplest machinery, fuel could be economised by flues, &c. The Russian teas brought by caravans, are the most expensive and best teas used in Europe. The Chinese themselves pay 7½ dollars per pound for the "Yen Ponchong" teas. Full chests were exhibited in 1851 by Mr. Ripley of various Pekoe teas, some of which fetch 50*s.* per lb. in the China market; whilst 7*s.* is the very highest price any of the sort will fetch in England, and this only as a fancy article. The plain and orange-scented Pekoes now fetch little in Great Britain, but all caravan teas are purchased by the wealthier Russian families. The finest, however, never leave China, being bought up by the Mandarins: for though the transit expenses add 3*s.* to 4*s.* per lb. to the value when sold in Russia, the highest market price in St. Petersburg is always under 50*s.* Among these scented teas are various caper teas flavoured with Chloranthus flowers and the buds of some species of plants belonging to the orange tribe, Magnolia fuscata, Olea flowers, &c. The Cong Souchong, or Ning-young teas, are chiefly purchased for the American market. Oolong tea is the favourite drink in Calcutta, though less prized in England, its delicate flavor being injured by the length of the voyage. For delicacy, no teas approach those usually called "Mandarin teas," which being slightly fired and rather damp when in the fittest state for use, will bear neither transport nor keeping. They are in great demand among the wealthy Chinese, and average 20*s.* per lb. in the native market.

The consumption of tea in the United Kingdom may now be fairly taken at fifty-four million pounds yearly, and sold at an average price to the consumer of 4*s.* 6*d.* per pound. The money expended for tea is upwards of twelve millions sterling. The population of the Chinese provinces, as quoted by Dr. Morrison from an official census taken in 1825, was 352,866,012, and we may fairly conclude that during the last twenty-eight years this population has extensively increased. If we multiply the population of China by four, we have—

	lbs.
Consumption of tea in China	1,411,464,048
Export to Great Britain and Ireland for the year ending June 30, 1851	64,020,000
Export to United States do	28,760,800
Exported to Holland, returned at 2,000,000 in "Davis's China."	3,000,000
Inland trade to Russia ...	15,000,000
Export to Hamburg, Bremen, Denmark, Sweden, &c., seven cargoes, about	3,000,000
Export to Sydney and Australasian Colonies, at least ...	6,000,000
Export to Spain and France, four cargoes	2,000,000
Total lbs.	1,533,244,848

The above is exclusive of the heavy exportation in Chinese vessels to all parts of the east where Chinese emigrants are settled, such as Tonquin, Cochin China, Cambodia, Siam, the Philippines, Borneo, and the various settlements within the Straits of Malacca. In comparison with such an enormous quantity, the 64 million lbs. consumed in the United Kingdom sink into insignificance.

	£.
The cost of tea to America, at the ship's side in China, say 29,000,000 lbs., at an average of 1*s.* per lb, would be.........	**1,450,000**
The cost to England, 64,000,000, at the same price...............	**3,200,000**
The cost to other places, say 25,000,000......	1,250,000
Russia, 15,000,000...............	750,000
Total...	£6,650,000

In China, tea is grown over an immense region, in small farms, or rather gardens, no farm producing more than 600 chests. The tea merchant goes himself, or sends his agents to all the small towns, villages, and temples in the district, to purchase tea from the priests and small farmers; the large merchant, into whose hands the tea thus comes, has to refire it and pack it for the foreign market. This refiring is the only additional process of manufacture for the foreign market. Mr. Fortune states that the small farmer and manipulator is not overpaid, but that great profits are received by the middlemen.

Thunberg informs us that the tea-plant grows plentifully in Japan, both in a wild and cultivated state, and Dr. Wallich says that it is found in Cochin China. I have met with it, says Fortune, in cultivation in China, from Canton in the south up to the 31st degree of north latitude; and Mr. Reeves says it is found in the province of Sham-tung, near the city of Sang-chow-foo, in latitude 36° 30' north. The principal tea districts of China, however, and those which supply the greater portion of the teas exported to Europe and America, lie between the 25th and 31st degrees of north latitude, and the best districts are those between 27° and 31°.

Kæmpfer says it is cultivated in Ja as far north as 45 degrees. It seems succeed best on the sides of mountain among sandstone, schistus, and granite.

The green-tea shrub is cultivated very extensively in the interior of the island of Chusan.

Mr. Boyer, director of the museum at Port Louis, Mauritius, succeeded in rearing 40,000 tea-trees, and expressed an opinion that if the island of Bourbon would give itself up to the cultivation, it might easily supply France with all the tea she requires; but in saying this he seems to have overlooked the need for many hands to pick the leaves and the expense of manufacture. The culture has also been tried on a small scale in St. Helena and the Cape Colony. The cultivation of the tea-tree might be tried with probability of success in Natal in South Africa. The plant grows in every soil, even the most ungrateful; resists the hurricanes, and requires little care. The picking of the leaves, like the pods of cotton, is performed by women, children, and the infirm, without much expense.

Cochin China tea is considered inferior to that of China, being less strong and pleasant in flavour.

An inferior sort of tea, with a leaf twice or thrice as large as that of Bohea, grows wild in the hilly parts of Quang-si, and is sold at from 12*s*. 6*d*. to 4C*s*. the picul of 133 lbs.

In Java, the Dutch have devoted much attention to tea cultivation, and the plantations are in fine order. Nearly a million lbs. of tea were shipped thence in 1848; but the tea is said to be of inferior quality, and grown and manufactured at considerable expense.

Japan produces both black and green tea. The black tea is very bad. The Japanese tea-tree is an evergreen, growing in the most sterile places to the height of about six feet. It is described by Kæmpfer as having leaves like the cherry, with a flower like the wild rose; when fresh the leaves have no smell, but a very astringent taste. Tea grows in all the southern provinces of Japan, but the best green is produced in the principality of Kioto, where it is cultivated with great care.

In *Ceylon*, Messrs. Worms attempted the cultivation of tea, but the island lies too far within the tropics to offer a climate like Assam, which is situate without them.

In *Penang* the tea-plant has reached upwards of six feet in height, and in as healthy a state as could be desired, but the leaf had no flavor, and although thousands of Chinese husbandmen cultivated spices and other tropical productions on that island, no one thought it worth while to extend the cultivation of the tea-plant in Penang. The Chinese there laugh at the idea of converting the leaf into a beverage.

Dr. Wallich mentions it in Cochin-China in N. lat. 17°, and in China in the southern provinces of Yunan and of Qungtung. Mr. Reeves informed Dr. Royle that, in a Chinese Herbal, tea is said to be produced, among other places to the northward of 31°, in nine places, in Hoo-Quang, three places in Ho-nan, one place in Shensi, and two places in Shantung; one of these latter, and the most northward of the whole, is Tangchow-Foo, in 36° 30′ N. lat.; and in the Japan islands, which extend from 30° to 41° of N. lat. Dr. Abel states having found it in an apparently wild state at See-chou, in the province of Kiang-see, about N. lat. 26°, where the hills were covered with pines. An excellent specimen in flower in the British Museum, was collected by Mr. Cunningham near Chusan, which is in 30° of N. lat., and where, he says, it delights in the tops of mountains like the pine. The note attached to it in the hand-writing of Mr. Cunningham, is Thea frutex flore albo rosaceo summitatibus montium gaudens uti pinus."—(*Herb. Mus. vol.* xciii., *fol.*, 146.) Dr. Royle further informs us that "a plant was given to him at Suddiya, which he had reason to suppose was a genuine tea tree." Lieut. Charlton writes, on the 17th May 1834, that he had been informed three years previously of the tea plants growing wild near Bheesa, whence, indeed, he obtained three or four young trees, which he gave to Dr. John Tytler, to be planted in the Government Botanical Garden. On the 8th November, he sent to Calcutta some seeds and leaves of the tea trees of Assam, which were forwarded on the 24th December to the Government by the Tea Committee, who announced that "the tea shrub is beyond all doubt indigenous in Upper Assam, being found there, through an extent of country of one month's march within the Honourable Company's territories, from Suddiya and Bheesa to the Chinese frontier province of Yunnan, where the shrub is cultivated for the sake of its leaf." So far back, however, as 1826, Mr. D. Scott sent from Munnipore, to Mr. G. Swinton, then Chief Secretary to the India Government, specimen of the leaves of a shrub which he insisted was a real tea. These we find were first discovered by Mr. Bruce, who was then in command at Suddiya. He sent tea seeds and plants to Mr. Scott, having been previously informed of their existence by his brother, the late Major Bruce; and he subsequently, in 1833, brought it to the notice of Capt. Jenkins. Descriptions have been published by these gentlemen of the several tea tracts which they had at that time an opportunity of examining. These, according to Dr. Wallich, were five in number,—Koojo and Niggroo, among the Singpho, Nuddooa (Noadwar) and Tengrae, in the Muttock country, and Gubroo, at the foot of the Naga Hills, in the territories of rajah Purrendur Singh. The last, Dr Wallich supposed to be connected with others to the southward, and with the tea plant originally announced as existing in Munnipore, and this, he says, may have originated from the plant at Hookum, and that all may have "originally travelled from the frontiers of China," where we know that a kind of tea is cultivated in the province of Yunnan. Mr. Bruce, in his latest account, published in August 1839 in the Journal of the Asiatic Society, gives an account of the discovery of other tea tracts, which then amounted to no less than "one hundred and twenty, some of them very extensive, both on the hills and in the plains." The hills on which tea had been found by Mr. Bruce, are the Naga Hills and those of Gubroo and Tipum. These discoveries were not lost sight of, and the Calcutta

Daily News thus notices the half yearly report of the Assam Tea Company:—"The crop of tea which in 1855 was 588,379 lb., and in 1856 638,789 lb., is expected in 1857 to reach 700,000 lb., or nearly twenty times as much as the produce of the Government establishments in the north west in the fifteenth year of their existence. It thus has been shown to thrive equally well in the vicinity of Canton, and the milder climate of Nankin, as in the northern latitudes of Pekin and Japan ; embracing, therefore, a distribution over twenty degrees of latitude. The knowledge of this fact led to an inquiry in India, so long since as 1827, as to the practicability of introducing the culture of the tea-plant into the northern regions of that vast country ; and the result was an opinion from Dr. Royle, that it might be successfully grown in the north-western portion of the Himalaya districts. He pointed out some localities particularly suited to the experiment in the district of Kumaon, a portion of the province of Delhi, and situated between the 29th and the 30th degrees of north latitude, to the north-west of Nepaul. This opinion was afterwards backed by the investigations of others, who agreed in the belief that there was no impediment to the successful introduction of the tea culture in the Himalayan regions, beyond the difficulty of obtaining a supply of plants, and some details relative to the Chinese mode of cultivation and curing of the article. In 1834 Lord William Bentinck formed a committee with the view of adopting measures for attempting this cultivation in India ; and the first step taken was the dispatch of agents to the tea districts of China, whence a supply of seeds and plants, and much valuable information, was brought. Nurseries were formed in Calcutta, and some ten thousand plants were reared, the greater portion of which were dispatched to Kumaon, though but a small fraction of them reached the Himalayas ; whilst a quantity was forwarded to the hill districts of the Madras presidency, but without any immediate commercial results. The plants dispatched northwards were distributed in several directions, and so well did they thrive, that in the year 1838 many of them had produced seed, which was at once sown, and thus formed fresh nurseries. In the meantime the existence of the plant in a wild state had been ascertained in the upper districts of Assam, one of the north-eastern provinces of the Bengal presidency ; and inquiries having been directed to it, evidence was not long wanting to shew that the plant was growing in not less than a hundred different tracts amongst the dense jungles of that country. In 1837, samples of tea, prepared from the wild plants of the Assam district, were forwarded to Calcutta, and favourably reported on. Observations and researches instituted in the Assam country went to show that the district really possessed most of the requisites of soil, position, altitude, and climate. Some valuable reports upon the peculiarities of this district, and the results of a number of experiments in the culture of the indigenous plants, were published at intervals between 1837 and 1840 ; and from these it appears that the best seasons for the manipulation of the tea-crop are in March, May, and July. Every inquiry goes to prove that the greatest success has been attained whenever the culture has been attempted on hilly slopes, or in the vicinity of rivers, with a temperature ranging from 27° to 80°; indeed it appears certain that the latter consideration is of far more importance than that of soil. The China tea-plants introduced into Upper Assam by the instrumentality of the Company's servants have not only thriven remarkably well, but attained a size and vigour unknown to them in their native soil. The first parcels of tea from these districts were highly approved of on their arrival in England, and realised enormous prices, partly owing, in all probability, to their novelty. The result of these sales, however, placed it beyond a doubt that the cultivation of tea could be profitably carried on in that part of India ; and in consequence a public company, entitled the "Assam Company," was formed for the purpose of carrying on the culture and manufacture of British Indian tea on an extensive scale. The East India Company having thus acted the part of pioneers, handed over their experimental plantations and establishments to the new company, who have since greatly enlarged the plantations and work, and have succeeded in producing a tea superior to any imported into Great Britain from China, and equalled only by the fewer samples which, under the old Company's system, used to be occasionally obtained. During the first years of their operations, the Assam Company encountered many obstacles, arising from the difficulty of procuring labour in sufficient quantity, from the want of skill of their first managers, and, above all, from the extreme remoteness of their property from all supervision. The crop in 1853 was calculated at 300,000 lbs, which has hitherto realised fully a third above the China teas. The produce of the company's tea-crop of 1847 realised 9,728*l.* nett ; that of 1848, 12,552*l.* ; that of 1849, 16,628*l.* ; that of 1850, 18,153*l.* ; and that of 1851, 22,151*l.* The nett average price per pound in those years was, for 1847, 1s. 4d.; 1848, 1s. 51$\frac{1}{16}$d.; 1849, 1s. 6$\frac{2}{16}$d.; 1850, 1s. 6$\frac{13}{16}$d.; and 1851, 1s. 8½d.

In the Himalayan districts the labours of the tea experimentalists have been equally successful with those carried on in the more easterly province of Assam. About the year 1842, the aid of some of the Chinese cultivators, who had been introduced on the Assamese plantations, was obtained for tea-farms in the Kumaon district of the Himalayan country; and by their instrumentality a quantity of black tea was produced and dispatched to Calcutta, whence it was shipped to Great Britain, and pronounced superior in strength and flavour to the generality of Souchongs. By the end of the year 1844 these experimental plantations contained upwards of a hundred thousand plants; and two years later covered nearly two hundred acres at various altitudes, varying from 2500 to 6500 feet above the sea-level. In the year 1848 this cultivation was still further extended, reaching to an extent of 1000 acres, not in one immediate neighbourhood, but stretching through many miles of country, and in some parts reaching the recently acquired Sikh territories on the north-west frontier. So deeply impressed was the local government with the importance of this new branch of industry, that a grant of ten thousand pounds sterling a year was voted to carry out the experiment until it should, as in Assam, be taken up by private enterprise. In 1850, the East India Company, determined to lose no opportunity of fully testing the value of this cultivation, dispatched Mr. Fortune to China to glean all possible information regarding the tea-plant, its natural history, and the manipulation of its leaves; and, if possible, to bring away from the Chinese dominions a fresh supply of plants and seed of the best varieties, as also some experienced cultivators and work-people. In all these objects their agent was singularly fortunate, and he returned to India with a supply of all that was desired; in plants, seed, work-people, and, better still, in accurate data regarding the various processes of the cultivation and manufacture of this article. The number of acres in cultivation by the Assam Company, in 1849, was about 12,000: 1,010 chests of the produce were sold in London on the 13th of March 1850, at a gross average of 1s. 11½d. per lb. The produce of 1847, sold in England, was 141,277 lbs., at a gross average of 1s. 8d. per lb.: that of 1848 was 176,149 lbs., which sold at the average of 1s. 8½d. The exact amounts obtained for the company's tea in the five years, ending with 1851, will be seen from the following figures:—

	Nett produce, lbs.		Average price.	£.
1847 ...	144,164	at per lb. ...	1s. 7d.	11,513
1848 ...	182,953	,, ...	1s. 8¼d.	15,436
1849 ...	216,000	,, ...	1s. 9½d.	19,350
1850 ...	253,427	,, ...	1s. 6⅛d.	18,163
1851 ...	271,427	,, ...	1s. 8½d.	22,152
1852estme.	280,000			

This exhibits a progressive increase in the aggregate value of the company's produce, also a rise in the value of the tea, 157,942 lbs. having been sold at the high average price of 1s. 11¼d. Of Assam tea, the sales in the London market in 1851 amounted to 2,200 packages against 1,900 packages in 1850, and all were freely taken (on account of their great strength) at very full prices.

Kumaon.—Seventy-six packages of Kumaon tea, both black and green, grown by the East India Company in the Himalayas as an experiment, were, in 1851, also brought to sale. They were teas of high quality; but being of the light flavored class, and not duly esteemed in the English market, they realised only about their relative value as compared with China teas of similar grade. The Souchong and Pouchong sold at 1s. 1¼d. to 1s. 3½d.; the Hyson, Imperial, and Gunpowder realised 1s. 7¾d. to 2s. 6½d.

Punjab.—In the British portion of the Punjab, it was at first resolved to expend £10,000 a year on the cultivation of the tea plant on the banks of the Beas, as well as at Anarkullee, and Kotghur in the Simla jurisdiction. Beyond the Beas is a series of valleys on the Noonpoor, viz. the Palklun, Kangra, Rillo, &c., from 3,000 to 4,000 feet above the level of the sea, separated from each other by small ranges of hills. The valleys are from three to four miles in breadth, and from sixty to seventy in length: they are sheltered on the north by high mountains.

On plucking the leaves.—This very important part of the business of tea cultivation requires to be carefully studied, for it is easy to render a plant unhealthy, or to destroy it altogether, by continually depriving it of its leaves. For the first two or three years, the leading shoots only should be topped, in order to *form* the plants and make them *bushy.* If too many leaves are annually taken from them, they will soon become sickly, stunted in appearance, and covered with dead branches. In China every child seems to possess intuitively the knowledge necessary to enable it to pluck leaves in the right way, and hence in that country the proper leaves only are taken, and the plants are rarely injured by over-plucking. The object the Chinese have in view is to obtain as large a quantity of leaves as the bushes are capable of yielding, not in any given year, but during the period of their existence; and although not vegetable physiologists, no one knows better than the Chinese that the way to accomplish this is by allowing the bushes to become fully developed, and to keep them in high health and vigour. The natives of India, at present, seem to have no idea of the importance of this principle, and consequently they do much harm to the bushes by over plucking and by plucking in the wrong way. Instead of nipping off the upper part of the young shoot with its leaves, as the Chinese do, they strip the leaves from it and leave the bare stems. These bare stems generally die down to the nearest leaves, and then the plants get covered with dead stems and present a sickly appearance. Besides the injury this system inflicts on the plants, a great loss is sustained at the same time. About an inch and a half, and some times more, of the top of the young shoots is soft and succulent, and makes just as good tea as the leaves themselves. The Chinese know this well, and hence they always nip off this portion with the leaves.—*Fortune 25th October* 1856. *Report in No.* 23 *Selections from the Report of the Government of India.*

Tea plants :—The plant in cultivation about Canton, from which the Canton teas are made, is known to botanists as the Thea bohea, while the more northern variety, found in the green tea country, has been called Thea viridis. The first appears to have been so named upon the supposition that all the black teas of the Bohea mountains were obtained from this species, and the second was called T. viridis because it furnished the green teas of commerce. These names seem to have misled the public, and hence many persons, until a few years back, firmly believed that black tea could be made only from Thea bohea, and green tea only from Thea viridis. In Fortune's "Wanderings in China," published in 1846, he made some observations upon the plants from which tea is made in different parts of China; while he acknowledged that the Canton plant, known to botanists as Thea bohea, appeared distinct from the more northern one called Thea viridis, he endeavoured to show that both black and green teas could be made from either, and that the difference in the appearance of these teas, in so far as colour was concerned, depended upon manipulation, and upon that only. In proof of this he remarked that the black tea plant found by him near Foo-chow-foo, at no great distance from the Bohea hills, appeared identical with the green tea plant of Che-kiang. It is now well known that the fine Muning districts near the Poyang Lake, which are daily rising in importance on account of the superior character of their black teas, formerly produced nothing else but green teas. At Canton green and black teas are made from the Thea bohea at the pleasure of the manufacturer, and according to demand.

Preparation of Green tea.—When the leaves are brought in from the plantations they are spread out thinly on flat bamboo trays, in order to dry off any superfluous moisture. They remain for a very short time exposed in this manner, generally from one to two hours; this, however, depends much upon the state of the weather. In the mean time the roasting-pans have been heated with a brisk wood fire. A portion of leaves are now thrown into each pan and rapidly moved about and shaken up with both hands. They are immediately affected by the heat, begin to make a crackling noise and become quite moist and flaccid, while at the same time they give out a considerable portion of vapour. They remain in this state for four or five minutes, and are then drawn quickly out and placed upon the rolling table. The rolling process now commences. Several men take their stations at the rolling table and divide the leaves amongst them. Each takes as many as he can press with his hands, and makes them up in the form of a ball. This is rolled upon the rattan worked table, and greatly compressed, the object being to get rid of a portion of the sap and moisture, and at the same time to twist the leaves. These balls of leaves are frequently shaken out and passed from hand to hand until they reach the head workman, who examines them carefully to see if they have taken the requisite twist. When he is satisfied of this the leaves are removed from the rolling table and shaken out upon flat trays, until the remaining portions have undergone the same process. In no case are they allowed to lie long in this state, and sometimes they are taken at once to the roasting-pan. Having been thrown again into the pan, a slow and steady charcoal fire is kept up, and the leaves are kept in rapid motion by the hands of the workmen. Sometimes they are thrown upon the rattan table and rolled a second time. In about an hour or an hour and a half the leaves are well dried and their colour has become *fixed*, that is, there is no longer any danger of their becoming black. They are of a dullish green colour, but become brighter afterwards. This does not allude to teas which are coloured artificially. The most particular part of the operation has now been finished, and the tea may be put aside until a larger quantity has been made. The second part of the process consists in winnowing and passing the tea through sieves of different sizes, in order to get rid of the dust and other impurities, and to divide the tea into the different kinds known as twankay, hyson skin, hyson, young hyson, gunpowder, &c. During this process it is refired, the coarse kinds once, and the finer sorts three or four times. By this time the colour has come out more fully, and the leaves of the finer kinds are of a dull bluish green. It will be observed, then, with reference to green tea—1st, that the leaves are roasted almost immediately after they are gathered; and 2nd, that they are dried off quickly after the rolling process.

Black tea.—When the leaves are brought in from the plantations they are spread out upon large bamboo mats or trays, and are allowed to lie in this state for a considerable time. If they are brought in at night they lie until next morning. The leaves are next gathered up by the workmen with both hands, thrown into the air and allowed to separate and fall down again. They are tossed about in this manner, and slightly beat or patted with the hands for a considerable space of time. At length, when they become soft and flaccid, they are thrown in heaps and allowed to lie in this state for about an hour or perhaps a little longer. When examined at the end of this time, they appear to have undergone a slight change in colour, are soft and moist, and emit a fragrant smell. The next part of the process is exactly the same as in the manipulation of green tea. The leaves are thrown into an iron pan, where they are roasted for about five minutes and then rolled upon the rattan table. After being rolled, the leaves are shaken out, thinly, on sieves, and exposed to the air out of doors. A framework for this purpose, made of bamboo, is generally seen in front of all the cottages amongst the tea-hills. The leaves are allowed to remain in this condition for about three hours: during this time the workmen are employed in going over the sieves in rotation, turning the leaves and separating them from each other. A fine dry day, when the sun is not too bright, seems to be preferred for this part of the operation. The leaves, having now lost a large portion of their moisture, and having become reduced considerably in size, are removed into the factory. They are put a second time into the roasting-pan for three or four minutes, and taken out and rolled as before. The charcoal fires are now got ready. A tubular basket, narrow at the middle and wide at both ends, is placed over the fire. A sieve is dropped into this tube and covered with leaves, which are shaken on it to about an inch in thickness. After five or six minutes, during which time they are carefully watched, they are removed from the fire and rolled a third time. As the balls of leaves come from the hand of the roller, they are placed in a heap until the whole have been rolled. They are again shaken on the sieves as before and set over the fire for a little while longer. Sometimes the last operation, namely, heating and rolling, is repeated a fourth time: the leaves have now assumed their dark colour. When the whole has been gone over in this manner, it is then placed thickly in the baskets which are again set over the charcoal fire. The workman now makes a hole with his hand through the centre of the leaves, in order to allow vent to any smoke or vapour which may rise from the charcoal, as well as to let the heat up, and then covers the whole over with a flat basket. Previous to this the heat has been greatly reduced by the fires being covered up. The tea now remains over the slow charcoal fire until it is perfectly dry; it is, however, carefully watched by the manufacturer, who every now and then stirs it up with his hands, so that the whole may be equally heated. The black colour is now fairly brought out, but afterwards improves in appearance: the after processes, such as sifting, picking, and refiring, are carried on at the convenience of the workman. It will be remarked, therefore, with reference to the leaves which are to be converted into black tea,—1st, that they are allowed to lie for some time spread out in the factory after being gathered and before they are roasted; 2d, that they are tossed about until they become soft and flaccid, and then left in heaps, and that this also is done before they are roasted; 3d, that after being roasted for a few minutes and rolled, they are exposed for some hours to the air in a soft and moist state; and 4th, that they are at last dried slowly over charcoal fires. The differences in the processes of manufacture of black and green teas are therefore most marked, and fully account for the difference in colour, as well as for the effect produced on some constitutions by green tea, such as nervous irritability, sleeplessness, &c. as shown in observations made by Mr. Warrington, of Apothecaries' Hall.—*Balls' Cultivation and Manufacture of Tea. Fortune, Tea Districts*, p. 281.

Raw tea leaves, just as they are plucked from the bushes, and unmanufactured, are exposed for sale in the markets of China. They are sold at from three farthings to five farthings a pound; and as it takes about four pounds of raw leaves to make one pound of tea, it follows that the price paid is at the rate of threepence to fivepence a pound, but to this must be added the expense of manipulation. In this manner the inhabitants of large towns in China who have no tea-farms of their own can buy the raw leaves in the market and manufacture the beverage for themselves and in their own way.

Tea, Caper.—This description of tea is produced near a place called Taishan, in the Canton province, a few miles inland from the city. Here it undergoes only the first process of manipulation; that is, it is fired, rolled, and dried, and the colour fixed, but nothing further is done to it. It is then packed up in mat-bags or baskets and sent down to Canton to be made up in the approved manner, and scented for exportation. On examining this tea at Canton, it has a very rough appearance, and in the state in which it was, seems unsuited for the foreign markets. The workmen in remaking it go to work in the following manner: A convenient quantity, about twenty or thirty pounds, is thrown into the drying-pan, which had been heated for the operation. Here it is sprinkled with a basinful of water, and rapidly turned over with the hands of the workman. The dry leaves immediately imbibe the moisture and become soft and pliable. This softening process prevents them from breaking down into dust, and fits them also to take any form which is considered desirable by the manipulator. The water used on the occasion stands in a large basin adjoining the drying-pans and has a yellow dirty appearance, which Mr. Fortune was rather at a loss to account for. At first sight he thought it was mixed with some ingredient which was intended to give a peculiar tint or colour to the tea, but on inquiry it turned out that his conjecture was wrong. Our guide, on being appealed to for information on the subject, coolly informed us that "there was nothing in the water, it was quite clean, but that the workmen were in the habit of washing their hands in it!" As soon as the leaves had become softened by the moisture and heat in the pan, they were taken out and put into a strong canvas bag, and twisted firmly into a round form, resembling a football. This bag was then thrown down on the floor, which had been covered with a mat, and a man jumped upon it with both feet, supporting himself at the same time by laying hold of a bamboo pole, which had been erected in a horizontal position for the purpose. The heel, sole, and toes of his feet were now kept in perpetual motion, in turning and twisting the ball while the weight of his body compressed it gradually into a smaller size. As the bulk of the ball is thus reduced by pressure, the canvas slackens, and it is necessary for the workman from time to time to jump off it and tighten its mouth by giving it an extra twist with his hands. The balls by this process of rolling and twisting, become at last very hard and solid, and are then thrown on one side, and allowed to be in this state for several hours: if this work has been done in the evening, they remain all night. By this system of pressing, twisting, and rolling, the greater portion of the moist leaves take a circular form, which goes on to perfection during the subsequent drying which the leaves have, of course, to undergo, and ends in the production of the round shot-like appearance by which this kind of tea is known. It is a most curious sight to a stranger who sees the mode of making this tea for the first time. A whole row of these men, nearly naked when the weather is warm, each with a large ball under his feet, which he is twisting and rolling with all his might, is so unexpected a sight in tea-making. The best kind of caper takes the round form naturally during the manufacture of souchong or congou, but only a very small quantity, about five per cent. could be procured in this way. By far the greatest portion of the caper exported is manufactured in the manner just described. But there is another mode of making caper which is scarcely as legitimate as the former. In one corner of the factory he observed a quantity of tea exceedingly coarse in quality, in fact the refuse of that which he had been examining. All the art of the manipulator, in so far as heating and pressing and rolling in the usual way, was not equal to make a good-looking "caper" out of this. The leaves were too old, too large and coarse in their present state. But although there might be some difficulty even to a Chinese in making small leaves into large ones, there was none whatever in making large leaves small, and their mode of doing this was as follows. These coarse leaves were first of all heated and moistened as the others had been, in order to make them soft and pliable. They were then thrown into square boxes and chopped up for some time until the size of the leaves was reduced. When this was accomplished to the satisfaction of the operator, they were then made into nice-looking round "caper" suitable for the market. The origin of the name this tea bears is no doubt from its resemblance in form to the flower buds of the caper-bush of the south of Europe, and yet it is rather a curious coincidence that the greater part of caper tea finds its market in the Cape of Good Hope. His Chinese guide informed him with a peculiar grin on his countenance, that when there is a large demand for green teas, caper is converted into imperial and gunpowder by dyeing it with prussian blue and gypsum. The "orange pekou" of commerce, which is produced in the same district as the caper, is somewhat like congou in make but the leaf is much more wiry and twisted, and is of a lighter complexion. The infusion produced by this tea has a yellow or orange tint, and hence the name of orange pekoe which it bears. Like hyson pekou amongst green teas this is made from the young leaves soon after they unfold themselves in spring, and hence many of the leaves are covered with white hairs which are formed at this season of the year. These hairy leaves are called pekoe ends by the trade. A large quantity of this tea is gathered and dried by itself, while another portion is taken out of that of which the "caper" is ultimately made."

Black Tea.—During the days of the East India Company's Charter all the best black teas were produced in the province of Fokien. The towns of Tsin-tsun and Tsong-gan in the vicinity of the far-famed Woo-e hills were then the chief marts for the best black teas exported by the Company. At that period the districts about Ning-chow, in the Kiangse province, were known only for their green teas. Now, however, and for many years past, although the Fokien black teas are, and have been, largely exported, those produced in the Ning-chou districts have risen in the public estimation, and generally fetch very high prices in the English market. If there be any one now who still clings to the old idea that green teas can be made only from the plant called Thea viridis, and black ones only from Thea bohea, he will find a difficulty in giving credit to the account of the manner in which the Ning-chou districts have changed their green teas into black. Many years ago a spirited Chinese merchant, who no doubt saw well enough that black and green teas could be made easily enough from the same plant, had a crop of black teas made in the Ning-chow district and brought to Canton for sale. This tea was highly approved of by the foreign merchants at that port, and was bought by the great house of Messrs. Dent and Company and sent to England. When it got home it found a ready sale in the market, and at once established itself as a black tea of the first class. Year by year after this the demand for this tea steadily increased and was as regularly supplied by the Chinese. At the present time the Ning-chow districts produced black teas only, while in former days they produced only green. If proof were wanting, this would appear sufficient to show that black or green teas can be made from any variety of the tea plant, and that the change of colour in the manufactured article depends entirely upon the mode of the manipulation.

Brick tea of Thibet.—A sample of this curious product was shown by the East India Company in 1851. It is formed of the refuse tea-leaves and sweepings of the granaries, damped and pressed into a mould, generally with a little bullock's blood. The finer sorts are friable masses, and are packed in papers; the coarser sewn up in sheep's skin. In this form it is an article of commerce throughout Central and Northern Asia and the Himalayan provinces; and is consumed by Mongols, Tartars, and Tibetans, churned with milk, salt, butter, and boiling water, more as a soup than as tea proper. Certain quantities are forced upon the acceptance of the western tributaries of the Chinese Empire in payment for the support of troops, &c.; and is hence, from its convenient size and form, brought into circulation as a coin, over an area greater than that of Europe.

Tea; the varieties manufactured.—Sir John Francis Davis, in his work, "The Chinese," says tea has always held a principal place in our intercourse with China, and that the fineness and dearness of tea are determined by the tenderness and smallness of the leaf when picked. The various descriptions of the black diminish in quality and value as they are gathered later in the season, until they reach the lowest kind, called by us Bohea, and by the Chinese (Ta-cha) 'large tea' on account of the maturity and size of the leaves. The early leaf buds in spring, being covered with a white silky down, are gathered to make pekoe, which is a corruption of the Canton name Pak-ho 'white down.' A few days' longer growth produce what is here styled 'black leaved pekoe.' The more fleshy and matured leaves constitute souchong; as they grow larger and coarser they form congou; and the last and latest picking is bohea. Tea-farmers, who are small proprietors or cultivators, give the tea a rough preparation, and then take it to the contractors, whose business it is to adapt its farther preparation to the existing nature of the demand. The different kinds of tea may be considered in the ascending scale of their value.

1. Bohea, which in England is the name of a quality, is in China the name of a district where various kinds of black tea are produced. The coarse leaf brought under that name to Great Britain is distinguished by containing a larger proportion of the woody fibre than other teas; its infusion is of a darker colour, and as it has been more subjected to the action of fire, it keeps a longer time without becoming musty than the finer sorts. Two kinds of bohea are brought from China: the lowest of these is manufactured on the spot, and there-

fore called "Canton Bohea," being a mixture of refuse Congou with a coarse tea called Woping, the growth of the province. The better kind of Bohea comes from the district of that name in Fokein, and, having been of late esteemed equally with the lower Congou teas, has been packed in the same square chest, while the old Bohea package is of an oblong shape.

2. Congou, the next higher kind, is named from a corruption of the Chinese Koongfoo, 'labour or assiduity.' It formed for many years the bulk of the East India Company's cargoes; but the quality gradually fell off, in consequence of the partial abandonment of the old system of an annual contract, by which the Chinese merchants were assured of a remunerating price for the better sorts. The consumption of Bohea in Great Britain has of late years increased, to the diminution of Congou, and the standard of the latter has been considerably lowered. A particular variety, called Campoi, is so called from a corruption of the general name Kiew-peo, 'Selection—choice;' but it has ceased to be prized in Great Britain, from absence of strength, a characteristic which is stated to be generally esteemed beyond delicacy of flavour.

3. Souchong (Seaou-choong, 'small, or scarce sort') is the finest of the stronger black teas, with a leaf that is generally entire and curly, but more young than in coarser kinds. What is called 'Padre Souchong' is packed in separate paper bundles, of about half a pound each, and is so fine as to be used almost exclusively for presents. The probability is that its use in that way by the Catholic missionaries first gave rise to the name. The finest kinds of Souchong are sometimes scented with the flowers of the Chloranthus inconspicuus, and Gardenia florida; and they cannot be obtained even among the Chinese except at high prices. A highly crisped and curled leaf called Sonchi, has lately grown into disrepute and been much disused, in consequence of being often found to contain a ferruginous dust, which was probably not intended as a fraud, but arose from the nature of the ground, where the tea ha been carelessly and dirtily packed.

4. Pekoe being composed mainly of the young spring-buds, the gathering of these must, of course, be injurious in some degree to the future produce of the shrub, and this description of tea is accordingly both dear and small in quantity. With a view to preserving fineness of flavour, the application of heat is very limited in drying the leaves, and hence it is, that Pekoe is more liable to injury from keeping than any other sort of tea. There is a species of Pekoe made in the Green tea country from the young buds in like manner with the black kind; but it is so little fired that the least damp spoils it; and for this reason, as well as on account of its scarcity and high price, the Hyson-pekoe, as some call it, has never been brought to England. The mandarins send it in very small canisters to each other, or to their friends, as presents, under the name of Loongtsing, which is probably the name of the district where the tea is made.

Green teas may generally be divided into five denominations, which are—1. Twankay; 2. Hyson-skin; 3. Hyson; 4. Gunpowder; 5. young Hyson. Twankay tea has always formed the bulk of the green teas imported into England, being used by the retailers to mix with the finer kinds. The leaf is older and not so much twisted and rolled as in the dearer descriptions: there is altogether less care and trouble bestowed on its preparation. It is, in fact, the Bohea of green teas; and the quantity of it brought to England has fully equalled three-fourths of the whole importation of green. Hyson skin is so named from the original Chinese term, in which connection the skin means the refuse or inferior portion of anything; in allusion, perhaps, to the hide of an animal or the rind of fruit. In preparing the fine tea called Hyson all those leaves that are of a coarser yellow and less twisted or rolled appearance are set apart and sold as the refuse or skin tea at a much inferior price. The whole quantity, therefore, depends on, and bears a proportion to, the whole quantity of Hyson manufactured, but seldom exceeds two or three thousand chests in all. The word Hyson is corrupted from the Chinese name which signifies flourishing spring, this fine sort of tea being of course gathered in the early part of the season. —*Fortune's Wanderings, pages* 219, 220, 221 and 222.

Mr. Williams, writing on the tea plant, says its botanical affinities ally it to the Camellia, and both have the same name among the Chinese; botanists call it Thea, and it is still a matter of dispute whether the different sorts are distinct species or mere varieties. Mr. Fortune found them growing together, and Loureiro, a medical missionary in China, regards all the varieties as ascribable to these causes, though De Candolle divides them into three species, Thea bohea, Thea viridis, and Thea cochinsinensis. The plant is from three to six feet high, and usually presents a dense mass of foliage on an infinite number of small twigs, a result of the practice of cutting it down. In Assam, where it has been found wild, it reaches the height of thirty feet. The leaf is a dark green color, of an oblong oval shape, and the flowers are white, inodorous, and single; the seeds are like hazel-nuts in size and colour, three of them being inclosed in a hard husk, and so oily as to corrupt soon after ripening; this oil is rather acrid and bitter, but is useful for various purposes.

The Chinese names given to the various sorts of tea, the produce of these varieties, are derived for the most part from their appearance or place of growth; the names of many of the best kinds are not commonly known abroad. Bohea is the name of the Wu-i hills (or Bu-i as the people on the spot call them), where the tea is grown, and not a term for a particular sort among the Chinese, though it is applied to a very poor kind of black tea at Canton; Sunglo is likewise a general term for the green teas produced on the hills in Kiangsu. The names of the principal varieties of black tea are as follows: Pecco, "white hairs," so called from the whitish down on the young leaves, is one of the choicest kinds and has a peculiar taste; Orange Pecco, called shang hiang, or "most fragrant," differs from it slightly; Hungmuey, "red plum blossoms," has a slightly reddish tinge; the terms prince's eyebrows, carnation hair, lotus kernel, sparrow's tongue, fir-leaf pattern, dragon's pellet, and dragon's whiskers, are all translations of the native names of different kinds of Souchong or Pecco. Souchong, or sian chung, means little plant or sort, as Pouchong, or folded sort, refers to the mode of packing it; Campoi is corrupted from kan pei, i. e., carefully fired; Chulan is the tea scented with the chulan flower, and applied to some kinds of scented green tea. The names of green teas are less numerous: Gunpowder, or ma hu, i. e., hemp pearl, derives its name from the form into which the leaves are rolled: ta chu, or "great pearl," and chulan, or "pearl flower," denote two kinds of Imperial; Hyson or yu tsien, i. e., before the rains, originally denoted the tenderest leaves of the plant, and is now applied to the young Hyson; as also another name, mei pien, or "plum petals;" while hi chun, "flourishing spring," describes Hyson; Twankay is the name of a stream in Chehkiang, where this sort is produced; and Hyson skin or pi cha, i. e., skin tea, is the poorest kind, the siftings of the other varieties; Oolung, "black dragon," is a kind of black tea with green flavor. Ankoi teas are produced in the district of Nganki, not far from Tsinenchan fu, possessing a peculiar taste, supposed to be owing to the ferruginous nature of the soil. De Guignes speaks of the Pu-'rh tea, from the place in Kiangsu where it grows, and says it is cured from wild plants found there, the infusion is unpleasant, and used for medical purposes. The Mongols and others in the west of China prepare tea by pressing it when fresh into cakes like bricks, and thoroughly drying it in that shape to carry in their wanderings. The poorer natives substitute the leaves of a species of Rhamnus or Fallopia, which they dry; Camellia leaves are perhaps mixed with it, but probably to no great extent. The refuse of packing houses is sold to the poor at a low rate.—*Williams' Meddle Kingdom, Vol.* II, *p.* 135.

Manufacture.—The questions have been often discussed whether black or green teas are made from the same plant, and whether they can be made from each other. Chinese account ascribes the difference in the color of black and green tea wholly to the mode of preparation; green tea is cured more rapidly over the fire than the black, and not dried in baskets afterwards; but throwing the leaf into red hot pans, and subsequently exposing it to the sun and drying it over a covered fire makes it black. Green tea can therefore be changed into black, but the contrary cannot be done, because the leaf is already black. Green tea is made by simply drying the leaves, "young ones over a gentle heat and old ones over a hot fire, for about half an hour or while two incense-sticks can burn out." By this mode more of the essential oil remains in the leaf, and is one reason, perhaps, why a greater proportion of green tea spoils or becomes musty during the long land journey to Canton. The tea cured for home consumption is not as carefully or thoroughly fired as that intended for exportation, and consequently probably retains more of its peculiar properties.

Testing of Tea.—Both kinds are repeatedly tested during the various stages of manufacture by pouring boiling water on a few leaves, to observe the color, aroma, taste, strength and other properties of the infusion. As many as fifteen drawings can be made from the best leaves before the infusion runs off limpid. In the usual manner of Chinese writings ten things are specifically mentioned by the native author to be observed in selecting green tea; such as, that the leaf must be green, firmly rolled, and fleshy; there must be no petioles adhering, no dirty or broken leaves of twigs; and the infusion should be greenish, aromatic, and oily. In selecting all kinds of tea, the color, clearness, taste, and strength of the infusion are the principal criteria; the weight of the parcels, taste and color of the dry leaf, and its smell when strongly breathed upon, are also noticed. Some Ankoi teas are tried by a lodestone to detect the presence of minute particles of iron.

Soil suitable for its Cultivation.—The soil most favourable for the growth of tea is a rich sandy earth, with a large proportion of vegetable mould in it, and situations on the sides of hills, where there is a good exposure and supply of water, produce the best flavoured leaves. The patches above the rice grounds are favorite situations, but the plant is seldom cultivated on the plains or lowlands. A loamy subsoil, with a sandy loose covering, produces a good crop of leaves and in the plantations visited in the Ankoi hills in Fuhkien, much of it is colored with iron. The greater part of the tea exported is grown in the provinces of Fuhkien, Chehkiang, and Kiangsu, but all the eighteen produce it, except in the northern regions lying along the base of the table-land in Chihli and Shansi, though the eastern parts, between the parallels of 25° and 35° north, afford it in the greatest perfection and abundance. With the increased demand its cultivation has extended, and perhaps that of cotton has diminished in a corresponding degree, the southern hills of Fuhkien, the western parts of Kwangtung, and districts in Kwangsi, also afford it for foreign markets. Russia is supplied from Szchuen and the adjoining region, while Birmah gets a part from Yunnan.

Cultivation.—Tea is usually raised by individuals, who cultivate a few dozen or scores of shrubs upon their own lands, and either cure the leaves themselves, or sell them to their neighbours, after assorting them according to their quality. There are very few large plantations under the care of rich landlords, but each little farmer raises tea as he does cotton, silk, or rice upon his own premises. The seeds are thickly planted in nursery beds, because many of them fail from their oily nature, and when the nurslings are a foot or more high they are transplanted into rows about four feet apart; sometimes they are put in the spot designed for them, and if more than one seed in a hole succeeds, it is removed. No preparation of the ground is necessary, nor is much care taken to keep the shrubs in a healthy state; those near Canton are usually covered with lichens, and when thus neglected worms attack the wood. The leaves are picked from the plant when three years old, but it does not attain full size before seven, and thrives according to cir s and care from fifteen to twen being in fact gradually killed by y depriving it of its foliage. Prunin wig to increase the quantity of leaves velops the branches laterally, so that large, healthy shrubs resemble a collection of plants rather than a single bush. The interspaces are frequently sown with vegetables, and the practice is to spread them as much as possible in order to prevent their being shaded. In the Bohea hills, where the best tea is produced, there is, according to the Chinese, considerable difference in the quality of the leaves from gardens not very far apart, and connoisseurs are as particular to inquire the name of the place whence their tea comes as western wine drinkers are to learn the names of the vineyards producing the best brands. The produce of old and celebrated nurseries is carefully connected and cured by itself, and one native authority states that the prices of these particular lots vary from 15 to 100 dollars per pound.

The annual produce of a single plant of large size is said to be from 16 or 18 to 24 ounces; but an English visitor to the Aukoi hills ascertained that the common average yield was not far from six ounces, and that a thousand square yards contained between 300 and 400 plants. Three crops of leaves are gathered during the season. The first picking is about the middle of April, or whenever the tender leaf buds begin to open, and while the leaves are still covered with a whitish down; these, though not very numerous, produce the finest tea, and the notion that some of the delicate sorts of tea are made from the flowers has originated from the whitish appearance this down imparts to them; for no tea can be made from the thin, scentless petals of the tea blossom. The second gathering is about the first of May, when the shrubs are covered with full-sized leaves. Chinese writers say that the weather has great influence upon the condition of the leaves, and that an excess or want of rain mildews or withers them, so as materially to affect the quality and quantity of the crop. When the proper time has arrived, a large number of hands should b employed to gather the leaves rapidly, and at this period the whole population, men, women, and children, find employment. Each person can on an average pick 13 lbs. of leaves in a day, for which the wages are about six cents. The third crop is collected about the middle of July, and there is also a fourth gleaning in August, called tsiu-lu, i. e., autumn dew, from the name of the season in which it takes place; the three previous ones called first, second, and third springs. The two last crops afford only inferior kinds, seldom exported.

Cultivation in China.—The tea shrub is cultivated every where and often in the most inaccessible situations; such as on the summits and ledges of precipitous rocks. Mr. Ball states that chains are said to be used in collecting the leaves of the shrubs growing in such places; and the greatest quantity is grown on level spots on the hill-sides, which have become enriched, to a certain extent, by the vegetable matter and other deposits which have been washed down by the rains from a higher elevation. Very little tea appeared to be cultivated on the more barren spots amongst the hills.

Soil.—The soil of the tea-lands about Woomshan seemed to vary considerably. The most common kind was a brownish-yellow adhesive clay. This clay, when minutely examined, is found to contain a considerable portion of vegetable matter mixed with particles of the rocks above enumerated. In the gardens on the plains at the foot of the hills the soil is of a darker colour, and contains a greater portion of vegetable matter, but generally it is either brownish yellow or reddish yellow. As a general rule the Chinese always prefer land which is moderately rich provided other circumstances are favourable. By far the greatest portion of the tea in this part of the country is cultivated on the sloping sides of the hills. He observed a considerable quantity also in gardens on the level land in a more luxuriant state even than that on the hill-sides ; but these gardens were always a considerable height above the level of the river and were consequently well drained.

Cultivation and management of plantations.—In the black-tea districts as in the green, large quantities of young plants are yearly raised from seeds. These seeds are gathered in the month of October, and kept mixed up with sand and earth during the winter months. In this manner they are kept fresh until spring, when they are sown thickly in some corner of the farm, from which they are afterwards transplanted. When about a year old they are from nine inches to a foot in height, and ready for transplanting. They are planted in rows about four feet apart. Five or six plants are put together in each hole and these little patches are generally about three or four feet from each other in the rows. Sometimes, however, when the soil is poor, as in many parts of Woo-e-shan, they are planted very close in the rows, and have a hedge-like appearance when they are full grown. The young plantations are always made in spring, and are all well watered by the rains which fall at the change of the monsoon in April and May. The damp, moist weather at this season enables the young plants to establish themselves in their new quarters where they require little labour afterwards, except in keeping the ground free from weeds. A plantation of tea, when seen at a distance, looks like a little shrubbery of evergreens. As the traveller treads his way amongst the rocky scenery of Woo-e-shan, he is continually coming upon these plantations, which are dotted upon the sides of all the hills. The leaves are of a rich dark green, and afford a pleasing contrast to the strange and often barren scenery which is every where around. The natives are perfectly aware that the practice of plucking the leaves is very prejudicial to the health of the tea-shrubs, and always take care to have plants in a strong and vigorous condition before they commence gathering. The young plantations are generally allowed to grow unmolested for two or three years, or until they are well established and are producing strong and vigorous shoots : it would be considered very bad management to begin to pluck the leaves until this is the case. Even when the plantations were in full bearing Fortune observed that the natives never took many leaves from the weaker plants, and sometimes passed them altogether in order that their growth might not be checked.

The Tea plant.—Mr. Fortune makes the following observations upon the tea plant itself. It has already been remarked that two tea plants considered to be distinct varieties, are met with in China, both of which have been imported into Europe. One, the Canton variety, is called Thea bohea, the other, the northern variety, is called Thea viridis. The former produces the inferior green and black teas which are made about Canton, and from the latter are made all the fine green teas in the great Hwuy-cho country and in the adjoining provinces. Until a few years back it was generally supposed that the fine black teas of the Bohea hills were also made from the Canton variety, and hence its name. Such, however, is not the case. When he visited Foo-chow-foo for the first time in 1845, he observed that the tea-plant in cultivation in that neighbourhood was very different from the Canton variety, and apparently identical with the Thea viridis of Chekiang. Foo-chow-foo was not a very great distance from the Bohea hills, and he had good reasons for believing that the Bohea plant was the same as the Foo-chow one ; but still he had no positive proof. The tea-plant is multiplied by seed like our hawthorns, and it is perfectly impossible that the produce can be identical in every respect with the parent. Instead therefore of having one or two varieties of tea-plant in China, we have in fact many kinds, although the difference between them may be slight. Add to this, that the seeds of this plant are raised year after year in different climates, and we shall no longer wonder that in the course of time the plants in one district appear slightly different from those of another, although they may have been originally produced from the same stock. For these reasons he is of opinion that the plants of Hwuy-chow and Woo-e are the same species, and that slight differences observed are the results of reproduction and difference of climate. With regard to the Canton plant—both in constitution and habit, it too may have originally sprung from one and the same species.

These changes, however, do not alter the commercial value of those plants found cultivated in the great tea-countries of Fokien and Hwuy-chow, where the finest teas are produced; for, while the tea shrub may have improved in the course of reproduction in these districts, it may have become deteriorated in others. For this reason seeds and plants ought always to be procured from these districts for transmission to other parts of the world where it is desirable to grow tea.

Cultivation at Hwuy-chow.—In the green-tea district of Hwuy-chew, and he believes in all other parts where the shrub is cultivated, it is multiplied by seeds. The seeds are ripe in the month of October. When gathered they are generally put into a basket, and mixed up with sand and earth in a damp state, and in this condition they are kept until the spring. If this plan is not pursued only a small portion of them will germinate. Like the seeds of the oak and chesnut, they are destroyed when exposed to sudden changes in temperature and moisture. In the month of March the seeds are taken out of the basket and placed in the ground. They are generally sown thickly, in rows or in beds, in a nursery, or in some spare corner of the tea-farm, and sometimes the vacancies in the existing plantations are made up by sowing five or six seeds in each vacant space. When the young plants are a year old they are in a fit state for transplanting. This is always done at the change of the monsoon in spring, when fine warm showers are of frequent occurrence. They are planted in rows about four feet apart, and in groups of five or six plants in the row. The distance between each group or patch is generally about four feet. The first crop of leaves is taken from these plants in the third year. When under cultivation they rarely attain a greater height than three or four feet. When the winters are very severe the natives tie straw bands round the bushes to protect them from the frost, and to prevent it and the snow from splitting them.

Tea picking or Tea Harvest.—Mr. Fortune says he made Ayukas temple his head-quarters for several days after the events took place which he has related in the previous chapter. His time was now fully occupied in visiting all the tea farms in the neighbourhood, and in getting information concerning the cultivation and manufacture of tea. It was the harvest-time for the principal crop of the season, and the natives were observed on every hill-side busily engaged in gathering the leaves. These tea gatherers were generally seen in small groups consisting from eight to twelve persons. One old man was usually at the head of each group, the others being women and children. Each had a small stool formed like the letter T, but broad of course at the top, for sitting on while gathering the leaves on the lower sides of the bushes. The foot stool being pointed, it was easily forced into the ground in order to render it steady, and as easily drawn out and carried to a different spot. When these tea gatherers are hired they are not paid by the day, but by the quantity of leaves they bring in to their employers. In making inquiries on the point he found they were paid at the rate of four and five cash a catty, and that they were able to gather from thirty to forty catty a day. In other words, each was able to gather from forty to fifty-three pounds of raw leaves per day, for which was received from 6*d.* to 9*d.*, or thereabouts. But it is only very expert and well trained hands that can make such a sum as this, children and very old people make, of course, something considerably less. Wages of labourers in the tea districts of China range from 2*d.* to 3*d.* per day with their food, which is almost always furnished by the farmers, and which may cost about 3*d.* or 4*d.* more, making the whole day's labour amount to 6*d.* or 7*d.* The food of this people is of the simplest kind—namely, rice, vegetables, and a small portion of animal food, such as fish or pork.

Scenting of Tea.—Having taken a passing glance at all the objects on entering the building, I next, says Fortune, directed attention to the scenting process, which been the main object of my visit, and I shall now endeavour to describe. a corner of the building there lay a large heap of orange-flowers, which filled the air with the most delicious perfume. A man was engaged in sifting them to get out the stamen and other smaller portions of the flower. This process was necessary, in order that the flowers might be readily sifted out of the tea after the scenting had been accomplished. The orange-flowers being fully expanded, the large petals were easily separated from the stamens and smaller ones. In 100 parts 70 per cent. were used and 30 thrown away. When the orange is used, its flowers must be fully expanded, in order to bring out the scent; but flowers of jasmine may be used in the bud, as they will expand and emit their fragrance during the time they are mixed with the tea. When the flowers had been sifted over in the manner described they were ready for use. In the meantime the tea to be scented had been carefully manipulated, and appeared perfectly dried and finished. At this stage of the process it is worthy of observing that, while the tea was perfectly dry, the orange-flowers were just as they had been gathered from the trees. Large quantities of the tea were now mixed up with the flowers, in the proportion of 40 lbs of flowers to 100 lbs. of tea. This dry tea and the undried flowers were allowed to lie mixed together for the space of twenty-four hours. At the end of this time the flowers were sifted out of the tea, and by the repeated sifting and winnowing processes which the tea had afterwards to undergo, they were nearly all got rid of. Sometimes a few stray ones are left in the tea, and may be detected even after it arrives in England. A small portion of tea adheres to the moist flowers when they are sifted out, and this is generally given away to the poor who pick it out with the hand. The flowers, at this part of the process, had impregnated the tea leaves with a large portion of their peculiar odours, but they had also left behind them a certain portion of moisture which it was necessary to expel. This was done by placing the tea once more over slow charcoal-fires in basket sieves prepared for the purpose of drying. The scent communicated by the flowers is very light for some time, but like the fragrance peculiar to the tea leaf itself, comes out after being packed for a week or two. Sometimes this scenting process is repeated when the odour is not considered sufficiently strong, and the head man in the factory informed me he sometimes scented twice with orange-flowers and once with the " Mo-le" (Jasminum sambac). The flowers of various plants are used in scenting by the Chinese, some of which are considered better than others, and some can be had at seasons when others are not procurable. I considered it of some importance to the elucidation of this subject to find out not only the Chinese names of these various plants, but also by examining the plants themselves, to be able to give each the name by which it is known to scientific men in all parts of the world. The following list was prepared with great care, and may be fully relied upon. The numbers prefixed express the relative value of each kind in the eyes of the Chinese, and the asterisks point out those which are mostly used for scenting teas for the foreign markets in the order in which they are valued. Thus the " Mo-le" and the " Sieu-hing" are considered the best and so on :—

1 Rose scented (Tsing moi-qui-hwa).
1 or 2 plum double (Moi-hwa)
2 *Jasminum sambac (Mo-le-hwa)
2 or 3 *Jasminum paniculatum. (Sieu-hing hwa.)
4 *Aglaia odorata, (Lan-hwa-or you-chulan).
5 Olea fragrans (Kwei-hwa).
6 *Orange (Chang-hwa).
7 *Gardenia florida (Pak-sema-hwa).

It has been frequently stated that the Chloranthus is largely used. This appears to be a mistake, originating, no doubt, in the similarity of its Chinese name to that of Aglaia odorata. The Chloranthus is called " Chu-lan," the Aglaia " Lan" or " Yu-chu-lan." The different flowers which I have just named are not all used in the same proportion. Thus of orange flowers there are 40 lbs to 100 lbs. of tea ; of Aglaia there are 100 lbs to 150 lbs ; and of Jasminum sambac there are 50 lbs. to 100 lbs. The flowers of the Sieu-hing (Jasminum paniculatum) are generally mixed with those of the mo-le (Jasminum sambac) in the proportion of 10 lbs. of the former to 30 lbs. of the latter, and the 40 lbs. thus produced are sufficient for 100 lbs. of tea. The " Kwei-hwa" (Olea fragrans) is used chiefly in the northern districts as a scent for a rare and expensive kind of Hyson Pekoe—a tea which forms a most delicious and refreshing beverage when taken a la Chinoise without sugar and milk. The quantity of flowers used seemed to be very large ; and I made particular inquiries as to whether the teas that are scented were mixed up with large quantities of unscented kinds. The Chinese unhesitatingly affirmed that such was not the case, but, notwithstanding their assertions, I, he says, had some doubts on this point. The length of time which teas thus scented retain the scent is most remarkable. It varies, however, with the different sorts. Thus the Olea fragrans tea will only keep well for one year, at the end of two years it has either become scentless, or has a peculiar oily odour which is disagreeable. Teas scented with orange blossoms and with those of the Mo-le will keep well for two or three years, and the Sieu hing kinds for three or four years. The Aglaia retains the scent longer than any, and is said to preserve well for five or six years. The tea scented with the Sieu hing is said to be most esteemed by foreigners, although it is put down as second or third rate by the Chinese. Scented teas for the foreign market are nearly all made in Canton and are known to merchants by the names of " scented Orange," " Pekoe," and " scented Caper." They are grown in and near a place called Tashan, in the Canton province. Mr. Walkinshaw informed him that other descriptions of tea, both black and green, have been scented for the English market, but have been found unsuitable. True caper is to black tea what the kinds called "imperial" and "gunpowder" are to green: it assumes a round, short looking form during the process of manipulation, and it is easily separated from the other leaves by sifting or by the winnowing machine. It is a common error to suppose that "imperial" or "gunpowder" amongst green teas, or "caper" amongst black ones, is prepared by rolling each leaf singly by the hand. Such a method of manipulation would make them much more expensive than they are. One gathering of tea is said to yield 70 per cent. of orange pekoe, 25 of souchong, and 5 of caper. The quantity of true caper would therefore appear to be very small; but there are many ways of increasing the quantity by peculiar modes of manipulation, as I shall afterwards show. In a large factory, such as at Canton, there is, of course, a considerable quantity of dust and refuse tea remaining after the orange pekoe, caper, and souchong have been sifted out of it. This is sold in the country to the natives at a low price, and no doubt is often made up with paste and other ingredients into those lie teas which now-a-days find a market in England. Nothing is lost or thrown away in China. The stalks and yellow leaves which have been picked out by women and children are sold in the country; while the flowers which have done their duty in the scenting process are given to the poor, who pick out the few remaining tea-leaves which had been left by the sieve or winnowing machine. Some flowers, such as those of the Aglaia for example, after being sifted out from the tea, are dried and used in the manufacture of the "fragrant Joss-stick," so much used in the religious ceremonies of the country. It appears from these investigations that many kinds of fragrant flowers besides those used by the Chinese would answer the purpose equally well, and therefore in places like India, where tea is likely to be produced upon an extensive scale, experiments in scenting might be made with any kinds of fragrant jasmines, daphnes, aurantiaceous or other plants of a like kind indigenous to the country. It will be observed from the description just given that the method of scenting teas, like most of the arts in China, is exceedingly simple in its nature and most efficient. It used to be said by those who knew nothing about the matter, that "the flowers were put over a slow fire, with the tea in a separate basket above them, and so the fire drove the scent from the flowers into the tea." Knowing the immense capacity which dry tea has for moisture of any kind, how much more simple and beautiful is the process of allowing it to lie for a space of time mixed up with undried flowers! A few years ago was published a description of the Chinese mode of yielding green teas to suit the depraved tastes in Europe, and particularly in America, where they are largely consumed. Scenting teas is a very different thing, and nothing can be urged against the taste for them. That this is so in the eyes of the Chinese may be gathered from the fact that, while they dye their teas, not to drink, but only to sell, they consume and highly appreciate these scented ones. The price paid for flowers used in the scenting process varies,like everything else according to the demand or supply in the market. In 1854 and 1855, it was about seventeen dollars per pecul, but sometimes as much as thirty dollars are paid for the same quantity. In former years, about the year 1840, as much as sixty dollars per pecul used to be paid for flowers. This information was given me, he says, some time after I had been examining the method of scenting in the Honan factory, and by another manufacturer, and confirmed me in the opinion I had then formed, namely, that after the tea is once scented with the proportions of flowers mentioned above, it is mixed up with large quantities of unscented tea. Were this not so, the large quantity of flowers used would render the tea much more expensive than it really is. Upon making further inquiries, of different individuals and at different times, I found, says he, that my surmises were correct. The results of the information thus obtained were, that sixty pounds of this highly-scented mixture were capable of scenting one hundred pounds of unscented tea, and no doubt it is sometimes used in even smaller proportions. The kinds called "Caper" and Orange Pekoe are quite different in appearance from teas made in the great black-tea provinces of Fokien and Kiang-si as large quantities of these teas—indeed, the whole which are exported—are made up near Canton.

Tea is well known to the natives of Lahore and Cashmere; but the latter are the more fond of tea, and prefer the Thibetan product to the English or even Chinese, notwithstanding the absence of aroma and perfume. The Bokharians and Russians are also fond of tea, and use generally the genuine Chinese production. The former make a soup of tea, by boiling the leaves, and then adding milk, salt and butter; a great cupful of this with bread, forms their daily breakfast. Both Russians and Bokharians drink tea generally without sugar, and chew the leaves afterwards, so that nothing is lost.

Adulterations.—Before noticing these, Dr. Hassall repeats some of the information previously given. He tells us that the tea plant is a hardy evergreen and leafy shrub which attains the height of from three to six feet and upwards. It belongs to the natural family Columniferæ (Ternstrœmiaceæ of Lindley,) which includes the Camellias. It is generally propagated from seed and the plant comes to maturity in from two to three years, yielding in the course of the season three and in some cases four crops of leaves. The first gathering takes place very early in the spring, a second in the beginning of May, a third about the middle of June, and a fourth in August. The leaves of the first gathering are the most valuable, and from these Pekoe tea, which consists of the young leaf buds as well as black teas of the highest quality, are prepared. Those of the last gathering are large and old leaves and consequently inferior in flavour and value. The leaves vary considerably in size and form ; the youngest leaves are narrow convoluted and downy ; the next in age and size have their edges delicately serrated with the venation scarcely perceptible : in those of medium and large sizes the venation is well marked, a series of characteristic loops being formed along each marginof the leaf, and the serrations are stronger and deeper and placed at greater intervals.

Varieties of Tea.—The principal varieties of black tea are Bohea, which is of the commonest and coarsest description, Congou, Souchong, Caper, and Padry Souchong and Pekoe, which are of the highest quality, the last consisting of the very young and unexpanded leaves, and which when clothed with down constitute flowery Pekoe.

The principal varieties of green tea are Twankay, Hyson-skin, young Hyson, Hyson Imperial, and Gunpowder, which in green tea corresponds with flowery Pekoe in black. Imperial Hyson, and young Hyson consist of the second and third gatherings, while the light and inferior leaves,separated from Hyson by a winnowing machine, constitute Hyson-skin, a variety in considerable demandamongst the Americans.

Tea plant.—There is according to most writers but one species of the tea-plant from which the whole of the above and many other varieties of tea are obtained, the differences depending upon oil, climate, weather, age of the leaves, and mode of preparation. The plants from which black teas are prepared are grown chiefly on the slopes of hills and ledges of mountains, while the green tea-shrubs are cultivated in manured soil. Upon this circumstance many of the differences between the two varieties depend. Other differences are occasioned by the processes adopted in the preparation and roasting of the leaves. Thus while black tea is first roasted in a shallow iron vessel called a "kuo," and secondly in sieves over a bright charcoal fire, green-tea does not undergo the second method of roasting but only the first that in the "kuo."

An important part of the manufacture of tea consists in the rolling the leaves, so as to impart to them their characteristic twisted shape. This is effected by subjecting the leaves to pressure and rolling by the hands in a particular manner. The first effect of the application of heat to the leaves in the Kuo is to render them soft and flaccid. When in this state, they are removed from the vessel and submitted to the first rolling, an operation which, after the renewed action of the Kuo on each occasion, is three or four times repeated with superior teas before the process is considered to be complete.

Scenting of Tea.—The following observations on the scenting of tea are extracted from Mr. Ball's " Account of the Cultivation and Manufacture of Tea in China."

The Chinese seem universally to agree in ancient as in modern times that no factitious scent can be given to tea which at all equals its natural fragrance : in short they say that only common tea requires scenting. Those persons who have had the opportunity of drinking some of the finest kinds of Souchong tea will perhaps agree with the Chinese in these opinions. There are however many scented teas which so far from being inferior are even costly and much esteemed both in China and in Europe. Of these the Chu Lan, or Cowslip Hyson, may be considered the best. " The tea about to be scented must be taken hot from the last roasting (which immediately precedes the packing, and poured into a Hyson chest so as to form a layer of two inches in height from the bottom, a handful or more of the fresh flowers (already separated from the stalks) is then strewed over the tea. In this manner the tea and flowers are placed in layers until the chest is quite full. The mouth of the canister is then closed and thus the tea remains for twenty-four hours. The proper proportion is three catties of flower to one hundred catties of tea. The next day the the chest is emptied when the tea and flowers are mixed together, they then undergo the process of " Poey," about three catties being put into one sieve. The Poey Song is completely closed that the tea and flowers are thus roasted about from one to two hours or rather until the flowers become crisp. The flowers are then sifted out and the tea packed. If the tea require any further scenting, fresh flowers must be used and the process repeated as before. The tea thus prepared is then mixed with other tea in the proportion of one part of scented tea to twenty of plain. The whole is then slightly heated in a kuo (chao), and when packed constitutes the description of tea denominated in England Cowslip Hyson. Tea may be scented at any time with this kind of tea, but it must be previously heated or roasted about two hours. " The mode of scenting black tea differs from that of green, and so far as is understood, there are two or three methods of performing this process. The Souchong or Caper teas, the Tetsiong and other teas of the Cowslip flavour, are also scented with the Chu Lan flower, Chloranthus inconspicuus. " After gathering, the flowers are separated from the stalk as before when some people dry them in the sun : but the best mode is to dry them in a Poey Song over a slow fire, taking care not to change the yellow colour of the petals. When dried they are put aside to cool and are afterwards reduced to powder. If this powder, the scent of which is very powerful, be sprinkled over the leaves previously to the last or two last roastings and rollings in the process of Poey, the tea will be highly scented, but this is an expensive mode, on account of the additional quantity of flowers required, and therefore is seldom practised. The usual mode is by sprinkling a small quantity of this powder over the tea during the last process of Poey, which takes place previous to packing. A small white powder frequently found in black teas of the caper flavour, cannot have escaped the observation of the tea dealer in England ; this powder is that of the Chu Lan flower, whose colour has been changed to white in the process of Poey. There is another scented tea of excellent flavour, which is made in small quantities and occasionally sent to foreigners as presents. This is a Souchong tea, scented with the flower of the 'Pae sheem' (Gardenia florida.) There are two other scented teas, also of fine flavour, both Souchong teas, the one scented with the Quy-fa, or Kuey-hoe (Olea fragrans) and the other with the Moo-Ly-Hoa (Jasminum sambac). Some people say that the three last tea are mixed with the flowers, as the Hyson tea is mixed with the Chu Lan and are scented in the same manner. But others say that two sieves are placed in the Poey Song, the lower one containing the flowers and the upper one the tea. The latter is the mode in which the Pae Sheem tea to which I have previously alluded is scented. These are all the flowers with which I am acquainted which are employed to scent tea, but in the Keun Fang Pu, and Quang Tong Chy, or Canton Geographical History, many others are enumerated as eligible for that purpose. These works also observe that flowers so used should be full blown." McCulloch, in his " Commercial Dictionary," draws an interesting parallel between the vine and the tea plant. " Considered as an object of agricultural produce, the tea plant bears a close resemblance to the vine. In the husbandry of China it may be said to take the same place which the vine occupies in the southern countries of Europe. Like the latter its growth is chiefly confined to hilly tracts not suited to the growth of corn. The soils capable of producing the finest kinds are within given districts limited and partial. Skill and care both in husbandry and preparation are quite as necessary to the production of good tea as to that of good wine. The best wine is produced only in particular latitudes as is the best tea, although perhaps the latter is not restricted to an equal degree. Only the civilised nations of Europe have as yet succeeded in producing good wines, which is also the case in the East with tea, for the agricultural and manufacturing skill and industry of the Chinese are there unquestionably pre-eminent. These circumstances deserve to be attended to in estimating the difficulties which must be encountered in any attempt to propagate the tea-plant in colonial and other possessions. These difficulties are obviously very great and perhaps all but insuperable. Most of the attempts hitherto made to raise it in foreign countries were not indeed of a sort from which much was to be expected. Within the last few years, however, considerable efforts have been made by the Dutch government of Java to produce tea on the hills of that island, and having the assistance of Chinese cultivators from Fokien, who form a considerable part of the emigrants to Java, a degree of success has attended them beyond what might have been expected in so warm a climate. The Brazilians have made similar efforts, having also, with the assistance of Chinese labourers, attempted to propagate the tea shrub near Rio de Janeiro, and a small quantity of tolerably good tea has been produced; but owing to the high price of labour in America, and the quantity required in the cultivation and manipulation of tea, there is no probability, even were the soil suitable to the plant, that its culture can be profitably carried on in that country. It may perhaps succeed in Assam, where its culture is now being attempted, for labour is there comparatively cheap, and the hilly and table lands are said to bear a close resemblance to those of the tea districts of China ; but we are not sanguine in our expectation as to the result." " All the black teas" says McCulloch, "exported (with the exception of a part of the Bohea grown in Woping, a district of Canton) are grown in Fokien, a hilly, maritime, populous and industrious province, bordering to the north east on Canton. Owing to the peculiar nature of the Chinese laws as to inheritance, and probably, also, in some degree to the despotic genius of the government, landed property is much sub-divided throughout the empire, so that tea is generally grown in gardens or plantations of no great extent. The leaves are picked by the cultivator's family and immediately conveyed to market, where a class of persons who make it their particular business purchase and collect them in quantities and manufacture them, in part, that is, expose them to be dried under a shed. A second class of persons commonly known in the Canton market as the tea merchants, repair to the districts where the tea is produced and purchase it in its half prepared state from the first class and complete the manufacture by garbling the different quantities, in which operation women and children are chiefly employed. A final drying is then given and the tea packed in chests and divided according to quality in parcels of from 100 to 600 chests each. These parcels are stamped with the name of the district grower, or manufacturer, exactly as is practised with the wines of Bordeaux and Burgundy, the indigo of Bengal and many other commodities; and from this circumstance get the name of chops, the Chinese term for a seal or signet." "The greater part of the tea is brought to Canton by land carriage, or inland navigation, but chiefly by the first, it is conveyed by porters, the roads of China in the southern provinces not generally admitting of wheel carriages, and beasts of burden being very rare. A small quantity of black tea is brought by sea, but probably smuggled, for this cheaper mode of transportation is discouraged by government, which it deprives of the transit duties levied on inland carriage. The length of land-carriage from the principal districts where the green teas are grown to Canton, is probably not less than 700 miles; nor that of the black tea over a mountainous country, less than 200 miles. The tea-merchants begin to arrive in Canton about the middle of October, and the busy season continues until the beginning of March, being briskest in November, December and January." There is another particular to which the comparison between the vine and tea plant made by Mr. McCulloch may be extended, namely, the not less general use of the infusion made from the leaves of the tea plant by the people of various nations of both the old and new worlds. In China, as appears from the following extract, tea is the common beverage of the people. The late Sir George Staunton informs us that "tea, like beer in England, is sold in public-houses, in every town, and along public roads and the banks of rivers and canals, nor is it unusual for the burdened and weary traveller to lay down his load, refresh himself with a cup of warm tea, and then pursue his journey." The wealthy Chinese simply infuse the leaves in an elegant porcelain cup, which has a cover of the same material; the leaves sink to the bottom of the cup, and generally remain there without inconvenience, though occasionally some may float or rise to the surface. To prevent this inconvenience sometimes a thin piece of silver, of filagree, or open work, is placed immediately on them. Where economy is necessary to be studied the teapot is used. The wealthy Japanese continue the ancient mode of grinding the leaves to powder; and after infusion in a cup, it is whipped with a split bamboo, or denticulated instrument, till it creams, when they drink both the infusion and powder, as coffee is used in many parts of Asia.

Analysis of Tea.—The infusion made from tea contains gum, glucose or saccharine matter, a large quantity of tannin, and a peculiar nitrogenised principle called theine; this is identical with caffein, and upon its presence many of the properties of tea depend. The amount of gum and tannin contained in a given sample of tea afford data by which its quality may to some extent be determined

Properties of Tea.—Lo Yu, a learned Chinese, who lived in the dynasty of Tang, A. D. 618 to 906, gives the following agreeable account of the qualities and effects of the infusion of the leaves of the tea plant.

"It tempers the spirit and harmonises the mind; dispels lassitude and relieves fatigue; awakens thought and prevents drowsiness; lightens or refreshes the body and clears the perceptive faculties." In Pereira's "Materia Medica" we find the following remarks relating to the properties of tea:—Its astringency is proved by its chemical properties. Another quality possessed especially by green tea, is that of diminishing the tendency to sleep. Tea appears to possess a sedative influence with regard to the vascular system. Strong green tea taken in large quantities, is capable in some constitutions of producing a most distressing feeling and of operating as a narcotic.

Adulteration of Tea. On the Use and Detection of Leaves other than those of the Tea plant.— It has been stated that the Chinese not unfrequently make use of the leaves of other plants besides those of tea, and in particular the leaves of Camellia sasanqua and Chloranthus inconspicuus.

La Veno Beno.—This is an article which may be noticed in this place, being now very commonly sold under the above attractive title, to mix with tea. La Veno Beno consists of a coarse powder, of a reddish brown colour, intermixed with small fragments of a leaf which is stated to be that of sumach ; to the taste the powder is astringent and bitter, and on analysis, it is ascertained to be composed in great part of coarsely powdered catechu.

Chinese Botanical Powder.—Like La Veno Beno, it is put up in packages, and sold at the same price ; it consists of a coarse powder, of a reddish-brown colour and astringent taste, and is made up of a mixture of catechu and wheat flour, the latter ingredient being added to reduce the strength of the catechu. Its use is open to the same objections, sanitary and others, as La Veno Beno.

From a consideration of the analysis of tea made by Dr. Hassall it appears

1st. That not one of thirty-five samples of black tea, as imported into England, contained any other leaf than that of the tea-plant.

2nd. That out of the above number of samples, twenty-three were genuine and twelve adulterated. The genuine teas were the Congous and Souchongs, &c., and the adulterated teas samples of scented Pekoe and scented Caper Chulan or black gunpowder, as well as imitations of these made from tea-dust.

3rd. That the adulterations detected consisted in facing, so as to improve the appearance of the teas, the surfaces of the leaves with black lead, an iridescent powder resembling mica, indigo, and turmeric, and in the manufacture of imitation tea out of tea dust, sand, &c.

The second table which he framed affords conclusive evidence

1st. That fabrication of spurious black tea was extensively carried on at that time in the British metropolis and in other towns of that kingdom.

2nd. That two processes of fabrication were adopted. In the first, the exhausted tea-leaves are made up with gum, and re-dried ; black lead, and the mica-like powder, rose-pink, and carbonate of lime being sometimes added to bloom or face the leaves as well as sulphate of iron to darken the colour of the leaves and to give astringency. In the second, leaves other than those of tea (the kind matters but little) are used. These, after being dried, are broken down mixed with gum, catechu and made into a paste ; the leaves are then re-dried and further broken down, and sometimes coated with gum. The spurious tea made from exhausted leaves is seldom sold alone, but is used either for mixing with genuine black, or is converted into green tea, in the manner to be described hereafter ; while that made from British leaves and catechu is either mixed with black tea in the form of dust, or else is faced and bloomed until it is made to resemble green tea.

From the third table it appears

1st. That out of twenty-four samples of black tea purchased of tea dealers and grocers resident in the British metropolis, twenty were genuine and four adulterated, the former being Congous and Souchongs, and the latter samples of scented Pekoe and scented Caper. It thus appears, that while the great bulk of the black tea used in England—viz., Congou and Souchong—as delivered to the consumer, is in a genuine state, the scented teas—viz., the Pekoes and Capers—are invariably adulterated. Lastly, that from the extensive fabricat.on of spruious black tea in Great Britain, it is necessary that the purchaser should be constantly on his guard.

Adulteration by artificial colouring in China.—The superintendent of the workmen managed the colouring part of the process himself. Having procured a portion of Prussian blue, he threw it into a porcelain bowl, not unlike a chemist's mortar, and crushed it into a very fine powder. At the same time a quantity of gypsum was produced and burned in the charcoal fires which were then roasting the teas. The object of this was to soften it in order that it might be readily pounded into a very fine powder in the same manner as the Prussian blue had been. The gypsum, having been taken out of the fire after a certain time had elapsed, readily crumbled down and was reduced to powder in the mortar. These two substances, having been thus prepared, were then mixed together in the proportion of four parts of gypsum to three parts of Prussian blue, and formed a light blue powder, which was then ready for use. This colouring matter was applied to the teas during the last process of roasting. About five minutes before the tea was removed from the pans—the time being regulated by the burning of a joss-stick, the superintendent took a small porcelain spoon, and with it he scattered a portion of the colouring matter over the leaves in each pan. The workmen then turned the leaves rapidly round with both hands, in order that the colour might be equally diffused. One day an English gentleman in Shanghae, being in conversation with some Chinese from the green-tea country, asked them what reasons they had for dyeing the tea, and whether it would not be better without undergoing this process. They acknowledged that tea was much better when prepared without having any such ingredients mixed with it, and that they never drank dyed teas themselves, but justly remarked that, as foreigners seem to prefer having a mixture of Prussian blue and gypsum with their tea, to make it look uniform and pretty, and as these ingredients were cheap enough, the Chinese had no objection to supply them, especially as such teas always fetched a higher price. Mr. R. Fortune took some trouble to ascertain precisely the quantity of colouring matter used in the process of dyeing green teas,not certainly with the view of assisting others, either at home or abroad, in the art of colouring, but simply to show green tea drinkers in England, and more particularly in the United States of America, what quantity of Prussian blue and gypsum they imbibe in the course of one year. To 4½ lbs. of tea were applied 8 mace 2½ candareens of colouring matter, or rather more than an ounce. In every hundred pounds of coloured green tea consumed in England or America, the consumer actually drinks more than half a pound of Prussian blue and gypsum. And yet tell the drinkers of this coloured tea that the Chinese eat cats, dogs, and rats, and they will hold up their hands in amazement, and pity the poor celestials. Two kinds of Prussian blue are used by the tea manufacturers—one is the kind commonly met with, the other is to be seen only in the north of China. It is less heavy than common Prussian blue, of a bright pale tint and very beautiful. Turmeric root is frequently employed in Canton, but I did not observe it in use in Hwy-chow. I procured samples of these ingredients from the Chinamen in the factory, in order that there might be no mistake as to what they really were. These were sent home to the Great Exhibition of 1851, and a portion of them submitted to Mr. Warrington, of Apothecaries' Hall, whose investigations in connexion with this subject are well known. In a paper read by him before the Chemical Society, and published in its "Memoirs and Proceedings," he says, " Mr. Fortune has forwarded from the north of China, for the Industrial Exhibition, specimens of these materials (tea dyes,) which, from their appearance there can be no hesitation in stating are fibrous gypsum (calcined), turmeric root, and Prussian blue ; the latter of a bright pale tint, most likely from admixture with alumina or porcelain clay, which admixture may account for the alumina and silica found as stated in my previous paper, and the presence of which was then attributed possibly to the employment of Kaolin or agalmatolite"

Green tea and its Adulterations.—According to most writers, there is but one species of tea plant from whicht he whole of the numerous varieties of both black and green are obtained, the differences in colour, quality, &c., resulting from soil, climate, age of the leaves and mode of preparation. We have already pointed out in a very brief manner the principal difference in the cultivation and preparation of black and green teas. The plants from which black teas are prepared are grown chiefly on the slopes of hills and ledges of mountains, the leaves are obtained in three and in some cases even four gatherings, those of medium size and age being chiefly used for the great bulk of the black tea, viz. the congous and souchongs. They are dried either under covered sheds open at the sides, which is the best method, or else by exposure to the sun. This process is a somewhat lengthened one, and during it a degree of fermentation is set up which is intimately associated with the colour, scent and flower of the leaves. Lastly, the leaves are subjected to a double process of roasting, first in a shallow iron pan termed a kuo, an operation which is repeated two or three times as may be necessary, and second in sieves called "poey long" over a bright charcoal fire. The shrubs which furnish the leaves from which green tea is prepared are cultivated in manured or garden soils, the leaves are greener, more tender, and juicy, and two gatherings of them only are made, the first begins between the 20th of April and the 5th of May, and lasts for about ten or fifteen days, and the second at the summer solstice. After gathering, the leaves should be dried and roasted as soon as possible, in fact the same day, that is, before the slightest fermentation has had time to set in, all exposure to the air being unnecessary and to the sun injurious. During the roasting, which is repeated once or twice in the "kuo," only the second method, viz., that in the poey long, not being practised, the leaves are at the same time fanned to hasten the drying by dissipating the moisture which rises during the operation. The principal varieties of green tea are Twankay, an inferior description of Hyson, young Hyson ; Hyson Skin, Gunpowder and Imperial ; all these, except the Twankay, are obtained from unsorted Hyson or Mao Cha in the manner described by Mr. Ball.

In the analysis of black tea, several substances were found to be employed either for the purposes of facing and colouring the surface of the leaves or to impart a stringency to the exhausted leaves. The substances ascertained were

Starch,
Gum,
Catechu,
Sulphate of Iron,
Rose Pink,
Log wood,

Black Lead,
Talc,
China Clay,
Soap Stone,
Indigo,
Turmeric.

In addition to the above it has been ascertained that many other substances are employed. The colours used in the facing of green tea are usually three, yellow, blue, and white. The yellow and blue colours, when mixed, form a green, and white is added, either to lessen the intensity of the former colours, or else to give polish to the surface of the leaves. The following is a recapitulation of the more important results arrived at by Dr. Hassal in the course of his investigations. The chief points ascertained with regard to Black tea are—

1st. That the principal black teas, namely, the Congous and Souchongs, arrive in England, for the most part, in a genuine state.

2nd. That certain descriptions of black tea, as scented Orange, Pekoe and Caper, are invariably adulterated, the adulteration in general consisting in the glazing of the leaves with plumbago or black lead; the Caper likewise being subject to admixture with other substances; as paddy husk, Lie tea and leaves other than those of tea.

3rd. That several varieties of a spurious Caper, or black gunpowder, are prepared, which consist of tea dust, and sometimes the dust of other leaves and sand made up into little masses with gum, and faced or glazed with plumbago, Prussian blue, and turmeric powder. In some cases these imitations are sold separately, but most frequently they are used to mix with, and adulterate the better qualities of Caper; viz., those which are made of tea faced with plumbago only. With respect to green tea, the principal conclusions are—

1st. That these teas, with the exception of a few of British growth and manufacture from Assam, are invariably adulterated, that is to say, are glazed with colouring matters of different kinds.

2nd. That the colouring matters used are in general Prussian blue, turmeric powder, and China clay, other ingredients being sometimes but not frequently employed.

3rd. That of these colouring matters, Prussian blue, or ferro-cyanide of iron, possesses properties calculated to affect health injuriously.

4th. That in Great Britain, there is really no such thing as a green tea—that is, a tea which possesses a natural green hue.

5th. That green teas, and more especially the gunpowders, in addition to being faced and glazed, are more subject to adulteration in other ways than black teas, as by admixture with leaves, not those of tea, with paddy-husk, and particularly with Lie tea.

6th. Lie tea is prepared so as to resemble green tea, and is extensively used by the Chinese themselves to adulterate gunpowder tea; it is also sent over to Great Britain in vast quantities, and is employed for the same purpose by English tea-dealers and grocers.

The above are the more important conclusions as to the condition of black and green teas, as imported, but these articles undergo further deterioration in Great Britain.

Thus evidence has been adduced to show,

1. That exhausted tea leaves are frequently made up with gum, &c., and resold to the public as genuine black tea, and, when artificially coloured and glazed, even as green tea.

2. That the substances employed in the colouring are in many cases very much more objectionable and injurious than those used by the Chinese, being often highly poisonous.

3. That it is no uncommon thing for tea, both black and green, to be fabricated from leaves not those of tea, and possessing no properties in common with the leaves of that plant.

4. That black Lie tea is often coloured and extensively employed by English dealers and grocers for the adulteration of green tea.

Shevaroy Hills, Madras.—The experiment of growing tea in the Madras Presidency has been often tried on a small scale. A number of plants supplied by Government through Dr. Wallich, were planted in the Shevaroy hills about the year 1844, and had thriven well: but though no doubt was entertained of the ease with which they could be propagated over a wide extent of country, no attempt was made to give the cultivation a practical turn, or to make a cup of tea from the southern India tree.

Coorg.—In Coorg, too, the experiment has been tested with like results, so that sufficient warranty exists to justify trials on the largest scale.

Java.—The Dutch have introduced the tea plant in their rich and fruitful colony of Java. That island lies between the sixth and eighth degrees of south latitude. In 1828, the first experiment in the cultivation of tea was made in the garden of the Chateau of Burtenzorg, at Java, where 800 plants of an astonishing vigor, served as an encouragement to undertake this culture, and considerable plantations were made in many parts of the island. The first trials did not answer to the expectations, as far as regards the quality of the article, the astringent taste and feeble aroma of which caused the conjecture that the preparation of the leaf, and its final manipulation, had not been exactly according to the process used in China. At present tea is cultivated in thirteen Residencies; but the principal establishment, where the final manipulation is made, is in the neighbourhood of Batavia. The tea which Java now furnishes yearly to the markets of the mother country, may be stated at from 200,000 to 300,000 pounds. It is intimated that the Government intends to abandon this culture to the industry of private individuals, under the guarantee of equitable contracts. The mountain range, which runs through the centre of the island, is the most productive, because the tea gardens, extending from near the base high up the mountains, reach an atmosphere tempered by elevation. The plant escapes the scorching heats of the torrid zone, and finds a climate by height rather than by latitude, adapted to its nature. But the plant is not confined to lofty ridges. In the plains, the hedges and fences, if one may so call them, are all planted with the tea shrub, which flourish in greater or less perfection throughout the island. But, as has already been intimated, the equatorial latitudes are not the most auspicious for the vigorous growth of a plant that requires a temperature equally removed from the extremes of heat and cold, and the quality of the tea is as much affected by the climate as the growth of the plant. A considerable quantity of tea is annually shipped from Java to Europe ; but the extension of the cultivation is no doubt checked by the exceeding fertility of the soil, and its adaptation to the growth of the rich products of tropical regions. Mr. Jacobson, inspector of tea culture in Java, has published at Batavia a work in three volumes, upon the mode of cultivating this plant, upon the choice of grounds, and the best processes for the preparation and manipulation of the leaves. This book, the fruit of many years of experience and care given to the subject, was well received by the cultivators who devote themselves to this branch of industry.

Tea grows on the Himalayas at an elevation of seven thousand feet above the level of the sea, in the valley of the Dhoon, at the base of the Himalayas, an elevation of two thousand feet, on the banks of the Brahmapootra in Assam, and the Soorma in Sylhet, at a very small elevation above the level of the sea. On hill or plain, from one thousand to eight thousand feet above the level of the sea, the tea plant thrives well, and the only condition that it appears to require is a light and porous soil. In India the tea plant flourishes from the confines of Affghanistan to the borders of Burmah, from the 25th to the 33rd degree of latitude, and from the 70th to the 95th degree of longitude. Over this vast area, wherever tea has been planted, it has more than answered the expectations of growers. The tea plant does not yield leaves fit for the manufacture of tea until the third year ; it increases yearly its produce until the eighth or tenth year, at which time it attains its maximum. It has been found indigenous in Assam and Cachar, aged, it is averred, sixty and seventy years, and still producing leaves of an excellent quality. A tea plantation may be compared to an English orchard,—a property producing an income during the life-time of the planter and passing to his descendants. From a series of experiments made in the hills and the Deyrah Dhoon, full grown plants yield tea in the proportion of 20 pounds to the 100 plants. An acre of land contains from 1,500 to 1,600 plants : the yield of tea would therefore be from 300 to 320 pounds.

In China plants are never touched until the third or fourth year after they have been planted. Good tea land is naturally moist, although not stagnant ; the tea-shrub is not a water plant, but is found in a wild state on the sides of hills. In China, rain falls in heavy and copious showers towards the end of April, and these rains continue at intervals in May and June. The first gathering of tea leaves, those from which the Pekoe is made, is scarcely over before the air becomes charged with moisture. The best mode of sending tea plants to a remote distance, is simply to sow the seeds in Ward's cases soon after they are gathered.—*The Universal Review. Fortune's Wanderings. Fortune's Tea Districts. Hassall's Food and its Adulterations.*

TEA-HEIH-TOO-SHWO. Chow-tsze was the originator of the second epoch of philosophical development in China. To him is ascribed the merit of having revived that distinct knowledge of the greatest truths which had been lost to the world for the thirteen centuries that had elapsed after the death of Mencius. And he regained that knowledge by the independent efforts of his own mind, unaided by any master. Only two of his works have been preserved, the Tea-heih-too-shwo and the Tungshat. He died in A. D. 1200 ; and in A. D. 1241, an Imperial rescript ordered his tablet, with those of four of his immediate predecessors, whose works he had annotated, to be placed in the temples of Confucius, which are to be found in every district city throughout the empire. From that time to this, a period of six hundred years, his views of philosophy, morality, and politics have been supreme in China. At this day, his commentaries on the Yih King and the Four Books are learnt by heart by millions of Chinese, with the text of these works. The Public Service Examinations cannot be passed unless this be done.

TEAK.

Sagwâu	HINDU.	Teak marum	TAM.
Jati	MALAY.	Teku chettu	TEL.

The far famed teak tree is a native of the mountainous parts of Malabar, of the mountains bordering on the banks of the Godavery above Rajahmundry, and of the Pegu, Moulmein, and Rangoon forests. It grows straight and lofty with cross armed panicles of showy white flowers. The wood is very hard but easily worked; it is soon seasoned, and being oily, does not injure iron, and shrinks little. It is probably the most durable timber known, hence its value in ship building. The Malabar Teak is considered the best and is always most valued in Indian Government dock yards. A valuable report by Dr. Falconer on the Teak forests of the Tenasserim Coast, was published lately among the Selections from the Records of the Bengal Government. The price of teakwood at present is 3 Rs. per cubic foot, double the ordinary rate. It is matter of regret considering the vast importance of teak timber to England, as a maritime nation, that the preservation of the teak forests was so long disregarded. On the Coromandel coast, it flowers in June and July, and the seeds ripen September and October. The wood has from long experience been found to be by far the most useful timber in Southern Asia; it is light, easily worked, and at the same time both strong and durable. That which grows on the mountains in the vicinity of the Godavery is occasionally beautifully veined and mottled. For ship building purposes, teak is superior to every other sort of wood, being light, strong, durable, whether in or out of water. Pegu produces the largest quantity, and its navigable rivers enable it to be brought down to the sea ports at a cheap rate. This timber has been found ill adapted for gun carriages. Indeed, when it is observed how easily it splits, it is surprising that it had been for so many years applied to this purpose, especially for the felloes.

The great depot for the Godavery teak is Coringa, where many vessels are built, yet even there it is found more profitable to plank vessels chiefly with teak brought from the opposite coast. Either from want of means of transport or the force of habit, the wood cutters about the Godavery cut short almost every log to a length of eighteen or twenty feet, and cut away one half of the thickness of the finest logs; leaving three projecting pieces which are pierced for staples for convenience in lashing either to the yokes of the buffaloes or for conveying it from the forest or in rafts on the water. In the Masulipatam and Rajahmundry district the timbers are classed as Tanabees 18 to 20 ft. × 18 in. × 10 in. Toondoors 14 ft. × 12 in diameter. Sirambees 18 ft. × 8 in.

Teak is brought in large quantities from the country bordering the Godavery and its tributaries.

Godavery teak varies much in density: much of it is finely veined; generally it is heavier than the Rangoon teak, but not equal to some from the Malabar Coast. In Ceylon, the Dutch largely planted teak, which has attained considerable size. Teak seems to require about 80 years to obtain perfection, but after 20 years a teak plantation would probably yield a valuable return in thinning.

Upon the whole, the Malabar teak seems the best. That of Rangoon is lighter and more open in the grain and is preferred for masts and spars. The dark or heavy teak of the mountains bordering on the Godavery is very little if at all inferior to the Malabar, but a good deal of the Godavery teak is very open grained. The logs brought to market are always irregular in shape. Where strength without any regard to size and shape is required, the small heavy logs brought down by return bullock carts to Masulipatam may be used. Major Campbell's experiments show the weight of a cubic foot to vary in the several specimens from 52 to 37 lbs, practical value of S. 92 to 50.

Tenasserim teak is the staple timber of the Tenasserim Provinces, and from its abundance in Province Amherst, and its valuable property of being impervious to the white ants, it is used in Maulmain almost exclusively, both for building purposes and for furniture.

The teak tree is of rapid growth, and the trunk grows erect, to a vast height, with copious spreading branches. The wood of the teak tree is by far the most useful timber in India; it is light, easily worked, and, though porous, it is strong and durable; it requires little seasoning, and shrinks very little: it affords tar of good quality and is rather of an oily nature, therefore does not injure iron, and is the best wood in India for ship-timber, house carpentry, or any other work where strong and durable wood is required. Malabar teak is esteemed superior to any other in India, and is extensively used for ship-building at Bombay. It grows in the teak forests along the western side of the Ghaut Mountains, and the contiguous ridges where the numerous streams afford water carriage for the timber. There is a variety, says Dr. Roxburgh, which grows on the banks of the Godavery, of which the wood is beautifully veined, closer grained, and heavier than that of the common teak tree; this kind is well adapted for furniture. The cohesive force of teak wood varies from 13,000 to 15,000 pounds per square inch ; the weight of its modulus of elasticity is 2,167,000 pounds per square inch, according to Mr. Barlow's experiments ; and the weight of a cubic foot seasoned, varies from 41 to 53 pounds.

Representing the strength of oak by 100,
that of teak will be, 109
Stiffness of oak by 100, ,, 126
Toughness of oak by 100, ,, 94

From which it appears, that it is much superior to oak in these properties, except in toughness ; but it is to be remembered, that these proportions are drawn from two or three experiments on teak, and most probably these were tried on very select specimens ; whereas those for oak from a mean specimen, selected from pieces of oak of various qualities.

Teak is considered a more brittle wood than the Saul or the Sissoo. In 25 years the teak attains the size of two feet diameter, and is considered serviceable timber, but it requires 80 years to arrive at maturity. Some of the old trees have beautiful burrs, resembling the Amboyna, which are much esteemed. Teak-wood when fresh has an agreeable odour, something like rosewood. The ships of war built of this timber weie—

Ships of the Line.—Minden, Cornwallis, Melville, Malabar, Wellesley, Ganges, Asia, Bombay, Calcutta, Hastings.

Frigates.—Salsette, Amphitrite, Trincomalee, Seringapatam, Madagascar, Andromeda, Alligator, Samarang, Herald.

Sloops.—Victor, Cameleon, Sphynx, Cochin.

It has been considered by many that a ship built of this sort of wood would last good from thirty to fifty years, for which time, report says, many ships have been known to run in India. The old Milford Bombay ship in the country trade of India, was the oldest and best-conditioned ship that ever came under Mr. Edye's notice. She was, he says, built of teak-timber about thirty-five years before he saw her ; she had been constantly at sea, and only had a small repair during that period. She was built of the Malabar teak. A forest patch of teak, when in full bloom, has much the appearance of a field of ripe corn when viewed from a distance, with a few spots of green interspersed ; by this appearance the native hill people discover the trees of teak at one season, and cut around their roots to prevent the sap from ascending the next year. The persons who work the forests of teak on the sides of the hills are thus able to distinguish at a distance those trees from the others.

The teak is probably the most durable of all timbers, it is very hard, and very heavy. It is extensively used for ship-building, for house carpentry, cart and coach building, and for house and camp furniture, for which it is well adapted, as it does not split. As regards strength, as shown by the weight it is capable of sustaining, it is inferior to several others. It is probably the most valuable timber in the world, both for strength, fineness, and durability, and for being always safe from white ants. It grows to an enormous size, attaining maturity in about eighty years. Wood reddish and susceptible of a very fine polish. It is one of the few tropical trees which sheds its leaves annually and at once. It has this advantage over oak, that while that has an acid which destroys iron, this has an essential oil which preserves it. Fruit rough, brown, size of cherry, worthless. Another species, the Tectona Hamiltoniana, is much smaller. In teak the concentric circles are not so wide as they are in the oak, the teak thereby acquiring great strength, compared with the oak: but the blue gum of Tasmania, the Eucalyptus globulus, *Lab.*, has greater density than either. The teak tree grows in the southern and western parts of the Peninsula of India, in Malabar, in Canara, in the Wynaad, in the forests of the Animallay hills, in Burmah, Sumatra, Java, Celebes and Sumbawa. Between Japara and Sourabaya several extensive teak forests occur, which are of vast importance to the island ; indeed there is no other kind of wood in the Archipelago which will endure so well in the water. But Java is the only island in the Archipelago possessing teak forests which are available to any extent for the purpose of ship-building. In Sumatra, Celebes, and Sumbawa, the forests are so far distant from the sea, that the expense of land carriage prevents, the natives from deriving any great advantage from its use. Teak is not known to inhabit the Malayan Peninsula. Mr. Conolly, about the year 1848, commenced planting teak seeds in Malabar, and every year since then additional land has been occupied by teak plantations. As the best method of rearing young trees, take a layer of fresh stable manure, three inches to be first strewed over the bottom of the trench, then four inches of decaying leaf mould, then one inch of wood ashes, and over this about six inches of a light sandy soil. The fine silt from the bed of a tank is the best. The seeds of some trees, like the tamarind and neem, sprout most readily when put in very thickly in handfuls at two inches from the surface. Some trees come up in three or four days, others in ten or twelve, while a few appear to have a particular month for coming up, and they remain in the ground without germinating till a particular season. This has been remarked with the Adansonia and teak. It may occur with other trees. A few trees like the orange, pummelo and lime, will germinate at any season of the year; but they seem to stop growing from April till about August, and if too much watered in the hot weather, they are apt to die. The common hedge plant of Madras, Inga dulcis or karkapilly, is also apt to be killed if too much watered during the hot season. Once a day is sufficient for trees and for most plants, and evening is the best time of day to water. It has been found that all young trees thrive better if the earth is loosened about their roots about once a week. This is best done with a steel fork in the evening after they are watered, and it acts beneficially by letting air in at the roots. The plants must not be too much disturbed. A good mode of rearing the teak tree is to steep the nuts in water for 36 hours, then sow them in holes four inches apart and half an inch under the surface, covering the beds with straw so as to prevent evaporation, and gently watering them every evening. The seeds sprout in from four to eight weeks. Teak does not frequently spring up under shade. The prevalence of other trees therefore over teak is a great hindrance to the growing up of seedlings in sufficient quantity to replace those trees that have been removed. Young teak is not injured by elephants. It belongs to a family of plants, Verbenaceæ, that affords no fodder for animals, and Dr. Falconer satisfied himself in passing repeatedly through forests infested with wild elephants, that they do not cause the slightest injury to young teak. Teak wood is used as a rib-lining of the arches in the caves of Karli, and is said to be coeval with their erection, about two thousand years ago. Pliny states that the beams in the temple of Apollo at Utica were in perfect preservation in his time, though they had then endured 1178 years. The teak furnishes an opaque dull ash coloured oil. When allowed to rest for some time it separates into two layers, an upper or dark coloured clear stratum and a lower and more solid deposit. Its chief use is for applying to wood work of all sorts, either alone as a natural varnish, or in combination with certain resins.—*M. E. J. R. Malcolm's Travels in South Eastern Asia, Vol. I. p.* 185. *Mr. Earl, pages* 44 & 45. *Selec. from the Records of Govt. of India, Foreign Dept. No. XXVIII. p.* 50, *IX. p.* 109. See Tectona.

The teal is a swimming bird of the family Anatidæ and sub family Anatinæ, and of the genus Querquedula. The teal are simply small ducks, and several species are known. They are of somewhat slender make and fly very rapidly. Teal have long been prized as a delicate food. Willughby remarks that, for the taste of its flesh and the wholesome nourishment it affords the body, it "doth deservedly challenge the first place among those of its kind." In the 'Portraits d'Oyseaux' 1557, the following quatrain celebrates its excellence, and alludes to its habits :—

> "Bien peu souvent se plonge la sarcelle
> Entre deux eaux, de lequelle la chair
> Est delicate : aussi couste elle cher
> Autant qu'oyseau qui soit petit comme elle."

Accordingly we see it holding a high place in ancient feasts. We find it among the 'goodly provision' at the banquet given at the enthroning of George Nevell, archbishop of York, in the reign of Edward IV. : 'Mallardes and Teales, 4000.' The price in the Northumberland Household Book is—'Teylles, 1*d*., mallards being 2*d*.'

Q. crecca, *Linn*, the common teal of India, is 14½ inches long. It is migratory and breeds in the northern and temperate regions, but it is one of the most abundant, as also one of the earliest visitors to India. It arrives early in September, and frequents both tanks and rivers, often in immense flocks. Its flight is amazingly rapid. Large numbers are netted and caught in various ways to supply the tealeries. It is a night feeder. It is most excellent food.

Q. circia, *Linn*. The blue winged or Garganey teal, is distributed over the greater portion of the Old World. It is even more abundant in India than the common teal, but is somewhat later in its arrival. It has a swift flight, occurs in vast flocks, and feeds at night. Vast quantities of this and Q. crecca are caught alive, some by large flap nets, others by nooses fixed to a long line across a jheel, and in some places by a man wading with his head above water, concealed in a large earthen pot, several of which have previously been set afloat.

Q. glocitans, *Pallas*, is the clucking teal of India. It is a rare bird both in Europe and in India, and appears to be most common in Northern Asia on the borders of Lake Baikal, and in China and Japan. It has a peculiarly loud clucking call, *mok-mok-mok-lok.*?

Other species are Q. falcata, *Pallas* ; Q. Javana, *Bodd.* ; Q. Manillensis, *Mull and Schl. Eng. Cyc.* See Birds.

TEAO. SIND. Cucurbita lagenaria, *Linn.*

Luar,	PUNJAB.	Khew,	SIND.

A small stiff-looking tree occurring in the arid tracts from Delhi westward through Harriana and the Central Punjab to the Salt Range and Trans-Indus, where it occurs up to 2,500 or 3,000 feet. Also in the Siwalik, and on the Beas below Kangra. This has perhaps the handsomest flower of any indigenous Punjab tree, and its gorgeous orange blossoms make quite a show in some parts in the west of the province. Trees of four and five feet are not uncommon; but at Sirsa, near the Sutlej, are seen trees up to 7 or 8 feet girth and 40 feet high. The leaves vary greatly in size. The foliage is browsed by cattle. The wood is hard, close grained and strong, but is rarely large or abundant; used for making charpoys, spinning wheels and ploughs in the Salt Range.—*Powell Hand Book. Dr. J. L. Stewart.*

TECOMA XYLOCARPA, G. DON. Bignonia xylocarpa, *Roxb.*

Shalduna of JUBBULPORE		Pedda teku,	„

This majestic forest tree is perhaps the most largely used of any of the woods of south-eastern Asia. It has been introduced into the Panjab, it is found in Bundelcund, on the Aravalli and Satpoora, and on the banks of the Taptee river. It grows as a majestic forest tree on the western side of India, from Nassik, N. W. of Bombay southwards to Severndroog : in the forest west of Vingorla, near Sawuntwarie : in the forest between Dharwar, Sunda and Sedashegur and in smaller patches above the ghats, in Canara, Malabar, Cochin, Travancore and Coimbatore in the Anamallai ; a small quantity occurs in the Nalla Malai mountains between Nellore and Cuddapah. North-east of this, it is known in the Nagpore and the Hyderabad territories, on the Godavery and its feeders, viz., east of Chanda, on the left bank of the Paen Gunga and north of the Indrawatti river in 20° N.L. also on the 18° N. L. close to the right bank of the Godavery, east of Warungul, and, further east, on the right bank of the Sebber river. In Ceylon, the Dutch largely planted teak, which has attained considerable size. It grows in Burmah and the Tenasserim provinces, also at the forks of the Salwen river, and west of Moulmein between the Martaban river and the Menam and nearly as far south as Tavoy, teak forests occur of great value. Further south and east it only reappears in Siam and in the mountainous parts of Sumatra, Celebes, Sumbawa, and Java. Between Japara and Sourabaya, several extensive teak forests occur, which are of vast importance to the island. But, Java is the only island in the Archipelago possessing teak forests available to any extent for the purpose of ship-building; for, in Sumatra, Celebes and Sumbawa, the teak forests are so far distant from the sea, that the expense of land carriage prevents the natives deriving any great advantages from their export. Teak is used in house building, for beams, for furniture of every description, and largely in ship-building. In the Madras gun carriage manufactory, it is used for all parts of light field carriages (except the beams); waggons and their limbers (except poles and splinter bars); also for heavy field and garrison carriages; garrison traversing platforms; for gun mortar platforms; and for all parts of heavy and light mortar carts; store carts (with the exception of poles and splinter bars): platform, line, and water carts; gins, and wheel work; heavy and light field ammunition boxes: transport carriages and limbers and furniture work.—*Drs. Roxburgh, Wight, Falconer, Mason, McClelland, Gibson, Cleghorn, Stewart, and Brandis; Mr. Edye, Mr. Rohde, Mr. Earl, Mr. E. O'Riley*; *Cal. and Mad. Cat. Ex.* 1862, *Madras Proc. Ex.* 1851, *Major Morgan, Captain Sankey.*

TECTONA TERNIFOLIA, Buch.

Tectona Hamiltonia, *Wall.* | Ta-hut Burm.

This species of teak grows on the banks of the Irrawaddy, at Segaen, Prome, Ava, and at the foot of Taong-Dong, and, from native descriptions, Dr. Mason imagines it is found in the province of Yay. It flowers in March, its wood is inferior to that of T. grandis.—*Drs. Mason, Voigt.*

TEDDA-PALA, Tel. Ixora parviflora.

TEDLA-PALA, Tel. also Chitti ankudu, Tel. Wrightia tinctoria, *R. Br.*

TEE, Burm. Properly h'tee, the umbrella which crowns the top of a Burman praw or pagoda, without which it is not considered to be sanctified. In restoring that of the Shooay Dagon at Rangoon, which had been destroyed by an earthquake in 1769, the king of Ava attended with an army of 50,000 men.—*Cole. Myth. Hind. p.* 397.

TEEA, a Bornean weight, the sixth part of the mace; about 6¼ grains.—*Simmonds' Dict.*

TEEAR, a race in the south-western parts of the peninsula of India, practising polyandry. See Teer; Tiyar.

TEEDONG. See Kunawar.

TEEHUN. See Khutri.

TEEJA or ZEEARAT, Hind. In mahomedanism, a visiting of the grave; also visiting the alum or standards.

TEEKA, Hind. A spot made on the forehead by hindus.

TEE-KA-LOUNG or Tha-ka-dat-ghee, Burm. A timber tree of maximum girth 3 cubits, maximum length 22½ feet. Abundant at Mergui and Tavoy. When seasoned it floats in water. It is used for bedsteads and for house building. Recommended as a durable, tough wood for helves or for hammer handles.—*Captain Dance.*

TEEKOR, Hind. Curcuma angustifolia.

TEEL, also Jingelli, Guz. Hind. Gingelly seed, Sesamum orientale.

TEELUR or CHELUR. A river near Shajehanpoor.

TEEN, Arab. Figs.

TEEN. Hind. Lit. earth, dust, or clay. Adam, according, to mahomedan belief, was created from it.

TEENA. See Dyes.

TEENAH, Heb. Fig tree of Ficus carica.

TEEN-TSING-FOO, or Tien-tsing, a Chinese city of great trade, particularly in salt, at the junction of the Eu-ho or Yunliang-ho with the Peiho.

TEEN YARI, a name of the sheeah sect of mahomedans, applied to them by the sunni mahomedans, because the shiah reject the kalif Abu-bakr as a successor of Mahomed, and claim the rule to have fallen to Ali.

TEEONG, Sumat. Gracula religiosa, *Linn.* the mina-bird.

TEER, properly Tevan, islanders, also written Tiyar and Teer, a caste in Travancore, certainly immigrants from Ceylon. They occupy also Malabar and are engaged in cultivation. Their women have forms of great symmetry, with a clear light brown complexion, uniform and brilliant. The chaste women of their class wear no covering on the upper parts of their bodies. Their name is written Teer, Teyar, Tiar, Eeyoover, or Juver, they are the toddy drawers of Malabar, and are a servile class who follow the rule of descent a matrice. They are polyandrous. On the Malabar coast they form a great part of the people; they are a fair, good looking race, treated as outcastes, and until recently were compelled to move from the road when a Nair approached. The Teer are being educated in the Government schools, obtain service, are acquiring land, and are very well to do. They are fairer and more refined looking than the Nair. Teer is said to mean island, and the Maldives and Ceylon are both named as their original country. Dr. Caldwell thinks they came from Ceylon.—*Caldwell.* SeeKummaler.

TEERAH, a small province or district, lying between Peshawar and Cabul, and confined on the north and south by the river of Cabul, and by the southern ridge of snowy mountains.—*Rennell's Memoir, p.* 151.

TEERAT'H, Hind. A holy place of pilgrimage, visited by hindus or jains. Amongst the most celebrated are the Ganges at Hurdwar; the town of Benares, Mount Aboo; Panderpur in the Dekhan, Triputty in the Carnatic, Conjeveram and Ramisseram. At Mount Aboo a group of five of the twenty-four jain pontiffs are more particularly reverenced, and distinctively called the Panch-Teerat'hi, viz. Rishubdeva, the first; Suntnath, the sixteenth; Nemnath, the twenty-second; Parswanath, the twenty-third; and Mahavira, the twenty-fourth. Each has his sacred mount or place of pilgrimage (teerat'h), and each is recognized by his symbol, viz., the bull, black antelope, conchshell, hooded serpent and tiger, and it is quite sufficient to find one of these symbols upon the plinth to ascertain the particular pontiff to which it belongs.—*Tod's Rajasthan, vol.* ii. *p.* 724.

TEESTA, a tributary to the Brahmapootra. It rises in about lat. 27° 59', lon. 88° 50′ S. S. E. and runs into the Brahmapootra after a course of 333 miles. It receives the Lachoong, 23 miles ; Rungbo, 22 miles ; Rungeet, 23 miles. It is navigable for craft of 6 or 7 tons as far up as Puharpoor, 15 miles beyond the divergence of the Attree.

TEESU, Hind ? Dhak flowers, flowers of Butea frondosa.

TEETA, Beng. Picrorrhiza.

TEETAH,——? Jute.

TEETH of animals, and teeth and tusks of elephants, form articles of commerce. The grinders or teeth proper are used for knife-handles and other purposes. The teeth of many carnivorous animals are used for necklaces and ornaments.—*Simmonds' Dict.*

TEE-THEE.——? Diospyros kaki.

TEEYER. See Teer ; Kummaler.

TEGADA, Tel. also Nalla tegada, Tel. Ipomæa turpethum, *R. Br.*

TEGH BAHADUR. See Sikhs.

TEG-GUMMADU, Tel. Gmelina arborea.

TEGOLE EMBRICI, It. Tiles.

TEH, Malay. Tea.

TEHAMA. A political division of Yemen, in Arabia, extending along the whole sea-coast of that province, washed by the Red Sea, with a varying breadth of from twenty to eight miles. Tehama is now a part of the Turkish empire, its principal cities are Hodaida, Lohea, Mokha, and Jezan on the sea-coast, with Zebeed and Bait-el-Fakeeh in the interior.

TEH-CHAU. All the Banner garrisons of China, save those of Fuhchu, Canton, Liang-chau, Ninghia, Chwangliang, Tai-yuen, Teh-chau, and the nine inner garrisons of the Metropolitan Cordon, send up a small number of officers and men to Peking to be there taught their duties in the hunting suite of the Emperor, should he repair to the preserves of Muh-lan, at Jeh-ho (Zhehol). These are in the keeping of a Tsungkw in (3a) two yih-ching (4a) eight fong-yu (5a) and eight hiau-ki kiau, or subalterns all under the orders of the tutung of Jeh-ho.

TEHR—? See Capreæ.

TEHERAN is known from repeated observations to be 3,600 feet above the level of the sea. It is in L. 35° 37′ N., and L. 50° 52′ E. It stands on a very low tract of ground near to the foot of the Elborz mountains, which at this part have an older and more romantic celebrity attached to them, than the gloomy fame they derive from Hassan Saheb and his sanguinary race. The ancient Hyrcania, a country of warriors, who are reported to have carried a charmed life, lying immediately north of these hills, their passes became the scenes of more than mortal combats, between the simply brave heroes of Persia and these magician chieftains : they are also noted for having been the place of refuge of the illustrious prince Zal. Teheran is surrounded by a deep ditch, towers, and a mud wall, embracing a circuit of eight thousand yards, with four gates: that to the south leading to Ispahan ; that to the north-west to Tabreez ; the other two look towards the hills in the corresponding directions.—*Porter's Travels, Vol. 1.* p. 309.

TEILA, Hind. Ribes grossularia.

TEING NYET, Burm. Cæsalpinia sappan.

TEIN-HPY-SO, Burm. Ar. White oxide of arsenic.

TEIN N'GYET, Burm. Cæsalpinia sappan, *Linn. Roxb. W. & A.*

TEITAN-COTTAY. Strychnos potatorum.

TEJ, Hind. Pers. Bark of Cassia lignea. Cinnamon.

TEJAS. Sp. Tiles.

TEJASH-CHANDRA. Sans. From tejas, glory, and chandru, the moon.

TEJBAL, Guz. Hind. Pers. The seeds and capsules of the Xanthoxylum hostile, which are employed by the natives of northern India as a remedy for the tooth-ache, and also for intoxicating fish. They have a warm, spicy, pepper-like pungency, a property which is participated in by the bark and other parts of the tree. The term is applied to the capsules and seeds of several species of Xanthoxylon and other drugs.—*Faulkner. Ben. Phar.*

TEJEND. See Mongol.

TEJ'HA. See Hindu.

TEJO-MAYA, Sans. From Teja, glory and maya, fulness. Teja, Sans. glory, is from tij, to sharpen.

TEJPAT, Aromatic leaves of Cinnamomum albiflorum, or of Cinnamomum tamala, also called in Hindi tamala patra. The term Tejpata is also applied to leaves of Laurus or Cinnamomum Malabathrum, the folia Malabathri of the ancients, and in Bengal it is given to the leaves of Cinnamomum nitidum, *Nees.* Their odour resembles that of cloves ; the flavour is aromatic and hot.—*Simmonds' Dict. Ben. Phar.* See Malabathrum.

TEJPAT-KA PHUL, Hind. Cassia buds.

TEKA, Sans. From teek, to judge.

TEKUNDA-JUTEE, Beng. Monetia tetracantha.

TEKATA-SHIJ. Beng. Euphorbia antiquorum.

TEKE. See Khiva.

TEKKALI. Tel. Clerodendron phlomoides, *Linn. Roxb. W. and. A.*

TEKKALI CHETTU, Tel. Clerodendron phlomoides, *Linn.*

TEKKEER ATTOVYE ANJELLY, Tam. A wood of Travancore, of a brown colour, specific gravity 0·528, 4 to 6 feet in circumference, used for house and ship building.—*Colonel Frith.*

TEKUT. See Mesopotamia. Tigris.

TEKU-CHETTU, Tel. Tectona grandis, *Linn.*

TEL, Guz. Hind. Any oil. Tel-i-gandhak, Petroleum : Tel-Multani, oil scented with orange flowers. Tel-Siya, lit. " black," or coarse oil, rape seed oil.

TELA, It. Linen. Calico, Tela-a-damascada, Sp. Damask. Tella Bambagina, also Tela Di Pinta, It. Calico. Tela Damaschina. It. Damask. Tela De Algodon, Sp. Calico, Tela De lino, Sp. Linen.

TELA. Hind. A blight on sugar-cane, like a dark powder.

TELA ARENARUM. See Cotton manufactures.

TELAE, Malay. Abrus precatorius, *Linn.*

TELAGA, Tel. A species of Gardenia, of the Godavery forests and Dekhan, has a very hard wood, would be very good for turning,—*Captain Beddome.*

TELAGA-BODAS. The Guevo Upas or Valley of Poison, is at the side of the volcano Papandayang in Java. It is 500 feet below the run of the old crater, which is now the Telaga-bodas or White Lake. It is a small bare place with many crevices, from which carbonic acid is poured, and many dead animals, dogs, cats, squirrells, rhinoceros, tigers birds and snakes are seen in it.—*Bickmore. p.* 53

TELA KUCHA, Beng. Kai-danda, Tel. Coccinia Indica, *W. and A.*

TELANGA-CHEENA, Beng. Lagerstræmia Indica.

TELA-PASHANUM, Tel. White arsenic.

TELASU, Tel. also Chinduga, Tel. Acacia odoratissima, *Willd.*

TELA TUMBATIN, Tel. Canavalia gladiata.

TELE, Malay. Seeds of Abrus precatorius.

TELEGRAPH. The Red Sea Telegraph was opened on the 1st October 1859.

TELEKI, Tel. Clerodendron phlomoides, *Linn.*

TELEKIA. This plant bears a yellow flower, and grows in any common garden soil.

TELEYA, Hind. ? A tree of Chota Nagpore with a soft, red wood.—*Cat. Ex.* 1862.

TELI.——? Cantharides.

TELI, Hind. In India, a term applied to shopkeepers, oilmen, who make and sell oils, a humble avocation. Kahan rajah Kishn, kahan Ganga teli : behold the distance between rajah Kishn and Ganga the oilman.

TELIA GARJAN, Beng. Guz. Hind. Wood oil.

TELICHERRY BARK. Connessi bark.

TELI MAKHI. Hind. Cantharides.

TELINGA, Tellunga, Tiling, or Telugu is the name of a people and their language, dwelling in the coast tract north from Madras to Orissa. The term is supposed by some to be derived from the Sanscrit words Tri-lingam, the country of the three lingums. The country is known as Telingana, and extends from Pulicat on the north of Madras, as far to the north as Ganjam, and westwards to Trepati, Bellary, Kurnool, Beder and Chanda throughout the regions where Telugu is spoken ; by Europeans the Tiling are styled Gentoo. See Telugu.

TELINGA POTATO, Eng. Amorphophallus campanulatus.

TELING KORAWA or Kasbi Korawa. See Korawa.

TELINI, Indian Blistering Fly. Species of Meloe or Mylabris cichorei. The wing covers are marked with large spots of light brown alternating with deep blue. Another blistering fly is small, steel blue, Cantharis violacea. —*Ben. Phar.*

TELKAIHA, Hind. Coccinia Indica.

TELKATCHA, Hind. Bryonia grandis.

TEL KODUKU. Tam. Tiaridium Indicum, *Schm.*

TEL-KOHUMBA, Sing. Margosa or Neem bark, the bark of Azadarachta Indica, used medicinally as a febrifuge.

TELL, a tributary to the Mahanuddy, it rises in L. 19° 54′, 82° 41′ and runs N. W. into Mahanuddy, length 130 m.

Tella galijeru, Tel. Trianthema decandrum, *Linn*, variety viridiflorum.

Tella Gantera, Tel., corruption for Tella dintena, Tel.

Tella gariki, Tel. Cynodon dactylon.

Tella gata, Tel. Pancratium Zeylanicum, *Linn. Roxb.*

Tella gadda, Tel. Garlic.

Tella giniya chettu, Tel. Alhaji maurorum, *Tourne*, syn. of Hedysarum alhaji, *Roxb.*

Tella gora chettu, Tel. Sida cordifolia, *Linn.*

Tella gummudu, Tel. Vitis lanceolaria, *Wall*, *A. and W.*, also the Stilago diandra of *Roxb.* The term gumudu is properly the name of Gmelina arborea, but is applied with some qualifying adjectives to several kinds of vine.

Tella guri vinda, Tel. Abrus precatorius, *Linn.* var. leucospermus.

Tella Guru ginja, Tel. Abrus precatorius, *Linn.* The black variety, Melanospermos.

Tella irugudu., Tel. Dalbergia latifolia, *W. and A. Roxb.*

Tella Iswari, Tel. a species of Aristolochia, or Bragantia.

Tella janumu, Tel. a species of Crotalaria.

Tella Jilakarra, Tel. a species of Cuminum.

Tella jilledu, Tel. Calotropis gigantea, variety alba.

Tella jiluga, Tel. Calsulia axillaris, *Roxb.*

Tella jonna, Tel. Sorghum saccharatum, *Pers.* Andropogon saccharatum, *Roxb.* also Devata dhanyamu, Tel.

Tella jonnalu, Tel. Sorghum vulgare.

Tella juvvi, Tel., also Bapanaburi, Tel. Ehretia buxifolia, *Roxb.*

Tella kakamuste, Tel. species of Sponia.

Tella kakara, Tel. Momordica charantia, *L.*

Tella kakisa, Tel. Gardenia montana, *R.*

Tella kaluva, Tel. Nymphæa pubescens, *W.*

Tella kasturi pasupu, Tel. Curcuma aromatica, *Salis*, Curcuma zedoaria, *Roxb.*

Tella keriya gass, Singh. Excœcaria agallocha, *Linn. Roxb. W. Ic.*

Tella korinda, Tel. Acacia cæsia, *W. and A.*

Tella lodduga. Tel. Species of Symplocos.

Tella maddi, Tel., also Maddi, Tel. Terminalia glabra, *W. and A.*

Tella manga, Tel. Gardenia lucida, *Roxb.*

Tella moduga, Tel., also Moduga, Tel. Butea frondosa, *Roxb.*

Tella mulaka, Tel. Solanum indicum, *Linn.*

Tella mulu goranta, Tel., also Malla mulu goranta, Tel. Barleria obovata, *Linn*

Tella Munaga, Tel., also Munaga, Tel. Var. of Hyperanthera moringa, *Roxb.*

Tella murupind, Tel., also Murupindi, Tel. Acalypha ciliata, *Port.*

Tella mutuku, Tel., also Manda motuku, Tel., also Nemmi chettu, Tel. Dalbergia Oojeniensis, *Roxb.*

Tella nela gummudu, Tel. Species of Batatas.

Tella nela mulaka, Tel., also Nela Mulaka, Tel. Solanum Jacquini, *Willd.*

Tella nela vemu. Tel. Hedyotis Heynei, *R. Br.* Oldenlandia herbacea, *Roxb.*

Tella neredu, Tel. Calyptranthes caryophyllifolia.

Tella nilambari, Tel. Barleria dichotoma, *Roxb.*

Tella pachari, Tel., also Porilla Sapara, Tel. Dalbergia paniculata, *Roxb.*

Tellani padmam, or Padmam, Nelumbium speciosum, *Willd.*

Tella pampena. This name was given by the Konda Dorala of Simhachalam. The name Bhutala Chairi was also applied to the same tree by some, but this tree differed from that so named at Vissannapeta, a plant of which was sent to the Agri-Horticultural Garden, where it proves to be a Euphorbiaceous tree.

Tella papata, also Papata, Tel. Pavetta Indica, *Linn.*

Tella patsaroo, Tel. Dalbergia paniculata, *Roxb. W. & A.*

Tella pedda goranta, Tel. White variety of Gomphena globosa, *Linn.*

Tella pidusu, Tel. Streptium asperum, *R. Cor.* These names are very local, the plant being uncommon at Samulcottah at Matur in Guntur, and at Simhachalam in Vizagapatam the Konda Doralu called it *Kokkera.*

Tella pippali. Tel. Symphorema involucratum, *R. W. Ic.*

Tella polki, Tel. ? See Polki.

Tella ponuku, Tel. Givotia Rottleriformis, *Griff, W. & A.*

Tella pula nirulli, Tel. Species of Allium.

Tella purugudu, Tel. Fluggea leucopyrus, *Willd.*

Tella purugudu, Tel., also Purugudu, Tel. Species of Phyllanthus.

Tella rantu, Tel. Adhatoda betonica, *Nees.*; the Justicia betonica of *Roxb. and Rheede.*

Tella sala barta, also Adavi mutya malle, Tel. Hibiscus hirtus, *Linn.*

Tella sandra, Tel. Acacia suma. Wood very good and strong, abundant in the Aukeesah, Godavery and Circar jungles.

Tella sapara, Tel. Acacia elata, *Grah.*

Tella sugandhi pala, Tel. Hemidesmus Indicus, *R. Brown.*

Tella tamara, Tel. Nelumbium.

Tella tegada, Tel. Ipomæa turpethum, *R. Brown.*

Tella tige, Tel. Dalbergia rubiginosa, *Roxb.*

Tella totakura, Tel. White variety of Amarantus oleraceus, *Linn.*

Tella tumma, Tel. Acacia leucophlœa, *Willd, W. & A.* also,

Tella udata, also Bail komma. Tel. Opilia amentacea, *R.*

Tella ulimara, Tel. ? Cratæva Roxburghii, *R. B. W.*

Tella ulimidi, Tel. ? Cratæva Roxburghii, *R. Br.* Capparis trifoliata, *Roxb.*

Tella umati, Tel. ? Datura alba, *Rumph.*

Tella uppi, Tel. Monetia tetracantha, *G. Don.*

Tella usirika, Tel. Phyllanthus pendulus, *Roxb.*

Tella uste, Tel. Solanum trilobatum, *Linn.*

Tella vadala, Tel. Getonia nutans, *Roxb.*

Tella vakudu, Tel. Variety of Solanum Jacquini, *Willd.*

Tella varinka, Tel. Ficus Benjamina, *Linn.*

Tella vatti veru, also Avuru, Tel. Variety of Andropogon muricatus, *Retz.*

Tella vavili, Tel. Vitex trifolia, *Linn.*

Tella vempali, Tel. Tephrosia purpurea, *Pers.*

Tellavi padmam, also Padmam, Tel. White variety of Nelumbium speciosum, *Willd.*

Tella vishnu kranta, Evolvulus pilosus.

Tella vulemara chettu? Tel. Cratæva Roxburghii.

Tella yirugudu, Tel. also Nalla yirugudu, Tel. Dalbergia latifolia, *Roxb.*

TELLE OR PAYANE, the Tamil and Malayala names of a tree on the Malabar coast and Travancore, a Shorea or Vateria, about sixty feet high, and two feet and half in diameter. It is an inferior sort of "pine," and is named by natives Dupi maram. It produces an inferior sort of damar, or resin, which is boiled down with cocoanut oil. When thus prepared, it is a substitute for pitch or resin, but very inferior. The wood is used for the masts of pattamar, catamarans, canoes, &c., but it is not durable.—*Edye, Forests of Malabar and Canara.*

TELLI, TAM. Anabas scandens.

TELLICHERRY, in lat. 11° 45′ N., long. 75° 28′ E., a town on the Malabar coast.

TELLIGEE—? Caryota urens.

TELLINGA, a dhoney or native coasting-vessel on the coast of Coromandel ?? *Simmond's Dict.*

TELMESSUS SERRATUS, a rare crab of the Gulf of Picheli.—*Adams.*

TELMI, SINGH. Bassia longifolia.

TELNUR MUDUL, BENG. Curculigo orchioides, *Gœrt.*

TEL-POTE, LEPCHA. Bassia butyracea, *Roxb.*

TELSU, TEL. Acacia odoratissima, *Roxb.*

TELUGU, the language of Telingana, partly subject to the British power, and partly to the nizam of Hyderabad. The boundary line of this language may be roughly drawn from immediately north of Madras, where it meets the Tamul by Kirkambari, and Cuddapah to Bellary, where it meets the Canarese, bordering which it runs to the west of Beder to Dangapura and Murkunda; then, turning eastward and having Gondwana as its northern boundary, it re-joins the line near Vizagapatam, and at Chicacole it begins to meet Urya. The most westerly spot at which it is spoken is the small town of Murkundah, about 30 miles west of Beder, and it reaches this by a wavy line running westerly from Sedashepet (Satyassi) on through Sungam and Beder and Dungapura to Moorghpettah or Murkunda; the villages in the whole of the line from Sedashepet to Murkunda, speak Telugu, Canarese and Mahratta, and are called Si b'hasha baste, three-tongue towns. In ancient times, Telugu seems to have been spoken as far north as the mouths of the Ganges. This appears both from the geographical limits which the Greeks have assigned to the territory of the Andhra race or northern Telugu people and from many of the names and places mentioned by Ptolemy up to that delta being found to be Telugu. Even now the Teling are tolerably pure along the southern boundary of Bustar, but Gond tribes are dwelling amongst them. Telugu is also called Telegu, Telingu and Telungu, and is the Andhra of Sanscrit writers, a name mentioned by the Greek geographers as that of a nation dwelling on or near the Ganges. It is the same language which, until lately, Europeans termed the Gentoo, from a Portuguese word signifying heathen or gentile. In respect to antiquity of culture and glossarial copiousness, it ranks next to the Tamul in the list of Dravidian idioms, but it surpasses all of them in euphonic sweetness.

The Telugu people are a taller and a fairer race than the Tamilar, many of the more northern of them being equal in stature to the Arian hindu of the north. They are more brahminical than the Tamilian races, and are as energetic as the latter though less restless.

The Telugu people are the most numerous branch of the Dravidian race, although the Tamil surpass them in restlessness and enterprise and in that self-reliance which supports them in their emigrations. Including the Naik or Naidoo (Nayaka), Reddi and other Telegu tribes settled in the Tamil country, who are chiefly the descendants of those soldiers of fortune by whom the Pandiya and Chola kingdoms were subverted, and who number not less than a million of souls: and including also the Telugu settlers in Mysore, and the Telugu inhabitants of the Nizam's territory and other native states, the people who speak the Telugu language may be estimated to amount to at least fourteen millions. Tamil and Telugu roots are in the great majority the same, but peculiarities in inflection and dialectic changes have so modified the modern tongues, that they differ from each other as much as Portuguese from Spanish, Irish from Welsh, Hebrew from Aramaic, and Hindi from Bengali.

The Teling race are bold and self-reliant. They are good farmers, carefully storing the rainfall in artificial ponds or lakes. They have been good infantry soldiers, but are not horsemen; they repeatedly drove back the Golconda and Beder armies. A considerable portion of the force with which Lord Clive fought the battle of Plassey was composed of Telings, and, until late years, perhaps even now, Tiling was the term given in northern India to the irregular foot soldiers employed there. Those engaged in civil life, push their way fearlessly amongst the other nations on their south and west; many of them are seafaring men, undertaking long voyages, and a portion of them, in former ages, conquered and held large islands in the Eastern Archipelago, where, under the term, Kling, from the Kalingapatam rulers, the peoples of India are still known. The Telings are partly Arian, partly a non-Arian people, but most of them follow outwardly the brahminical teachings, though adhering to many unorthodox rites; they are sober and staid, little impressionable and not easily excited. A body of them, known as Reddi, a very energetic enterprizing race, have held large municipal rights for centuries. An extensive colonization of southern India, by the Teling race, took place under the Bijanagar dynasty, and they still exist there as distinct communities. The Reddi migrated from their original seats near Rajahmundry over the whole of southern India and even into the Mahrashtra country, where they are met with as far north-west as Poona, and are considered the most thriving ryots. The Reddi are large men, good cultivators. Many of those in the Cuddapah collectorate were, till A. D. 1865, addicted to dacoity. In their marriages, in the south of India, a young woman of 16 or 20 may be married to a boy 5 or 6 years old, but she lives with some other adult male, perhaps a maternal uncle or cousin, or it may be with the boy husband's father, *i. e.* her father-in-law, though she is not allowed to form connection with the father's other relatives. The offspring of these arrangements are fathered on the boy husband. When he grows up, the wife has become old or past child bearing, and he adopts the same course.

The Telugu country is nearly twice larger than the Tamil. It is less thickly populated. Considerable colonies of Telugu people have been formed in the Tamil country, who retain their own language. The Telugu country, as a border land, has been subject to the devastation and rapacious oppression of conquerors from a distance who yet would not so far settle among its people as to blend and have common interests with them, or establish well-ordered governments among them. The whole face of the country —dotted with hill forts, destitute of irrigation, with (till lately) large tracts of waste land, bare of gardens—bears testimony to this. The fewness of flourishing towns and of large temples; the presence, in all the larger villages, of petty forts, and in most of the smaller villages of round towers commanding the doors of all the houses, from which to fire upon gang robbers; the style in which the best houses are built, everything being sacrificed to strength and security; all have the same significance. The abject servility of courts and kacheries is shewn by the term "*devaravaru*," God, with the honorific plural, applied to a superior, while the genius of the language forbids the use of anything but the singular for the deity. The common word in use for saving or taking care of any thing as money is *dapettee hide.* Only after the Disarming Act, consequent on the 1857 mutiny, the people of all classes got out of the habit of carrying arms with them. Except along the coast, hardly any Europeans penetrated into the Telugu country earlier than the beginning of the nineteenth century, and only within the last few years have the efforts even of missionaries extended beyond the limits of the town where they established themselves. The Telugu people compared with the Tamil are physically a larger, handsomer and more robust race, partaking much of the Aryan element. The tall forms, drooping (yet broad) shoulders, and regular Circassian features of the rayat and reddi races in particular, are in strong and favorable contrast to the general make of the Tamil people. They are of a free, independent spirit—not so tractable or plastic as the Tamil people. Under the robbery and oppression of former rulers, they emigrated, or in their turn became robbers; but slavery is unknown among them. Though they are very jealous for caste as far as they do observe it, and will make great sacrifices for it, nothing like the extreme homage paid by the southern outcastes to the superior castes is either demanded or yielded in the Telugu country. Not like the Tamil people—there, tell them a thing, and they'll do it quietly; here, say a word and the Tamilar answer you. Servility is confined to the brahmins and mahommedans of courts and kacheries—regions where the immediate presence of the former rulers used to be felt. The rayat has a firm, stolid attitude, and a free, steady stare. The people avail themselves with avidity of their rights as soon as they become aware of them. The abuses that prevailed under the supposed sanction of Sircar were countless, but wherever it became known that any one of them was unlawful, it soon passed away. Telugu people, with all their ignorance, are ever ready to petition and appeal and to fight for their rights to the last. They are very faithful and submissive to lawful authority. *Sircar* is a magic word with them; and it is hard to say what extent of wrong they will not endure, if they believe it sanctioned by Government. Whether it is that the hard rule of their former masters taught them submission; or whether the instincts of a people emerging on the whole under a kind Government from a state of desperate oppression and anarchy to one of prosperity, are necessarily peaceable; or whether again, the nearness of the Nizam's dominions to all parts of the British-Telugu country teaches them to appreciate their present masters, resistance to official power is never in any case dreamed of. They will evade, cheat, run away, appeal—anything but resist. You never hear of a riot among the Telugu people, though they are spirited enough, the Tamil sepoy may perhaps be the more smart and active; but for good behaviour, solid steadiness in the ranks, and discipline, the Telugu man carries the palm.

The Telugu people are more enterprizing and energetic than the Tamil. Not only as a conquering race, but in times of oppression and famine when other hindus remain at home to die in crowds, the Telugu people are used to emigrate, and wherever they go, they attain respectability among the several classes to which they belong. A large proportion of Telugu brahmans, merchants and bazaarmen in Madras, hold very fair positions in their respective ranks. A good sprinkling of reddis is to be found as far south as Tinnevelly. The numerous body called in the Tamil country Badayar or Vaduvar, north men, are Telugu, and belong to the kapu or rayat, or agricultural class. All the bearers and Waddaru in the south are of Telugu origin. The flow of emigration gradually ceased with the returning prosperity of the country and the rapid improvement of the Telugu people under what little European influence they have enjoyed is a fair index to their capabilities. Their towns are beginning to be something worthy of the name. Money and the marks of it are rapidly on the increase. In the Rajamundry district and other parts, the people have thrown themselves into the indigo and cotton trade; and by traffic, under immense disadvantages, they make the western, as well as the eastern, coast their own.—*Revd. Dr. Caldwell.*

TELU KONDI CHETTU, Martynia diandra, *Glox.* Literally scorpion's tail.

TELUMANI, TEL. also Naga-danti, TEL. Tiaridium Indicum, *Linn.*

TELUMANI CHETTU, TEL. Tragia involucrata, *Linn.* Manichettu means gem tree, the Sans. syn. Telu, Vrishi kali is "a line of scorpions."

TE MARM, MAR. Diospyros ebenum.

TEMBILI, SINGH. a variety of cocoanut in Ceylon called king cocoanut, of a bright orange colour, and somewhat oval shaped.—*Simmonds' Dict*

TEMBOW, or black-heart wood, grows in the Malabar forests to about eighteen inches in diameter, and from twenty-five to thirty-five feet in height. It is considered a useful wood by carpenters for general purposes in house building, and for native vessels, and implements of agriculture.—*Edye M. and C.*

TEMETTAM, MAL. Lead.

TEMIA, a genus of perching birds, the species of which are now ranged under Crypserinæ, C. vagabunda and C. temia occur. The first of these is the Pica vagabunda of Gould's 'Century of Birds from the Himalaya mountains.' Dr. Horsfield gives Corvus varians as the synonym of his Phrenotrix temia (the Chekitut, or Benteot, of the Javanese), and states that although not a rare bird in Java, his Phrenotrix is by no means familiar, and never approaches the villages and habitations like many others.—*Zoological Researches in Java. Eng. Cyc.*

TEMPERINI, It. Penknives.

TEMR, properly Tamr, Arab. Phænix dactylifera.

TEMIN. See Wahabi.

TEMPERATURE. In Madras the maximum daily heat occurs at noon.—*Sykes*

TEMPLE is the term by which Europeans designate the places of worship of the hindus, the bud'hists, the Japanese, and the Chinese. That of the hindu is also known as the pagoda, a word the source of which has not been traced, but the Burmese call it prau, the Tamil people call it koil, the Telugu people call it gudi, by the Persian mahomedans it is styled a But-Kada or idol house, and the Indian mahomedans call it a Dewal, or house of god, from deo, god, and alaya, a habitation. The better known temples of the hindus of the south of India are those of Dwarka, Dewal or Somnath, Jejuri, Pandarpur, Tripatty, Trichinopoly, Madura, Tanjore, Conjeveram, Ramnad, and Jagganath. Conjeveram is remarkable for possessing both a Saiva and Vaishnava shrine. Ordinarily, the hindu temples of the south of India consist of the garbah-graham in which the vigraham or idol is kept. It is a square pedestal with one or more cupolas, and, where the cupolas are repeated, one above another, each is supported by two bearers (dhari) at each of the four corners. There is a walled enclosure, at each corner of which, if a saiva temple, is a figure of Siva's vahan, the bull nandi ; and if a vaishnava temple, is a figure of garuda, the eagle vahan of Vishnu. In front is the portico or arched colonnaded vestibule.

In Rajputana, the most celebrated temples are those of Ek-Linga or Siva, in Mewar ; of Krishna at Nat'h-dwara, and the temples at Komulmer ; Nadole ; Mundore ; Ajmer ; Tamba-Nagari ; Kuraira ; Barolli, Ganga-bheva ; Dhoomnar ; J'halra Patun ; Morakuro ; Cheetor and Nagara.

The whole of the building of Jyteshwara or Sankarachar temple, in Kashmir, is of stone, which is laid throughout in horizontal courses, no cement appearing to have been employed. This horizontal treatment is peculiar to most hindu buildings in India, and is adhered to in all the ancient examples of Kashmir. The style of the temple Jyteshwara reproduces itself in all the hindu Kashmirian buildings. The high-pitched pyramidal roof, the one, two, or more gables or pediments, the enclosing wall, and the character of the base mouldings, are features common to all. In Bengal the pediments and gables are slightly curved, and much more numerous, but alike in Kashmir and Bengal, the primary form was the square block surmounted by a pyramidal roof. The mode of elaborating the plan remained the same in both countries, and consisted in the addition of one or more projections to each of the original four sides of the square.

The various orders of hindu sacred architecture are distinguished by the form of the "sikra," which is the portion springing from and surmounting the perpendicular walls of the body of the temple. The sikra of those of Siva is invariably pyramidal, and its sides vary with the base, whether square or oblong. The apex is crowned with an ornamental figure, as a sphynx, an urn, a bull, or a lion, which is called the kallas. When the sikra is but the frustrum of a pyramid, it is often surmounted by a row of lions, as at Bijolli. In the "mindra" or cella, is the statue of the god ; the munduf, in architectural nomenclature, is the pronaos ; and third, the portico.

In Rajputanah, all temples dedicated to Bal-siva, the vivifier, or 'sun-god,' face the east. The portico projects beyond the munduf ; occasionally pilasters are placed on either side of the entrance to the munduf, serving as a support to the internal torun, or triumphal arch.

The Eklinga temple is of white marble and of ample dimensions. Under an open-vaulted temple supported by columns, and fronting the four-faced divinity, is the brazen bull nandi, of the natural size ; it is cast, and of excellent proportions. Within the quadrangle are miniature shrines, containing some of the minor deities. Siva is represented with three eyes, hence his title of Trinitra and Tri-lochun, the Tri-ophthalmic Jupiter of the Greeks. From the fire of the central eye, according to hindoo belief, is to proceed Pralaya or the final destruction of the universe. This eye, placed vertically, resembling the flame of a taper, is a distinguishing mark on the foreheads of his votaries. But the ordinary marks on the foreheads of the Saiva sect, are a round spot about the root of the nose, or a crescent on the forehead. The priests of Eklinga are termed Gosain or Goswami, which signify control over the senses, and the high priests are celibates. The idol emblem of Siva is often called Bawa Adam or father Adam. The grand temple of Barolli in Rajputanah is dedicated to Siva, whose emblems are everywhere visible. It stands in an area about two hundred and fifty yards square, enclosed by a wall built of unshaped stones without cement. Beyond this wall are groves of majestic trees, with many smaller shrines and sacred fountains ; just before entering the area, is a pillar erect in the earth, with a hooded-snake sculptured around it. The body of the edifice, in which is the sanctum of the god, and over which rises its pyramidal " sikra," is a square of only twenty-one feet ; but the addition of the domed vestibule (" munduf") and portico, makes it forty-four by twenty-one. The whole is covered with mythological sculpture, without as well as within, emblematic of the great god (Mahadeo) who is the giver, as well as the destroyer of life. In a niche outside, to the south, he is armed against the " Dytea" (Titans), the " rooad-mala," or skull-chaplet, reaching to his knees, and in seven of his arms are offensive weapons. His cap is the frustrum of a cone, composed of snakes interlaced, with a fillet of skulls : the " cupra" is in his hand, and the victims are scattered around. On his right is one of the maids of slaughter (Jogini) drunk with blood, the cup still at her lip, and her countenance expressive of vacuity ; while below, on the left, is a female personification of death, mere skin and bone, a sickle (" koorpi") in her right hand, and its knob a death's head, which completes this group of the attributes of destruction.

To the west is Mahadeo under another form, a beautiful and animated statue, the expression mild, as when he went forth to entice the mountain nymph, Mera, to his embrace. His tiara is a blaze of finely-executed ornaments, and his snake-wreath, which hangs round him as a garland, has a clasp of two heads of Sehesnag (the serpent-king), while Nandi below is listening with placidity to the sound of " the dumroo." His " cupra" and " karg" or skull cap and sword which he is in the attitude of using, are the only accompaniments denoting the god of blood.

In the northern compartment is a picture disgustingly faithful of death and its attributes, vulgarly known as " Bhookha Mata," or the personification of famine, lank and bare, her necklace, like her lord's, of skulls. Close by are two mortals in the last stage of existence, so correctly represented as to excite an unpleasant surprise. The outline is anatomically correct. The mouth is half open and distorted, and although the eye is closed in death, an expression of mental anguish seems still to linger upon the features. A beast of prey is approaching the dead body ; while, by way of contrast, a male figure, in all the vigour of youth and health, lies prostrate at her feet.

Dhoomnar, famed for its buddhist's caves, has also been at one time a seat of the Vaishnava sect, and at another, a seat of the Saiva religionists. There is a gallery 100 yards in length, terminating in a quadrangular court, measuring 100 feet by 70 and about 35 feet in height, hollowed out of the cellular iron clay rock, in the centre of which is the temple of the four armed divinity, Chatur-bhuja, or Vishnu, the ground plan of the temple being the usual mindra and munduf and portico. Vishnu, who is here adored as the " four-armed," is placed upon an altar clad in robes of his favourite colour (pandu, or yellow ochre), whence one of his titles, Pandurang. The principal shrine is surrounded by the inferior divinities in the following order. First, on entering, are the ' Polea' or ' Porters,' Ganesa is upon the right, close to whom is Sarasvati, " whose throne is on the tongue," and on the left are the twin sons of Kali, the " Bhiroo," distinguished as kala, black, and gora, fair ; a little in advance of these is a shrine containing five of the ten Mahabedia, or ministering agents of Kali, each known by his symbol or vahan, as the bull, elephant, buffalo, and peacock. The Mahabedia are all evil genii, invoked in "jup," or incantations against an enemy, and phylacteries, containing formulas addressed to them, are bound round the arms of warriors in battle. At the back of the chief temple are three shrines ; the central one contains a statue of Narayana, upon his hydra couch, with Lakshmi at his feet. Two Dyta, or evil spirits, appear in conflict close to her, and a second figure represents her in a running posture, looking back, in great alarm, at the combatants. Smaller figures about Narayana represent the heavenly choristers administering to his repose, playing on various instruments, the moorali or flute, the vina or lyre, the muyoora or tabor, and the mudhung and thal or cymbals, at the sound of which a serpent appears rearing his crest with delight. From the south side the eye has an unlimited range over the plains beyond the Chumbul, even to Mundisore and Sondwarra. Descending some rude steps from that place of view, there opens a cavern, the roof of which is supported by one of those singularly shaped columns named after the sacred mounts of the Jains. Here every thing on one side is Budhist or Jain, on the other all is Sivite or Vaishnava. At the entrance to an adjoining cave are various colossal figures, standing or sitting, characteristic of the Budhists or Jains. There are representations of the deified pontiffs of the Jains, and a group of five are the most celebrated of the twenty-four, and distinctively called the Panch-Teerati, viz., Rishubdeva, the first ; Suntnath, the sixteenth ; Nemnath, the twenty-second ; Parswanath, the twenty-third ; and Mahavira, the twenty-fourth. Each has his sacred mount, or place of pilgrimage (teerat), and each is recognized by his symbol, viz., the bull, black antelope, conch-shell, hooded serpent, and tiger, and it is quite sufficient to find one of these symbols upon the plinth to ascertain the particular pontiff to which it belongs. At the further end of the cave known as Bheem's Bazar, is a dahgopa supporting the roof. Two columns, called Sumeru, support the roof, and as Sumeru mount is sacred to Adi-nat'h the first pontiff, it is likely that he was here worshipped. There is an extensive piazza, supported by rows of massive square columns, all cut out of the solid rock, evidently a d'harmsala for pilgrims, and on the exterior are numerous square cells, the apartments of the Srawak or Jain laity. There are also many Pausid-sala, or halls of the Yati, or initiated disciples who stand in the same upright meditative posture as the pontiffs. Jain architecture is as distinct in character from the brahminical as their religion. There is generally a chasteness and simplicity in their temples, affording a wide contrast to the elaborately sculptured shrines of the Saiva and other polytheist sects of India. The design of the Jain temple at Komulmer is truly classic and consists only of the sanctuary which has a vaulted dome and colonnaded portico all round. A temple at Hallybede, about 60 miles N. W. of Seringapatam, in Mysore, is almost identical with that at Komulmer. But Colonel Tod found that Saiva sectarians had introduced into the Jain temple of Komulmer a massive monolithic emblem in black marble, of the hindu Jiva-pitri. At Kuraira is a temple of some celebrity, dedicated to the twenty-third of the Jain apostles, Parswanat'h. There are inscriptions recording its foundation in S. 11, and several from 1300 to 1350. The temple is imposing, and though evidently erected in the decline of the arts, may be considered a good specimen of the twelfth century. It consists of two domes, supported by numerous massive columns of a species of porphyry, of close texture, excessively hard, and taking a fine polish. The capitals of the columns are filled with Jain figures of their pontiffs. The domes are of nearly equal diameters, about thirty feet each, and about forty in height; under the further one is the sanctum of Parswa. There is a splendid colonnaded vestibule at the entrance, richly sculptured, which gives a very grand appearance to the whole edifice, but it stands in the midst of desolation.—*Tod. Rajasthan. Cole. Ill. Build, Kashm.*

TEMPLE, Sir Richard, a Bengal civilian, was the first Commissioner of the Central Provinces, which he greatly improved by forming numerous roads. He instituted an Antiquarian Society at Nagpore.

TEMPOH, a long-measure of Sumatra, of 4¼ inches.—*Simmond's Dict.*

TEM-SHANG, a river in the Khassia Hills, in L. 25° 19′ North, L. 91° 43′ East.

TEMUCHIN, afterwards known as Chinghiz, was born of a Mongol tribe on the banks of the Onon, in 1162. His successes against the nations of Tartary led to his being saluted in 1206 by the diet of his nation as Chinghiz Khan. According to Quatremere, however, Chinghiz did not use the higher appellation of Kaan or Qaan, which was first adopted by his son Okkodai and his successors as their distinctive title, identical with Khaqan, the Χαγανος of the Byzantine historians. Properly a distinction should therefore be preserved between khan, the ordinary title of Tartar chiefs,—and which has since spread to Persian gentlemen and become a common affix to the names of mahomedans of Hindustan of all classes and Qaan, as the peculiar title of the supreme chief of the Mongols. The conquest of China was commenced by Chinghiz, although it was not completed for several generations. In 1205 he invaded Tangut, a kingdom occupying the extreme northwest of China, and extending beyond Chinese limits in the same direction, held by a dynasty of the Tibetan race which was or had been vassal to the Kin. This invasion was repeated in succeeding years; and in 1211 his attacks extended to the empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chungtu or Peking. In 1219 he turned his arms against Western Asia, and conquered all the countries between the Bolor and the Caspian and southward to the Indus, whilst his generals penetrated to Russia, Armenia, and Georgia; but a lieutenant whom he had left behind him in the East continued to prosecute the subjection of Northern China. Chinghiz himself on his return from his western conquests renewed his attack on Tangut, and died on that enterprise 18th August 1127.

Okkodai, the son and successor of Chinghiz, followed up the subjugation of China, extinguished the Kin finally in 1234, and consolidated with his empire all the provinces north of the Great Kiang. After establishing his power over so much of China, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia, and Asia Minor, whilst another great host under Batu, the nephew of the Great Khan, conquered the countries north of Caucasus, overran Russia, making it tributary, and still continued to carry fire and slaughter westward. One great detachment under a lieutenant of Batu entered Poland, burned Cracow, found Breslaw in ashes and abandoned by its people, and defeated with great slaughter at Wahlstadt near Lignitz (April 12, 1241) the troops of Poland, Moravia, and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. Batu himself with the main body of his army was ravaging Hungary. The king had been very slack in his preparations, and when eventually he made a stand against the enemy, his army was defeated with great loss, and he escaped with difficulty. Pesth was now taken and burnt, and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear through Europe, which the defeat at Lignitz raised to a climax. Indeed weak and disunited Christendom seemed to lie at the foot of the barbarians. The Pope, to be sure, proclaimed a crusade, and wrote circular letters, but the enmity between him and the emperor Frederic II. was allowed to prevent any co-operation, and neither of them responded by anything better than words to the earnest calls for help which came from the king of Hungary. No human aid merited thanks when Europe was relieved by hearing that the Tartar host had suddenly retreated eastward. The Great Khan Okkodai was dead in the depths of Asia, and a courier had come to recal the army from Europe. In 1255 a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaelians or "Assassins" on the south of the Caspian, and then successively against the khalif of Baghdad and Syria. The conclusion of this expedition under Hulagu may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor Kulai extended indeed largely the frontiers of the Mongol power in China, which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and south-eastern borders, but he ruled effectively only in the eastern regions of the great empire, which had now broken up into four:—(1) the immediate empire of the great Khan, seated eventually at Khan balik or Peking, embraced China, Corea, Mongolia, Manchuria, and Tibet, and made claims at least over Tunking and countries on the Ava frontier; (2) the Chagatai khanate, or Middle Empire of the Tartars, with its capital at Almalik, included the modern Dsungaria, part of Chinese Turkestan, Trans-oxiana, and Afghanistan; (3) the empire of Kipchak, or the Northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai on the Wolga, covered a large part of Russia, the country north of Caucasus, Khwarizm, and a part of the modern Siberia; (4) Persia, with its capital eventually at Tabriz, embraced Georgia, Armenia, Azerbaijan and part of Asia Minor, all Persia, Arabian Irak, and Khorasan.—*Yule Cathay, I. p.* cxxi.

TEN, Tam. South.

TENA, Tel. Tam. Bee. Honey.

TENA MARM, Tam. Cocos nucifera.

TENARY ELLE, Tam. Cadaba Indica.

TENASSERIM is that tract of country lying between 17° and 18° N. latitude along the eastern side of the Bay of Bengal, and between it and a high chain of hills about 40 miles inland, and includes the Mergui Archipelago, that is, the chain of islands along the coast 15 or 20 miles distant from it. The surface of the country is mountainous, thinly populated, and much intersected by streams. Between the sea and the boundary range is another lower one, separated from the higher by the river Tenasserim. The grand range is in some places 5,000 feet high: its breadth at Martaban has never been ascertained, but further south, in the latitude of Tavoy, it appears to be 40 miles across, whence it gradually narrows to 10 miles near Mergui. The whole range is covered with pathless jungle, and may be said without exaggeration to be without a human habitation of any kind. The coast is very irregular, and low for some miles inland, consisting of uncultivated mangrove islands. The Tenasserim, which rises in about 16° N. latitude, flows through a valley scarcely broader than its bed to the southward, the easiest navigable for large ships, although, in 1825, the cruiser "Thetis" sailed up the southern entrance as far as old Tenasserim. The river is navigable for boats for 100 miles. After the permanent establishment of the Portuguese in India, trading emporia were pushed forward to all the ports previously known to and frequented by the Arabs; Ceylon, Martaban, the city of Tenasserim on the smaller stream of that name in Lat. 12° 5' N., Junk-Ceylon and Malacca became ports of trade in which factories were permitted to be held under treaty with the native powers, and which until the advent of the Dutch in the Indian seas, formed a monopoly of wealth and influence to the Portuguese. During the latter part of the 16th century the Portuguese, Genoese and Dutch held commercial intercourse with Martaban, then a sea-port town, and with the city of Tenasserim in the present Mergui district. Tin was the chief article of trade, with gold, gems of the sapphire class, aromatic woods, skins of leopards and other wild animals, dye wood, supposed to be sapan wood, dried fish and petroleum. During the wars which occurred between the Burmese and Talien race, for supremacy, and the aggressive excursions of the Siamese, the populations that once worked the tin mines as a means of subsistence were dispersed, and the country left to great decay and ruin. The present trade of Maulmain is dependent solely on importations from the contiguous foreign states, upon which the vitality of Maulmain depends. The authorities near the Tenasserim province are the Yoon of Zimmay, Laboug and Lagong of the east, and the Red Karen on the west bank of the Salween; the former have on all occasions evinced a high appreciation of the friendly intercourse which has been uninterruptedly maintained. From the ranges of mountains forming the sources of the Ye River in Lat. 14 ° 40′ N., eastwards to the Bay of "Henzai" and on to the Pok-chan boundary river in Lat. 10° 10′ N., the upraised granite is highly stanniferous, more so in some localities than others, as in the low hills in the vicinity of Malewan on the Pok-chan, and at several points near Mergui where the ore has been found in large masses of marled crystals of a pure peroxide not exceeded in richness by either the mines of Banka or those of the most productive of Cornwall; all the mountain streams which issue from the central ranges of hills throughout the line indicated, possess a portion of stream ore as a constituent quite sufficient to repay a properly organized plan of extraction, and in the alluvium which formed the ancient water courses, the tin beds are to be found in their vicinity and indicate the presence of old workings, the source of their former importance: these beds are from 3 to 12 feet in thickness, and give a proportion of washed ore equal to the best average of the Junk-Ceylon mines.

Gold is present with tin. The Siamese government obtains a large amount of gold annually from the washing of the streams which flow into the Gulf of Siam, on the eastern flanks of the mountain ranges under notice. Some of the richest workings are situate on streams forming the affluents into the "Lenyah River" below Mergui, within British territory.

Coal was worked near Mergui, but after a considerable outlay abandoned owing to its impure quality; that as well as a similar deposit found on the Tenasserim river belongs in fact to a distinct series of carboniferous deposits, pertaining more to "lignite." True coal is found in great abundance and of first rate quality at the head waters of the Nawoon stream, a branch of the lesser Tenasserim river.

Iron is found throughout the whole surface of the provinces in the state of oxide, in extensive clay ironstone beds, and as magnetic ore, the former on the Gyne river, and the latter on the Tavoy Island, and at several localities on the course of that river. There is a magnetic hill near Tavoy, and ore occurs at places on the course of that river, and antimony, manganese, galena, bismuth and copper ores. The limestone of the mountain groups occurs in a variety of forms, and hard, compact and variegated marble, are present and available for all commercial purposes. In the islands of the Mergui Archipelago the only inhabitants are the "Selung," a race who reside permanently in their boats and occasionally bring to the ports on the coast for sale, tortoise shell, the larger shells of the Triton and "Nautilus," valuable for their mother-of-pearl, the gigantic "Tridacna," and pearls from a "Meleagrina," found in the deep bays of Lampee Island, also "Beche-de-mer," "Sharks fins," "dried fish," and occasionally "Edible Birds nests."

The following woods occur:—"Anan," Fagrea fragrans; "Padouk," Pterocarpus; "Thengan," Hopea odorata; "Baub wai," Careya; "Peingado," Dalbergia? Some of these, especially the "Hopea," are the giants of the forest vegetation, from whose enormous boles the bottoms of the sea going Cattoo are constructed. Of these woods several would be found more serviceable than teak for lining iron-plated war-vessels, their power of resistance being superior to that timber, and they would also serve for beams and scantling of the larger dimensions in the construction of those vessels. The native fishermen obtain for their nets, lines and ropes of a strength of fibre and durability equal to the best of European manufacture: and they obtain "tannin" from the salt-water mangroves.

The province of Tenasserim is separated from Pegu by the Sitang river, and extends south to the commencement of the Malayan peninsula, including the districts of Martaban, Tavoy and Tenasserim. The coast is generally alluvial; tidal channels, which separate a broad and continuous belt of island from the main, run into the interior, and the hilly tracts are covered with dense forest. The summer rains are everywhere heavy and long continued, commencing in May or the beginning of June, and lasting till November, and amounting at Tavoy to 208 inches, and at Maulmain to 175. The vegetation of Tenasserim is a continuation of that flora which, commencing in Sikkim and Bhotan, is continued throughout the Malayan Archipelago. Teak is common in the interior, but has its southern limit in 15° N. lat., where the mountains become too humid for its growth.—*Mr. E. Riley, Hooker and Thomson Flora Indica.*

TENDU, also Tendua, Hind. Ebony. Diospyros ebenum, also D. lanceolata, hill ebony, and D. melanoxylon.

TENG, a Burmese grain-measure, equal to about two bushels, and usually termed by foreign merchants a basket.—*Simmond's Dict.*

TENGA, Tam. Cocos nucifera. cocoanut.

TENGAH, Malay. A variety of the mangrove (Rhizophora) exported extensively to China, where it is used for tanning leather and fishing nets, and is used locally as a dye, a decoction of it producing a deep black colour when the cloth or substance has previously been dyed blue. It is plentiful in the mangrove forests on the coast and river banks of the province Wellesley.

TENGAI, Tam. Cocos nucifera, *L.*

TENGALAI, lit. the southern branch, a sect among the southern Vaishnavas, distinct from the Vadagalai, or northern branch.—*Wilson.*

TENGA PUNNAKU, Tam. Cocoanut oil.

TENGGER MOUNTAINS, a range in Java connected with Gunungdasar E. of Surabaya; where a remnant of the people still follow the hindu worship. These people occupy about forty villages, scattered along this range of hills in the neighbourhood of what is termed the sandy sea. The site of their villages, as well as the construction of their houses, are peculiar, and differ entirely from what is elsewhere observed in Java. They are not shaded by trees, but built on spacious open terraces, rising one above the other, each house occupying a terrace, and being in length from thirty to seventy, and even eighty feet. The door is invariably in one corner, at the end of the building, opposite to that in which the fire-place is built. At the interment of an inhabitant of *Tengger*, the corpse is lowered into the grave with the head placed towards the south (contrary to the direction observed by the mahomedans), and is guarded from the immediate contact of the earth by a covering of bamboos and planks.—*Raffles' History of Java, Vol. I, pp.* 329, 331.

TENG-I-TEKO. See Mommai.

TENG-KHAT, Burm. ? A heavy solid wood of Amherst, fit for turning purposes, used for rice-pounders, &c.—*Cat. Ex.* 1851.

TENGSA. See India.

TENGURI. Beng. Stilago diandra.

TENG YET, or Ten yet, Burm. Cæsalpinia sappan.

TENIMBER ISLANDS. See Timor Laut.

TENKAYA. Tel. Cocos nucifera, the nut. Several products of this useful palm receive distinct names, as Tenkaia bellam, sugar from the palm; Tenkaia gurutu————? Tenkaia kalu, palm-wine; Tenkaia nunai, cocoanut oil. The cocoanut palm is called in Telugu by two names, Tenkaya chettu, and Kobbari chettu.

TEN-MOZHUKU, Tam. Bees' wax.

TEN-MU, Hind. Lit. three mouths, properly Tin-mu, the name of the river formed by the junction of the Chenab, Jhelum and Ravi. At Multan it is half a mile wide.

TENNA, Maleal. Setaria Italica; Panicum Italicum, *Linn.*

TENNAM KITTU. Tam. Cocoanut leaves used in thatching.

TENNA MARAM. Tam. Cocoa-nut palm. Tennam-Kai, nut. Tennam-nar, the coir fibre. Tennam-kaloo, the palm wine, Tennam oli, the cadjan leaf used for writing on with a style instead of paper and a pen, Tennam vellum, sugar.

TENNEY, Tam. Setaria Italica, Panicum Italicum, Millet.

TENNUS. Mahr. Dalbergia Oojeinensis, *Roxb.*

TEN-SIO-DAI-SIU. See Japan.

TENT CLOTH. Eng. Canvas.

TENTI, Hind. Capparis aphylla.

TENTS are used throughout India by all travellers of any position, and during war, are carried by the armies of the British and native states of India. They are made of cotton canvas, lined or unlined, receive different names, and cost various sums. A double-poled regulation tent, of four cloths throughout, with four feet verandah, complete, with carpets, bamboo chicks, purdahs, gunny bags and ropes, 28 feet by 16 feet will cost Rs. 670, and 23 feet by 14 feet will cost Rs. 520.

A single-poled regulation tent, of four cloths throughout, with four feet verandah, complete as above 16 ft. sq. will cost 450 Rs., 12 ft. sq. will cost 310 Rs.

Hill tents with four folds of cloth throughout, complete as above, 14 ft. sq., with two saiban, 265 Rs., 10 ft. sq. with two saiban 200 Rs.

Swiss cottage tents, double fly, with saiban, complete as above 16 ft. sq., 390 Rs., 12 ft. sq. 300 Rs.

Rowti, five cloths to the fly, and four to the kanat, complete as above 16 feet by 14 feet 210 Rs., 13 feet by 12 feet 175 Rs.

Shameeanah, 40 ft. sq. and 12 poles 400 Rs., 15 ft. sq. and 4 poles 90 Rs.

Beechobah tents, five cloths in fly, and four in kanat, as above, 12 ft. sq. 135 Rs., 8 ft. sq. 90 Rs.

TENTOOLLEE or Koyan, Uria? Tamarind tree?

TENTUKI, the Malayala name of a Ceylon tree which grows to about twelve or eighteen inches in diameter, and twelve feet high: it cannot be considered valuable. It is sometimes used by the natives for inferior and common purposes.—*Edye on the Timber of Ceylon.*

TENU. Tam. Bee.

TEOLUN NADDI, a small stream near Neemuch.

TEORA, Beng. Lathyrus sativus, blue flowered chickling vetch. The expressed oil of the seeds is a powerful and dangerous narcotic.

TEORIE, Beng. Hind. also Doodh-kalmi, Ipomœa turpethum.

TEPHRODORNIS, a genus of birds, belonging to the Dicrurinæ or Drongo shrikes, of the family Laniadæ. T. affinis and other species occur in India.

TEPHROSIA, a genus of plants of the order Fabaceæ of which about thirty species occur in the south and east of Asia. Tephrosia piscatoria, the Fisher's tephrosia, contains the narcotic principle of the genus, and is used in the East Indies for the same purposes as T. toxicaria is in the West Indies.—*Eng. Cyc.*

TEPHROSIA PURPUREA, Pers.

T. stricta,	*Grah.*	G. colonila,	*Ham.*
T. lanceæfolia,	*Lind.*	G. lanceæfolia,	*Roxb.*
Galega purpurea,	*Linn.*	G. cærulia,	*Rottl.*

Ban-nil,	Beng.	Punkhi,	Sans.
Surpunka,	Hind.	Kat Kolingi,	Tam.
Kolinil,	Maleal.	Vempali; Bonta Vempali,	Tel.
Bansa	Panjab.		
J'hojru,	,,	Tella Vempali	,,

This occurs in the Punjab and North-west Provinces of India, from the Salt Range to Dehli, and is common on the eastern coast of the peninsula. In Harriana the twigs are used for making baskets. The root is bitter, and given by the native practitioners in dyspepsia and chronic diarrhœa.—*O'Shaughnessy, page* 292.

TEPHROSIA LANCEÆFOLIA, Linn. syn. of Tephrosia purpurea, *Pers.*

TEPHROSIA TINCTORIA.

T. hypargyrea,	*DC.*	T. nervosa	
Galega Heyneana,	*Roxb.*		
Ceylon Indigo,	Eng.	Anil,	Singh.

This plant is found in Mysore and in Ceylon. It yields a blue colouring matter, used for the same purposes as indigo.—*Voigt.*

TEPHUM, Mahr. a drill.

TEPPICHE. Ger. Carpets.

TEPURIYA, Beng. Physalis Peruviana.

TER. See Swastika.

TER SULPHIDE OF ANTIMONY, Sulphuret of antimony.

TERAGAY, the chief of the tribe of Berla, a man of distinguished piety and liberality.—*Markham's Embassy, p.* 13.

TERAH, father of Abraham. He left Ur of the Chaldees for Horan (Harra) *i. e.*, back towards Asroene or Sarug, on the way to Canaan.

TERAI, a valley at the foot of the Himalayas. For nine or ten months a disease, denominated by the natives the "Ayul," renders the Terai impassable to man, so deadly are its effects even to the natives of the country. At the north foot of the Khasia, in the heavily timbered dry Terai, stretching for sixty miles to the Burrampooter, it is almost inevitable death for a European to sleep any time between the end of April and November. Mr. H. Inglis was the only survivor of a party of five, and he was ill from the effects of his illness for upwards of two years, after having been brought to death's door by the first attack, which came on within three weeks of his arrival at Churra, and by several relapses. Temperature in September 77° to 80°; and in November 75° to 77°. The Terai of the Nepaul dominions is profitable from the revenue yielded by its productions. Valuable timber and turpentine, ivory and hides, are shipped down the Boori Gundak, on which river Segowly is situated, to Calcutta; still the cost of a government licence for cutting timber is so heavy as in a great measure to deter speculators from engaging in an undertaking in which so considerable an outlay is demanded, exclusive of the expenses attendant on the felling and transport of the timber. Besides the saul, the Terai contains ebony, mimosa, and other useful trees. Nepaul possesses mines of, sulphur, and it is said, of antimony.—*Hooker, Himalayan Journal, Vol* 1. *p.* 266. *Oliphant's Journey, pp.* 39, 173.

TERANA PALLAM. Tam. Webera corymbosa.

TERAP TREE, a tree of Malacca and Singapore.

TERAPHIN, mentioned in Gen. 31,19,30, 34, are Assyrian images.

TEREBELLUM, a genus of Gasteropodus molluscs.

TEREBINTHACEÆ, a natural order of plants, according to Jussieu, which Robert Brown subdivided into the five orders Anacardiaceæ, Burseraceæ, Connaraceæ, Spondaceæ, and Amyridaceæ.

TEREBINTHINA. Lat. Turpentine.

TEREDO. Pholas.

TEREDON. See Chaldeo.

TEREGAM. MALEAL. Callicarpa lanata.

TERMENTINA. IT. Turpentine.

TERHOOT, a revenue district of Bengal formed out of ancient Behar.

TERIN. See Kandahar.

TERK PLANT. See Kelat.

TERMES, the white ant.

White-ant	ENG.	Termites (pl.)	LAT.
Dewak	HIND.	Chellu,	TAM.
Do-tus	JAP.	Chathulu,	TEL.

Species of this insect are abundant in India, Ceylon, the Cape of Good Hope and St. Helena, and attract early attention from the large conical mounds of earth which they erect, and the destruction they produce in timber. The ordinary white-ant has the head large and rounded, and, besides the ordinary compound eyes, it has three ocelli, or simple eyes, situated on the upper surface ; the antennæ are as long as the head and thorax, inserted in front of the eyes, and composed of about 18 joints. The abdomen is terminated by two small jointed appendages. Sir J. E. Tennent remarks that as the lofty mounds of earth have all been carried up from beneath the surface, a cave of corresponding dimensions is necessarily scoopedout below, and here, under the multitude of miniature cupolas and pinnacles which canopy it above, the termites hollow out the royal chamber for their queen, with spacious nurseries surrounding it on all sides, and all are connected by arched galleries, long passages, and doorways of the most intricate and elaborate construction. In the centre and underneath the spacious dome is the recess for the queen—a hideous creature, with the head and thorax of an ordinary termite, but a body swollen to a hundred times its usual and proportionate bulk, and presenting the appearance of a mass of shapeless pulp. From this great progenitrix proceed the myriads that people the subterranean hive, consisting, like the communities of the genuine ants, of labourers and soldiers, which are destined never to acquire a fuller development than that of larvæ, and the perfect insects, which in due time become invested with wings and take their departing flight from the cave. But their new equipment seems only destined to facilitate their dispersion from the parent nest, which takes place at dusk, and almost as quickly as they leave it they divest themselves of their ineffectual wings, wearing them impatiently, and twisting them in every direction till they become detached and drop off, and the swarm, within a few hours of their emancipation, become a prey to the night-jars and bats, which are instantly attracted to them as they issue in a cloud from the ground. Those that escape the caprimulgi fall a prey to the crows on the morning succeeding their flight. The natives of India, also, in the morning, gather and eat them, fried with a little ghee, as they are pleasant tasted. One species of white ant, the Termes taprobanes, was at one time believed by Mr. Walker to be peculiar to Ceylon ; but it has recently been found in Sumatra and Borneo, and in some parts of Hindustan. There is a species of Termes in Ceylon (T. monoceros) which always builds its nest in the hollow of an old tree ; and, unlike the others, carries on its labours without the secrecy and protection of a covered way. The cobra snake generally makes its home in the caverns of the white-ant, and it is believed to live on the termites within. At Vasarapad, near Madras, are many ant-hills with numerous snakes.—*Tennent's Sketches of the Natural History of Ceylon*, p. 4' 3·415. See Termitidæ, Termitinæ.

TERMINALIA. This genus of plants is found in the tropical parts of Asia and America, and many of them furnish valuable timber and other useful products. The genus belongs to the natural order Combretaceæ, has about 23 species, 17 of which are natives of the E. Indies. The bark of Terminalia arjuna is used in India in medicine, for its astringency, and in dyeing, as that of Bucida buceros in Jamaica, and that of Terminalia benzoin in the Isle of France. The galls found on the leaves of T. chebula are powerfully astringent and used in dyeing yellow and black, the ripe fruit of T. bellerica is reckoned astringent, and that of T. Moluccana is like it. That of T. chebula, in an unripe state, and of different ages, has long been known under the names of black, yellow, and chebulic (Kaboolee from Cabool) myrobalans, and considered generally laxative. The fruit of T. citrina, of T. angustifolia, of T. Gangetica, is like that of T. chebula, and employed for the same purposes. The kernels of T. catappa have the same hindi-persian name "badam" applied to them, as to those of the common almond ; they are eaten as such, and are very palatable. Dr. Royle had seen the tree as far north as Allahabad, in gardens. The kernels of T. Moluccana, and those of T. bellerica, are also eaten. From the latter a gum exudes, as from Combretum alternifolium in South America. A milky juice is described as flowing from T. benzoin, *Linn.*, which, being fragant on drying, and resembling benzoin, is used in churches in the Mauritius as a kind of incense. The 17 species found in the East Indies are as under :

angustifolia,
arjuna,
bellerica,
berryi,
bialata,
catappa,
chebula,
citrina,
coriacea,
crenulata,
fatræa,
glabra,
gangetica,
moluccana,
paniculata,
procera,
tomentosa.

Some species are as yet undetermined. Dr. Mason says that the Tenasserim provinces yield the T. chebula, and two other species, one of which he describes as "the bitter wood of Tenasserim," a small tree, used for boats in the neighbourhood of Amherst, and exempt from the attack of the teredo. The good timber and bitter bark, assimilate it to Roxburgh's Pentaptera arjuna, but the foliation is different. The other species, a large timber tree, is common in the interior; its winged fruit indicates its connection with Dr. Roxburgh's genus Pentaptera. One species, Hanagal, Canarese, is a Mysore wood, used for furniture and house building. Another species, Kosee, Tel., is a tree of Ganjam and Gumsur, extreme height 50 feet, circumference 4 feet, and height from ground to the intersection of the first branch, 22 feet. It is used for posts, door frames and rafters, and is burnt for firewood, being tolerably plentiful. Another species, Arjuna, Tel., either T. alata or T. glabra ? is a tree of Ganjam, extreme height 100 feet, circumference 8 feet, and height from ground to the intersection of the first branch, 36 feet. This is used for making boats in the same way as the Holondho and Jamo. The tree is not very common in Gumsur, but abounds in the forests of Bodogoda. Every member of the genus Terminalia yields useful timber. In the celebrated myrobalans of ancient and eastern pharmacy, an astringency is the prevalent principle, although the fruits of Terminalia chebula are gently laxative also. T. catappa affords edible kernels, like almonds, and are named *badam*. T. benzoin of the Mauritius gives a milky juice, which becomes fragrant as it dries, and is burned as incense in churches.—*Fleming, As. Res. XI. p.* 182, 8vo. *Voigt. Roxb.*

TERMINALIA ALATA. AINSLIE; *W. Ic.*

Terminalia tomentosa, *Roxb.*

The bark.

Marudum bark,	ENG.	Marudum pattai,	TAM.
Arjuna,	SANS.	Muddie patta,	TEL.

This tree, of the Punjab and the peninsula, often grows to a very large size. Its wood is employed for long beams in house building, and in the northern parts of Canara it is used for making boats and canoes. The Aurora cruiser was built of this wood. Specimens of wood sent from Chota Nagpore to the Exhibition of 1862, as that of this Terminalia, was described as a hard, brown timber. Fruit glabrous, bark deeply cracked, astringent and febrifuge. The bark, as it appears in most of the Indian bazars, is of a reddish brown colour, and has a strong, but not unpleasant, astringent taste. In the southern provinces, the powder of it, in conjunction with gingeli oil, is used as a valuable application for the kindatalie (Apthæ of grown people), and the Akkirum, or Apthæ of infants. In the Wynaad, it is used for the same purposes as Ben teak, under which name it is frequently sold. It is common on the Western Ghauts, and in Wynaad: wood not durable.—*Ains Mat. Med. p.* 209. *Roxb. Fl. Ind.* ii. 440. *O'Shaughnessy, p.* 340. *Drs. Wight and Gibson. Cal. Cat Ex.* 1862.

TERMINALIA ANGUSTIFOLIA. JACQ.

T. benzoin, *Linn.* | Catappa benzoin *Gærtn.*
Narrow-leaved Terminalia, ENG.

The dried milky juice of this small tree is fragrant and resembles benzoin, for which it is used as a substitute in the Mauritius churches. Its fruit, one of the myrobalans, is used similarly to those of Terminalia chebula. The three kinds of myrobalans yield, with alum, a good durable yellow, and with salts of iron, a black colour. They are in very common use in India, and have been so from time immemorial, they have been introduced into Great Britain for tanning purposes, and a large quantity is annually imported. Flowers small, green, odoriferous, March and April. A milky juice flows out from this tree, which being fragrant on drying and resembling benzoin, is used in churches at the Mauritius as a kind of incense.—*Royle. Eng. Cyc. Voigt. Cat. Ex.* 1862.

TERMINALIA ARJUNA. W. AND A.

Pentaptera arjuna, *Roxb.*

This tree grows in the Punjab, in Bengal, in the Erawadi jungles south east of Surat, and in Canara and Sunda, but only by rivers and streams, mostly below the ghats, and reaches there an immense size. As a forest tree, it is rare in the northern parts of the Bombay side, but very common in the south Konkan from Ramghur southward, and there too always found in the vicinity of streams and rivers. It reaches everywhere a very large size, and is esteemed equal to the Black Aeen, though the rapidity of its growth would hardly countenance this opinion. In the Central Provinces it grows almost exclusively on the banks of rivers, and to an enormous size; but being frequently rotten at the heart, it does not always reward the labour of cutting. In the southern forests of Pegu, next to teak, the most valuable kinds of timber found in abundance, are T. glabra and T. arjuna, which present clean trunks of six to eight feet in diameter, and fifty to eighty feet high without a branch. They would afford excellent mast-pieces and spars for naval purposes, and might be tried for gun carriages. its wood is there dark brown, as strong as teak, and usually attains a girth of from seven to nine feet, with height in still more lofty proportion. It is heavy, but splits freely when exposed to the sun's rays, white ants attack it, seeming to prefer moist situations. Its strength is undoubted, and carefully selected specimens would be valuable as a tie beam and rafter wood. In Nagpore, the length of the timber is from 18 to 30 feet, and girth from 4½ to 4 feet, and it sells there at 5½ annas the cubic foot. The bark is justly celebrated as an application to wounds.—*Drs. Voigt, Gibson, McClelland, J. L. Stewart and Mason. Capt. Sankey.*

TERMINALIA BELERICA. Roxb.

T. punctata, *Roth. ?*	Myrobalanus bellerica ?

Beleyleb,	PERS.	Bahadrha,	,,

This very large forest tree has a straight trunk and a spreading head. It grows in Ceylon up to an elevation of 2,000 feet. on the open grassy plains, and it is found in the peninsula of India and in Pegu. The tree is not uncommon in the Walliar jungles, of Coimbatore, but is considered of no value there. It grows on the Sevalik tract, and at Peshawar, and occurs planted up to the Indus. Grows also in Goalparrah, Sukanaghur, Goruckpur, Dhomtola, Morung mountains. Flowers small, greyish-green, offensively smelling. The wood is white and soft and is not much used. In the Bombay Presidency, this is found abundantly both in all the inland and the coast jungles, but although one of the largest and finest looking trees in the forest, straight, and of great scantling, it is quite useless as a building timber, being immediately attacked by worms. In Ganjam and Gumsoor it is said by Captain Macdonald to be a tolerably common tree ; it attains an extreme height of 50 feet, and from the ground to the intersection of the first branch, is 10 feet. It is common throughout British Burmah. A cubic foot weighs lbs. 40, and in a full grown tree on good soil, the average length of the trunk to the first branch is 80 feet and average girth measured at 6 feet from the ground is 12 feet. Bark, when wounded, gives out a large quantity of an insipid gum arabic. Its fruits are known as the Beleric myrobalans, they are astringent, tonic. Kernels, tasting like filberts, eaten by the natives, and held to be intoxicating when eaten in abundance. It attains full size in 60 years ; the people of Canara consider it unlucky to employ it in house building. Fruit astringent, used medicinally, and for tanning leather, and forms one of the ingredients for making ink. It is a good avenue tree and is extensively cultivated for the sake of its dense foliage, as the leaves are considered the best and most nutritious of all fodder for cattle, particularly for milch cows. The oil separates into two portions—the one fluid, of a pale oil green color, and the other white, flocculur and of the consisence of ghee.—*Madras Museum Report. Simmonds, p.* 510-514. *Drs. Roxb, W. and A., Wight, Gibson, Brandis, McClelland, Voigt and Cleghorn, Captain Macdonald.*

TERMINALIA BERRYI. W. AND A.

Pentaptera angustifolia, *Roxb.*

Vella murdah wood,	ANGLO-TAM.	Vellai marudu,	TAM.
		Vallay murda	,,

This, a tree of the peninsula of India, attains a very large size, especially at the foot of the western ghats, where it is used for canoes. It is not indigenous in the Bombay forests, but grows on the Balaghut, on the banks of the Kali naddi and Gutpurba, and has been introduced into Coimbatore. The bark is quite smooth and nearly as green as the leaves. The wood is white, described as of ordinary quality, but used on the Malabar coast for canoes and for making the broad wooden platters in use among fishermen and ship lascars.—*Drs. Wight, Gibson, Voigt, p.* 30.

TERMINALIA BIALATA. WALL.

Pentaptera bialata, *Roxb.*		Lein.	BURM.

A tree of the mountainous parts of India, with small greenish yellow flowers, common in British Burmah and growing in Martaban, but the wood is not used. A cubic foot weighs lbs. 39. In a full grown tree on good soil the average length of the trunk to the first branch is 80 feet, and average girth measured at 6 feet from the ground is 12 feet.—*Drs. Voigt, Brandis. Cal. Cat. Ex.* 1862.

Hinghudi,	Sans.	Badame vittulu,	Tel.

This beautiful tree, with small purplish green flowers, grows in the Moluccas, in both peninsulas of India, in all parts of the Deccan, in Bengal, and is common in the gardens of Europeans and natives of the Madras and Bombay presidencies. It attains a large size in Malabar, where the wood is said to be much esteemed, and in the forests of the Godavery it is said to be very strong. Dr. Gibson, however, says that the wood does not appear to him to be of average quality or fit either for public or domestic purposes, except as firewood. The English in India call it the Indian almond tree with reference to the oval and flattened shape of its drupe. The kernel, however, is cylindrical, it is eaten and is palatable, resembles the almond in taste and composition, and yields an excellent oil. The bark and leaves yield a black pigment which is made into Indian ink. It is raised easily from seed, and in a good light soil, well watered, will, in two years, be ten or more feet in height, and give blossom. It is rather a handsome tree, and from its large leaf (which turns red previous to its falling off,) has a very striking appearance. Mr. Latham says, in Nalla mallai, it is a serviceable wood, chiefly used as posts. Its colour is yellowish-brown and it has a close grain. Captain Beddome says that as it occurs in the forests of the Godavery, the wood is very strong, and Voigt says the wood is good.—*Useful Plants, Drs. Voigt, Gibson, Wight, Cleghorn, O'Shaughnessy, Irvine, and Riddell. Captain Beddome.*

This tree grows in Ceylon, in both the peninsulas of India and northwards to Nepaul, the Punjab, and every where is a large tree; in Coimbatore it is of gigantic size, furnishing planks three feet broad. There, its wood is of a dark colour, heavy and hard, sustaining a weight of about lbs. 400, but is very cross grained, and difficult to work. In Canara and Sunda it abounds above the ghats, and the wood it yields is of average quality for houses. In the Bombay jungles it is more rare than on high table land on and near the ghauts. The wood there, also, is strong and rather hard, but on that side of India it does not reach any great size, and is generally gnarled, owing to the exposed situations in which it grows. Also, Dr. Gibson is of opinion that in describing it as a most gigantic tree, Dr. Wight must have confounded the wood of Terminalia bellerica with that of this tree. Captain Beddome says its timber from the Godavery is very hard. In Ganjam and Gumsur, where it is tolerably plentiful, its extreme height is 45 feet, circumference 4½ feet, and its height from the ground to the intersection of the first branch is 20 feet, and it is employed for the beams and rafters of houses, but, on account of its abundance, chiefly for firewood. On the Godavery it is said to yield a very hard valuable timber. In Nagpore, according to Captain Sankey, the average size of its timber is 16 feet with a girth of 4½ feet, and sells there at 5¼ annas per cubic foot. There, the Hurda has a yellowish colored wood which becomes very dark on the outside in the process of seasoning, it is attacked by white ants, and is inferior in strength to teak, appears to have but little essential oil, and is said to be very subject to dry rot. Its value is principally from the ease with which it works. According to Dr. McClelland, in Pegu it is a large timber tree, plentiful throughout the teak forests, and yielding wood of a red colour, strong, adapted for house building. Dr. Brandis adds, that it is common on the hills of British Burmah, and gives a valuable wood used for yokes and canoes, the heartwood being yellowish brown. A cubic foot weighs lbs. 53 In Pegu, in a full grown tree on good soil, the average length of the trunk to the first branch is 80 feet, and the average girth measured at 6 feet from the ground is 12 feet. It sells there at 12 annas per cubic foot. Dr. Cleghorn says that when used as sleepers for railways, in Southern India, it appears to be liable both to the attacks of fungi and of the carpenter bee. Its fruit is used by tanners. The leaves are punctured by an insect, and hollow galls are developed, which are powerfully astringent, and answer well for tanning and making ink. They also yield for chintz painters and carpet weavers, their best and most durable yellow. (Roxb.) The fruit, which is largely exported, is well known for its dyeing properties, yielding also a black dye, and is substituted for gall nuts. It is also used medicinally. The astringent bark is also said to be employed in tanning. The fruit and galls are used by dyers and harness makers; with alum they give a durable yellow, with ferruginous mud an excellent black, and they make useful ink. The unripe fruit are known as black, yellow and chebulic (Kabuli) myrobalans from their colours, which vary according to age.—*Drs. Royle, Cleghorn, Gibson, Wight, McClelland, Voigt, and Brandis, Captain Macdonald, Captain Beddome, Mr. Latham, Thwaites, and Captain Sankey.*

TERMINALIA CITRINA. Roxb.

Myrobalanus citrina, *Gærtn.*

Huri tuki.	BENG.	Liba,	SANS.
Haria, Harra,	HIND.		

A very large and tall timber tree of Assam and the Khassya hills, and is common in the Kotah jungles. The wood is very hard and shunned by insects. Drupe oblong, lanceolate, about two inches long, two in circumference, obscurely five-grooved, dull orange yellow, smooth; nut oblong, deeply five-grooved, one-celled. Fruit a gentle purgative. It is often made into a pickle. The fruit is used as that of T. chebula. All these myrobalans are largely collected, and used by the natives in dyeing and in medicine.—*Irvine, Gen. Med. Top. p.* 103. *Voigt, Roxb. Fl. Ind. Vol.* II. *p.* 436. *O'Shaughnessy, p.* 340.

Ayni	of N. ,,		

A largo tree of peninsular India, is a valuable, well known timber tree of the Godavery forests and very common in Malabar, both above and below the ghauts. The Aeen or Ayni of Malabar is the Artocarpus hirsuta. The wood is there very durable, and is used in house, ship, and boat building. In Canara and Sunda, it is the most common tree in the large jungles both above and below the ghats, and is there used for beams and pillars for houses: also for ships and boats. The heart wood is one of the most durable known. It seems to be regarding this tree that Dr. Gibson speaks when he mentions that several of the forest revenue officers have expressed their opinion that the exporting of Aeen for "keeta" or firewood, should be prohibited. It is employed by the Telegraph department for posts, along with sal and teak. It has small dull yellow flowers, and its wood is strong, hard and heavy, and made into solid wheels for buffalo carts.—*Drs. Gibson, Cleghorn, Forests and Gardens, p.* 267 *and Voigt, p.*38. *Captain Beddome.*

TERMINALIA CRENULATA. W. & A.

Pentaptera crenulata, *Roxb.*

A tree of the peninsula of India, with good timber.

Arjun	,, PUNJAB.	Sahajo,	URIA.

A valuable timber tree, with a large and lofty trunk, a native of Sylhet, Monghyr, Rajmahal, and it grows throughout the peninsula of India, south to Ceylon, where it is very abundant up to an elevation of 2,000 feet. It is a large tree, procurable in Coimbatore, and found most abundantly in all the coast jungles of the Bombay Presidency, as also in those above the ghauts. The wood is dark coloured, very hard, heavy and strong, inch bars, bearing from 430 to 450 lbs., and large beams of it were, in 1850, readily procurable for house building, for which and many other purposes it is valuable. It is a good wood for trenails, but they should have a second seasoning after they are manufactured, as there is a material shrinking immediately after the piece has been cut out of the log and shaped, and their ends should be dipped in tar to preserve them. It is very hard, heavy and durable under water; in Ganjam and Gumsur, its extreme height is 60 feet, circumference 4½ feet, and height from the ground to the intersection of the first branch, 30 feet: it is one of the commonest trees in those jungles, cattle sheds are sometimes floored with it, and rice pounders are also said to be occasionally made of it; it is extensively used for firewood and in making potash. The bark is used for tanning.—*Drs. Voigt, Wight, Cleghorn and Gibson, Thwaites. Captains Beddome and Macdonald. Mr. Latham.*

TERMINALIA INTERMEDIA. SPR. syn. of Terminalia catappa, *Linn.*

TERMINALIA MACROCARPA. BRANDIS.

Htouk-gyau, BURM.

One of the largest trees in Pegu, and very common; the stems are of very regular shape, heartwood dark brown, and used for house posts and planking. A cubic foot weighs lbs. 58; in a full grown tree on good soil the average length of the trunk to the first branch is 80 feet, and average girth measured at 6 feet from the ground is 12 feet.—*Dr. Brandis. Cal. Cat. Ex.* 1862.

TERMINALIA MOLUCCANA. WILLD.

Kala drooma, SANS.

A native of the mountainous countries of the N. E. of Bengal, on the Khassya mountains Assam, &c. Drupe round, ovate, size of a large nutmeg, used as T. bellerica, for which it is substituted. Fl. small, dull yellowish brown, unpleasantly smelling. There are two varieties, β. macrocarpa, largish-fruited; γ. microcarpa, small-fruited. Both kinds of fruit sold in the bazaar under the name of Buhura.—*Roxb. Fl. Ind. Vol. II, p.* 433. *O'Shaughnessy, page* 341. *Voigt.*

Ashan: Usan,	BENG.	Eyn,	MAHR.
Piya-shal,	,,	Eyne,	of NAGPORE.
Madi,	CAN.	Sein,	PANJ.
Karrai mutti,	,,	Maradu maram,	TAM.
Piasal,	DUK.	Carru maradu,	,,
Asan,	HIND.	Nalla maddi,	TEL.

Common in the ghauts of the Malabar coast, grows in the Concans, and at Monghir, Rajmahal and Oud'h; grows in abundance in the Nalla-Mallai, and is a well known valuable timber in the forests of the Godavery. In the Madras Presidency it is used for house building; it bears a good transverse strain, and is a wood much esteemed for all railway purposes. The Asan tree grows spontaneously in the Taraee jungles, and its wood is there considered durable and elastic, and for many purposes preferable to sal. In Nagpore, like Bejasar, this timber has white wood surrounding the body and heart, which is of a blackish colour; the ring however, in this case, does not exceed 1½ inch in breadth. The dark wood is extensively heavy, being exactly of the same weight as water, and has a much more winding grain than Bejasar. In strength it is far superior to all its forest congeners, and from the strength given by Barlow for American teak, it even appears to excel that celebrated timber; but in Nagpore, from the crooked manner in which the tree grows, seldom furnishing more than a 20 feet tie beam. It is a difficult timber to work up, splits freely when in exposed situations, and by all accounts is very subject to dry rot. Were the latter defect overcome by the steeping process, and the former guarded against, no timber can bear a comparison with it: for the joists of a terraced roof it would be invaluable. It is much used where toughness of fibre is of importance, as in gig-shafts. White ants will not attack it. It is both a tie beam and rafter wood. In Nagpore, its average length is 18 feet and the maxima 28 to 24 feet, and average girth 4½ feet, and its selling price 5 annas the cubic foot. Its astringent bark is used for dyeing black.—*Captain Sankey, Captain Beddome, Cal. Cat. Ex.* 1862. *Drs. J. L. Stewart, Voigt.*

TERMINALIA VERNIX. One of the trees which affords the celebrated Chinese black lacquer. It is a native of China and the Moluccas, and abounds in a resinous juice, which is collected and used in the natural state as a varnish.—*Eng. Cyc. O'Shaughnessy, p.* 341.

TERMINALIA VIOLATA.

Pauiah, BURM.

Both this and Terminalia belerica, "Laibwai" Burm. are very plentiful throughout the Pegu, Tounghoo, and Tharawaddy forests; the former less plentiful. Both are large timber, and would answer for all purposes of house-building. Wood white colored.—*McClelland.*

TERMITIDÆ. This family is distinguished by the following characters:—Wings with few transverse nervures, folding horizontally; tarsi 4-jointed; antennæ short and moniliform; body depressed. See Termes.

TERMITINÆ, a section of Neuropterous insects, in which Latreille includes the genera Mantispa, Raphidia, Termes, and Psocus. These genera, however, are usually regarded as constituting three distinct families.—*Eng. Cyc.*

TERNALLA BENDA. TEL. Sida alnifolia, *Willd.*

TERNATE, on the west coast of Gillolo, is a high island, but of small extent, being about 6 miles long. Fort Orange is in lat. 0° 49′ N., long. 127° 30′ E. The island of Ternate is governed by a sultan, who has sway over several other islands. The Dutch have a settlement here, and have long been on good terms with the ruling powers. It is the most important of the Molucca group, as it produces a vast quantity of cloves, besides every variety of tropical fruits. It was taken by the British in 1810, but was restored in 1815. This island is round, and about twenty-five miles in circuit, the land gradually rising to a huge peak in the centre. It is of volcanic formation, is well wooded, and abounds with game.--*Marryat's Indian Archipelago, p.* 45.

TERNATE CLITORIA. ENG. syn. of Clitoria ternatea.

TERNSTRŒMIA. Species.

Puzzeen zwa, BURM.

A large tree of Tavoy, used in building.—*Dr. Wallich.*

TERNSTRŒMIACEÆ, of DeCandolle, the Theads, a natural order of plants, chiefly trees or shrubs, forming 28 genera and including 132 species, of which 57 occur in the East Indies, in Java, Ceylon, both the peninsulas of India, the Khassya mountains, Assam, and Nepaul, viz. :—

1 Cochlospermum,
9 Ternstrœmia,
1 Anneslea,
1 Adinandra,
9 Eurya,
4 Cleyera,
12 Sauranja,
9 Gordonia,
7 Camellia,
1 Thea,
2 Shina,
? Pyrenaria,
1 Reinwardtia.

The tea plant is the most remarkable of this order.

TESSELARIA. See Diospyros reticulata.

TESTUDINARIA. See Dioscoreaceæ.

TESTUDINATA. See Chelonia ; Testudo.

TESTUDINIDÆ, a family of reptiles of the section A, cataphracta or shielded reptiles, order Chelonia, and including the genus Testudo and genus Homopus.

TESTUDO, the land tortoise, a genus of the order Chelonia, of which several species occur in the East Indies, viz. Testudo elongata; T. Horsfieldii ; T. Indica ; T. platynotus ; T. radiata ; and T. stellata. The affinities with Testudo shown in the shell and extremities of Colossochelys atlas, hold equally good in the construction of the head of Colossochelys. The head of the adult, to correspond with the dimensions of the shell, and according to the proportions furnished by a large Testudo Indica, was deduced to have been two feet long.

The generic name given by the discoverers of Colossochelys atlas has reference to the colossal size of the fossil (κολοσσὸς et χέλυς), and the specific one to its fitting representation of the mythological tortoise that sustained the world, according to the systems of Indian cosmogony. The first fossil remains of Colossochelys atlas were discovered in 1835, in the tertiary strata of the Sewalik Hills, or Sub-Himalayah, skirting the southern foot of the great Himalayah chain. They were found associated with the remains of four extinct species of Mastodon and Elephant, species of Rhinoceros, Hippopotamus, Horse, Anoplotherium, Camel, Giraffe, Sivatherium, and a vast number of other mammalia, including four or five species of Quadrumana, also a great number of reptilian forms, such as crocodiles, and land and fresh water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India, in particular to the Crocodilus longirostris, from the existing forms of which zoologists have been unable to detect any difference in heads dug out of the Sewalik Hills. The same remark applies to the existing Emys tectum, now a common species found in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. Prof. Thomas Bell, after a rigid examination, confirms the opinion that there are no characters shown by the fossil to justify its separation from the living Emys tectum. There are therefore fair grounds for entertaining the belief as probable that the Colossochelys atlas may have lived down to an early period of the human epoch and become extinct since:—1st, from the fact that other Chelonian species and crocodiles, contemporaries of the Colossochelys in the Sewalik fauna, have survived; 2nd, from the indications of mythology in regard to a gigantic species of tortoise in India.—*Jour. As. Soc. Ben.* No. 247 of 1855.

The four-horned antelope is the only species of a strictly Indian genus, of the sub-family Antelopinæ. It is of uniform brownish bay colour above, beneath lighter. Its length is 40 to 42 inches, height at shoulder 24 to 26 inches, anterior horns up to 1½ inches, and posterior horns 4 to 5 inches. It is found throughout much of India, but is unknown in the Malabar forest, Lower Bengal, valley of the Ganges, Ceylon, and further India. It frequents jungly hills, and open forests in the plains, abounds in the Eastern Ghats, occurs at the foot of the Himalayas, and is rare in Sindh and the Western Panjab. The specific term chickara, applied by Hardwicke, is erroneous, as throughout India the Indian gazelle is so called.

TEPETRADYNAMIA SILIQUOSA. See Mustard.

TETRAGASTRIS OSSEA. GÆRTN. Tremia nudiflora, *Linn.*

TETRAGLENES, one of the Coleoptera.

TETRAGONIACEÆ, a natural order of plants, of which two species, Sesuvium repens and Tetragona expansa occur in the East Indies, Sesuvium repens along the sea shores, and S. tetragona in Japan and N. Zealand.

TETRANTHERA. A genus of plants, belonging to the Lauraceæ.

T. apetala, *Roxb.*, Kookoor chita, BENG. is a tree of peninsular India, Bengal and Assam, and of the northern part of New Holland.

T. Gardneri, *Thw.* A tree 40 to 50 feet high, of the central province of Ceylon, at an elevation of 4000 to 6000 feet.

T. glaberrima, *Thw.*, a small Ceylon tree, growing at 4,000 feet elevation. Also, may be mentioned, T. longifolia, T. ligustrina, T. iteodaphne, small or moderate sized trees of Ceylon. T. monopetala of peninsular India and Oudh, also T. nemoralis, and T. ovalifolia of Ceylon, the last a tree 30 to 40 feet high, with T. Roxburghii of India and Ceylon, the Bo-mee-gass of the Singhalese. Wight gives in Icones T. glabrata, ligustrina, monopetala, Panamanja, tomentosa, and Wightiana. —*Voigt, Thwaites. Wight. Ic.*

TETRANTHERA MONOPETALA. ROXB.

Gwa ; Harein,	BEAS ASSAM.	Maida-lakri,	HIND.
Buro kukur chettu	BEN.	Nara chettu,	TEL.
Jungli rai am,	HIND.	Nara mamidi,	,,

A middling sized tree, native of the peninsula of India, of Bengal, Oudh, and the Siwalik. Its cinnamon smelling leaves are given to silk worms. The wood is not valued. The bark is used in medicine, being considered stimulant, and after being bruised, is applied fresh or dry to contusions, and sometimes mixed with milk or made into plaster.—*Dr. J. L. Stewart.*

TETRANTHERA NEMORALIS. THW. A plant of Ceylon in the Galle district, growing under the shade of large trees in forests. —*Thw. En Pl. Zeyl. p.* 255.

TETRANTHERA NITIDA. ROXB. Kintonijam, BENG. name in the neighbourhood of Silhet, where it is indigenous, and grows to be a useful timber tree of very great size. In the more remote forests which cover the Garrow hills, it is so large as to admit of being made into canoes of full fifty feet in length, for which purpose this tree is preferred.—*Roxburgh's Flora Indica, Vol. III., p.* 818.

TETRANTHERA ROXBURGHII. NEES.

T. apetala *Roxb.*,	*Corr.*	Sitsæa sebifera	*Pers.*
T. citrifolia,	*Juss.*	Sebifera glutinosa,	*Loureiro.*
Tomex sebifera,	*Willde.*

This tree grows in China, in New Holland, throughout India, in Assam, the Punjab, Siwalik tract, the Salt Range, to 2500 feet. Bark mildly astringent, used by the hill people in diarrhœa. It is the mueda lukree of Hindostanee druggists, and a favourite application to bruises and wounds. It is somewhat fragrant, and slightly balsamic and sweet. Tetranthera Roxburghii is a variable plant. The fruit is globose, black, and about the size of a pea, yielding a kind of greasy exudation, from which the Chinese manufacture candles of a bad quality, and which serves as a basis for salves. This fixed oil is supposed to constitute the principal part of the fruit of Persea gratissima, the Avocado Pear.—*Cat. Ex.* 62. *Thw. En. Pl. Zeyl. p.* 255. *O'Shaughnessy. Eng. Cyc.*

TETRANTHERA TOMENTOSA. WIGHT.

Mussay payettie, TAM.

A considerable sized tree, but not described by Roxburgh, though he is the authority for the name.—*Wight. Ic.* 1834.

TETRAONIDÆ, a family of birds, including the grouse, partridges, American partridges, quails, and Guinea fowl. The grouse are peculiar to the northern portions of both continents : partridges are found in Europe, Asia and Africa, disappearing in the Malayan peninsula except in its extreme west. Quails have the same distribution as the true partridges, but have a tendency to accumulate in the south-eastern portion of the Malayan peninsula, where with Turnix of the Tinamidæ, they are the only tropical Gallinaceous birds. The Guinea fowl are natives of Africa.

Sub-Fam. Tetraoninæ or true Grouse, as yet not observed in India.

Sub-Fam. Perdicinæ or Partridges ; those occurring in India may be divided into Snow cocks and Snow partridges peculiar to the highlands of central Asia and the Himalayas ; ordinary partridges, comprising the Francolin and Chakor ; Grey partridges, Wood partridges, and Bush quails ; the True Partridges represented by the grey partridge of Europe, with one species from Tibet, and the great group of African partridges.

I. *Snow Cocks and Snow Partridges.*
Tetrogallus Himalayensis, *Gray,* the Himalayan Snow Cock.
Lerwa nivicola, *Hodgson,* the Snow Partridge.
Partridges.
Francoliuus vulgaris, *Stephens,* the Black Partridge.
F. pictus, *Jard. and Selby,* the Painted Partridge.
II. *Rock or Sand Partridges.*
Caccabis chukor, *Gray,* the Chukor.
Ammoperdix bonhami, *Gray,* the Seesee Partridge.
III. *Grey or Bush Partridges.*
Ortygorius Ponticerianus, *Gmelin,* the Grey Partridge.
„ gularis, *Temm.* the Kyah Partridge
IV. *Wood Partridges.*
Arboricola torqueola, *Valen,* Black-throated hill Partridge.
„ rufo-gularis, *Blyth,* Rufus-throated hill Partridge.
Perdicula Cambayensis, *Latham,* Jungle Bush Quail
„ Asiatica, *Latham,* Rock Bush Quail.
„ Erythrorynoha, *Sykes,* Painted Bush Quail.
Sub-Fam. Coturnicinæ. Quails.
Coturnix communis, *Bonatere.* the large Grey Quail.
„ coromandelica, *Gmelin,* Black breasted Quail.
Excalfactoria Chinensis, *Linn,* Blue breasted Quail.

Dr. Hooker says that the Tetrao-perdix nivicola, the Himalayan grouse, is a small gregarious bird which inhabits the loftiest stony mountains, and utters a short cry of "Quiok, quiok." In character and appearance it is intermediate between grouse and partridge, and is good eating though tough.

The Tetrao Kata or sand-grouse, Pterocles melanogaster, called the rock-pigeon, is a fast-flying bird.

The Chakor, HIND., or Atash Khor, PERS. The chokor partridge, Tetrao rufus (perdix rufa, or Cacabis chukor of Jerdon,) is said by natives to be enamoured of the moon, and at full moon to eat fire. The two Persian words signify fire-eater. The chakor is an extremely common bird in all parts of the valley of the Indus, and throughout Tibet. In winter, when the hills are covered with snow, they are to be found in great numbers close to the rivers, even in the immediate neighbourhood of the villages ; in general, when approached, they lie close among the crevices of the stones. Dr. Thomson was invited by the thannadar of Iskardo to be present at a hunting party, which he had arranged for the capture of the chakor, or painted partridge, by surrounding a spot of ground, in which these birds are numerous, with a ring of men, who approaching from all directions, gradually form a dense circle of perhaps a hundred yards in diameter. When the partridges are disturbed by a horseman in this enclosure, they can only fly towards the living wall by which they are surrounded. Loud shouts, and the beating of drums and waving of caps and cloaks, turn them back, and they are driven from side to side till at last, exhausted with fatigue, and stupid from the noise and confusion, they sink to the ground, and allow themselves to be caught by hand. The scene was a very striking one. The spot selected was a deep dell, full of rocks, but without trees. The sport, however, did not seem so successful as usual, six or eight birds only being captured.—*Dr. Thomson's Travels in Western Himalaya and Thibet, p.* 2. *Jerdon's Birds of India. Hooker Him. Jour. Vol.* II. *p.* 113. *Burton's Pilgrimage to Meccah, Vol. I. p.* 226.

TETRAONYX BATAGUR. See Chelonia.

TETRAX CAMPESTRIS, the Otis tetrax

or 'little Bustard' of Europe, N. Africa, Asia Minor, Mesopotamia, and of the extreme N. W. of India in the Peshawur valley.

TETRODON, of the order Plectognathi, instead of having distinct teeth as usual in the class, have the jaws provided with a substance resembling ivory, formed somewhat like the beak of a bird, and fitted for crushing crustaceous animals and fuci, upon which they live. The Tetrodons are distinguished by the possession of four large teeth, the jaws being each divided by a central suture. These fishes are confined to the seas of warm climates : some of them, as also the Diodon, are called Globe-fishes. Species of Tetrodon are capable of inflating the abdomen, and in this state, when taken or handled, they emit a grating sound. They are also remarkable for tenacity of life, which they are capable of sustaining for several hours after having been taken out of their element. They have a peculiar, disagreeable odour, resembling that of Gobioidæ, which continues for several years in specimens preserved in spirits of wine. In the Malayan countries they are considered highly poisonous, and are even objected to as manure.—*Eng. Cyc.*

TETTAM PAREL MARAM. Maleal. Strychnos potatorum, *Linn.*

TETTAN KOTTE. Tam. Mal. Strychnos potatorum.

TETTI. Can. Eggs.

TETU. Mar. Bignonia Indica.

TETUAN. See Semitic Races.

TEUCRIUM, a genus of unimportant plants of the natural order Lamiaceæ, of which T. botrys, T. leucosceptrum, and T. stoloniferum occur in the East Indies, T. chamædrys of Europe, and some parts of Asia, is an ingredient in the celebrated Theriaca andromachi, or tareaq farooq.—*O'Shaughnessy, p.* 488. *Voigt. p.* 463.

TEUFELSDRECH. Ger. Asafœtida.

TENGALA, a religious sect in the south of India.

TEUTHIS. Linn. All the species of this genus are supposed by the Malays of the straits to be highly poisonous ; they are not eaten, but set aside among offal of fish to be used as manure.

TEW-US, also Tunnus. Mar. Dalbergia oojeinensis.

TEXEIRA, a Spanish author who translated the History of Persia, which was the first part of Mir Kond's great book in seven volumes, called Rauzat-us-safa. Texeira extracted thence this History, which he has presented to the world in Spanish ; but it has been since translated into French by Cotolendi. Texeira had travelled into Persia, and made himself acquainted with the language of that country. He finished his first part with an Abridgement of the History of the Kalifs, &c.—*History of Chenghis Khan.*

TEXTILE ARTS, the East has, from the earliest times of which we have any record, been famous for its textile fabrics ; and India, notwithstanding the great mechanical inventions of the western world, is still able to produce her " webs of woven air," which a manufacturer of the last century attempted to depreciate, by calling them " the shadow of a commodity, " at the same time that his townsmen were doing all they could to imitate the reality, and which they have not yet been able to excel. Though the invention and completion of a loom for weaving would indicate a high degree of ingenuity as well as a considerable advance in some other arts, the hindoos were acquainted with it at a very early period, for in the hymns of the Rig Veda, composed at least 1200 years B. C., " weavers' threads" are alluded to ; and in the Institutes of Menu it is directed,—" Let a weaver who has received ten bales of cotton thread give them back, increased to eleven by the ricewater and the like used in weaving."

That cotton was employed at very early periods is also evident from the Indian name of cotton, Karpas, occurring in the Book of Esther, ch. i. v. 6, in the account of the hangings in the court of the Persian palace at Shushan, on the occasion of the great feast given by Ahasuerus, were " white, green, and blue hangings." The word corresponding to " green" is Karpas in the Hebrew. It seems to mean cotton-cloth made into curtains, which were striped white and blue. Such may be seen throughout India in the present day, in the form of what are called purdahs. (Vide " Essay on Antiquity of Hindoo Medicine," p. 145.) The mode in which these are used, and the employment of the same colours in stripes, is still known in " sutrunjees," or cotton carpets. That the hindoos were in the habit of spinning threads of different materials appears from another part of the Institutes of the same lawgiver, where it is directed that the sacrificial threads of a brahmin must be made of cotton, that of a shatriya (second caste) of sana (Crotalaria juncea), and that of a Vaisya, of woollen thread. The natives of India prepare fabrics not only of cotton, but also of hemp, and of jute, and other substitutes for flax ; also of a variety of silks, and the wool of the sheep, goat, and camel, as well as mixed fabrics of different kinds. But it is for the delicacy of the muslins, especially of those woven at Dacca, that India has so long been famous. It is pleasing to find that these manufactures still continue pre-eminent for fineness combined with softness. From a careful examination of the cottons grown in different parts of India, as well as of those of other parts of the world, we find that it is not owing to any excellence in the raw material that the superiority in the manufacture is due, for English spinners say that the Indian cotton is unfit for their purposes, being not only short but coarse in staple. It is owing, therefore, to the infinite care bestowed by the native spinners and weavers on every part of their work, that the beauty of the fabric is due; aided, as they are, by that matchless delicacy of touch for which the hindoos have long been famous. But this is no small advantage, for, according to one of their authors," the first, the best, and most perfect of instruments is the human hand." Experiments were made for a series of years, at the expense of the Indian Government, to grow American cotton in the Dacca district, but without success; owing, it was thought by the American planter in charge, to excess of moisture, and to the depredations of insects. The hindoo weaver is often described as hanging his loom to a tree, and sitting with his feet in the ground. If he did so, his productions would appear more wonderful than they are, as being still more the result of means unsuited to the end. But this is the case only with the coarser fabrics. A late resident of Dacca has given a minute account of the cotton manufacture of that district, and thence we learn positively, what might as certainly have been inferred, that great care is bestowed on every part of the process. The spinning-wheel is usually considered to be an improvement upon the distaff and spindle, as modern machinery is upon the inexpensive spinning-wheel. In facilitating work and diminishing expense, the spinning-wheel was, no doubt, a great improvement, and is still employed throughout India for the ordinary and coarser fabrics. But the spindle still holds its place in the hands of the hindoo woman, when employed in spinning thread for the fine and delicate muslins to which the names of Shabnam or "Dew of Night," Ab-i-Rawan or "Running-water," &c. are applied by the natives, and which, no doubt, formed the Tela ventosa of the ancients; and those called Gangitika in the time of Arrian were probably produced in the same locality. Mr. James Taylor, of the Bengal medical service, in a report which was sent by the Court of Directors to India, gave much interesting information respecting the cotton manufacture of Dacca: and to the Exhibition of 1851, he sent a series of views of the different parts of the process, together with the instruments used in spinning, as well as some specimens of their fine thread. He shows that the hindoo woman first cards her cotton with the jaw-bone of the boalee fish, which is a species of Silurus; she then separates the seeds by means of a small iron roller worked backwards and forwards upon a flat board. An equally small bow is used for bringing it to the state of a downy fleece, which is made up into small rolls to be held in the hand during the process of spinning. The apparatus required for this consists of a delicate iron spindle, having a small ball of clay attached to it, in order to give it sufficient weight in turning, and imbedded in a little clay there is a piece of hard shell, on which the spindle turns with the least degree of friction. Besides these, a moist air and a temperature of 80° is found best suited to this fine spinning, and it is therefore practised early in the mornings and in the evenings, sometimes over a shallow vessel of water, the evaporation from which imparts the necessary degree of moisture. The spinners of yarn for the Chundeyree muslins in the dry climate of North-West India are described as working in underground work-shops, on account of the greater uniformity in the moisture of the atmosphere. The Indian spinning-wheel is looked upon with contempt by those who look to the polish rather than to the fitness of a tool. Professor Cowper, than whom none was a better judge, observing that the wood-work of some of these spinning-wheels was richly carved, inferred that the strings with which the circumference was formed might have some use, and not have been adopted from poverty or from idleness. In making working models of these instruments, he has found that in no other way could he produce such satisfactory results as by closely imitating the models before him, the strings giving both tension and elasticity to the instrument. The spindles, moreover, being slightly bent or the hand held obliquely, the yarn at every turn of the spindle slips off the end and becomes twisted. As the different processes are fully described in the work alluded to, I need not, says Dr. Royle, dwell further on this part of the subject, except to mention that the common dimensions of a piece of Dacca muslin are twenty yards in length by one in breadth. There are more threads in the warp than in the woof, the latter being to the former in a piece of muslin weighing twenty tolas or siccas, in the proportion of 9 to 11; one end of the warp is generally fringed, sometimes both. The value of a piece of plain muslin is estimated by its length and the number of threads, in the warp, compared with its weight. The greater the length and number of threads and the less the weight of the piece, the higher is its price. It is seldom, however, that a web is formed entirely of the finest thread which it is possible to spin. The local committee of Dacca having given notice that they would award prizes for the best piece of muslin which could be woven in time for the Exhibition, the prize of 25 rupees was awarded to Hubeeb Oollah, weaver of Golkonda, near Dacca. The piece was ten yards long and one wide, weighed only 3 oz. 2 dwts, and might be passed through a very small ring. Though the cotton manufactures of India seem to have greatly fallen off, from the cheapness of English manufactured goods, it is gratifying, as well as unexpected, to learn from the report of the Revenue Board Madras, that up to the year 1871, weavers continued to increase in numbers, and in the year 1850, it was stated by Dr. Taylor, that, as the finest muslins formed but a small portion of goods formerly exported to England, the decay of the Dacca trade has had comparatively little influence on this manufacture, as these delicate manufactures still maintain their celebrity in the country, and are still considered worthy of being included among the most acceptable gifts that can be offered to her native princes; and he believes that the muslin being then made was superior to the manufacture of 1790, and fully equal to that of the reign of Aurungzebe. He also informed us that a college for the education of the natives, stands on the site of the former English factory. Fine muslins were sent to the Exhibition of 1851, not only from Dacca, but also from Kishengurh in Bengal; likewise from as far south as Collar, in the Rajah of Travancore's dominions, as well as from Chundeyree in the Gwalior territories. Specimens of almost every variety of the cotton manufacture, such as the coarse garrha and guzzee for packing, clothing, and for covering corpses, with dosootee, &c. for tents, canvas for sails, towels, and table-cloths, and every variety of calico, were sent from Nepal and Assam, as well as from all along the valley of the Ganges, from Bengal up to the Jullundur Doab, in the Sikh territories; also, from Cutch, Ahmedabad, Surat, and Dharwar on the western side of India; from the central territories of the Nizam, and of the rajah of Nagpore, and from the islands of the Indian ocean. The finest pieces of calico, and Punjum longcloth, were sent from Juggiapettah, in the Northern Circars, which was formerly the great seat of this manufacture. It is curious that some of these places, noted for their manufactures, did not even grow their own cotton. Dacca, no doubt, grew most of what it required for its muslins, because the thread did not swell in bleaching, but it also imported cotton formerly from Surat, as well as from Central India. Azimgurh imports its cotton chiefly from the same source to which the Northern Circars was also formerly indebted, while Chundeyree imports its cotton from the distant valley of Nimur. In 1851, among the fabrics there were a great variety, which proves that the natives are acquainted with every kind of weaving, from guzzee and gauze, to striped, chequered, and flowered muslins. The last are interesting as specimens of an art which has been long known in the East, and the mode of making which has often puzzled weavers in Great Britain. In manufacturing figured (jamdanee) fabrics, Mr. Taylor informs us, they place the pattern, drawn upon paper, below the warp, and range along the track of the woof a number of cut threads, equal to the flowers, or parts of the design intended to be made; and then with two small fine pointed bamboo sticks, they draw each of these threads between as many threads of the warp as may be equal to the width of the figure which is to be formed. When all the threads have been brought between the warp, they are drawn close by a stroke of the ley. The shuttle is then passed, by one of the weavers, through the shed, and the weft having been driven home, it is returned by the other weaver." Most of these flowered muslins are uniform in colour, but some are in two colours, and chiefly woven in Bengal. Specimens of double weaving in cotton, and showing considerable skill, with a pleasing arrangement of pattern and colours, were sent from Khyrpore, in Sindh. These kinds are also woven in Ganjam. Flax, hemp, and substitutes for them are all well known and extensively cultivated in every part of India; but flax is so solely on account of its seeds, which yield oil and oil cake, though some very good flax has been produced in some parts of Bengal; and the hemp; on account of the intoxicating principles secreted in its leaves and green parts, and which, in different forms, is known under the name of bhang, husheesh, churus. The fibre of the plant, as grown in the plains, is too dry and brittle to be useful either for rope making or for textile fabrics, though in the Himalayas some excellent ropes and canvas are made, and the culture might be greatly extended if there was demand for the produce. Species of crotalaria, of hibiscus, of corchorus and of many other genera, yield fibres which are used for rope-making; but that of the species of corchorus commonly called jute, for making gunny bags, used for packing, which are even exported to America for packing their cotton. In the Peninsula these bags are made of Crotalaria juncea, or goni plant. The Rhea fibre, which is closely allied to, if not identical with the China grass, is used for making fishing-lines and some kinds of fabric, but its employment may be greatly extended. So also the plantain, the pine-apple, and the sanseviera fibre, of all of which some fabrics have been made and exhibited, but in too small quantities to attract much attention, though some will probably become important articles of commerce.—*Dr. John Forbes, Royle on the Arts and Manufactures of India, p.* 487 *to* 494.

TEYAMMUM. AR. HIND. PERS., the mahomedan legal purification with sand, where water is not obtainable. See Bathing. Lustrations.

THALASSIANS. See Chelonia.

THALASSINA SCORPINOIDES, the burrowing lobster of the Fiji islands; so named from its scorpion-like tail.—*Hartwig.*

THALATHI MARAM. TAM. Grewia tiliæfolia.

THALAU-TAGAR. BURM. Nitric acid.

THALAI NAR. TAM. Fibre of Pandanus odoratissimus, screw pine. — *Simmond's Dict.*

THALE. TAM. Pandanus odoratissimus, *Linn.*

THALE NAR. MALEAL. Fibre of Pandanus odoratissimus.

THALI, a small salver, a platter.

THALES. See Vedas.

THALESAP, a lake on the north of Kambodia, sixty miles in circumference.

THALICTRUM FOLIOLOSUM. DC.

Meadow rue	ENG.	Shuprak	HIND.
Pili jari	HIND.	Burmoti.	PUNJABI.

This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 5000 to 8000 feet; at Mussooree, and generally on the Himalayas. Thalictrum flavum is termed in France "the poor man's rhubarb," as a substitute for which medicine it is generally employed. The bitter root of the Indian species, in doses of 5 to 10 grains, acts as a tonic and aperient, and is given in the interval of intermittent fevers and in convalescence from acute diseases. It promises to succeed well as a febrifuge of some power and an aperient of peculiar value.—*O'Sh. p.* 161. *Cleghorn Panjab Report. Voigt, p.* 3. *Ben. Ph.* 219.

THAKOORWARE. See Salagrama.

THALI-KIRE. TAM. Ipomœa sepiaria.

THALI MARATHU. CAN. Sapindus emarginatus.

THALIN. Viburnum fœtens.

THALI-SAMAN——? Jewellery.

THALLI. HIND. See Magra.

THALLOGENS, a class of plants proposed by Lindley to include those flowerless plants which are distinguished by the absence of an axial stem. It includes all the Cryptogamia, with the exception of ferns and mosses.—*Eng. Cyc.*

THAL-PADMO. BENG Hibiscus mutabilis.

THAMA-JAM-WAI-ZEKE. BURM. Pterospermum aceroides.

THAMA-KHAI-OK. BURM. Abutilon Indicum, *Don.*

THAMBA. GUZ. Copper.

THAMBATIN. TAM. Canavalia gladiata, *DC.*

THAM KHUAN. Certain imposing ceremonies, which mark the principal events or eras in the life of a Siamese, such as the shaving his head-tuft, his reception as a bonze, his marriage, the advent of a new sovereign, &c.—*Bowring, Siam, I.* 117.

THA-MAN-THA. BURM. A tree of Moulmein, wood used as an ordinary building material.—*Cal. Cat. Ex.* 1862.

THAMAR. ARAB. Fruit.

THAMMAI. A tree native of Amherst, a strong, handsome wood, like Ægiceras, or box-wood.—*Cat. Ex.* 1862.

THAMMAN. HIND. Grewia Rothii.

THAMOND. An Arab tribe of Petrea.

THAMTHAR of Salt Range, Grewia villosa.

THAN or Thani. HIND. of the Chenab district and Lahoul; Juglans regia, Walnut.

THANA. HIND. Missiessya hypoleuca.

THANAH, or Tanna, in L. 19° 12′ N.; L. 72° 59′ E., in the Konkan, N. of Bombay, top of the church spire is 106 feet above the sea. A hill, 3 miles E. of Thanah is 1,369. A hill at Kolva, near Thannah, is 973 feet above the sea.

THANARI. HIND. Staphylea emodi.

THA-NAT. BURM. Cordia myxa, *Linn.*

THA-NAT-DAN. BURM. Garcinia elliptica, *Wall.* Gamboge tree.

THA-NAT-THEE BURM. A timber tree of Amherst, Tavoy and Mergui, said to be abundant all over the provinces, but is not easily obtained in Moulmein, of maximum girth 3½ cubits, and maximum length 30 feet. When seasoned, it floats in water. It is a durable, yet light wood, with a very straight grain; and is used for every purpose by the Burmese, and much recommended for helves.—*Captain Dance.*

THAN-BA-YA. BURM. Citrus bergamia, *Risso and Poit.*

THAN-DAY. BURM. Bignonia, species.

THANDRAIKYA. TEL. In the Nalla Mallai, an ash coloured wood, resembles hickory in fibre; is close and tough, and would be a very useful wood.—*Mr. Latham.*

THANDU-KIRE. TAM. Amarantus oleraceus, *Linn.*

THANESUR, near Umballa. Its ruins have been sacred to hindus as a place of pilgrimage since the heroic ages. Its temple was sacked by Mahmud in A. D. 1011. At Phewa in Thaneswar, on a slab of sandstone in a temple, is an inscription in Sanskrit, date 279 Sambat, probably of the Vallabhi era. The character used in the inscription is a variety of Kutila. The kings and princes mentioned are Mahendrapala, Jatula-Vajrata, Yajnika, Sagga, Purna, Deveraja, Ramachandra Bhoja. This inscription is very imperfect but interesting as throwing some light on a dark period of Indian history, if we may assume the Bhoja of the document to be the first of that name noticed by Abul Fazl and Prinsep, his era is definitely fixed. —*Beng. As. Soc. Journ. Vol.* XXII. *p.* 673.

THANGI, also Thangoli. PUNJ. Corylus colurna, *Linn.*

THANG-TOUNG, the royal cubit in Burmah, 19$\frac{1}{10}$ inches.—*Simmond's Dict.*

THANI. HIND, also Than, of Chenab district and Lahoul, Juglans regia, Walnut.

THAIN. TAM, Terminalia bellerica, also its fruit, the myrobalans.

THANNA. HIND. Custom house, a police station. Thannadar, the chief of police of a station.

THANNAB SHAH, one of the Kutub Shahi dynasty in Hyderabad in the Dekhan.

THANNA-DAN. BURM. A native of Amherst, and said to be a fruit tree; it has a reddish brown, heavy, wood, fit for machinery or other purposes requiring great strength; it is totally exempt from attacks of insects, but somewhat liable to split.—*Cat. Ex.* 1851.

THAN-THAT. An Amherst wood used for stocks of various instruments; it is a capital wood, and seems to be a kind of saul.—*Cat. Ex.* 1851.

THAN-THAT, BURM. Very difficult to procure, but found inland up the Gyne and Attaran rivers in the Tenasserim provinces. When seasoned it floats in water. It is a capital wood, very durable; used by Karens for bows, for shoulder yokes, spear handles, and many other purposes. Excellent for hammer handles from its tough fibre.—*Captain Dance.*

THAN-THAT-GYEE. BURM. A tree of Moulmein, used for building materials.—*Cal. Cat. Ex.* 1862.

THA-NU-WEN. BURM. Curcuma zedoaria, *Roxb.*

THAN-WEN. BURM. Crocus sativus, *Linn.*

THANY MARAM. TAM. A tree common about Nelambore and in Coorg; wood much used, but not durable, being very liable to be attacked by insects.—*McIvor, M. E.*

THANZATT. HIND. Hordeum hexastichum.

THA-PHON. BURMESE. Ficus lanceolata, *Roxb.*

THAPUR. HIND. Ficus caricoides.

THA-PYKE-THA. BURM. A tree of Amherst, Tavoy and Mergui, of maximum girth 5 cubits, and maximum length 30 feet. It is very abundant along the banks of rivers, all over the provinces. When seasoned, it floats in water. It is a wood of no durability.—*Captain Dance.*

THAR. AR. The blood revenge.—*Burton's Pilgrimage, I. p.* 346.

THAR, of Nepaul. Capricornis bubalina, *Hodgson.* The Himalayan wild goat.

THA-RA-PHEE. BURM. Calophyllum longifolium.

THARANCHILLY. TAM. A Travancore wood of a bamboo colour, 5 to 8 feet in circumference; used for canoes only.—*Colonel Frith.*

THARANJULLA. TAM. A Travancore wood of a bamboo colour, specific gravity

0·576; used for common buildings.—*Colonel Frith.*

THARAWADI. See Ava.

THARNEL. Hind. Benthamia fragifera.

THARPANAM. See Hindu.

THARRA. Tel. Grewia tiliæfolia, *Vahl.*

THARRAN, a small Burmese violin.

THARRI. Hind. Dioscorea deltoidea.

THARTAVEL. Maleal. Spermacoce hispida.

THARU. See Haiyu, Chetang.

THARUAR. Hind. Benthamia fragifera.

THAS,—a bamboo-measure.

THATCH. In the peninsula of India, the thatch in use with the people is made of palmyra leaves. It is the best thatch for houses and the most durable. Next to it, in Madras, ranks in value the Cyperus textilis, a grass which grows on the banks of rivulets, in the low country, and is called "Koary." The leaf of the cocoanut is a very perishable material, and only employed by the very poor. In the Dekhan, a long grass is chiefly used. The Karen in Burmah use the large palmated leaf of a tall wild palm, a species of Livistonia, but the Europeans and Burmese there use the leaves of the Atap, leaves of the Nipa fruticans. The Karen in Amherst province employ the tall grasses, "Imperata cylindrica," "Saccharum cylindricum," and S. spontaneum. Long grasses and sedges (Arundo, Saccharum and Scleria) are cut and stacked along the water's edge of the Brahmaputra in huge brown piles, for export and thatching. The palms are much employed in India for thatch, but the natives also use the straw of the common grains called in Tamil vakel or Vagghil straw (A. muricatum), and the Spice grass (Andropogon schœnanthus.) They also use the cocoanut leaves made into a kind of coarse matting called Tennam kittu. Gabagaba. Malay, the midrib of palm leaves, particularly of the leaf of the sago palm, is much used throughout the Moluccas for building and fencing.—*Hooker Him. Jour, Vol.* II, *page* 373. *Ain.'s Mat. Med. p.* 203.

THA-THANA-BAIN. Burm. Defender of the Faith. The title of the High Priest or Patriarch of all the Poongyi or budd'hist priests of Burmah—*Yule, p.* 165.

THA-THEE. Burm. Bignonia, *species.*

THATINAR. Tel. Fibre of Borassus flabelliformis.

THATYAL, meaning the maimed, a wandering Gond tribe, also called Pendabarya, or minstrels of God, also Matyal, because their songs are chiefly in honor of the goddess Mata. They make baskets.

THAU-THET-NGAI. Burm. Bignonia, species.

THAU Heb. The heathen notion that certain influences in nature might be controlled and directed by occult signs, was an easy transition from an originally divine rite;

> "Behold, here is my Thau !
> Let the Almighty answer me.
> Surely I would take it upon my shoulder,
> And bind it as a crown to me."

Thau, the Tauutic emblem of the Egyptians, the hieroglyphic of the god Toth, was originally expressed, according to Kircher, by the simple figure of a cross, like the Greek T and the Coptic *dau.* The Hebrew *tau* is supposed to have been derived from it, though it has deviated from its shape. It is frequently found on the Egyptian obelisks, and was always regarded as a talisman of extraordinary potency. The original in Ezekiel is, "set a *tau* upon their foreheads," instead of "mark"; which sense the Vulgate preserves, "mark with the *letter tau* the foreheads," &c. : upon which Louth observes, that in the parallel passage in the Septuagint, τσ Eημιον, "a mark," should be *Tau* Eημιον, the mark Tau. It is worthy of note, that in the Samaritan character, in which Ezekiel wrote, it is agreed among the learned that the *tau* was formerly cruciform, corresponding in shape with the Tauutic cross and the English letter T. From this we learn, that the crucifix was a sacred sign among the Jews, as well as the Egyptians, a hieroglyphic marking, the property of the deity. In this sense the language of Job is beautiful and appropriate. "Behold, here is my Thau ! let the Almighty answer me.' Count de Gebelin observes that n France, in the early ages of christianity, during the ceremony of baptism, the officiating priest said, "Crucis thaumate notare," hence, the Jews themselves, in the later periods of their history, fell into the error, as also did the early Christians; and even in modern times the potency of the wizard's charm, and the fortune teller's crawl, is an article of vulgar belief. The phylacteries of the Jews, mentioned by our Lord, were strips of parchment, inscribed with paragraphs of the law, which were worn on their caps and arms, and inscribed on their door posts, to prevent the intrusion of evil agencies, as the root in the Greek, from whence the name is derived, signifying to guard or preserve, plainly shows. The Christian heretics of the second century, especially the Gnostics, used gems, inscribed with the word Abraxas, for a similar purpose; and still do the curious arts, which the Ephesians abandoned, maintain their hold upon the popular mind. In the east, the vaishnava and saiva hindoo affix marks to their foreheads, mahomedans defend their houses and persons with passages from the Koran, and the Greek imprint the crucifix as a resistless spell. The all-potent words

Abraxas, variously written Abrasax and Ias, occur, referring to the supreme deity and Jesus. The "curious arts" of the early Christians were condemned in the council of Laodicea. A.D. 364, can. 36; the fathers declaring, that such phylacteries or charms were bonds and fetters to the soul, and ordering those who wore them to be cast out of the church.—*DuCange, Glossar. Voces Ligaturæ, Legationes, Milner's Church History.*

THAWA, a lowland tribe mentioned by Dr. Campbell as inhabiting similar tracts to their neighbours the Mechi.—*Campbell, pp.* 50, 149.

THAU-BAUN-PO. Burm. A wood of Tavoy, an inferior wood, used for common canoes.—*Mr. Blundell.*

THAU-GAAT-THITTOO. Burm. An inferior wood of Tavoy.

THAUN. Burm. Eurya, species.

THAUNG DARI. Thaung-khao. See Laos.

THAUR. Hind. Ficus reticulata.

THAVATHRU. Tam. Guatteria longifolia.

T'HAY. The T'hay stock, the people of Siam, have been an intruding race, conquering from north to south. See India. Siam.

THAYET. Burm. Mango.

THA-YAY-BEW. Burm. A not very abundant tree, but found inland all over the provinces of Amherst, Tavoy and Mergui. Maximum girth 2 cubits and maximum length 20 feet. When seasoned it floats in water. It is not a durable wood.—*Captain Dance.*

THA-YET-KYA. Burm. A Tenasserim wood of maximum girth 2 cubits, and maximum length 20 feet. Not very abundant, but occasionally procurable inland near the back of hills near Moulmein, and here and there all over the provinces. When seasoned it floats in water. It is durable and light, and a good wood for helves.—*Captain Dance.*

THAYETMYO, a military station in Pegu near the British frontier, on the right bank of the Irawadi.

THAY-KYA-BA. Burm. In Amherst, Tavoy and Mergui, of maximum girth 3 cubits and maximum length 24 feet, very abundant, but straggling inland all over the provinces. When seasoned it floats in water. It is used for house posts, but is not a durable wood.—*Captain Dance.*

THA-YIN-GEE. Burm. A small tree of Amherst, Tavoy and Mergui, of maximum girth ½ cubit and maximum length 6 feet. Abundant all over the provinces. When seasoned it floats in water. It is utterly useless except for firewood.—*Captain Dance.*

THAY-THA. Burm. In Amherst, Tavoy and Mergui, of maximum [illegible]th 3 cubits and maximum length 22 feet, widely scattered in and all over the provinces. When seasoned it floats in water. It is a tolerably good and tough wood, liable to rot in store, and therefore not recommended.—*Captain Dance.*

THAY-YO-THA. Burm. In Amherst, Tavoy and Mergui, of maximum girth 5 cubits and maximum length 25 feet. Very abundant all over the Tenasserim and Martaban provinces. When seasoned it floats in water. It is a useless wood, rots very quickly, and is only used for temporary buildings.—*Captain Dance.*

THE'. Fr. Tea.

THEA CHINENSIS. Sims. The celebrated tea plant, one of the Ternstrœmiaceæ, a native of China, of Assam, and the regions south to the borders of Cochin China. It has three varieties:—T. Bohea, *Linn.*, and T. viridis. Though now so extensively employed, the introduction of tea into Europe is of comparatively recent origin, though it must, however, have been used in China from very early times. It is differently named in different parts of China, as Tcha, or Cha, also Tha, whence we have Tsia, The, and Tea. In Persian works in use in India, tea is called Cha-i-Khatai, or Tea of Cathay. The properties of tea depend chiefly on the presence of tannin, of a volatile oil, and of a principle called theine ($C_8H_5N_2O_2$), which has been found to be identical with caffeine and is a salifiable base. It may be obtained in white silky needles; has a mild, bitter, taste, is soluble in hot, but sparingly so in cold, water and alcohol. With sulphuric acid and hydrochloric acid, it forms crystalline compounds, and is supposed to exist in tea in combination with tannic acid. The quantity of tannin is stated by Brande, and as appears by the taste, and in the analyses of Mulder, to be greater in green than in black tea. Sir H. Davy and others have stated that black tea contains the largest proportion of tannin. The volatile oil is in larger quantity in the green than in the black tea. Tea is well known for its astringent and moderately excitant properties, chiefly affecting the nervous system, producing some degree of exhilaration, and of refreshment after fatigue. Its effects are well seen in the wakefulness produced, especially by green tea, in those unaccustomed to its use. But it is thought by some to act as a sedative on the heart and blood-vessels; or, as Dr. Billing explains it, tea and coffee are sedatives, and relieve the stupor produced by stimulants, or the drowsiness of fatigue, or other plethora, only by counteracting the plethoric state of the brain induced by the continued stimulation of action—thus merely restoring the brain to its normal state. Liebig (*Anim. Chem.* p. 179) has suggested that *Theine*, as an ingredient of diet, may be useful in contributing to formation of taurine, a compound peculiar to bile. Besides being useful as a diluent, it may often be prescribed as an agreeable and refreshing beverage ; in some cases, especially when made strong, acting as an excitant, and other times producing sedative and calming s. Tea is very extensively cultivated in ra valley and Kullu, in Assam, and on e Neilgherries.—*Cleghorn Punjab Report. Royle Ill. Himalayan Botany. Royle Productive Resources, p.* 257-311. See Kullu and Kangra, Tea.

THEA COCHINCHINENSIS, about eight feet high, leaves lanceolate, flowers of three to five sepals and five petals, solitary, terminal ; found wild in the north of Cochin-China, where it is also cultivated, being used medicinally by the natives as a diaphoretic. Thea oleosa is also a shrub of eight feet high, found in the fields in the neighbourhood of Canton, and named from its seeds yielding a large quantity of oil, which is used for burning and as an article of diet. The leaves are lanceolate, the flowers of six sepals and six petals, peduncles 3-flowered, axillary; fruit stated to be indehiscent, rather a berry than a capsule.—*Eng. Cyc.*

THEANA. See Damon and Pythias.

THEATRICAL representations are common among the Burmans, the Chinese, and Malayanesians, but are of comparatively rare occurrence amongst the hindus. In ancient hindu times, plays were written for representation on lunar holidays, royal coronations, at fairs and religious festivals, marriages, taking possession of a house or town, and the birth of a son. Specimens of these dramatic writings were given in the translation of Sakuntala by Sir W. Jones, in that of Prabodha Chandrodaya, or Rise of the Moon of Intellect by Dr. Taylor of Bombay, and in Professor Wilson's Hindu Theatre. They seem to have been written for one performance, lasting for four or six hours, and to have been represented only once. With the Burmese, a dramatic representation lasts a whole day or more, and with the Chinese, even for ten days. Amongst the Athenians a piece was never performed a second time, at least under the same form. The hindu drama is in Sanscrit. The Burmese representations are stated by Mr. Oldham to be indelicate, but Colonel Phayre's opinion is not in accordance with these. In India, amongst the hindus, traces of an inferior order of the drama are to be found in the dramatized stories of the Bhaur (Hind.) or professional buffoons : in the Jatras of the Bengalis and the Rasa of the western provinces. The Bhaur is a representation of some ludicrous adventure by two or three persons, carried on in an extempore dialogue, usually of a very coarse kind, and enlivened by practical jokes not always very decent. The Jatra is generally the exhibition of some of the incidents in the youthful life of Krishna, maintained also in extempore dialogue, but interspersed with popular songs. Radha, the mistress of Krishna, his father, mother, and the Gopi are the ordinary dramatis personæ, and Nareda acts as buffo. The Rasa partakes more of the ballet, but it is accompanied also with songs ; whilst the adventures of Krishna or Rama are represented in appropriate costume by measured gesticulations. The most recent dramatic hindu writings are of a mythological and sectarial character.—*Wilson's Hindu Theatre.*

THEBURSKUD. See Kunawer.

THEDAN.—— ? See Dyes.

THE-DEW. Burm. Bixa orellana.

THEE. Ger. Tea.

THEE-HO-THA-YET. Burm. Anacardium occidentale, *Linn.*

THEEKREE, a piece of a broken earthen pot.

THEEN. Burm. Phrynium dichotomum.

THEER. Ger. Tar.

THEER VALA CONNAI. Tam. Bauhinia tomentosa, *Linn.*

THEET, in Burmah, the eighth part of a hand's breadth ; 12 theet are equal to 1 span.—*Simmond's Dict.*

THEET KHA, a light timber of Tenasserim, easily worked and in great request for small canoes : it is a scarce tree however. "Theet kha," "Anan" and "Peengado" are impervious to the destructive attack of the "teredo ;" the two latter may possess such property as the consequence of their closeness of fibre and extreme hardness, but the same reason cannot be applied to "Theet kha" from its opposite characteristics. In the latter case, it is owing, in all probability, to the existence of some acrid principle in the wood (implied by its name "bitter wood") which, similar to oxide of iron, has the effect of repelling the insect.

THEET KA TO. Burm. Cedrela toona.

THEET KHYA. Burm. Castanea Indica, *Roxb.* C. Martabanica.

THEET-KYAM-BO. Burm. Cinnamomum iners, *Rein.*

THEE KHYA THA. A timber of maximum girth 1 cubit and maximum length 12 feet. Very abundant all over the Tenasserim and Martaban provinces, in Amherst, Tavoy and Mergui ; when seasoned it floats in water. It is a very crooked grained perishable wood ; and not recommended.—*Captain Dance.*

THET LENDH. Burm. A tree of Moulmein, used for all ordinary building purposes.—*Cal. Cat. Ex.* 1862.

THEET MEN. Burm. Agathis loranthifolia, *Salisb*, also Dammara orientalis, *Lamb*, and Podocarpus neriifolia.

THEET-PHYIOU. This tree is a native of Amherst; it is a useful white wood, is used for fan handles, and would answer for common carpentry; it resembles Acacia serissa, —*Cat. Ex.* 1851.

THEET-SAI. Burm. Buchanania latifolia.

THEET-SEE. Burm. Melanorrhæa usitata. See Resin. Thit-see.

THEET-TA-GYEE. A Tavoy wood, suitable for common carpentry.—*Mr. Blundell.*

THEET-TO. This is a native of Amherst, is said to be a fruit tree; it is a dark-brownish grey, hard, heavy wood, and employed in boat building, making carts, &c.—*Cat. Ex.* 1851.

THEET-YA. Burm. Gordonia floribunda, *Wall.* In Amherst, employed for rice grinders or pounders. It is a superior, compact close, tough, brown wood, fit for any thing requiring great strength and durability.—*Cat. Ex.* 1851.

THEET-YA-HAN. In Tavoy, a close grained teak, used for posts.—*Mr. Blundell.*

THEET-YA-NEE. In Tavoy, a close grained brown wood; rather shaky.—*Mr. Blundell.*

THEET-YA-PYIOU. A heavy strong wood of Tavoy.—*Mr. Blundell.*

THE-HO-THA-YET. Burm. Anacardium occidentale.

THEIM. Burm? A timber of Amherst, used as house posts, rafters, and general purposes of carpentry.—*Cat. Ex.* 1851.

THEIN. Burm. A chapel for the consecration of the Burmese priesthood, constructed on holy ground.—*Yule, p.* 12.

THEIN-NE MORMEIT. See Shan.

THEIT-TO Burm. Sandoricum Indicum.

THE-KUL-WA. Burm. a species of Laurus.

THELA. Hind. A disease or blight of cotton.

THE-LA-BAY. Burm. A timber tree of Amherst, Tavoy and Mergui, of maximum girth 3 cubits and maximum length 20 feet. Not very abundant, but obtained from Tavoy Mergui and Yea. When seasoned it floats in water. It is a brittle, useless wood for ordnance purposes, though employed by Burmese for house posts, and to support the shafts of wheels.—*Capt. Dance.*

THELATUTH, the laterite or brickstone is used as a builders stone, for which it is excellently fitted. Most of the handsome Roman Catholic churches at Goa are built of it.

THELI. Hind. Juniperus squamosa, the creeping juniper.

THELLI MARA. Maleal. Canarium strictum, *Roxb.*

THELPHEUSA, a genus of Crustacea, comprising

Thelpeusa indica, *Edws.* Coromandel Coast.
" chaperon arrondi, *Q. and G.*
" perlata, *Edws.* Cape of G. Hope.
" leschenaudii, *Edws.* Pondicherry.

THELU. Hind. Juniperus religiosa.

THEM-BAW-H'SOKE-GYEE. Burm. Cicca disticha, *Linn.* Otaheite gooseberry.

THEM-BAU-KA-MA-KAH. Burm. Azadirachta Indica.

THEM-BAW-THEE. Burm. Carica papaya, *Linn.*

THEM-MAI-THA. Burm. A very abundant wood, found all over the provinces of Amherst, Tavoy and Mergui, on both sides of the Moulmein river, and on the sea coast. Its maximum length is 12 feet and maximum girth 2½ cubits; and, when seasoned, it floats in water. It burns with an intense heat, and is therefore used in preparing salt, and is recommended as an excellent wood for fuel for steamers, and probably would be a good charcoal wood.—*Capt. Dance.*

THEN-GAN. Burm. also Thengan-phayung. Burm. Hopea odorata, *Roxb.*

THENG-BAN-SHA, a bast of Arracan, coarse looking, and of a reddish brown colour, but divisible into a number of very thin layers, with a good deal of flexibility and some toughness.—*Royle.*

THENGAI. See Singhpo.

THENG-GAN. Burm. This wood, a native of Amherst, is employed for house posts, carts, boat building, paddles, and oars. It is an excellent compact wood, fit for gun carriages. It is the wood in most general use for almost all purposes, but principally for large canoes, which form the bottoms of the native trading crafts; this is owing to its being more plentiful than most of the others, easily worked, and, by killing the tree before felling, as with teak, is rendered capable of floating. This process, however, is rarely observed, the tree selected for working is felled and hollowed on the spot, and the canoe removed to the neighbourhood of the water to undergo the process of widening by fire; some trees producing by this rude process canoes of 60 to 70 feet long by 6 to 8 feet breadth across the centre.—*Cat. Ex.* 1851.

THENGHOI, also Then-ki. Chin. Cloves.

THENG MAH. Chinese. Urtica heterophylla. See Neilgherry Nettle.

THENG-TUA. Burm. Acetate of copper.

THENNUM PISIN. Maleal. Resin of Cocos nucifera.

THENUS— ? See Scyllaridæ.

THENUS ORIENTALIS. Edws. A Crustacean of the Indian Ocean.

THEOBROMA CACAO, Linn.

Cocao sativus *Lam.* | C. minus *Gærtn.*

The smooth leaved chocolate nut tree is a native of South America, now cultivated in several parts of India and of the E. Archipelago. It is interesting in consequence of its seeds being largely employed in diet. The tree is a native of Mexico, but extensively cultivated in the West India islands, and remarkable for its large and oval, yellow, cucumber-like capsules, hanging from the sides of the trunk and branches. These are divided into 5 cells, each filled with 8 to 10 ovoid seeds, piled one upon another, and covered by a membranous and succulent aril. There are several varieties of these seeds or nibs, which are more or less esteemed. The kernels of the seeds yield by pressure about one-half their weight of a fatty oil, commonly called Butter of Cacao, at one time much lauded for its medical properties. The seeds, pounded, digested, and boiled with water, with the oil skimmed off, and sweetened with sugar and milk, afford a wholesome and agreeable beverage. The Cacao sold in the shops consists either of the roasted kernels and husks, or of the husks only, ground to powder ; it is sometimes made from the cake left after expressing the oil from the beans. Much of the cheap stuff sold under this name, is very inferior, being made with damaged nuts that have been pressed for the oil, mixed with potato-flour, mutton-suet, &c. Flake cocao is cocao ground, compressed, and flaked by machinery, Chocolate (from the Indian name chocolalt) is made by triturating in a heated mortar the roasted seeds without the husks, 10 lbs. with an equal quantity of sugar, and about 1½ oz. of vanilla, and 1 oz. of cinnamon, into a paste, which is put up in various forms. The mass of the common chocolate sold in England is prepared from the cake left after the expression of the oil, and this is frequently mixed with the roasted seeds of ground peas and maize, or potato flour, to which a sufficient quantity of inferior brown sugar, or treacle, and mutton suet is added to make it adhere together. The chocolate-nut tree is seen in Tavoy gardens, and it brings its fruit to perfection. This tree has been introduced into Travancore, where it thrives well ; the fruit is round but smaller than that produced in South America. It thrives well in the Calcutta Garden. The nutritive properties of chocolate depend on a concrete oil or butter of most agreeable flavour, of which 1000 parts of the seed yield 386.—*Drs. Royle, Mason, Riddell and O'Shaughnessy, page* 227. See Cacao.

THEOCK, a river in Gowhatty.

THEODOTUS I., a Bactrian ruler. B. C. 256. See Greeks of Asia.

THEOG, Here, nearly eight miles from Fagu, there is a fort belonging to a Rana, or hill chieftain, and a small village, with a good many fields. The cultivation at this great elevation, for the fields reach to at least 8000 feet, is principally of barley, which is sown in early spring, and reaped in the beginning or middle of June, according to the season.—*Dr. Thomson's Travels in the Western Himalaya and Tibet. page* 37.

THEOPHILUS INDUS. See Christianity.

THEOPHRASTUS, the contemporary of Aristotle, mentions fishes (De piscibus) found in the Euphrates which, in the dry seasons, leave the vacant channels and crawl over the ground in search of water, moving along by fins and tail.

THEOS. See Greeks of Asia.

THEP-YENG. Burm. This, a native of Amherst, is said to be a fruit tree : the trunk affords a compact, fine grained wood.—*Cat. Ex.* 1851.

THER. Hind. Capra jemlaica, *Ham. Smith.*

THERAI, a forest or jungle tract at the foot of the Himalaya. No two climates and locations can be more dissimilar than those of the hills and terai, and no races are more distinct in their habits, manners and aptitudes than the people of the hills and those of this jungle belt below. There is little or no Terai or forest belt north-west of the Saharunpur district and the Dehra Dhoon, but, thence eastwards, this belt stretches along the foot of the hills through Rohilcund, Oudh and the Bengal frontier up to Assam, and a great part of the Oudh Terai was transferred to the Nepalese. Dr. Campbell describes the people of the Nepal Terai, as a vast assemblage of bastard hindus.—*Campbell, p.* 47, 50. See Terai.

THE-RA-PI. Burm. Calophyllum longifolium.

THERAPIA. See Platanus orientalis.

THERAUDIN in Guzerat, occupied by the Bagela race.

THERMOMETER. The subjoined table shews the boiling points of distilled water at different elevations, up to 17,455 feet :—

THESAURUS ZEYLANICUS, a botanical work by John or the elder Burmann, published in 1737, with 110 plates, containing figures of 155 plants, which are generally very characteristic and well executed. Burmann's work appears to have been principally drawn up from specimens collected by Dr. Paul Hermann, who was sent out to Ceylon, in 1670, and remained till 1677 at the expense of the Dutch East India Company, for the purpose of describing all the plants and species growing in that island. Hermann's Museum Zeylanicum was first published in 1717, although it appears to have been written many years before; besides the plants of Ceylon, it contains many species collected at the Cape of Good Hope, unfortunately not distinguished from the others, a circumstance which afterwards led Linnæus into the error of considering them all natives of the East. Hermann's herbarium had been lost upwards of half a century, until chance threw it into the hands of M. Gunther (apothecary to the king of Denmark), who sent it to Linnæus, requesting him to examine it, and affix the names to the plants throughout the collection. Its great value, from the collector having been so eminent a man, induced Linnæus to examine the whole with much attention, and he was thereby enabled to form many new genera and settle many doubtful species. He published the result of his labours under the title of Flora Zeylanica, sistens plantas Indicas Zeylonæ insulæ, quæ olim 1670-1677, lectæ fuere a Paulo Hermanno, Professore Botanico Leydensi; demum post 70 annos ab A. Gunthero, Pharmacopæo Hafniensi, orbi redittæ. (Holm. 1747, 8vo. pp. 254. tab. 4.) In an appendix, the new genera are concisely given by themselves, copied from an academical dissertation published under Linnæus' presidency, by C. M. Dassow.—*Wight's Prodromus Floræ Vol*, I. *p.* 9.

This tree is generally met with in Ceylon and in Southern India, in avenues or lining roads, but is in most abundance near the sea. It is of quick growth, and yields a good shade, but is inconvenient on road sides and in gardens, from the quantities of leaves it sheds, and the numerous large flowers which fall. It is commonly planted from cuttings, from which cause, perhaps, the tree is often hollow in the centre. It yields, when ripe, a very strong, hard and durable timber, with a colour like mahogany, but its use is limited from the difficulty of getting it of large size. It is used for chairs in Madras. On the Bombay side, where it is found only near the coasts, it is much used in the construction of cart wheel spokes, and for the timbers of native boats. The shoots are also in extensive use there, as rafters for houses, and at all times fetch a good price when sold for this purpose. The Bombay Government formed plantations of this tree at Sakuria in Alibagh, at Sat Tar, and in Colaba. The increasing scarcity of this tree is such that wheel-spokes were, some time ago, being paid for by the gun-carriage department at 12 annas each. There are a pretty large number of these trees within the village precincts of many of the cultivators in the Concan, but these are mostly reserved for the supply of choice rafters, afforded by the straight shoots of the tree, while the stem is most frequently hollow; and therefore the ripe-wood, or such of it as remains, is worthless for ordnance purposes. Though of rapid growth, its wood is not in much use. Some Ceylon caterpillars sting. A greenish one, that occupies the Thespesia populnea at a certain stage in its growth, descends by a silken thread, and hurries away. The moth of this is supposed to be a Bombyx, near Cnethocampa, *Stephens.—Drs. Voigt, Wight, Gibson and Cleghorn, Captain Beddome, Thwaites.*

THETSEE, a varnish obtained from Melanorrhœa usitata, in Arracan, and used for lacquering.—*Simm. Dict.* See Thit-see.

THETTI. TAM. Syn. of Ixora coccinea, *Linn.*

THEVATHARU. Tam. Guatteria longifolia, *Wall. W. & A.*

THEVAHDARUM. Tam. Cedar wood, a timber of Travancore, of a flesh color, specific gravity 0·457, 2 to 8 feet in circumference, and used for palanquins, cabin fittings, furniture, &c.—*Colonel Frith.*

THEVENOT the younger, was a great traveller. He was born at Paris, and died at Miana in Persia, about eight days' journey from Tauris, Nov. 18, 1667. He was Monsieur Petis de la Croix's friend, so he took care to revise his Memoirs, and had them printed in three volumes. The first contains his travels into Turkey; the second his travels to Persia; and the third to India. Monsieur Petis de la Croix, jun., the oriental interpreter to the king of France, being at Miana afterwards, disinterred his bones near the caravansera, where they had been buried, and had them interred at Tauris, under the altar of the Capuchins church there, in 1676. Mouri and other French writers confounded the two Thevenots as appears from the "Dictionaire Historique" of Ladvocat. (Par. 1760): and the "Nouvelle Bibliotheque d'un Homme de gout." Tome III. p.454. (Par. 1777), styling him indifferently "Fager," or the nephew, or the traveller.—*Vol. I. p.* 169. *History of Genghizcan, p.* 446·

THEVETIA NERIIFOLIA. Juss.

Cerbera thevetii *Linn.* | Cerbera thevetis, *Don.*

Exile tree Eng. | Yellow oleander. Eng.

This plant is common in the gardens of the peninsula and is a common ornamental shrub in Calcutta; grows to the height of ten or twelve feet, with long tapering leaves; it is grown from seed, and blossoms throughout the year. Its juice is acrid. Two grains of its bark have been affirmed to be equal to an ordinary dose of Cinchona. The wood is worthless.—*M.E.J.R. Cat. Madras Gardens, Riddell, Ind. Ann. No.* 6.

THEW-GA-NET. (Tilsa?) A tree of Akyab. A very good wood, used for work of all kinds. Grows to a large size, and is very plentiful in the Akyab and Ramree districts. —*Cal. Cat. Ex.* 1862.

THE-YA. Burm. Shorea obtusa, *Wall.*

THEYAH. Burm. An inferior wood of Tavoy.—*Mr. Blundell.*

THIN-BAW. Burm. Carica papaya, *Linn.*

THING—? A tree of Akyab, which grows to a large size and is very plentiful. Its wood is used in house building.—*Cal. Cat. Ex.* 1862.

THIN-GA-DOE. Hopea, *species.*

THINGAN. Hopea odorata, *Roxb.*

THINGAN-KYAUP. Burm. A Tavoy tree, with a close grained, heavy, strong wood, used in ship and house building, for carts, &c.—*Mr. Blundell.*

THIN-WIN. Burm. A tree of Moulmein, a species of Pongamia. The root is used medicinally.—*Cal. Cat. Ex.* 1862.

THIRPILI. Mal. Chavica Roxburghii.

THIRST. The Eastern Arabs allay thirst by a spoonful of clarified butter, carried on journeys in a leathern bottle. Every European traveller has some recipe of his own. One chews a musket-bullet or a small stone. A second smears his legs with butter. Another eats a crust of dry bread, which exacerbates the torments, and afterwards brings relief. A fourth throws water over his face and hands, or his legs and feet; a fifth smokes. But to conquer the craving, be patient and do not talk. The more you drink, the more you require to drink—water or strong waters. But after the first two hours' abstinence you have mastered the overpowering feeling of thirst, and then to refrain is easy.—*Burton's Pilgrimage to Meccah, Vol. III, p.* 19.

THIRTANKARA, a sainted Jain teacher. See Jain. Karli.

THIRU VALA CONNAY. Tam. Bauhinia tomentosa, *Linn.*

THISSA. Hind. Rhus buckiamela.

THIT-KA-DO. Burm. Cedrela toona, *Roxb.*

THIT KYAH. Burm. Quercus semiserrata, *Roxb.*

THIT-LIN-DA. Burm. Spathodea, *species.*

THIT-NA-MYENG, also Thit-na-nweng, Burm., of Akyab, a dye of Burmah; thread is coloured yellow by it; and when oil and sealing-wax are added, a red colour is obtained. See Dyes.

THIT-NEE. Burm. A beautiful red, but heavy, wood, of British Burmah. A cubic foot weighs lbs. 80. In a full grown tree on good soil, the average length of the trunk to the first branch is 50 feet, and average girth measured at 6 feet from the ground is 8 feet. It sells at 12 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

THIT-PA-GAN. Burm. Pongamia, *species.*

THIT-PHYEW. Burm. Sibia glomerata.

THIT-POUK. Burm. A species of Lagerstræmia, a light wood of British Burmah not much used. A cubic foot weighs lbs. 35: in a full grown tree on good soil, the average length of the trunk to the first branch is 20 feet, and average girth measured at 6 feet from the ground is 4 feet. It sells at 8 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

THIT-SEE. Burm. The black gum of the

Melanorrhœa usitatissima, *Wall.* Burmese books are written on palm leaves with a style, and certain of the sacred books which are written in the square chacracter are inscribed with the black gum.—*Yule, p.* 36.

THITTEL—— ? See Dyes.

THIT-WA-JI. Burm. Armosia dasycarpa.

THMENG-BA. Burm. A timber of Tavoy, like red Jarool ; used for posts and cotton rollers.—*Mr. Blundell.*

THMENY-TSHOUT. Burm.*Qu.* Thmeng-tshout, a small, heavy, coarse, brown, wood of Tavoy, used for door frames and boat beams. —*Mr. Blundell.*

T'HODA. A race dwelling on the Neilgherry mountains, in the peninsula of India. The Thodawar race say that they are the aborigines, and the other classes regard them as the lords of the hills. They occupy the Todawar naad and Mulka-naad. Their villages are in the depths and on the skirts of the forests. Their houses are built in the form of a parallelogram, 10 feet by 6, roof semi-circular and door 1¾ to 2 feet high, and 14 inches to 1½ feet wide and is the only aperture. Their appearance is noble, some of them being upwards of 6 feet high. They marry, but the women practice polyandry, and infanticide was once prevalent, but it is said that no girl has been destroyed since 1819. In their polyandric habits, they assimilate to the Coorg, the Nair, and the people of the Himalayas, and in infanticide, with the Rajpoots. Their numbers in 1825, were men 145 ; women 100 ; boys 45, and girls 36=326. They burn their dead, and once afterwards sacrifice bullocks to the manes. The following are a few Todawar words:—

Polsh-ti	...Temple.	Tilum	.....Pleasure.
Eshu	......Morning.	Ter	........Deity
Kukh	.....Daughter.	Uhk	........Fie.
Mukh	......Son.	Urkom	..A servant.

Turuvi	...Monkey.	Err	..........Buffalo.
Ishk	......People.	Aras	..........House.
Mort	.......Home.	Uschus	.....Mid-day.
Cubbon	...Iron.		

The Toda, properly the *Tuda* or *Tudava* language, is that spoken by the Tudavar, a primitive and peculiarly interesting tribe inhabiting the Neilgherry hills, practising quasi-druidical rites, and commonly believed to be the aboriginal inhabitants of these hills. They do not at present number more than from 300 to 500 souls. It is supposed that they never could have exceeded a few thousand, but have diminished through opium eating and polyandry, and at a former period, the prevalence among them of female infanticide. The Tuda is the oldest indigenous speech on the hills. According to Metz, the Toda never pray. Even among the priests, he says, ' the only sign of adoration that I have ever seen them perform is lifting the right hand to the forehead, covering the nose with the thumb when entering the sacred dairy, and the words " May all be well" are all that I have ever heard them utter in the form of a prayer.—*Lubbock Origin of Civil, p.* 254. See India, pp. 73-75.

THO-JI CHAN-MO, a plain in Ladak covered with natron. In its centre is the Tsho-kar, or white lake, called by the hindus of Chamba and Bisahar, Khari Talao, or the salt lake, in lat. 33° 15′ N. and long. 77° 50′ E., at an elevation of 15,684 feet. To the south of the Tsho-kar is a small fresh water lake that supplies the salt-water lake. It is a favourite haunt of the Kyang or wild horse

THOKAY. Tam. A wood of Tinnevelly, of a red colour, specific gravity 0·950 ; used for building purposes.—*Colonel Frith.*

THOLLUM, a name in Bellary for the East India Company's old rupee, weighing 176¼ troy grains.—*Simmond's Dict.*

THOLOO-PANY—? Momordica charantia.

THOM. Hind. Allium sativum.

THOMAS, George, an Englishman bred to the sea, but who in 1781-82 deserted from a vessel of war in Madras, and took service with the petty chiefs of that presidency. In 1787 he took service with the Begum Sumru, and rose into high favor. But, becoming dissatisfied, he entered the service of Apa Kunda Rao, a principal officer of Sindhia. He distinguished himself in 1799 and 1800, but after twice defeating Perron's troops, he shortly after surrendered, retired within British territory, and died in 1804.

THOMAS, Edward, a Bengal Civil Servant, author of Coins of the Pathan Sultans of Hindustan : Editor of Prinsep's Antiquities, and joint Editor of Sir Henry Elliot's posthumous History of India.

THOMAS. St. Thomas the apostle is generally believed to have proceeded to Arabia and India, and to be buried at St. Thomé or

Mylapur, a suburb of Madras, where his tomb is shown in the Roman Catholic cathedral under the Portuguese clergy. But there is much doubt both as to the places in which he laboured to extend a knowledge of the doctrines of Jesus the Christ, and as to the place and circumstances of his demise ; even in the same cathedral at St. Thomé is a bone relic, sent from a former Pope of Rome and older traditions in the West assert positively that Thomas was buried at Edessa. There is a hill ten miles from Madras, called St. Thomas' Mount, to which, from unknown times, Syrian christian and Roman christian pilgrims from Syria and all Asia repair, and at the Little Mount, at the Marmalong bridge, six miles from Madras, is shown a cave where St. Thomas is said to have been killed. There are numerous native christians in Madras and its neighbourhood, mostly the fishermen who go to sea through the surf in their catamaran and masula boats, but no tradition exists as to their conversion. Those near the Triplicane temple of Vishnu have houses built over temple ground, on the stipulation of pulling the idol car. Nicephorus declares St. Thomas to be the apostle of the Indians ; and Gaudentius says, like Sophronius, that he died in India at the town of Calamina, which is no other than Mylapore, a place at a short distance from Madras. Marco Polo relates that St. Thomas was accidentally killed when at prayer in a wood, by a low caste man, who was shooting at peacocks ; and that, as a consequence of this mischance, none of the poor man's tribe could ever enter the place where the saint lay buried. Gibbon says that "Marco Polo was told on the spot that he (St. Thomas) suffered martyrdom in the city of Meliapore." This however, is clearly an erroneous statement. Dr. Fryer, who visited India about 1680, says that "about this Mount live a caste of people, one of whose legs are as big as elephant's, which gives occasion for the divulging it to be a judgment on them, as the generation of the assassins and murtherers of the blessed apostle St. Thomas, one of whom I saw at Fort St. George." Such the miraculous origin of elephantiasis ! Some of the doubts as to St. Thomas the apostle have arisen from the martyrdom of a christian named Mar-Thomas. It is on record that Alfred the Great despatched from Britain an embassy under Sighelm, Bishop of Shireburn, to the shrine of the saint at Madras. This was in 883, and it seems little likely that if the legend of the death and burial of St. Thomas in the neighbourhood of Madras really arose out of the fact of the death and burial of Mar Thomas—an event which took place only about half a century before Alfred's embassy,—there should have been at that time, either in Egypt or Great Britain, any confusion of an incident which occurred fifty years before with one that was at least eight centuries old. It is surmised by Gibbon and other writers, that the pilgrims were despatched from Great Britain but never proceeded farther than Alexandria, where they "collected their cargo of legend." The Christians, on the coast of Malabar, trace their paternity to the Apostle Paul, who "went through Syria and Cilicia confirming the churches." They looked to Syria as their spiritual home. They owned the supremacy of the Patriarch of Babylon. It appears that while the Indian bishoprics were under the authority of the christian Patriarch of Seleucia, an Armenian christian named Thomas Cana, took up his abode in Malabar, and some suppose that his name has led to the belief that Thomas the disciple visited India.—*Kaye's Christianity in India, pp.* 4-24. *P. Vincenzo Maria, Viaggi, pp.* 132-136, *in Yule Cathay, II. p.* 378. *Huc's Christianity, Vol. I, p.* 2.

THOMBATY—? Oleum cucumis-colocynthis.

THOMBOO —— ? See Cloths.

THOMSON, Dr. Thomas, a medical officer of the Bengal army, an eminent scientific botanist and traveller. Author of Travels in the North-western Himalayas, and, with Dr. Hooker, joint author of the Flora Indica. Dr. Thomson's botanical collections made in the plains of North-west India, between 1842 and 1847, chiefly in Rohilkund, Loodiana, and the Punjab, amount to about 1000 species. His Himalayan collections were partly collected in Kumaon and Garhwal during short visits to these provinces in 1844 and 1845, but mainly consist of the herbarium collected during a Government mission in the North-west Himalaya and Tibet, in 1847, 1848, 1849, in the course of which he visited, in 1847, Simla, Kunawer, Piti ; and in 1848, Kashmir and the Punjab, Himalaya Ladak, and the Karakoran Pass. The summer of 1849 he spent at Simla and Ladak. These amount to rather more than 2,500 species.

THONDE NAR. Tam. Fibre of Callicarpa lanata.

THOOMBE KIRE. Tam. Leucas aspera.

THOOMOOTEE. Tam. Cucumis pubescens.

THOONGUN. A tree of Akyab. It is plentiful, but has a small wood, used for oars and banghies.—*Cal. Cat. Ex.* 1862.

THOOTHI. Tel. Gossypium. Cotton.

THOR, of the Scandinavians, is the same as Sor or Sol, the sun, Surya, the ancient people of the north pronounced "ss" as "th." Thor's battle axe is the cross. "Pattee" is the "swastika" of the budd'hist, and the monogram of Vishnu and Siva. Thor's symbol of governance was the last letter of the Samaritan alphabet, the "tau" or "tao" in its decussated form. It is the mark which the prophet Ezekiel (ix. 4) was ordered to place on the foreheads of the faithful in Judah, and Indian women still place it on their stores of grain. It is placed on the jars of water from the Ganges and Indus, and in the south of India is used as the emblem of disembodied Jain saints. It is the mystical "Tao Sze" of the budd'hists, is the chief ornament on the sceptre of the Bon-pa deities of Tibet, and is expressed on the "Artee" or musical bell born by Bal Govind. See Basant.

THUL-BAN-BU. Burm. Anacardium occidentale, *Linn.*

THI. See India.

THICK-LEAVED LAVENDER. Eng. Anisochilus carnosum.

Kachubung,	Malay.	Kari oomatay,	Tam.
Rotiubung,	,,	Nalla oomati,	Tel.
Hummatu,	Maleal.	Tatura,	Turk.

There are several species of Datura: and the whole plant of D. fastuosa has a rank odour, which may be detected at a distance. All parts possess medicinal properties. The seeds are brownish or black, flattened, kidney shaped, without odour, except when bruised, and have a bitter weakish taste. For the purpose of facilitating theft, and other criminal designs, the seeds are frequently given in India with sweetmeats, to stupify merely, but not with the intention of killing: although there is no doubt that for the latter purpose it has also been used. The root, dried leaves, capsules, and seeds are recommended by European medical practitioners in India, to be smoked in cases of spasmodic asthma. The white flowered thorn apple is D. alba, *Rumph.*, D. fastuosa, *Willd*, the purple flowered variety.—*Faulkner. O'Shaughnessy.* See Datura stramonium, D. alba, D. fastuosa.

THOSSA. Hind. Ficus Roxburghii, F. macrophylla.

THOTHA-KUTTY. Tam. A wood of Tinnevelly, of a red colour, used for furniture of every description. This seems an illustration of the errors arising from using vernacular names. It appears to mean garden knife.—*Colonel Frith.*

THOW LANGNA of the Terai, Hog-deer, Axis maculatus, *Ham. Smith, Gray.*

THOUN-BEN, Burm. Artocarpus, species.

THOUNG-THA-LAZ? A tree of Akyab which grows to a large size, but is not by any means plentiful. Its wood is used for oars and sometimes in house-building.—*Cal. Cat. Ex.* 1862.

THOUNG-THU, a population on the Karen frontier speaking a dialect of the Karen language. The Thoung-thu, or southern mountaineers, are scattered through Cambodia, Burmah proper, and the Shan states, and are seen at Mergui and Tavoy.—*Mason*, pp. 94, 95.

THOUN-MYN-GA. BURM. A wood of Tavoy, used in building.—*Mr. Blundell.*

THOURA, HIND. MAR. Conocarpus latifolia.

THOUSAND ISLANDS. A group of about 60 islands, in the passage from Batavia to Banca. The most northern is in lat. 5° 24′ S., long. 106° 32′ E.

THOVARY PARPU. TAM. Cajanus Indicus. Pigeon pea. See Burri toovar, Tour, Dhal, Dhol.

THRAAN. DUT. GER. also Fisch-tran. GER. Blubber.

THRACIA, a genus of molluscs.

THRACIAN. See India.

THRASAETINÆ, a Sub-Fam. of birds with two gen. 5 sp., viz. 1 Pseudastur; 4 Spizaetus.

Thread is formed by twisting together fibres of cotton, silk, or flax.—*Faulkner, McCulloch.*

THREAD OF THE EGYPTIAN LOTUS. See Nelumbium speciosum.

THREE-LEAVED CAPER TREE. Cratæva Roxburghii, *R. Br. W.*

THRUSH. The blue rock-thrush, Petrocincla cyanea is the P. pandoo of Colonel Sykes, and it is distributed over south-eastern Europe and the temperate and torrid parts of Asia. By some it is supposed to be the bird alluded to in Scripture, "the sparrow that sitteth alone upon the house-top." The difference in plumage between sexes and young birds caused much confusion with the earlier Indian naturalists. Specimens likewise from the Himalayas have been found to have longer bills than individuals from other countries, and accordingly Mr. Blyth named the latter P. longirostris. This long-billed variety is common among the rocks of the N. W. Himalayas; it would seem this is a permanent race of Petrocincla cyanea, and peculiar to the more northern regions, inasmuch as all Dr. Adams procured in Ladak and Cashmere belonged to the above variety. The hill-black-bird, or blue water-thrush (Myiophonus Temminckii) is one of the most beautiful and common tenants of the Himalayan streams. It builds its nest on the cliff over the mountain torrent; during incubation the male may be seen sallying forth, sporting from cliff to cliff, his melodious note sounding sweetly among the roaring of the troubled waters. The sweet melodious song of this species has a resemblance to that of the blackbird, but is softer. The blue of the body is more intense on the breast, and forms a gaudy halo across the forehead.—*Adams.*

The Pagoda thrush (Acridotheres pagodarum) is probably the bird referred to in Lalla Rookh;—

"Mecca's blue sacred pigeon, and the thrush
Of Hindostan, whose holy warblings gush
At evening from the tall pagoda's top."

The Missel thrush, Turdus viscivorus, performs an up-and-down migration on the western ranges of the Himalayas, being found at high elevations in summer, and in the more sheltered situations of the valleys during winter. The black throated thrush (Turdus atrogularis) is generally distributed over the woods and cultivated tracts of these ranges. The black throat is wanting in some varieties, and there are several well marked similarities to what has been called the red-necked thrush (Turdus ruficollis), which Mr. Hodgson considers a distinct species.—*Adam's Sportsman in India.*

THRYSSA. This genus, says Swainson, has the general aspect of the anchovy "Engraulis," but the body is broader, the mouth enormous, and opening almost vertically. A species that inhabits Tenasserim waters may be denominated the Thryssa anchovy.—*Mason.*

THSAN, an itinerary measure of China, equal to 28·633 miles.—*Simmond's Dict.*

THSIN, a name of the empire of China, taken from the dynasty of this name, applied to this country, has nearly always been some form of Sin, Chin, Sinæ, China. The region in question was known to the ancients as the land of the Seres; to the middle ages as the empire of Cathay. The name "Chin" has been supposed to have come to Europe through the Malays, like many another word and name connected with the trade and geography of the far east, and to have been applied by them to the great eastern monarchy, from the style of the dynasty of Thsin, which a little more than two centuries before the christian era enjoyed a brief but very vigorous existence, uniting all the Chinese provinces under its authority, and extending its conquests far beyond those limits to the south and the west. There are however reasons for believing that the name of China must have been bestowed at a much earlier date, for it occurs in the laws of Manu, which assert the China race to have been degenerate Kshatriya, and the name occurs in the Mahabharat, compositions many centuries older than the imperial dynasty of Thsin. Marco Palo says, "I shall take another occasion to establish that the statement in the Laws of Manu is partially true, and that people from India passed into

Shensi the westernmost province of China, more than one thousand years before our era, and at that time formed a state named Thsin, the same word as China." It is remarkable that, as the same scholar notices, the name of China is used in the Japanese maps.—*Lassen*, i. 857-8; *Panthier, Marco Polo*, p. 449, 550. See China.

THSUN, or Tsum, a Chinese long measure nearly 1¼ inches.—*Simmond's Dict.*

THUAR. HIND. Euphorbia antiquorum.

THUCKKALI. TAM., also Sime thukkali-pallam, TAM. Solanum lycopersicum.

THUG, a class of murderers and robbers, who sprung up under the first mahomedan dynasties. 500 were executed in Etawa in the reign of Akbar. It was on the discovery of thirty dead bodies in different wells of the Doab, that thuggeeism again came to the knowledge of the Calcutta Council in 1810. About the year 1830, it became known that no part of the whole of India was free from these murderers, and a department was formed by the British Indian Government, empowered to suppress them. This was effected by the officers of the Thuggee Department tracing out the members of the gangs by inducing prisoners to become approvers, and reformatories were established to reclaim both the children and the adult. By the year 1860, the gangs had become almost wholly destroyed. Gano is a class of thugs.—*Saunder's Magazine, September* 1852. *Tr. of Hind. Vol.* 1, *p.* 373. See Dacoity.

THUGGANEE JOGI. See Jogi.

THUHAR. HIND. Euphorbia nivulia.

THUJA, a genus of plants belonging to the natural order Pinaceæ, of the section Cupresseæ. T. Orientalis *Linn*, the Chinese Arbor-vitæ, grows in Siberia, Nepal, China, and Japan, and T. excelsa, *Bong*, also grows in Japan along with T. pendula, *Lamb.*, the weeping arbor-vitæ of Tartary. See Evergreens.

THUJOPSIS DOLABRATA. *S. & Z.* A tree of Japan.

THUKALLUM. MALEAL. Elettaria cardamomum.

THUL. HIND.

T'hur,	CHALD.	Tur,	PERS.
Taarn,	DAN.	Tor,	SAX.
Tur, Sos,	GREEK.	Tur,	WELSH.
Thurm,	GERM.		

The Rajputanah desert, running to the Indus, is marked with t'hul, rooe and sand ridges, or Thul-ka-Tiba, some of which are very lofty. Thu'l means an arid bare desert; rooe is equally expressive of desert, but implies the presence of natural vegetation, in fact, the jungle of the desert. The word Maroost'hulli is compounded of the Sanscrit mri, to die; and st'hali, arid or dry land; which last, in the corrupted dialect of those countries, becomes t'hul, denoting tracts particularly sterile, the converse of the Greek oasis. Each t'hul has its distinct denomination, as the t'hul of Kawar; the t'hul of Goga, &c.

T'huls are numerous in western Marwar, which is a corruption of Maroo-war, classically Maroo-st'hulli or Maroost'han, the region of death. It is also called Maroo-desa, the country of death, which is synonymous with Mor-d'hur used by the bards, and though the term Marwar is now restricted to the country subject to the Rahtor race, its ancient application was to the entire desert between the Sutlej and the ocean.

The t'hul of the Looni embraces the tracts on both sides of the river forming Jhalore and its dependencies. Jhalore is one of the most important divisions of Marwar, but the region south of the river cannot be included in the t'hul. When the Pramara race held paramount rule in Maroo-st'hali, Jhalore was one of the nine castles of Maroo. Jhalore has only the desert plants, the jhal, babool, and karil.

The t'hul of Tirruroe intervenes between that of Gogadeo and the frontier of Jesulmir. The name is from tirr, moist, and rooe. The t'hul of Khawur lies between Jessulmir and Barmair and abutting at Giraup into the desert of Dhat, is in the most remote angle of Marwar. The Sahrai find pasture for flocks of sheep and herds of buffaloes in this t'hul.

The Malli-nat'h t'hul is also called Barmair formerly occupied by the Malli or Mallani, of Chohan, or as some declare, of Rahtor origin; great numbers of camels, the best in India, are reared here.

Kherd'hur, the land of Kher, from the Kher plant, and from it also called Kherala and Kheraloo, the home of the Kher, was formerly occupied by the Gohil race, who robbed the caravans or kafila, as they crossed the desert, The Rahtor race drove out the Gohil, who are now the lords of Goga and Bhownuggur near the gulf of Cambay, and till lately swept the ocean as far as Sofala or the Gold Coast, as pirates and slave-hunters. Junah Chotun are two ancient towns. Nuggur Goorah, between Baymair and Nuggur Goorah, is one immense rooe containing deep jungles of Khyr, or Kher Kaijri, Karil, Keip, p'hok.

Gogadeo-ca-t'hul, the t'hul of Goga, a name celebrated in the heroic history of the Chohans, is immediately north of Eendovati, and one description will suit both. The sand-ridges (t'hul-ca-teeba) are very lofty in all this tract; very thinly inhabited; few villages; water far from the surface, and having considerable jun-

ridges of the Rajasthan deserts are designated. The term is identical with the Tor and Thur, and Tull of other languages; thus the Coptic T'hul has the same meaning. T'huls are bare and arid tracts, contradistinguished from rooe, jungle desert.

The Thul, or desert of drift sand in the Sind Sagor Doab, has Leia, Muzaffarnaggar, Dehra Ghazi Khan, Jampore, and Dhoondoo on its skirts. The sand lies in huge wreaths and hillocks, the latter often reaching the height of 40 or 50 feet above the general level of the country, which is, for the most part, destitute of vegetation, a few of the leafless pogh bushes, with some jhund and bur or peeloo, also occur, and occasional oases occur. There are small patches of ground, free from sand and like little valleys surrounded by low hills. The soil is everywhere strongly impregnated with kullur, (impure nitrate of soda.) *Tod's Rajasthan, vol.* ii. *pp.* 296-300. *Annals*, ii. 289. *Captain Dias in P. P.* 265 *of* 1861. See Thurr.

THUL-I-TAUBA. Ar. the hill of repentance is on the Tigris, and is so named because of the tradition that when Jonas threatened the Ninevites, they went to this hill and vowed repentance. The Gaelic Tillee Beltein, i. e., the hillock of the fire of Baal, is a town in Perthshire, where the Beltane festival is held on old May-day.

TAURUS is a mountain of Asia. Jab'l Tur is the mountain near Mount Sinai.—*Elliot.*

THUL KOOREE. Beng. Hydrocotyle Asiatica.

THUL-PUDMO. Beng. Hibiscus mutabilis.

THUM. Hind. Berchemia, sp. In Bassahir, Thum is the Fraxinus xanthoxyloides, or crab ash, and in Kanawar it is Puliurus aculeata.

THUMBATAN-KAI. Tam. Dolichos ensiformis.

THUMI SAMBHUTA. See Tibet, Magar.

THUNBERG, C. P., a Swedish botanist, who visited Ceylon in 1777, author of the Flora Japonica. He also laboured in Java.

THUNBERGIA, a genus of climbing plants of the natural order Acanthaceæ, called after Thunberg. Amongst the species are T. alata, of Zanzibar, T. angulata of Madagascar, T. fragrans of Hindustan and the ghats of the peninsula, and T. grandiflora of all India. These plants are grown from seed in any good soil and bear flowers of various colours. T. grandiflora has large flowers with no inner calyx; the leaves are angular, cordate: the anthers bearded and spurred and it hangs in beautiful blue racemes, and is adapted for covering trellis work. T. fragrans has a climbing stem, with cordate acuminate leaves somewhat angular at the base. A large beautiful creeper, N'way h'myo, Burm, with azure flowers, belonging to the genus Thunbergia, is a conspicuous plant in the forests of Burmah. The species are handsome climbing plants, with a fragrant odour, with white, yellow, and blue flowers; they require a free rich sandy soil and plenty of drainage. The large varieties with blue flowers should be planted out and trained upon pillars, trellises or trees. Natives of the tropics; raised from seeds, cuttings, layers, and suckers.—*Riddell. Eng. Cyc. Mason.*

THUNDA, Hind. Cold, cool. Thunda-churi a cold-kaife. Thunda-karna (lit. to cool), laying the ullums, &c. away. Thunda-mussala, seasonings.

THUNG-BAIN. See Shan

THUNG-HSEN-PAN. Burm. Gardenia florida, *Linn.*

THUNG-SHIN-PAN. Burm. Garlic.

THUNIR. Hind. Thunu? Hind. Taxus baccata.

THUNKU-PUSHPA. Maleal. Clitorea ternatea, *Linn.*

THUN-NA-KA. Tam. A wood of Tinnevelly, of a whitish brown colour, used for making trunks.—*Colonel Frit.*

THUOC, the Chinese "chih," cubit, or foot, and the generic name for the measure of length in Cochin China, which varies according to circumstances. Those more commonly employed are:—

		Metre.	Eng. Inches.
1.	That used for measuring ships for the service of ports ...	0·405	= 15·945255
2.	That used for wood at Turon ...	0·425	= 16·732675
3.	That mentioned by Taberd in his valuable Anamitic Dictionary..	0·48726	= 19·18391346
4.	That used by the king for measuring silks and other cloths in his transactions with foreigners ...	0·594	= 23·386374
5.	That used by the natives in the Turon market...	0·61	= 24·01631
6.	That used according to Morrison ...	0·64968	= 25·57855128

—*Simmond's Dictionary.*

THUP-TEE. A musical instrument.

THU-RA-PEE. Burm. Calophyllum species.

THURB—? Sanseviera zeylanica.

THURLKURI. Beng. Hydrocotile Asiatica, *Linn.*

THURNEL. Punjabi. Benthamia fragifera.

THURR and Parkur, is a sandy desert in Sindh. The desert talookas of Omerkote consist of a narrow strip of sand hills and waste lying north of the Runn of Cutch, and stretching about 130 miles from district Mahomed-inland languages. As a general rule, the Arabic is the language for the whole of the sea-coast, from the Delta of the Nile to the Straits of Gibraltar, and from the Straits of Gibraltar to the mouth of the Senegal river. On the southern borders of the Sahara the Berber language is conterminous with the Woloff, Serawoolli (?), Fulah (?), Sungai, Howssa, and Bornu (?) languages; its southward extension, on the eastern half of Africa, being sufficiently wide to embrace the whole area of the Great Desert. To the east its extension from north to south is less; the Tibboo language being spoken as far west as Fezzan, and as far north as the oases of Augila and Siwah. The remarkable magnitude of the Berber area was known to the authors of the Mithridates.

Tibbu of Lyon and Hodgson seems to belong to the Nubian class, and to be Libyan or Lybes. For Egypt and the parts connected with Asia by the Isthmus of Suez, the permanent influence of Arabia began under the successors of Mahomed. For Abyssinia, and the parts about the Straits of Babelmandeb, the permanent influence of Arabic began at a period anterior to history, as manifested by the constitution of the old Æthiopic language and its derivatives.—*Dr. Latham in Rep. Brit. Ass.* 1847, *pp.* 210, 215.

TIBELEBU, the name of a tree in Canara and Malabar, also named Nambogum. The wood is close grained, and for general house building purposes used as a strong durable wood. It may be procured from eight to thirty-six inches in diameter, and from twenty to thirty-five feet long.—*Edye Forests of Malabar and Canara.*

TIBERIAS, a lake in Palestine anciently called the Sea of Chinnereth, from its vicinity to the town of that name. Its Scripture names are the Sea of Galilee, so called from its situation on the western borders of that division of Palestine, and the Lake of Gennezareth, from the neighbouring land of the same name, and also the Sea of Tiberias, from the contiguous city of Tiberias, now known by the name of Tabaria, the only large city existing on its shores. The lake is about fifteen miles in length, and six to nine in breadth. Lake Tiberias was the scene of one of our Lord's miracles, Luke viii. 23,24. "There came down a storm of wind on the lake, and they were filled with water, and were in jeopardy. Then he arose, and rebuked the wind and the raging of the water, and they ceased, and there was a calm." The town of Tiberias is situated on its western shore, nearer the northern than the southern end. Within about a mile from the town, and close to the edge of the lake, are some hot springs enclosed by a small square stone building surmounted by a dome. Their waters consist of a strong solution of muriate of soda with a considerable intermixture of iron and sulphur. There are several other springs in the immediate neighbourhood, but they are not turned to account. The place is known by the name of El Hamam, the generic word for baths. Its ancient Hebrew name, Emmaus, has a similar signification. Above the springs, on the sides of the western hills, from this as far as to Tiberias, are numerous caverns.—*Robinson's Travels, Palestine and Syria, Vol. I.* p. 124.

TIBET is arranged by its people into Kham Yul or Eastern Tibet, called also Potchen or Great Tibet; Wei Tsang or Tibet Proper, and A.i or N. W. Tibet. Tibet is also called by the people Pot or Bod, or Bod Yul, the land of Bod, and is called by the Chinese Si-Tsang. Tibet, in the language of Ladak, is called Bod, and a Tibetan Bod-Pa, whence the word Butan of the plains, applied to Tibet. Tibet is also divided into upper, middle, and little Tibet, and extends from Lhassa to Gilghit, a distance of 1,200 English miles. Little Tibet contains about 12,000 square miles, is about 170 miles long, and lies between 74° and 76° 35' E. Little Tibet or Bultistan, is called by the Kashmiri Sri Butan. Tibetan districts are Khapolor, Chorbad, and Keris, on the Shayok river. Khartakshe, Totte and Parguta on the Sing ge chu; Shigar on the Shigar river, and Balti and Rongdo on the Indus. Tibet is mentioned by Abu Zaid ul Hasan in A.D. 915, by Ibn Haukal in A. D. 950, by Abu Rahan in 1030, and by Edrisi in A D. 1154. Some suppose that Marco Polo entered Tibet, but the wonderful stories which he tells of its people indicate that he wrote from hearsay. Marco Polo sojourned in the hills of Badakshan for the sake of his health, and he describes the countries of Wakham, Pamer, Bolor, and Kashmir. And notwithstanding the wide-spread fame of Prester John, the first Europeans seem to have visited this country in the middle of the seventeenth century. Yul-Sung or L'hassa, the residence of the grand Llama, is the capital of Butan or Northern or Upper Tibet. Leh or Ladak is the chief town of that part of Butan, called Middle Tibet, and Iskardo is the principal place in Little Tibet. The Bulti or natives of Little Tibet say that Ladak, Iskardo, Khopalu, Purik, Nagyr, Gilghit and Astor, are distinct Tibets. The people of Ladak are buddhists; those of Little Tibet are shiah mahomedans. In their marriages the bride comes to the house of the groom. Cultivation in Little Tibet is carried on entirely by irrigation. The language of Tibet

Khan's Tanda on the west, to the Jodhpore frontier on the east. The principal town is Omerkote, situated between the desert and the plains. It has long been the acknowledged capital of this part of the country, and with its mud fort, was considered the key to the desert, commanding the high road between Marwar and Sindh.

THUS—— ? Frankincense.

THUT. Hind. Salvia lanata.

THUTU VELI, Maleal. Solanum trilobatum.

THUYA. See Thuja.

THWOOT-TA-BAT. Burm. Achras sapota, *Linn.*

THY——? A tree of Akyab, which grows to a large size, and is plentiful in the Ramree and Sandoway districts. Its wood is used for posts and firewood.—*Cal. Cat. Ex.* 1862.

THY-KA-DAH. Burm. Erythrina, species.

THY-KA-DO——? A tree of Akyab, which grows to a large size, but is not very plentiful. It is used for furniture.—*Cal. Cat. Ex.* 1862.

THYM-BRO. Burm. A good strong durable wood of Tavoy, used in boat building.—*Wall.*

THYMELACEÆ, Lindl. A natural order, the Mezereum tribe of plants, 22 Gen. 17 species occurring in India, viz. 14 Daphne ; 1 Linostoma and 2 Cansjera.. Daphne viridiflora, *Wall*, occurs in China. D. Cannabina, *Lour*, grows in Nepal and Cochin-China, and a soft, smooth and tough paper, the celebrated Nepal paper, is made from its inner bark. This order of plants is very uniform in character, and is formed of shrubs or herbs with simple and alternate leaves, axillary or terminal flowers. An acrid stimulant principle abounds in most of the species hitherto examined, which possesses very valuable medicinal properties, though not devoid of dangerous powers, if taken in excessive doses. A crystalline substance named Daphnine has also been separated from the bark of some species of Daphne.—*O'Shaughnessy, page* 599. *Voigt.*

THYME LEAVED GRATIOLA. Gatiola monnieria.

THYMUS CITRIODORUS. Lemon Thyme. Eng.

THYMUS VULGARIS. Linn.

Hasha,	Arab.	Ipar,	Hind.
Garden Thyme,	Eng.		

An erect plant, sometimes procumbent at th base, or clothed with a hoary pubescence. It is a native of the south-west parts of Europe, in dry plains and on hills and uncultivated places free from woods. It has a pungent aromatic odour and taste, is cultivated for culinary purposes, used in soups, &c., and many varieties of it are met with in gardens. It is delicate plant to rear, best by seed, grown n pots, but it may be increased by slips, and dividing the root. It is raised from seed, requires a sandy soil and free drainage.—*Riddell. Jaffrey.*

THYNAN. Burm.—? A tree of Akyab, a small wood used in house building It is not very plentiful.—*Cal. Cat. Ex.* 1862.

THYRSUS of Bacchus, was brought by him from the east.

THYRUS. See Eurylepis.

THY-VALA VER. Maleal, roots of Gynandropsis pentaphylla.

THY-ZAU-HOONG—Burm.? A tree of Akyab. It is small and plentiful, and its wood is used for colouring thread.—*Cal. Cat. Ex.* 1862.

TIAMLE. Hind. Ficus Roxburghii.

TIAN. Hind. Acer criticum.

TIANAC—— ? See Simiadæ.

TIAN-SHANG. See Arians.

TIARI, Hind. Solanum verbascifolium.

TIARIDUM INDICUM. Schm.

Heliotropium Indicum *L.*		H. cordifolium	*Mœnch.*
Hati Shuru.	Beng.	Tel koduku.	Tam.
Indian turusole.	Eng.	Tal mani.	Tel.
Benja patsja.	Maleal.		

This annual plant grows in Chittagong and Travancore amongst rubbish in rich and rank soils. It is used in medicine.

TIAR, a race in Malabar who form the mass of the field labourers, but their chief avocation is to collect and form coarse sugar from the juice of the palm. Their women are exceedingly pretty, with masses of long hair. They follow the polyandric custom for all the brothers to have but one wife among them.—*Markham, p.* 346. See Teer, Teyar.

TIAULANDHA. Hind. Viburnum fœtens.

TIAYANG. See Coyan.

TIBA, in the Punjab, inferior sandy, dry soil. Tiba means hillock, and the term is especially applied to uneven sandy ground of a somewhat high level. See Bhur.

TIBARENI. See Chaldea.

TIBBA, a mound, hill, mountain.

TIBBAN ASAAD ABOO KARIBA. See Kaba.

TIBBOO. In the Berber group of languages, all that is not Arabic in the kingdom of Morocco, all that is not Arabic in the French provinces of Algeria, and all that is not Arabic in Tunis, Tripoli, and Fezzan, is Berber. The language also of the ancient Cyrenaica, indeed of the whole country bordering the Mediterranean, between Tripoli and Egypt, is Berber. The extinct language of the Canary Isles was Berber ; and, finally, the language of the Sahara is Berber. The Berber languages in their present geographical localities are essentially has thirty simple letters, out of which fifteen different sets are formed, which may be used with a prefix of some other letter. Thumi Sambhuta was the first who taught the Tibetans the use of the Kashmirian characters, which remain unchanged to this day. More rain falls in Tibet than in Ladak, approaching even to a rainy season. Slavery is a Tibetan institution. Polyandry is common. The gravel of its steppes yields gold, but the value of the crude borax of its lakes is far greater than its precious metal. The tea trade of Tibet is carried on in the form of blocks, weighing about 8 lbs. and which sell at from 12 to 48 shillings each. According to Dr. Scott in vol. XV. of Asiatic Researches when the Boti of Upper Tibet fight with a Deb raja or governor, or with Pilos, if any one be killed, both parties rush to obtain the body, and the successful party take out the liver and eat it with butter and sugar. They also mix the fat and blood with turpentine, and make candles which they burn before their idols. The bones of persons killed in war are used for musical pipes. They make beads from the skulls, or set them in silver as water cups to be used in their religious ceremonials. Chevalier Bunsen observes (*Report Brit. Assoc.* 1847) that according to Chinese traditions, Tibet is the land of their earliest recollections, and Dr. Latham (*Rep. Brit. Assoc.* 1845) says that in addition to their grammatical analogy, there is an absolute glossarial affinity between the languages of Tibet and China : and that the Chinese, Tibetan, Bhutan, Burmese, Siamese, and all the so-called monosyllabic languages are allied to each other. Bhot according to Latham, is a word traceable under the appellations of Bult in Bultistan. But in Butan, Bet in Tibet, or in such words as the Bhooteya or Bhotya ; and, in ethnology, comprises the Little Tibetans, the natives of Ladak, the Tibetans of Tibet Proper, and the closely allied tribes of Butan. Balti, or Baltiyul is called Palolo or Balor by the Dard, and Nang Kod by the Tibetans. It is preserved by Ptolemy in Byltæ. Part of the Bhot country is frequently called Skardo or Iskardo from the name of its well known fort and capital. Balti proper is a small table land, and with that of Deotsu, is about 60 miles long and 36 broad, the mean height of its villages above the sea is about 7,000 feet. The Balti people of Little Tibet, the Byltæ of Ptolemy, though Tibetan in language and appearance, are all mahomedans, and differ from the more eastern Tibetans of Le (who call themselves Bhotia or inhabitants of Bhot,) by being taller and less stoutly made. Their language differs considerably from that of Le, but only as one dialect differs from another. The Bhot of Ladak is strong, hardy, short and square, with a decidedly Mongol physiognomy—by which is meant a flat face, broad cheek, depressed nose, very large ears, oblique and narrow eye curtained at the coners, black hair and low stature, their average height being 5 feet 6·1 inches : the skulls are less Mongolian, having a capacity of 72 cubic inches, 80 cubic inches being a fair capacity for a European.

The Grand Llama is a Bhot. The ordinary monk or priest in Tibet is the Gylong, above whom are the Llama or presidents, and below whom are the Tohba and Tuppa. The Tuppa is a probationer who is admitted into the establishment to which he would attach himself at the age of 8 or 10, and receives instruction accordingly. At 15 he becomes a Tohba, and at 24 a Gylong. provided his acquirements be satisfact
There are two sects, the Gyllupka, who d
in yellow, and the Shammar in red,
Shammar Gylong being allowed to mar .
The Bhot of the Tibetans have been extending westward. As a general rule, the Himalaya divide Hindustan from Bhotland, but there are Bhot in several parts south of the crest of those mighty mountains in Garhwal and Kumaon. The people of Le, the eastern Tibetans, call themselves Bhotiah, or inhabitants of Bhot. They are not so tall and are stouter made than the Tibetans of Balti or little Tibet, who, though Tibetan in language and appearance, are all mahomedans. M'hon is the name given in Tibet to all the hill people between the plains of India and Tibet. The Tibetans and Nepalese are Mongols, and have all the characterstics of the Mongol race. In Tibet, the sovereign Llamas are deposited entire in shrines prepared for their remains, which are ever afterwards regarded as sacred and visited with religious awe. The bodies of the inferior Llamas are usually burnt and their ashes preserved in little metallic idols, to which places are assigned in their sacred cabinets. Ordinary persons are treated with less ceremony—some are carried to lofty eminences where they are left to be devoured by ravens, kites, and other carniverous animals. But they also have places surrounded by walls where the dead are placed. The Mongols sometimes bury their dead ; often they leave them exposed in their coffins, or cover them with stones, paying regard to the sign under which the deceased was born, his age, the day and hour of his death, which determine the mode in which he is to be interred. For this purpose they consult some books, which are explained to them by the Llamas. Sometimes they burn the corpse, or

leave it exposed to the birds and wild beasts. Children who die suddenly are left by their parents on the road. In Spiti, in the N. W. Himalaya, when a person dies, the body is sometimes buried, or burnt, or thrown into the river, or cut into small pieces and burnt, admonitions are made over the body to the departed spirit, such as do not trouble yourself, you cannot enter it (meaning the dead body), in summer it quickly becomes corrupt, in winter it freezes and is too cold for you.

Bhot means Tibet; Bhotan the end of Tibet: Balti includes Hasora, Rongdo, Rong-yul, Shagar, Skardo, Balti, Parkuta, Tolti, Khartaksho, Kiris, Khaybalu and Chorbat.

Ladak or the Bot Pa of Tibet, includes Spiti. Zangskar, Purik, Suru, Hembako (Dras) Ladak proper or Le, Nubra, Rong, Rupshu and Hanle.

The language of the Bhotiah of Tibet, the Bhutiah or Tibetan, is also that of Bhutan and is a connecting link between the polysyllabic and monosyllabic languages. Garhwal is to a large extent Bhot.

Dras adjoins Kashmir the intercommunication being by the Zoji pass a remarkable depression of 11,300 feet, through which flow the moist winds of Kashmir and Dras is the most humid and fertile province of Tibet. Tibet is reckoned by Gutzlaff in his 'Life of the Emperor Taou Kwang,' page 227, to comprise an area of 30,200 square miles; and to have a population of about six millions. Tibet, as thus indicated in the enumeration of the dependencies of China, embraces Little Tibet or Balti, the capital of which is Iskardo; Western Tibet, the principal town in which is Leh, and Tibet Proper or Eastern Tibet, having Lassa as its capital and chief city. Following Humboldt, Dr. Thomson divides Tibet into two grand divisions: the western one, and the eastern one. Western Tibet, is a highly mountainous country, lying on both sides of the Indus, with its longer axis directed like that river, from south-east to north-west. It is bounded on the north-east by the great chain of mountains, to which Humboldt, following Chinese geographers, has given the name of Kounlun, by which it is separated from the basin of Yarkund. On the south-east, its boundary is formed by the ridge which separates the waters of the Indus from those of the Sanpu." To the north-west and south-east, its boundaries are somewhat arbitrary, unless the political division of the country be had recourse to, which, depending on accidental circumstances, entirely unconnected with physical geography or natural productions, is so liable to change that its adoption would be extremely inconvenient. In drawing a line of separation between India and Tibet, in those parts where mountain chains are not available for the purpose, regard the latter to commence only at the point where the aridity of the climate is too great to support forest trees, or any coniferous tree, except juniper. As limited by these boundaries, Western Tibet includes the whole valley of the Indus and its tributaries, down to about 6000 feet above the level of the sea: a considerable portion of the upper course of the Sutlej down to between 9,000 and 10,000 feet, and small portions of the upper course of the Chenab, of the Ganges (Jahnavi) and of the Gogra. The above very elaborate definition of boundaries, however, is founded mainly, as regards the limits of India and Tibet, on the geographical distribution of plants.

The second grand division, or Eastern Tibet, is an exceedingly mountainous country; it contains immense masses and ranges of the most rugged mountains in the world interspersed with extensive plateaus and deep level-bottomed valleys along the streams and rivers.

The Tibetans do not recognize a continuous chain of mountains running parallel to the Himalaya; nor are they acquainted with "Kounlun" as the name of any mountain range. They are familiar with the Himalaya on one hand and call it "Kangri," which simply means *Snowy region*, and they know that the country of the Mongols, or Mongolia, lies parallel to it on the other hand. A great distinguishing feature in the physical geography of Eastern Tibet is the Yaroo river or Sanpoo of English maps. Thus characterised, in popular estimation—which is not founded on the physical features of the country, on its natural productions, or on political divisions of territory, separately or jointly,—Eastern Tibet is bounded on the north-west by the Kangtisee range of mountains. The highest portion of the "Kangtisee" range is believed to be the "Kylas," of Strachey and a greatly elevated tract of country extending from the base of this range; on the north by Mongolia, on the east by the Sifan and Sechuen provinces of China, and on the south by the Himalaya, from the point at which it is pierced by the Brahmaputra on the east, to the meridian of the Mansarowar and Rawan Rud Lakes on the west. The general direction of the Kangtisee range is north and south, and it is said to connect the Himalaya and Mongolia, as by a cross-bar. It runs to the east of the Mansarowar and Rawan Rud Lakes, its highest point is said to exceed in elevation any portion of the Himalaya, and four large rivers have their sources in different parts of the range, viz., the Singh Khawab or Indus, the Langehoo Khawab which runs through Ladak, the Marchace Khawab which is known as the Gogra, and the Tamchoo Khawab or Yaroo, the great river of Eastern Tibet. In the city of Lassa and over the whole of Tibet, "Geawa Remboochi" or the "Grand Llama" is nominally the supreme authority in temporal and spiritual affairs. His residence is in Patala Goompa, which is on the north side of Lassa. M. Huc says, that "Lassa" in the Tibetan language means "Land of Spirits." The Mongolians on the same authority call this city "Mon-che-dhot," i. e., Eternal sanctuary. Cheboo Llama gave the following interpretation, "L'ha" means God, "Sa," abode or resting place, hence it is the city of God, or the Eternal city. There are two resident envoys from China called "Ampa" stationed at Lassa, subordinate to them are two great officers—Chinese, designated Daloo-he : their rank and occupation are those of general officers. Next to these are two Phopun who act as Paymasters of the troops, and perform the duties of our Adjutant and Quarter-master Generals. They are also Chinese. One of the Daloo-he, and one of the Phopun are generally stationed at Digarchi. These officers constitute the general staff of the army in Tibet. Next in rank are three Chonghar. They are Chinese, and Military Commanders ; one is generally stationed at Digarchi and another at Tingri near the Nepal frontier of Tibet. Below these are three Tingpun, non-commissioned officers —also Chinese. There are no other Chinese military officers in Tibet. The usual number of Chinese troops, all Mantchoo Tartars, in Tibet, does not exceed 4,000 men. Stationed at Lassa 2,000, Digarchi 1,000, Giangtchi 500, Tingri 500. The above shews that the Chinese functionaries in Tibet are political and military officers only. All Civil appointments are held by Tibetans. The local temporal government of Tibet is headed by the Grand Llama, entirely guided in all political and military affairs and mainly so in civil affairs by the Chinese Ampa and the emperor of China.

The first officer is the Chemeling, the second Kandooling, the third Tengeling ; they are all Tibetans, and the Chief Llamas—Awatari—of Goompas bearing those names. The principal Goompas at Lassa and its vicinity are the

From the three Llama counsellors, the emperor of China nominates the Noume-hen, "Nome Khan" of M. Huc, who may be called President of the Council, or Prime Minister. Gealchup Noume-hen is the proper title, which being translated, is "[illegible] image of Geawa" or the Grand Llama. He is Regent when the Grand Llama is a minor, and at all other times is the *alter et idem* of his holiness. The Noume-hen is always one of the three great Llama above named. At his death or removal from office, he is succeeded in the Noume-hen's office by one of the two remaining counsellors, always however under orders of the emperor. His successor must, as in the case of a "Grand Llama," be an awatar, i. e., he must re-appear in the flesh as a child and be raised to that position. Of equal rank with the Noume-hen, but having no temporal authority, is the Genden Tepa Llama ; he is next to the Grand Llama himself, the highest clerical authority. He is finally appointed by the emperor, being in the first instance chosen on account of his superior attainments and sanctity by the local authorities. He is chief of the great monastery of Genden. The persons privileged to take a part in the selection and recommendation of the Genden Tepa, for his holy office, are the Noume-hen, the two Ampa, and the four Shapee. They propose him for election to the Grand Llama ; after his approval, the Ampa procure his appointment from the emperor. The Genden Tepa is chief Llama of a Goompa, but not an awatari Llama. Next in rank and power to the Noume-hen are the four Shapee. They are not Llamas, are always Tibetans, and the principal executive officers of the Government in the Financial, Revenue and Judicial departments. These departments are not separated and under distinct officers. The Shapee are the highest Judicial officers in the Civil and Criminal Courts. Next to the Genden Tepa is the "Llama Yeung'ing" the private guru, or high priest of the "Grand Llama." He is also appointed by order of the emperor, and is sometimes an awatari Llama, but not always. His office is to teach and train the Grand Llama in childhood and youth, and lead him, if he can, afterwards. This is indeed an important personage in the Buddhist world, being no less than the keeper of the Grand Llama's conscience. The nomination to this post being in the hands of the emperor, furnishes an interesting clue to the extent of the imperial power over the church of Tibet.

The Che Kap Kempu Llama is a churchman of great influence in the Government. He appears to represent the Grand Llama in the council of state and in the deliberations of the Shapee. He may be called Secretary [illegible], and the Shapee [illegible] called the Financial [illegible] Home Secretaries, [illegible] managed by two officers [illegible]h are Llamas, and act [illegible] one of them is treasurer [illegible] of the "Grand Llama," and the [illegible] behalf of the Noume-hen or tempo[illegible]te. They are assisted by two sub[illegible]rers styled Shonjote. Four officers de[illegible]ated Da-pun are the commanders of the Tibetan troops, and act as Civil and Political Commissioners on occasions of frontier or other disturbances; they are Tibetans, and not Llamas. The ordinary course of official promotion is from a Da-pun to a Shapee; of equal rank to the Da-pun is the Che pun, who is however a Civil officer and acts in all departments as deputy to the Shapee. Shate Shapee was the energetic Commander-in-Chief of the Tibetan army which opposed the Nipalese under Jung Bahadoor. The Shapee is often employed as Commissioner on deputations in Civil affairs either judicial or fiscal, and all the cases sent up by the Police for trial before the Shapees are forwarded through this officer. All appointments to the offices above noted, require the confirmation of the emperor. There are seven classes of officers, viz.:

Tinkpun.—Superintendent of Police and Jails.

Sherpankpa.—Assessors to the superintendent, and to act as checks on his proceedings.

Boopun.—Military officers subordinate to the Da-puns, but also employed in civil affairs when required.

Jongpun.—Collectors of revenue and magistrates in the interior. They hold office generally for three years only. They are all laymen. One of these officers who is employed in the district of Gar, known to us as Gartope, is named the Garpun. He has charge of the salt and gold-diggings in that direction, both of which are valuable. In the Kampa country to the east of Lassa, these officers are styled Markam teje.

Giapun.—Subordinate military officers, non-commissioned.

Dingpun.—Ditto, ditto.

Choopun.—Ditto, ditto, privates are called Ma Mi, which means "fighting men."

The patronage of these seven classes of officers nominally lies with the Gealchup Noume-hen, but the Chinese Ampa have a veto if they desire to exercise it, and the working of the system is to procure the approval of these high officers to the appointments before they are made.

One of the Ampa annually visits the Nepal and Ladakh frontiers. In 1846, Keshen was the only Ampa or representative of the emperor in Tibet, but he was one of the eight Tongtong of the empire, and specially deputed to arrange Tibet affairs at that time, and the usual system of two Ampa was then suspended. When Keshen was ordered to be executed for having sold the interests of his country to the British during the war, his life was spared at the entreaty of "Sac Llama," the friend of the emperor "Taokwong," and sentence of banishment in chains was substituted. Subsequently, at the urgency of the same Llama, Keshen was appointed viceroy to Tibet. Affairs at Lassa and throughout Tibet were in great confusion at the time; three Grand Llamas had died by poison in a few years, and the Noume-hen was suspected of the crime. Keshen had the opportunity given him of redeeming his fame, and he did so by re-establishing order in the country, and convicting the Noume-hen. It is a curious fact, however, that he proceeded from his banishment in Manchouria to his Government at Lassa in chains, that is to say, he wore a gold chain, the badge of punishment, round his neck, concealed by his garments, nor was it removed, and his forgiveness complete until he quitted Lassa as Governor of Sechmen. The Noume-hen and the four Shapee have the entire control of the land assessment, commerce, customs, and other sources of revenue, and no accounts of the revenues or the disbursements of Tibet are required by the emperor. The Chinese troops and all the Chinese officers in Tibet are paid by China and in money; the Tibetan troops by assignments of the Government share of the land tax. There is no money revenue sent to Pekin, an annual embassy with presents only in cloths, images, books, incense, &c., There is a fund in Patala Goompa to which 100,000 rupees is added annually, never opened except in time of great war expenses; it was opened to repel Zorawar Sing the Sikh general, who invaded Tibet from Cashmere in 1842. The Ampa's pay is 140 rupees per day, and he gets large presents while travelling in Tibet. A Shapee's pay is 140 rupees per mensem from China, and he has lands and other emoluments from the Grand Llama. They have no artillery in Tibet; the cavalry is mounted on ponies; the principal troops are infantry, and great pains are taken to make them good marksmen. Prizes and promotions are the invariable rewards of good marksmen. The Chinese or Tartar troops are kept quite distinct from the Tibetan ones, which are only a militia called out when required, and not regularly paid. The Imperial troops quartered in Tibet do not exceed 4,000 men, and the Tibetan force is not so strong. There are 2,000 Imperials at Lassa, 1,000 at Digarchi, 500 at Giangtchi, and detachments at Phari and Tingri. The last named post is on the high road from Kathmandu to Lassa, and is situated on a plateau called the "Tingri Maydan" by the Nepalese. The Imperial troops are armed with long matchlocks, to which a rest is attached. The Tibetans have very few firearms, being provided with bows and arrows and short swords. The powder is of a very inferior description, and it does not appear that the troops are ever practised in military manœuvres. The Tibetans of the higher class wear Chinese satins in the warmer seasons, and the same lined with fur in the cold; all others, male and female, wear woollens in the warm, furs and sheep skins in the cold weather, and never go about without boots. The men do not go about armed. The common people never wash during the cold season; very sparingly at other times. The reason given for this being that the skin of the face cracks and ulcerates from the cold, if water is applied to it. The people of towns, who do not go much outside the house, wash occasionally, but the universal prejudice is strong against ablutions of the person, and it is equally extended to their clothing, which is worn in a filthy and greasy state. Soap is high priced and little used in Tibet; the supply is from India, through the Cashmere traders via Ladakh, and from Nepal. A small quantity also goes from Bengal through Bhootan and Sikim. There is a grass in the country, or a plant resembling grass, the root of which, pounded with water, makes a lather and is used for washing clothes. Travelling in the winter and indeed generally is performed on yaks. The women ride astride on them like the men, and they are so masculine, and dressed so much alike, that it is difficult to distinguish between them. A Tibetan village or town is never surrounded with filth, as in India. To every house there is a privy, and the contents are carefully preserved for manure. In towns the contents of the privies are sold annually, and those of people of wealth sell highest. In some situations, where the soil is suitable, saltpetre is made from the earth about the privies, but the regular supply of this article, which is used for making gunpowder only, goes from India. At the time of the Sikh general Zorawar Singh's disastrous incursion from Ladakh into Tibet as far as Gartope in 1842, there was a good deal of saltpetre taken into Tibet through Sikim, also sulphur and lead bullets.

The dead are not burned or buried, but are exposed on high places to be devoured by vultures. For this business there is a class of men who make it their sole vocation. They are called "Raga Tongden;" they are a low race held in dislike and shunned, but they are generally rich; they go about to the living, begging and extorting money. When refused or ill-treated, they retaliate with abuse, which is often successful. "Very good," say they, "you won't give us alms now, you will come into our hands some day; and we will put a rope round your neck, drag your body through the streets, and throw it to the dogs," and the latter part is the frequent fate of the poor man's body, as these men keep numerous dogs to devour the bodies. The bodies of the wealthy are carefully disposed of; they are carried in a litter to the top of a hill, set apart for the purpose, the flesh cut in pieces, the skull and bones pounded in a mortar, and when all is ready a smoke is raised to attract the vultures, who collect in thousands to eat it up.

The Chinese have spacious burial grounds at Lassa and Digarchi, and there, as in their own country and wherever they reside, they are well cared for and ornamented. The Lassa one is said to contain 100,000 tombs. In the time of Waugh, a celebrated raja of Lassa, there was an insurrection against the Chinese, which ended for the time in the annihilation of the whole army, and the massacre, by the Tibetans, of the whole Chinese population. The funerals of the Chinese at that time were estimated at 4,000. This massacre was punished by the emperor with signal vengeance, and since that time the Chinese supremacy has been finally established all over Tibet. There was a petty insurrection in 1843, in which many Chinese were killed. There are twelve great annual Festivals, viz. Bumteung, Kansupecha, Chushupecha, Gesupecha, Nesupecha, Gosungpecha, Gyajeepecha, Lallupecha, Chindupecha, Dudupecha, Kagyurpecha, Lukphopecha. Pecha is equivalent to Puja. On the anniversary of the death of a Chief Llama of a Goompa, there is a great festival and illumination. At Tashi Lumbu, three such are held annually. The "Lassea Morun" festival of M. Huc is properly called the "Lha-sa Meuhlum." It is the anniversary of the first proclamation of the religion of Budha by Sakya at Lassa. The year is divided into four seasons. First, Chid, or early spring, February, March and April. Second, Teuh, or spring proper, May, June and July. Third, Yirrh, or rains, August, September and October. Fourth, Gunh, or winter, November, December and January. Some showers and southerly winds occur in Chid. In Teuh, it is temperate and dry, but showers, thunder and lightning occasionally prevail. In 1845, a great earthquake was experienced in the Province of Kham north-east of Lassa. It was most severe in the district of the Dirgi Raja. About 3,000 men were killed, and a Goomba destroyed by the opening of the earth. About the year 1820, the district of Komp in the province of Kham was visited by a severe shock; one village was destroyed by the opening of the ground. During Yirrh, there is constant but not heavy rain and hail in September and October. Frost begins early in November and increases all through the winter. Heavy falls of snow are rare except on the mountains. Only three kinds of soil are recognized; a blackish one, a reddish one, which is described as rather clayey, and a grayish colored one, which is also clayey and contains a good deal of sand. The last is found along the beds of streams and yields good crops. The reddish soil is also fertile; it frequently contains gravel and stones; it is the prevailing soil in the tract called Dingcham, which extends along the northern face of the great Himalayan chain from Tamang to Keroong, but this region is quite barren. Mean elevation 16,000 feet at least. The blackish soil most abounds in the districts or provinces of U and Chang; it is the most fertile of all, but also contains stones and gravel. The fertility of the culturable soil is highly spoken of, and 40 and 50 fold in wheat is considered the average. Crops are generally very certain, and blights or other accidents rare. Early frost sometimes overtakes the harvest and spoils the grain, when the grass is at the same time burnt up, and this causes scarcity and famine. It is then the granaries are opened and the corn merchants make their fortunes. There is no interference with the price of grain. It is always dear compared with India, but varies considerably; and the principal cause of scarcity appears to be the early setting in of frost. This is said to be induced by continued clear nights which are greatly dreaded in harvest time. Wheat, barley, and other crops sowed in April and May are reaped in September and October; all are irrigated. The peach ripens at Lassa in October and November. It is sun-dried and preserved. No grapes are grown at Lassa. The whole supply of raisins is received from Ladakh. The plough is used in all old cultivations: yak, bullocks and ponies occasionally are trained to it. The plough is the same as the Indian one, made entirely of wood, except the stock, which is pointed with iron. Timber for ploughs is imported from Sikim and Nepal. Rhododendron Hodgsoni and birchwood make the best ploughs. Cultivation in fresh lands is done with the hoe. The Tibetans do not use a harrow, the grain being covered in with the hand. Barley in Tibet takes the place of potatoes in Ireland; four-fifths of the population live on it. Neither wheat, barley, nor peas will come to maturity as a paying crop in any part of Tibet without irrigation, and the water flooding of the fields, by which they derive a fertilizing effect from the frost, is equally necessary to prepare the soil for these crops. Wheat requires three or four irrigations or waterings from the time the seed is sown till the ear bursts, after which it will ripen without further watering. The flooding of the lands in winter, and watering of the crops in summer, are principally effected from drains or canals cut from the rivers; very little watering is performed from wells. The whole of the arable lands along the Painom river, and the most of it on the Yaroo Sanpoo, are terraced, and have maintaining walls of stone raised a little above the surface of the fields. Great pains are taken for the equable distribution of the water by running it off from terrace to terrace, and it is applied from the leather bags when it cannot be brought to run on particular spots. Watering freely is indispensable to all crops in Tibet. The atmosphere is so dry, and the soil so destitute of moisture, that without it the sun burns up the crop before it comes to ear. In a land of so little rain, and with an atmosphere so dry and sun so scorching as to render irrigation and free watering indispensable, the questions which naturally arise are, what extent of area can be watered from the rivers by canals and drains? and is there more arable land in Tibet than admits of being irrigated from the rivers? To answer the first question, it would be best to refer to the statistics of the Nile irrigation, in illustration of the extent to which land on either side of a river may be irrigated by artificial means, not by the overflowing of its banks, which is not usual by the Yaroo of Tibet, and is therefore not to be taken into the comparison. But to reply to the second question: the culturable land on either bank of the Painom river, from its source to Digarchi, has not a maximum breadth any where of more than four miles, i.e., eight miles in all for the extreme breadth. In many places, however, the river is closely confined by mountains. From Digarchi to Giangtchi on the Yaroo, one day's sail, the culturable land on either side the Yaroo varies from two to four miles. From Giangtchi till the Yaroo escapes from the Kambola range, its course is exceedingly tortuous, generally through great mountains, and it has but a very narrow bed of culturable land in a few places. It is closely pressed in by great mountain ranges in the Kambola district, and elsewhere in this portion. The utmost estimated extent of culturable land in the Yaroo valley, from the point at which it leaves the Kambola range entirely to the junction of the Kechooor Lassa river, is a total breadth, both banks included, varying from 20 to 40 miles. There is more flat land on the south than on the north bank of the Yaroo. The Kechoo river is closely hemmed in by mountains on the eastern bank; on the western bank it has a belt of about four miles of culturable land only. These particulars will afford some assistance for reckoning the culturable area of the finest part of Eastern Tibet, and will shew it to be very small indeed compared with the total area of this rugged country, and it is universally asserted that the land is every where dependent on river irrigation for its fertility. On this subject M. Huc says, "Paulon, fine purple cloth, scented sticks and wooden bowls, are the only good manufactures; neither is their agricultural produce remarkable. Tibet being almost all covered with mountains and intersected by impetuous torrents, furnishes its inhabitants with but little soil suited for cultivation; the valleys alone can be sowed with any prospect of reaping a harvest." When the Yaroo does overflow its banks, the sediment it leaves is fertilizing. The Yaroo soil deposit is generally light and sandy. Three feet of digging brings you to the water at Digarchi, which stands in the flat and low delta of the Painom and Yaroo rivers; 20 feet is required at Kambajong. Kambajong is a police station in Dingcham. (See *Hooker's Himalayan Journal and Map*). Many Tibetans believe that the Painom rises in Sikim, but its sources are no doubt, as given by Turner, in the vicinity of the Ramchoo Lakes north of Phari. A horse dak is four days from Digarchi to Lassa, a boat by the Yaroo takes 12 days to the disembarking place nearest to Lassa. It is 12 days' journey to the Salt Lakes from Digarchi due north.

The number of crops is very limited; wheat, barley, buckwheat, peas, turnips, and a little mustard comprise the whole. There is no regular rotation observed. As in India with all crops, so it is in Tibet. Wheat is grown for generations in the same ground varied in some places by barley or buckwheat, about three times as much barley being grown as wheat. All the Suttoo eaten with tea is roasted barley, and this may be considered as the staple article of food for all travellers. At Digarchi, Giangtchi, and generally in the province of Chang or Tsang, grain is more plentiful than in the neighbouring province of U; in the former 10 to 15 seers (20 to 30 lbs.) of wheaten flour per Company's rupee is reckoned cheap, and in the latter about half the quantity is so. The dung of animals is so much in request for fuel, that scarcely any is used for manure, nor is there any spare fodder or other vegetable matter available for composts. Human ordure and ashes are therefore the principal manures in use; both are carefully preserved, and very valuable. In the towns the contents of public privies are a source of revenue to the Government, and lodging-houses have privies attached to them which are most jealously watched. The contents of these places are removed by a class of people who principally live by the occupation, and are the filthiest of all the population, which is everywhere and in every grade very dirty. They work with their hands at their vile occupation, and in the middle of it, unwashed, may be seen drinking hot tea, and eating raw and sun-dried flesh close to the piles of ordure. Ashes are mixed with the ordure, and this is reckoned the best of all manures. Liquid manure (ordure with water) is also in use, but sparingly. This mode of using manure is probably taken from the Chinese. The crops grow nearly free of all weeds. The Tibetans reap with an untoothed sickle, the crops being all cut close to the ground to save the fodder. Wheat is tied up in small sheaves and stacked on the ground, or in yards near the houses. The corn is beaten out by the flail as in Europe, the women taking a part in the threshing with the men. This is done with great care, so that not a grain is lost. There is also a kind of hackle used for beating out the corn, a beam eight or ten feet long, toothed with iron spikes, through which the sheaves are drawn. The winnowing is performed in the open air. The grain is ground into meal by water-mills. In some villages mills are built by subscription, and the parties use them in turn. There are public mills also. The millers in these take one part in 20 as payment. There is a great press at the mills for two months after the harvest, when they are going day and night, as frost sets in in November so hard that they cannot be used again till the spring. There are no windmills in Tibet, although in no country in the world is there a more steady wind in the cold season. A Chinese soldier is very highly paid in Tibet; i.e., he gets as much as 12 to 16 India Rupees per mensem. The Tibetan soldier has no regular money pay. He is allowed the Government share of revenue on a portion of land, his own farm or another, and this does not exceed 40 or 50 India Rupees per annum.

Masons, carpenters and other artificers can earn from eight annas to one rupee a day in the towns; common labourers three and two annas. Gold and silver-smiths are highly paid, eight annas in the rupee for fine work is the usual rate. The bread in use is all unleavened, and cooked on heated stones or gridirons. The poor people make their bread with coarse wheaten flour and water; the better classes with fine flour and butter. It is a sort of heavy biscuit, made in a long twisted loaf-like shape. The sweet and pure farinaceous taste of the fine flour of Tibet equals the best Cape or American flour. Rice is only eaten in Tibet by the Chinese and the richer Bhotias. The whole supply is received from Bhootan and Sikim. The Tibetans do not cook and eat it plain as the Indians and Chinese do, but make it up into large balls with butter and sugar, using it as a pudding and sweetmeat. The staple food of the country is "Champa," called Suttoo in India; it is finely ground flour of toasted barley. It is universally eaten and without additional cooking, and is excellently suited to the people of a country which is so ill-supplied with fuel. Mixed up with hot tea and formed into solid balls, it is called "Paak." Prepared with lukewarm water, it is called Seu. Travellers often carry the "Paak" ready made in skins, and eat it as they go along; but if it is possible to get fuel, they prefer making a jorum of tea, and having the paak warm and fresh. The Tibetans are great eaters when they are in plenty. Tea is drunk at all houses, and at every meal, and is regularly used four times a day, i. e., in the morning early, about 8 A. M., at noon, and in the evening. For breakfast, which is always eaten at daylight and before washing of hands, face or mouth, the favourite dish is Took-pa, a sort of broth made with mutton or yak's flesh, champa, dry curds, butter, salt and turnips. This is eaten without bread, and followed by a cup of scalding tea. They never drink tea when it is the least cold, and if a foreigner allow his cup to cool and then drink it, he is considered a very careless fellow. An attendant is always on the watch when tea is being served, and replenishes the cup with a ladle or from the hot teapot, until you cry "Hold, enough," or empty out your cup, and put it in the breast of your cloak, the usual receptacle of many necessaries to a Bhotia. The snuff bottle, thick woollen nose cloth, tea cup, bits of dried flesh, &c., are all huddled here, without remorse, and it is a most filthy receptacle.

Pen, a carbonate of soda, is found all over Dingcham and Tibet, south of the Yaroo; it appears as a whitish powder on the surface of the soil, never in masses under ground. It is not used to make soap or otherwise in the arts; a small quantity is always put into the water with tea; it is considered to improve the flavour, and it gives a high brown colour to the decoction. It is generally used in medicine.

Chulla, or Borax, does not seem to be produced in any part of Tibet south of the Yaroo river. It is largely imported into Digarchi, whence it is distributed to the other parts of Tibet, and to India via Nepal, Sikim and Bootan, whence it finds its way to Calcutta and Europe. The general direction of the Yaroo is easterly.

Sicha, Saltpetre, is produced generally in Tibet, and manufactured at the large sheep-folds, where composts of sheep's dung and earth are formed to produce it.

Moghee, Sulphur, is not found in Tibet. India exports this article for consumption at Lassa, where gunpowder of good quality is made. The charcoal of the poplar (changma) and of the willow (langma) are considered the best for gunpowder, and this is fortunate, as these two trees alone attain to any magnitude near Lassa.

Lencha, common Salt. Three sorts are known in commerce, *Sercha*, white and best; *Chàma*, reddish and good, *Pencha*, yellowish and bad, contains soda or magnesia and earthy matter. All the salt consumed in eastern Tibet is said to be the produce of lakes or mines situated to the north of the Yaroo river, or comes from "Lache," a district lying between Digarchi and Ladak, which is traversed by the Yaroo. Still there are people who assert that it is also dug out of the ground. The salt-producing districts are the most rugged and inaccessible that can be imagined; men and sheep only can reach the salt deposits, and the elevation prevents their being worked, except for the warmer half of the year, April to November. Thousands of sheep are employed in carrying the salt from the deposits to places accessible to yaks. These latter animals carry it all over Tibet in loads up to 160 lbs. Sheep in open places will carry 20 to 24 lbs.: but in the vicinity of the deposits, the ruggedness is so great that eight to ten lbs. are as much as can be safely put upon them. Snow falls annually after November in the salt-producing tracts, and covers the ground or two months or more. The elevation of these places cannot, it is believed, be under 22,000 feet. At Digarchi, 1st quality, 2 Rs. per maund, or 20 lbs. for 1 shilling. At Giangtchi, 20 per cent. dearer. At Lassa, 5 Rupees per maund, or 8 lbs. for 1 shilling. Digarchi, the nearest salt mart, may be twenty days' journey on horse-back from the nearest salt lakes. It is believed that salt is now in course of being deposited in a lake at Tinke in Dingcham—near one of the sources of the Arun river, but it is not worked, and great pains are taken to conceal the fact, as there is a prophecy that whenever salt shall be found in the lakes of Dingcham, the glories of Tibet shall be on the wane; which means, that a rush shall be made from all sides for the salt, which will render the exclusion of strangers ineffectual. Salt is given to sheep and cattle in Tibet, but not to horses.

Doh so, stone charcoal, or coal, is nowhere found in Tibet. It is known in that country as a produce of China, which is seen at Siling and other marts on the Tibetan confines of China.

Ser, or gold, is found in the sands of a feeder of the Yaroo which flows from a country called "Shapduk," and falls into the northern side of the Yaroo to the west of Digarchi. The greater part of the gold of Tibet is the produce of mines or diggings. The Yaroo itself does not yield any gold-washings. There are no mines of iron, silver, copper, quick-silver or lead in Tibet. All these metals, and their oxides, are imported from China.

Yellow Arsenic, "Pabea" is found at Teloongchurfoo, near the borders of China, to the north and west of Lassa.

Peu-she, Amber. Tibetans always wear large opaque amber-like beads in their necklaces; but the substance is not a produce of their own country, nor is it amber; it is believed to be expissated turpentine-gunda feroza, mixed with some hardening material. Friction makes it smell of turpentine. It is brought from Siling and other marts of China.

Turquoise, *Gya-yeu,* or China stone. *Pe-yeu,* Tibetan stone. *Te-yeu,* Cashmere stone, is greatly prized in Tibet, and every one wears it, real or imitation, in rings, necklaces, earrings and amulet cases. The best are very rare, and although found in Tibet, no one can give an intelligible account of the localities. "A great merchant of Tibet named Chongpo, who traded, ages ago, with India, and once crossed the seas beyond India, brought the finest real turquoise to his native country. From that time the stone has been known there, and like coined money, it continues to circulate in the country as a medium of exchange." The imitations brought from China are made of common earthen-colored or other compositions. They are easily detected. Those imported via Cashmere are real stones but not valuable. Their only test of a real stone is to make a fowl swallow it; if real it will pass through unchanged.

Digarchi to Punchooling 3 marches.

Direction at Digarchi north-west across the Yaroo.

Route to Salt Mines.

Stations.	Marches.		Stations.	Marches.	
Amring jong......	4	N. W.	Bomet	3	N.
To Nackchang....	8	N. W.	Lon-kurqun	10	N.
Sang-zang Lhoda	6	N. W.	Tarokchau..	2	N.
Sakojong...	7	N. W.	Borgpagege.	3	N.
Tot-hen...	8	N. W.	To Salt Mines	1	N.

Being 55 marches for loaded men, each 10 miles, say 550 miles.

Route to the Gold diggings is the same as far as Sangzang Lhoda, thence to Kasha 10 marches, N. by W. To Komunk, 5 ditto, N. Two more marches to Gold diggings, N. These marches may be each 12 to 15 miles.

The larger mammals are

The Goa—An antelope.

Gnov—The Ovis ammon.

Rigong—Hare.

Kiang—Wild ass.

Lawa—Musk deer.

Shaoo—A large deer, Cervus affinis vel. C. Wallichii.

Cheu or *Chiru*—Antelope Hodgsoni.

Dong—The wild yak of Tibet. The fiercest of all known ruminants. It will rarely allow a man to escape alive if it can come up with him. It is generally hunted on horseback, the great aim being to detach one from the herd. It affects open grassy places and goes in large herds. Its favourite pasturages being ascertained, in the midst of these the hunters, who are on foot, throw up circular enclosures of stone a few yards apart, the hunter taking up a position in one of them. When a "Dong" is within shot, the hunter having fired at him, instantly quits his enclosure for another; for as soon as the animal hears the shot, whether he has been hit or not, he, guided by the smoke of the discharge, rushes furiously on the enclosure, and commences knocking it to pieces. When the hunter gets another shot at him he retires again from his shelter to a fresh enclosure, and so on, till he has killed his game. The ordinary size of the "Dong" is four times that of the domestic yak, it is black all over, having occasionally a white streak in the forehead. The horns of a full grown bull are said to be three feet long, and the circumference must be immense. The common mode of describing it is to throw out the elbow, bring the fingers to the ribs and point to the circle thus formed as the size of the base. It is used by the grandees of Tibet at marriages and other feasts, when it is filled with strong drink, and handed round to the company. Nothing more commendatory of the host's jovialty can be said, than that "he regaled his guest out of the Dong's horn." The horns so used are finely polished, and mounted with silver, or gold, and precious stones.

It is common in a Tibetan goompa (Lamaserai,) to see a stuffed "Dong" standing in front of the image of Maha Kali, at whose shrine the animal is thus figuratively sacrificed; axes and other instruments of sacrifice are ranged around the image. Strange that buddhists should preserve *this* feature of hinduism in their places of worship; not more so however than, as Huc describes, that a Llama should nearly go into fits on seeing a louse from his tunic impaled for the microscope, while the whole of his countrymen and co-religionists are among the greatest slaughterers and consumers of butcher's meat in the world.

Pegoo—the Yak.

Cow—small, like the cow of Bengal. Hair long.

Sauh—cross between cow and yak.

Sauh Yak—produce of cow by yak bull.

Ba Sauh—produce of female yak by bull. These are great milkers, better than yak or cow; tail half cow, half-yak. Females give young with bulls or yaks, best produce with yaks. Elevation of shoulder less than in the yak. Hair long but less so than the yaks.

Look—Sheep, four principal varieties; 1st, Chang Look, or northern sheep, very large with fine wool. Flocks of 400 to 1000 tended by one man;—2nd, Sok Look, rare, but greatly prized; it is a doomba or heavy tailed sheep, comes from the province of Sok situated to the east of Lassa; wool not very fine;—3rd, Lho Look, a very small sheep generally white, sometimes black, is bred principally about Lassa; wool very fine and like the shawl wool;—4th, Changumpo Look; abundant about Geroo and in Dingcham, generally very large fine sheep, all with wool white, very fine and soft. The flesh of all the Tibet sheep is fine grained and good.

Peu Ra—Tibet goat, small, hairy, of all colours. Hasan under coat of fine wool, similar to the shawl wool, but there is no shawl wool trade from Eastern Tibet to India at present. Flesh pretty good.

Phak—Pig, two varieties. The Lho Phak or southern pig, is most abundant to the south of Lassa, and is similar to the Indian village pig, and the small China pig now abundant in Lassa and other towns: no wild hogs anywhere in Tibet. The Chinese butchers in Lassa blow their pork and take in the country folks greatly by its fine appearance.

Cha—Common Fowl, generally small in Tibet, and there is no large kind as in Sikim, where the fowls are remarkably large.

Damjha—Ducks, not eaten by the Tibetans, but greatly prized by the Chinese, for whose use only they are bred near and in

Damjha Cheemoo—Goose, not eaten by the Tibetans, but much liked by the Chinese.

Gang Sir, Gung Kur, Chaloong, and Toong Toong—comprise the numerous wild fowl, swimmers and waders, which migrate from India in March and April, and return in October and November; they are all eaten, but not extensively. There is a sort of prejudice against killing them; but as they all breed on the lakes and rivers of the country and are most numerous, the eggs are found in great quantities. The people who live by gathering and selling these eggs never rob a nest of all its contents, but take about half the eggs. This forbearance arises from the general aversion to taking life which prevails in Tibet, and it has its reward, as it is supposed that the birds if entirely deprived of their young, would not again return.

Chungoo—a wild Dog, reddish colour.

Koong—the Civet, is brought from China and inhabits the Chinese borders of Tibet. It is mottled rather than striped.

Sik—Leopard. Tibet or contiguous countries.

Tagh—Tiger do. do.

Somb—Bear. A red and a black species.

Nekor-nehu—a large sheep, or goat, or antelope, found in the very rugged mountains north of the Yaroo river, and in the neighbourhood of the salt mines or lakes. It is four feet high, has very large horns, sloping back, and four feet long, has a tail 15 inches long, is shaggy, and of various colours, sometimes black and red.

No leeches, musquitoes or peepsa in Tibet; and maggots or flies are never seen there. There are no bees or wasps in Dingcham or Tibet proper. In the valley of Choombi, a good deal of fine honey is found, which is exported to Tibet.

The lakes in Tibet are full of fish; one kind named "choolap," grows to the weight of 8 lbs.; it is not well flavoured or delicate. Enormous quantities are taken by the hand in the winter season; when the lakes are frozen over, a hole is made in the ice to which the fish immediately rush, and are then pulled out by the hand. Salt is not used to preserve fish, they are gutted, split up, the tail put in the mouth and allowed to dry in the open air, they keep in this way for a year. The principal lakes on this side the Yaroo are Yamdo, Yeumtso, Ramchoo, Kala, and Chomotetoong near Dobta.

The number of sheep in Tibet is extraordinary. The flocks are immense, and a person of no consequence whatever will have 2,000 or 3000 sheep. The large owners have as many as 7,000. The fleece is taken once a year in May or June. The ewes breed twice a year. The great lambing season is in April and May, the other in October and November. Many of the autumn lambs die from the cold, but this is not considered any great loss as the skins are so valuable. A cloak of lamb skins made of fourteen skins is worth 25 Tibet rupees, or 10 India rupees. The rams (two or three for every hundred ewes) remain with the ewes always, but after the ewes are in young, the rams have a sort of breeching put on to prevent annoyance to the pregnant ewes. The males are gelded when quite young or up to a year old; the prices vary from five to seven Tibet rupees per head, i.e., two to three India rupees.

The Government dues on sheep farms is 10 per cent. in kind, every three years; this is in addition to a general tax of one rupee per door on all houses per annum.

During the summer season, but little fresh meat is used. The Tibetans do not like to boil it, and are not partial to it raw unless it has been dried. In November there is a great slaughtering in the towns, and a wealthy man in the country will kill two hundred sheep at this time for his year's consumption. The animal is butchered, skinned and gutted, and then placed standing on its feet in a free current of air. It becomes in a couple of days quite hard, and white, and is then ready to eat. It is kept in this way for more than a year, and undergoes great vicissitudes of climate without spoiling. It has been seen at Darjeeling in the rains quite dry and hard, and in no way decomposed. When long exposed to the wind of Tibet it becomes so dry that it may be rubbed into powder between the hands. In this state it is mixed with water and drank, and used in various other ways. The Tibetans eat animal food in endless forms, and a large portion of the people eat nothing else. The livers of the sheep and other animals are similarly dried or frozen, and are much prized. To a person unused to the dried meat of Tibet, the liver is represented as peculiarly distasteful; it is bitter, and nearly as hard as a stone. The fat is simply dried, packed in the stomachs, and thus sent to market or kept for home use. The skins furnish clothing for the working classes and servants. All classes in Tibet put on furs of some kind at the commencement of the winter. It is not reckoned reputable to kill your own meat, and therefore every hamlet has its professional butcher. In towns it is a great trade from the enormous quantity of meat consumed. Some butchers will have five hundred carcases dried and ready at their stalls. The trade of a butcher —Shempa—is hereditary and a despised one. The horns of animals are not turned to any useful purpose in Tibet. Small houses are built in the suburbs of Lhassa with horns and clay mortar. Goats are also reared in considerable flocks, but principally on account of their milk. The flesh of the sheep is infinitely preferred. The milk of yaks, cows, sheep and goats is used alike for making dried curds and the various preparations of milk used by these people. The milk of mares does not appear to be used at all in Eastern Tibet. Although ponies are extensively bred there, the number of other cattle renders it unnecessary. Fowls are of a small breed, and are reared with some difficulty. The large fowls of Sikim and Bootan are much prized there. The Tibetans do not care about fowl as an article of diet, and it is only since the period of the Chinese supremacy that fowls, pigs, or fish have been used by them. Even now in the places remote from Chinese posts, pork and fowls are not to be had. The Chinese must have pork, eggs, fowls, and around Lhassa, Giangtchi, Digarchi and other places, and their stations, these are reared for Chinese consumption.

In July and August severe fevers are not uncommon; cholera is not known; dysentery occurs, and is often violent, sometimes proving fatal in four days. Cough and diseases of the chest are not prevalent.

Ophthalmia is very prevalent and very severe. Itinerant occulists go about the country and are in good repute: they never perform operations, but cure by application of unguents and washes. Three days travelling in the snow without hair-blinds is sure to produce ophthalmia.

Skin diseases are by no means common, although the people are so filthy in their habits. The most dreaded and the most fatal of all diseases is the small-pox. The people fly the contagion, leaving their homes in the most inclement weather. Inoculation is regularly performed annually in the warmer seasons. Two methods are in use, one by incisions on the wrist, the other is effected by inhalation. A plug of cotton which has been impregnated with small-pox virus and dried, is introduced into the nose and left there for two or three days, at the end of which time symptoms of the small-pox appear. This method was introduced from China, where it is largely practised. Dropsy is rather a common disease, and is generally fatal in the cold season. There is very little rheumatism in Tibet proper; at Bakchan in Choombi it prevails to a very great extent. There is a malady called the "Laughing disease" which is much dreaded; people die of it. It consists of violent fits of laughing with excruciating pain in the fauces and throat; men and women have it alike, and it is named "Joomtook" in the language of the country.

It frequently proves fatal in a few days, but is not accompanied with fever.

In Tibet the cycle of Jupiter, Vrihaspati Chakra, is used. Their epoch occurs in 1025 A. D. Mr. Csoma de Koros mentions that in the Tibetan sacred books, three periods of their compilation are expressly stated, first under Sakya (520 to 638 B.C.), then under Asoka, king of Pataliputra, 110 years after the decease of Sakya; lastly by Kanishka, upwards of 400 years after Sakya. *Boom*, a Tibetan work in 12 volumes containing tracts of the Eloopka Section.

All the elevated country of Central Asia, situated to the north of the lofty snow mountains which encircle India from Kashmir to Assam, is familiarly known to Europeans by the name of Thibet or Tubet,—most properly, Tibet. This name is also commonly employed by the mohamedan nations to the north and west to designate the same country, but is not known in the language of the Tibetans themselves, among whom different portions of the country are usually known by different names. Tibet appears to be characterized by great uniformity of climate and productions, and perhaps also of physical features, but is naturally separable into two grand divisions. One of these, the waters of which collect to join the Sanpu, which in India becomes the Brahmaputra, is still scarcely known; the other, drained principally by the Indus and its tributaries, has been repeatedly visited by European travellers. The line of separation between these two portions lies a little to the east of the great lakes Manasarawar and Rawan, from the neighbourhood of which the country must gradually slope in both directions towards the sea. Western Tibet, according to the popular opinion on the subject of the countries to the north of the Himalaya, forms a plain bounded on the south by the Himalaya and on the north by Kuenlun; but this, however, is so far from being the case, that the greater part of the surface of the country is traversed in all directions by ranges of mountains in every respect similar to the Himalaya, of which in fact those south of the Indus are ramifications, while those on the north are branches of the snowy chain of Kuenlun. It is extremely difficult to describe in an adequate manner the extreme desolation of the most barren parts of Tibet, where no luxuriant forest or bright green herbage softens the nakedness of the mountains, but everywhere the same precipices, heaps of rocks, and barren monotonous deserts meet the eye. Tibet includes the mountain valleys of the Indus and Yaru or Brahmaputra, together with the whole axis of the Himalayas, and the heads of many of the valleys which descend on the Indian side, and which are situated beyond the mass of snow throughout a great part of the chain. Beyond the Indus and Yaru are the southern slopes of the Kuenlun. Western Tibet is considerably drier than Eastern Tibet. The chain of the Kuenlun, where it forms the northern boundary of Western Tibet, is not less elevated than the Himalaya, and is covered throughout a great part of its length with perpetual snow. Its axis has not been crossed by any European traveller, but has been reached by Dr. Thomson, who visited the Karakoram pass, elevated 18,300 feet. The Kuenlun chain has been called the Mus-tagh, Karakoram, Hindu-kush, and Tsungling or Onion Mountains, from the prevalence of a species of Allium. It is also called the Belur-tagh, which, according to Cunningham, is synonymous with the Balti mountains, and it is the Bulut-Tag or Cloud Mountain of Captain H. Strachey, who confines the term to the east of Samarcand and south of Khokand. The mean elevation of Western Tibet is estimated by Captain Strachey at 15,000 feet, but many ranges have a mean of 19—20,000 feet, with peaks innumerable 21—25,000 feet. Many extensive areas, Guge, Nari, Nubra, Rupchu, and Zanskar, are above 15,000 feet continuously for many miles in all directions, and the majority of the passes are above 17,000 feet. The basin of the Indus at Le is 117,800 to 12,000 feet. The climate of Western Tibet is arid; rain and snow at moderate elevations are scarcely known. Cultivation is luxuriant below 12,000 feet, and attains the height of 15,000 feet. Eastern Tibet is supposed to have the same general aspect as Western Tibet, as far east at least as Jigatzi or Teshu Lumbu and Lhassa. That the mountain system of East Tibet is an enormously elevated mountain mass, is proved by the statements of many intelligent Tibetans, by the Chinese geographers, by the narrative of M. Huc, and the fact of so many of the large rivers of Asia flowing from several directions. Showers of rain are frequent about Jigatzi in the summer months. The mountain chain to the north of the Yaru is enormously elevated over a belt of many miles in breadth, and many of the greatest rivers in Asia rise within the area. At Lhassa the country is open and stony, and without trees, except such as are cultivated just as in Western Tibet. Further east in the direction of China, the mountains are covered with forests, while in the S. E. in the valley of the Yaru, a subtropical climate is soon reached.

Western Tibet is a country of such general elevation, that, only in the province of Balti, villages are to be found below a height of 6,000 feet. As a whole, Tibet is very thinly populated, the greater portion of the inhabitants living at heights varying between 9,000 and 11,000 ft. Some of the chief towns of Tibet have been built at considerable elevations; Leh, the capital of Ladak, and one of the most important commercial places of Western Tibet, lies 11,527 ft. above the level of the sea. Tibet, like the Himalayas, has its summer villages. One of them, Gartok, on the Indus, at a height of 15,090 ft., has a special interest attaching to it from the commercial importance of the place. Every year, in August, a large fair is held there, and occasionally visited by several thousands of natives from almost every part of the Himalaya and Central Asia. The houses in Gartok being few in number, the people have to encamp in the black or coloured cloth-tents which they bring with them, enlivening the usual quiet aspect of the place with the appearance of a second and larger town under canvas. This is certainly the greatest height at which man is known to congregate for mercantile purposes. Some of the other Tibetan summer villages, as Norbu (15,946 ft.) and Puga (15,264 ft.), are built on sites, near which salt and borax, important export articles of Tibet, are found, and serve only as occasional sheltering places to shepherds.

Tibet has long been famous throughout Asia, and even in Europe, for its numerous herds of sheep, and the superior quality of the wool which they provide ; with the rearing of these herds many of its inhabitants are exclusively occupied. In summer, the flocks are driven to pasture grounds, some of which reach an elevation of 15,000 to 16,349 ft., beyond which the Tibetan shepherds venture

In the Kuenlun, even the foot of its southern (Tibetan) slopes is so elevated, that no villages or pasture grounds exist at all ; by combining with recent observations a variety of reports received, we obtain for its northern slopes 9,400 ft. ; as the limit of permanently inhabited villages (Buslia 9,310 ft.) ; summer villages reach about 10 200 ft. ; and pasture grounds do not occur above 13,000 ft. There are several routes into Tibet, one by the northern banks of the Lohit, and through the Mishmi hills into Tibet, called the Mishmi route. Mr. Georgia Bogle, who was sent in 1775 by (Mr. Hastings) the Governor of Bengal on an embasssy to the Grand Llama of Tibet, in 1774, travelled by way of Coos-Behar, Tassasudon, and Paredrong, to Channanning, the then residence of the Llama, and nearly in the same parallel of latitude with Lhassa.

Through Darjiling is the shortest mountain passage across the Himalaya into Tibet and Central Asia, and there is no doubt that a large commerce in British manufactures could be established for these countries. Mr. Moorcroft gave it as his opinion that "it is at our option whether Central Asia shall be supplied with goods from Russia or England." The brothers Schlagintweit corroborate that view. Mr. Bogle said that the trade must have been a very considerable one in broadcloths, and that the demand for it was still very great in his time. Dr. Hooker, in his evidence before the Colonization Committee, said there was nothing the Tibetans admired more than the cloth of his garments, and he believed, if they could obtain British woollens, they would gladly use them. The principal products of Tibet are gold, jewels, shawl-wool (the same as the Cashmere shawls are made of), ponies, immense quantities of borax, and salt. Almost all the salt consumed in the Himalaya is from Tibet, and it is brought with immense labour, upon the backs of men, women, children, and animals ; with communication easy and cheap by rail roads from Calcutta to Darjiling, the salt of the sea coast of India will entirely supersede that of Tibet in the Himalaya, and the natives, too, much prefer it.

The great Tibet road leads from India to Central Asia, runs in the gorge through which the Sutlej passes. All the inhabitants of the snow valleys trade ; they reside from March until November in the valleys just under the ghats, where a scanty cultivation is carried on by their women, and whence the men take flour, rice, cotton, sugar, &c. into bet, bringing back borax, salt and wool. from November to March they abando snowy ranges for the banks of the Alakn about Kurupryag, Nandpryag, &c., and on interchanges with the traders at Na bad. They use the Chour-gai or yak for tr port ; it carries 150 to 200 lbs. It is a chased at from 10 to 15 rupees. Gold, is all else of a yellow colour in Tibet, is sacred to the grand Llama. The gravel of the northern steppes of Tibet yields gold in grains, but the value of the crude borax of the lakes surpasses, as an article of trade, that of the precious metal. Gold is found on the banks of the Basha stream, in Little Tibet. Vigne has no doubt that the drun or marmot of Little Tibet are the "ants as big as foxes" noticed by Herodotus as throwing up gold. Nagyr is celebrated for its gold washings. Tavernier tells us (p. 156) that "toward the Tibet, which is the ancient Caucasus, in the territories of a raja beyond the kingdom of Chachemir, there are three mountains close one by another, one of which produces excellent gold, the other granats, and the third Lapis Lazuli."

Thokjalung, in latitude 32°, is the chief gold field of Western Tibet. It is a large desolate plain about 16,000 feet above the level of the sea, and in 1868, the pundit sent by Captain Montgomerie saw a nugget weighing 75 tolas or 2 lbs. In Tibet the gold fields are said to extend from Rudok to Lhassa, or eleven degrees of longitude = 700 miles. They also extend northerly to between Aksu and Ili. Numerous parts of Central Russia and China also contain gold. Marco Polo relates that in Tibet, they eat raw meat and worship images, and have no shame respecting their wives. Ibi-gamin is a glacier in Eastern Tibet, in height 22,260 feet English = 20,886 French feet. The Chong are a hill tribe on the side of the Mekong basin, but towards the sea, between L. 11° and 12° N. They preserve more of the Australo-Tamulian character than any of the neighbouring tribes. Their hair, instead of being stiff or harsh as in the Mongolian, Tibetan, and prevalent ultra-Indian and Malaya-Polynesian races, is comparatively soft, the features are much more prominent and the beard is fuller. The majority of the Afghan and Tibetan plants are also natives respectively of the Caspian steppes and North Persia on the one hand, and of Siberia on the other. They have been described by Russian botanists, and especially by Ledebour, Bunge, Turczaninow, C. A. Meyer, and Fischer, besides being rendered classical by the labours of Gmelin and Pallas. Boissier's Diagnoses Plantarum Orientalium, published in the 'Annales des Sciences Naturelles,' contain descriptions of many new Persian and Levantine plants, mainly from the collections of Kotschy and Aucher-Eloy, which are also common to Western Tibet, Afghanistan, Sind, Beluchistan.

Middle Tibet, or Ladak, in the reign of Aurungzebe, was invaded by the Kalmuks, and the ruler of the country, unable to repel them, applied for aid to the Mogul governor of Cashmere, who granted it on condition that Ladak became tributary to the Mogul empire. On the eastern frontier of Ladak lies the large province of Chantan, known to the Booteas as Himdes or Hemdes, the 'Region of Cold,' comprehending what has been called Upper Tibet. This country was formerly subject to independent princes, but their authority gradually merged in that of H'lassa (the name of the capital of Bootan), which is under the nominal authority of China, a Chinese governor residing in the city. By virtue of some ancient agreement, the wool of the shawl goat, of which this cold country is the chief resort, is sold exclusively to the people of Ladak: hence probably arose some constructive claim on the part of the Sikhs.

Moorcroft speaks highly of the cultivation of wheat and barley in Tibet, and he once saw field of the latter grain in that country such as he had never before beheld, and which he says an English farmer would have ridden many miles to have looked at.

The Tibetan postfixes po, mo, &c. are found in Serpa (be, ba, me, mo,) Lepcha ; (bo, mo,) ; Kiranti (ba, ma, va, vo,) ; Sunwar (Pha), but they are rare, save in Serpa, with substantives. As qualitive affixes they occur in Serpa (generally contracted to m,) Limbu (ba, pa, va, ma, euphonically la, ra,) ; Kiranti, Murmi (ba, pa) ; Guning (ba, va, bo.) The Tibetan ka, ga, occurs in Newar (ku, ko, go, gu) ; Magar and Sunwar have cho (generally so in Sunwar). To numerals Kiranti suffixes ya and Limbu sh. Verbal postfixes occur in all the vocabularies le, re, ne, e Limbu ; ra, na, a (apparently) Kiranti ; ni, na Magar &c. Mr. Hodgson says the Murmi, Gurung, Magar and Sunwar in speaking always add a terminal of to the imperative.

The Tibetan pony, though born and bred 10,000 to 14,000 feet above the sea, is one of the most active and useful animals in the plains of Bengal, powerful and hardy, and when well trained early, docile, although by nature vicious and obstinate.—*Hooker, Vol. I. p.* 118, *to p.* 131. *Travels, Moorcroft's.*269,280, *Cunningham's History of the Sikhs, p.* 2. *Journal of the Indian Archipelago, No. IV. and V. TICA, a commentary, most of the Siddhantas which have been written by modern hindu authors, such as the Arya, Parasara, and other treatises known by that designation, as well as the ticas of Bhascara Acharya, Varaha Mihira, and others, may be considered as commentaries on the four principal Siddhantas of the hindoo religion.

TICAL, a Chinese weight, also money of account ; as a weight about 4¼ oz. or the 16th of the catty, as a money reckoned at the third of a pound sterling. It is also called a ly-ang ; another name in Burmah for the kyat, a weight which consists of 252 grains. In Siam the tical coin and weight is 236 troy grains, and its value in England is about 2s. 6d. sterling.—*Simmond's Dict.*

TICHODROMUS MURURIA, or Wall Creeper of S. Europe, is very common in the Himalaya, Afghanistan, &c. It occurs in rocky situations, and on the scarped sides of mountain roads, and it is often observed in the N. W. Himalaya. At a distance it looks like a very large grey and scarlet butterfly, as with expanded wings it noiselessly creeps over the rock, poking its long awl-shaped bill into every little nook and crevice. —*Adams.*

TICKEL, Colonel, 31st B. N. I, wrote on the Birds of Borabhun and Dhalbun in *Bl. As. Trans.* 1833, *vol. II.* 569, and contributed largely to the stock of knowledge regarding the ornithology of Central India and Burmah.

TIC-POLONGA. A name given in Ceylon to a poisonous snake about 3 or 4 feet long.

TIDES. The usual vertical rise and fall of the tides along the peninsula of India is small. In the straits of Malacca it is from twelve to fourteen feet, while in other parts of the world, in the same latitude, there is scarcely any variation. The tides at Singapore correspond in this respect with those in the Straits. The vertical rise and fall of the tide upon the coast of Cochin-China varies from six to fourteen feet, and the periods and duration of the ebb and flood are by no means regular. In latitude 12°, on the same shore, there is but one tide in the course of twenty-four hours. It has been said that the tides in the tropics rise and fall very little. Although it is granted that in high latitudes the perpendicular flow and ebb is generally greater than in low, still there are many examples of considerable tides in the latter. At the head of the Gulf of Cambay, in latitude 22°, Horsburg states that the perpendicular depth of the rise and fall of the tides is from thirty-six feet at the full and change of the moon. So, also, according to the same authority, in Surat road, it is from twenty to twenty-one feet, and from fifteen to seventeen in Bombay harbour ; again, in the Gulf of Martaban, which is far within the tropics, the rise and fall of the tide, at the full and change of the moon, is twenty-three and twenty-four feet, and of Rangoon bar about twenty or twenty-one feet. In Gasper straits, within 2½° of the equator, there is occasionally, from local causes, a rise and fall of sixteen or seventeen feet on the spring tide, but this is rare in other places so near the equator. These instances, all mentioned by Horsburg, show that very considerable tides occur within the tropics. The range of the tides, however, greatly varies, from 1½ feet in the open ocean at the Mauritius to 20 feet at Rangoon, 21 feet at Mergui and Martaban, and 30 feet at Surat.

TIDHARA. Hind. Euphorbia antiquorum.

TIDORE, on the west coast of Gilolo, is about six miles long. A mountain on the N. E. end of the island, is in lat. 0° 40′ N., long. 127° 22½′ E. Tidore is over 4000 feet high. Tidore, like Ternate, from which it is two or three leagues distant, is formed in its southern part of lofty hills. The soil is of great fecundity, and plentifully watered by streams from the peaks. The people appreciate these blessings, and labour more earnestly on the land than those of the sister isle, distinguishing themselves by an aptitude for agricultural occupation. Near is Batchian, the largest of the chaplet of isles surrounding Gilolo, fertile as Tidor, but neglected and rotting in its wealth and beauty, under the hands of a population universally indolent. The soil is volcanic, and below the active crater springs of sulphureous water break from the ground in the most picturesque situations. Among the people here, as in Amboyna, the christian converts are the most inert and servile. The situation and aspect of the island are beautiful, its fertility is abundant, its climate leaves little to desire, yet is all but a waste, with a scant and scattered population immersed in poverty. Monkeys are to be found nowhere else in the Moluccan archipelago. The Molucca sea is sprinkled with smaller islands interesting and curious in themselves, but too little important, and too numerous, to be separately noticed. Among them may be enumerated Tawali, Mandola, Lutta, Hanika, Saparua, Ghissa, the Keffing Isles, Amblow, Manifra, Kilang, Bono, Harekoe, Hominoa, Noesa Laut, Hila, Kilwari, Binoa, Nelany, Manipa, Manok, Myo, Tesory, Serua, Motir, Bally, Tomoguy, Selang, Gag, and Battang Pally. There is considerable variety in their aspect, form, and size. Some, like Battany Pally, are not half a mile round, though bearing a grove of trees. Others, considerably larger, are of moderate elevation, and wooded over their whole extent. Pulo Gag, unlike most of its companions, presents an English appearance, being luxuriantly fertile, but with the exception of a few tall timber clumps, entirely bare of trees. Many are wholly uninhabited. The greater and the lesser Keffing, however, now little known islets S. E. of Ceram, are well peopled by mahomedan Malays, and sprinkled with houses of traders engaged in traffic with the Nassau, the Ki, and the Tenimber isles, where they sell the produce of their fishery, tortoise, and trepang. The isles are low, but remarkably picturesque.—*St. John's Indian Archipelago, Vol. I. p.* 140. *Forrest's Voyage to New Guinea*, 37, 39, 545. *Temminck*, *Possessions Neerlandaises*, *Vol. III. p.* 151, 154. *Hogendorp*, *Coup d. œil sur Java. TIELLA, in Malayala and Tamil, a tree which is not much known in Ceylon. It grows from eight to twelve inches in diameter. It is used by the natives in the frames of country boats; and, from its strength and durability is found to answer the purpose well.—*Edye, Ceylon.*

TIEN CHING—? See Dyes.

TIEN-DZA. CHINESE, a title of the emperor of China. The emperor has in his palace a bell for the use of the oppressed who claim his protection, but it is now as much off duty as the cymbal or drum of the mandarins. The idea of the family is the grand principle that serves as the basis of society in China. Filial piety, the constant subject of dissertation to moralists and philosophers, and continually recommended in the proclamations of emperors and the speeches of mandarins, has become in the views of the Chinese the fundamental root of all other virtues. All means are made use of to exalt this sentiment, so as to make of it an absolute passion; it assumes all forms, mingles in all actions, and serves as the moral pivot of public life. Every crime, every attempt against the authority, property, or life of individuals, is treated as filial disobedience, whilst, on the other hand, all acts of virtue, devotion, compassion towards the unfortunate, commercial probity, or even valour in battle, are referred to filial piety; to be a good or a bad citizen, is to be a good or bad son. The emperor is the personification of this grand principle, which dominates and penetrates more or less deeply all the strata of society in this immense agglomeration of four hundred millions of individuals, and in the Chinese language he is called Hoang-te, August Sovereign, or Hoang-chou, August Elevation; but his name *par excellence* is Tien-dza, Son of Heaven.—*Sirr's China and the Chinese, Vol. I., p.* 423. *Huc. Chinese Empire, Vol. I. p.* 358.

TIEN PAK OR TIEN PE HIEN, is the principal place, on the south coast of China, where salt is produced, and several hundred junks are annually employed in transporting it to Canton.

TIEN TSING —— ? See Dyes.

TIE THIE. BURM. Ficus carica, *Linn.* The fig.

TIFTEK PERS. TURK. Goat's hair.

TIGA MUSHADI. TEL. ? Cocculus acuminatus, *DC.*

TIGE. TEL. A creeper.

TIGE BACHCHALI. TEL. Basella cordifolia, *Lam.* B. alba, *Linn.*

TIGE CHIRRI. TEL. Chirri is Amarantus tige, a climber. The Sanscrit syn. Marishah is said to be Am. oleraceus.

TIGE GADDI. TEL. A creeping species of grass.

TIGE GARIKA. TEL. A creeping or bent grass called Agrostis stolonifera. Garika is Cynodon dactylon.

TIGE GUMMUDU. TEL., or China mandula mari. Vitis Linnæi, *Wall.* Cissus vitiginea, *R.* i. 406.

TIGE JEMUDU, also Somalata and Pulla tige, TEL. Sarcostemma acidum. S. brevistigma, *W.* S. viminale, *R. Br.* Asclepias acida, *R.* ii. 31.

TIGE JILUGA. TEL. Æschynomene Indica, *L.* Hedysarum nalitali, *P.* iii. 365.

TIGE MUSHIDI. TEL. or Tige mushini, or Kappa tige. Tiliacora acuminata, *Miers.*

TIGE POKA, or Nela-poka TEL. SANSC. Calamus, *Sp* Yojanam, also Yojana valli, the latter word answering to tige a climber, is said to be Rubia.

TIGERS occur throughout India, in the Malay peninsula, Chinese Tartary, Eastern Russia; but unknown in China. The tiger uses its fore paw in self-defence and in fighting, but it seems to use its teeth in catching its prey, grasping the neck. After killing it frequently lets its prey remain till nightfall, when it returns to feed upon it. The aborigines of Central India reverence in a mild inoffensive way, the sun, the moon, the tiger and the bhut or household spirits. They use tiger's claws as charms, heap up cairns, and tie bits of rags to trees, but in these last they resemble the hindu and buddhist. It ranges on the mountains of India up to 6000 and 7000 feet. In hot weather, the tiger harbours near rivers, in thickets of long grass, brushwood, or amongst the tamarisk bushes of river islets. The tigers of Lower Bengal and Central India are particularly savage and ferocious. The average size of a full grown male tiger is from 9 to 9½ feet, but occasionally in India a tiger is killed measuring ten feet in length. They catch the wild hog, the sambar, and the spotted deer, but they often prey on cattle and seize the villagers. It is naturally a cowardly animal, and always retreats from opposition unless wounded or provoked. A herd of cattle will attack a tiger and compel it to relinquish its prey. On one occasion, a herd of buffaloes rushed on a tiger that had seized their herd-boy, and compelled it to drop him. The wild boar sometimes kills a tiger; they eat frogs, the porcupine, animals that have died of disease, and also their own kind. They are partial to particular localities and to old ruins, old temples, and three or four may be seen lying together on the tops of the walls. An old tiger will kill a cow about once a week, remaining near the carcase for two or three days, and sometimes longer, gnawing the bones before returning to its retreat. A tigress has from two to four cubs at a birth, which remain with her till they be able to kill for themselves. Tigers that have killed a man, generally continue to take that food. In the Mundlah district east from Jubbulpore, in 1856, and previous years, on an average between two or three hundred villagers were killed annually, and Mr. Jardine found several villages of the Bastar country deserted owing to the ravages of tigers. The clavicle of the tiger lies loosely imbedded among the muscles near the shoulder joint, and is considered of great virtue by the natives of India. The whiskers are supposed to constitute a deadly poison, and are carefully burned off the instant the animal is killed: but in some parts of the South of India, they are supposed to endow their possessor with unlimited power over the opposite sex; the claws are mounted in silver and set as bracelets. In Cochin China many of them obtain their livelihood by tiger-catching, the skin of this animal being valuable. They use a novel mode of ensnaring these savage beasts. Two Malays generally go in company, and travel over many parts of the country. Those who follow this business regularly have chops, or permits, from the Quong of Saigon, allowing them to build a hut for their use in any place they think fit. The hut is built on the top of four bamboos, from fifteen to twenty feet high; and, as the tiger cannot climb these, the two men can remain in it, and watch their snares in safety. The snare consists of large leaves, or sometimes pieces of paper about six inches square, covered on one side with a substance of the same nature as bird-lime, and containing a poison, the smallest particle of which, getting into the animal's eyes, causes instant and total blindness. They are laid about thickly, with the bird-limed side upwards, in the track of a tiger; and as surely as the animal puts his paw on one of the treacherous leaves, he becomes a victim; for, finding it stick to his foot, he shakes it, by which means other leaves adhere to it; he then probably rubs his paw over his head, in the attempt to rid himself of these leafy encumbrances, but they stick to his head and face; he then perhaps rolls himself on the ground, when he becomes fairly covered; and, while scratching and rubbing himself to get free, some of the poisonous bird-lime gets into his eyes and blinds him. He growls and roars in agony, and this is the signal for his captors to come and despatch him. The Malays then skin the animal, and take away parts of his body that may be valuable. They leave the carcase, well strewn with more leaves, as a bait for other tigers; they also ensnare other animals and birds in the same manner. Captain F. Nelson, of Siddapore and Peddacheroo, recommends poisoning tigers. Buffaloes or bullocks should be picketed in the most likely cross-paths in the jungle. As soon as one is killed and any part eaten, a tea-spoonful of strychnine should be inserted under the flap of the skin next the part eaten. The skin should be raised with a bamboo knife like a paper-cutter. No human hand should touch the carcase, and one person only should approach to insert the poison: a watcher in a tree would keep the vultures off till sunset, when he should quit the place.—*Adventures in Cochin China, Amoy, China, by Edward Brown. Jerdon.*

TIGE KRANAGA. Tel. Pongamia uliginosa, *D. C.* Galedupa uliginosa, *Roxb.*

TIGER BEETLES occur amongst the Coleoptera of Hong Kong.

TIGER LILY. Pardanthus Chinensis.

TIGER FLOWER. Tigridia conchiflora.

TIGER'S FOOT IPOMÆA. Ipomæa pestigridis.

TIGER'S MILK TREE. Excœcaria camettia, *Spreng.*

TIGE VEMPALI. Tel. Tephrosia, Sp.

TIGE VISESHAH. Tel. A climber.

TIGLIA. Lat. Croton tiglium. Tiglii oleum. Lat. Croton oil, Nepala oil.

TIGLIUM KLOTCHIARUM. Rheede. Croton tiglium.

TIGE MODUGA. Tel. Butea superba, *Roxb.*

TIGO-GIN. A silver coin of Japan of 40 mas, worth about 13 shillings.—*Simmond's Dict.*

TIGRANES, of Armenia. See Greeks of Asia.

TIGRE. See Semitic races.

TIGRIDIA CONCHIFLORA. The beautiful Tiger flowers, are grown like other lilies, the flowers open in the morning, and are of short duration : a second blossom appears on the same stem about the third day after the first has withered.—*Riddell.*
